Mr Andrew Carnegie.

THE  
STREET RAILWAY  
REVIEW

INDEX TO VOLUME IV

1894

CHICAGO  
WINDSOR & KENFIELD, PUBLISHERS  
269 DEARBORN STREET

# INDEX.

Articles marked "\*" are illustrated.

## EDITORIAL:

Accidents ..... 744  
 Accident Insurance..... 390  
 Addressing Passengers..... 390  
 Advertising..... 389  
 Amalgamated Association of Street  
   Railway Employes..... 453  
 Arrest of Train Crews..... 324  
 Artesian Well Power..... 2  
 Baltimore Fender Ordinance..... 619  
 Baltimore Fender Report..... 678  
 Baltimore Ordinances..... 389  
 Bellev's Prophecy..... 1  
 Boarding Cars..... 260; 741  
 Boyd, James..... 617  
 Brakes..... 130  
 Bribery by Supply Companies..... 743  
 Bridges, Occupancy by Street Rail-  
   ways..... 65  
 Brooklyn Daily Papers Howl..... 195  
 Brooklyn Trolleys..... 323  
 Business Outlook..... 197; 259  
 Cairo, Egypt, Tramways..... 129; 389  
 Car Starters..... 195  
 Car Wiring..... 677  
 Change in Paying Fare..... 67  
 Chicago Electric Franchises..... 262  
 Children on Streets..... 129  
 Comparison of Traction Methods..... 130  
 Complaints..... 743  
 Conduit Railways..... 197; 744  
 Construction of Interurbans..... 677  
 Construction Work for 1894..... 2  
 Convention at Atlanta..... 453; 517  
 Convention Dates..... 517  
 Convention Exhibits..... 678  
 Convention Papers and Reports..... 66  
 Damage Suits..... 196  
 Death from Trolley Circuit..... 325  
 Decline in Prices..... 323  
 Delays on Cable Roads..... 259  
 Dirty Rails..... 742  
 Duties on Street Railway Material..... 742  
 Education of Public to Ride..... 260  
 Ejection of Passenger..... 323  
 Electrocutation..... 743  
 Electrolysis..... 259

Address all Communications and Remittances to THE STREET RAILWAY REVIEW,  
 269 Dearborn Street, Chicago.

H. H. WINDSOR, Editor. F. S. KENFIELD, Business Manager.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,  
 269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4. JANUARY 15, 1894. NO. 1

Moving houses across and along railway tracks was quite bad enough under horse car practice, but where trolley wires must be cut is a positive nuisance. The general opinion is for securing municipal legislation which shall furnish suitable protection.

A LARGE field, as yet untouched, is the construction of electric lines for handling freight cars from the main line of steam roads, a few miles, to inland towns. Where water power is available the problem becomes one of easy solution. Such a line has been in very successful operation for some months past, in Maine, and in addition to the heavy work named does a good passenger and express business.

THE question as to the specific difference between a surface and elevated railroad, received a precedent in Pennsylvania in the recent decision of the case of the City of Philadelphia against the Northeastern elevated railroad, whose charter announced it as "a street passenger railway." The court held that whether built and operated on the surface of the street, or on pillars or posts at some distance above the street, it was the same in either case, "a street passenger railway."

A POSSIBLE use for the several hundred old and very small horse cars, now in disuse throughout the country, may be suggested by the tower and tool car described

this month. Some of the cars named are even unfit for joining with another similar car and being converted into twenty foot bodies, but may at trifling expense and with the ordinary help available on every road, be converted into portable machine shops for overhead repairs, and still do good service for the new power and the new age which have displaced them.

"THESE channels of internal communication will be multiplied, till all the broad avenues of the city are occupied by them," says Bellew's Pictorial magazine, in 1855, as quoted elsewhere in this number. "We have no doubt," continues the writer, "that within a few years many of our suburban villages, which are now served with omnibuses, will be connected with the city by horse railroads." How fully the prediction has been realized is evident from a glance at our monthly directory of American street railways.

ONE of the most needed city ordinances, and not in Chicago alone by any means, and a measure which has long and earnestly been advocated by this magazine, has now become an operative municipal law. It is none other than making it an offense for children of either sex under eighteen years of age, to "hitch on" moving street cars. It might occasion a smile with some who read this but who have never visited certain districts of this city where girls from six to fifteen years of age vie with the boys as to who can cause the conductor the most trouble. The first enforcement of the law resulted in a large catch, which was treated to one night in the lockup and a dollar fine, per head, next day. What has been an unmitigated nuisance, for years past, now promises to be wholly remedied. It is a law which should exist in every city. We print the text of the ordinance elsewhere.

IN the Ohio legislature a bill has been introduced making it obligatory upon all municipalities in the state to grant street railway, gas, and similar franchises, only to the highest competitive bidder. This opens a fine field for the sand-bagger, and will certainly delay, if not entirely prevent, the building of lines which would otherwise be constructed. The residents of any community have only to gain by increased transportation facilities of any kind, and instead of adding to the already heavy burdens of these enterprises it would be much the wiser to raise a bonus and give the new road a lift. It is impossible to construct a new line without advancing the value of property, and the city and state receives an increased revenue from this increased valuation, which should be considered as ample discharge of whatever obligation pessemistic legislators may suppose to exist.

THE REVIEW makes its annual bow, and admits that with this number it is three year's old, and "goin' on four" now. We refrain from calling special attention to the fact that the past year has been a peculiarly hard one on publishers, and that the favorite trade journals in all lines of business have lost a large amount of patron-

age—some as much as one-half. It is, therefore, with modest pride that we are able to announce that the REVIEW shows a handsome increase in the year's business of 1893. No economy has been practiced, or the question of cost once allowed to enter into the consideration of what was deemed desirable or necessary for our reading columns. This current issue is simply a fair sample of what our readers have had each month, and were it not against our established policy we should like to print every one of the many hundred letters of appreciation and encouragement our readers have so generously and kindly sent us. We prize them highly, and find in them our best endeavor for improvement. This reminds us, the REVIEW this year will,—well, just watch, kind reader, and you will see.

REPORTS from our correspondents in various parts of the country while somewhat guarded are, in the main, surprisingly hopeful, and denote a decided improvement in railway work as near at hand. Roads have wholly exhausted their stock of repair parts and are forced to become considerable buyers in these lines, and for immediate consumption. Other roads which are only operating one-third or one-quarter their usual equipment, are in many cases, stripping the idle cars to repair those running, and as soon as spring opens, with necessarily increased riding, there will be a sudden and extended demand. As to new lines, there is much to encourage; with the banks full of idle money, both East and West, there will be no great difficulty in securing proper aid for strictly legitimate enterprises, which will take advantage of the lowest prices in materials and labor in years, to build. Many lines will surely be built this summer, and employment for the working classes is bound to increase as spring advances. This will be speedily felt by roads which are not now earning more than expenses. Taken altogether, we consider the outlook and conditions as showing a decided improvement, and that the worst is over.

WITH the fading light of the dying year went out the life of one, who unlike it, possessed his strength of mind and body to the very last. No name was more familiar or words of counsel better known in the street railway fraternity, than those of William Richardson. To a commanding voice and figure he added the ripe experiences of his three score years and ten, and guided both by a thoroughly well-balanced mind. Nor was he devoid of humor, and the record of conventions for the last ten years reveal a ready repartee which was shot as an arrow from the bow: yet he always maintained that quiet dignity and self-possession which marks the true gentleman. Doubtless no one was better known than he, both in the city of his home, and the councils of the American Street Railway Association, and the news of his demise is received with sadness and surprise. There is feeling of pain that one who was just about to retire and enter upon the enjoyment of accumulations and honors, the fruit of a life of intense activity, should not have been spared the fulfillment of that desire, yet those who knew him best realize

that to one of his temperament and ability, a life of idleness would have been impossible. He died with the harness still on, in the strength of accomplished successes, and the beauty and respect of a life well lived.

WE publish this month a description of one of the most novel and interesting features of electrical power supply it has been our privilege to lay before our readers. Books by the score have been written on the utilization of the power of falling water, but it has remained for the enterprising people of South Dakota to throttle the force of the wonderful artesian wells, which, like magic, have responded with veritable geysers, where man explored the secrets of old Earth with his diamond drill. Laying aside the multitude of interesting questions as to the source of this supply, we accept its existence, and look forward with confident expectation to a remarkable utilization of this power in the production of electricity. The roar and beauty of Niagara are wanting; only a few feet of steel pipe protruding from the ground; only an unpretentious water-wheel and a sparkling little river running away on its beneficent errand of irrigation. But it is the same effective power, and progressive minds have already consummated plans which will ere long furnish transportation between the young towns and villages which are rapidly becoming cities, and electricity will be the medium of the power; and old Nature will give of her secrets and her strength to generate this electricity. We dare suggest this approaches very near to something new under the sun.

WHEN the Metropolitan Traction Company, of New York City, shall have completed the construction of the additional cable lines for which it now has franchises, it will have reached the limit within which cable construction is practical. The cable is undoubtedly the more economical system where a large volume of business must be handled and the route is reasonably straight. To complete the necessities of rapid surface transportation in that city requires a system which shall follow the beaten paths of travel established by the public, and which involves a winding route, much of which covers streets where travel is light as compared to such great arteries as Broadway. On these lines the company properly desires to operate the trolley system. The conduit system of electric traction has never been successfully operated in this country, nor have storage batteries as yet fully demonstrated their claims, although some advance seems to have been made in this direction during the past six months. The trolley, therefore, presents the only relief at present. If there is any better system the Metropolitan wants to know it, and to bring the question to a positive issue, have offered to pay \$50,000 for any plan which shall be presented before March 1, of this year, and have named the State Board of Railroad Commissioners as the judges. The prize is a large one, and if any method superior to the trolley exists, now is the time to substantiate its claims. If none can claim the reward the public in all fairness is bound to accept the verdict.

THE scheme, for it is nothing more, of one J. E. Dunn, to secure a Congressional bill establishing a District commissioner, and himself as that functionary, with the privilege of assessing every grip and motorman five dollars for an examination as to fitness, is an outrage and an absurdity. Dunn tries to draw a precedent from steamboat engineers, who are very properly under government surveillance. Of course the condition of a vessel with a boiler in momentary danger of explosion and miles from any place where experienced men know anything about such matters, is not a circumstance to the awful peril of a car load of street car passengers at the moment when a brake shoe becomes cracked or the fare register fails to work, and the company's shops and barns mayhap as many as two blocks from the scene of mechanical carnage. But if the examination of street railway men has any merit, let the good work be extended to include drivers of merchants' delivery wagons, and the festive milkman, and the lackey who drives the senatorial coach, and the omnibus man; all of whom are far more dangerous to humanity than the car driver who can't drive outside of his established line of rails to save his life. Then there is the man with a wheelbarrow, who, under many circumstances, can be a really dangerous person; and the push cart, which is not entirely devoid of peril, and by no means that least menace to society—the hand organ. Car drivers also should qualify on a West Point final examination, and possess none but sound teeth; have the necessary height and weight, and be able to lead the german. In the mind of the schemer all this should be Dunn.

CHICAGO ALLEY L ELECTION.

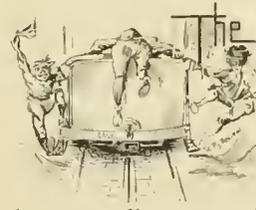

The election of three directors for the Chicago & South Side Rapid Transit Company was the occasion of some excitement, January 4, owing to the dissatisfaction of a minority of the stockholders with the present management. The directors chosen were C. T. Gray, E. L. Lobdell and J. Hinkley. Mr. Lobdell represents the minority. The following table shows some interesting facts in regard to the performance of the road in 1893.

MONTH.	No. of Passengers carried	Earnings.	Expenses.	Percentage of expenses to earnings.	Average cost per passenger.
January.....	1,051,139	\$ 52,556	\$49,705	94.5	.0473
February.....	1,056,444	52,822	48,810	92.5	.0462

November.....	1,457,675	72,883	56,509	77.6	.0388
December.....	1,283,378	64,168	57,647	89.9	.0443

The December daily average of passengers carried is 41,399; total for year, 30,045,747.

DAY OF JUDGMENT.

For the Small Boys who Hitch on Chicago Street Cars.

CITY COUNCIL of Chicago, on December 4 last, legalized one of the most needed and sensible acts of city legislation which has been accomplished here in a long time. It was none other

than an ordinance against hitching on street cars, and the text in full is as follows:

Be it ordained by the City Council of the City of Chicago:

SECTION 1. No minor under the age of eighteen years shall climb, jump upon, or cling to, or in any way attach himself or herself to any horse, cable, electric or other street car of any kind while the same is in motion.

SEC. 2. Any person who shall violate the provisions of Section one of this ordinance shall, upon conviction, be fined not exceeding the sum of ten dollars.

SEC. 3. This ordinance shall take effect and be in force from and after its passage and due publication.

Owing to the distractions of a municipal election the ordinance attracted little attention, and its sudden execution on January 1 came like a cyclone to the cyclonic small boy, who in large numbers celebrated the new year by disporting himself in his accustomed pastime. But a big cop was abroad in the land, and speedily deported enough young trespassers to fill a cage at the Harrison street station. They were kept all night in a cell, and next morning fined one dollar and costs, and went out into the new year with a desperate desire to let cable cars alone and to do missionary work among "de kids" who are still addicted to "hitching on."

It is a reform measure of more than passing importance and one which the REVIEW has advocated from the date of its very first issue. The success of the measure here should encourage managers in other cities to secure similar protection, which is at once a like protection to companies, the public, the parents of the offenders, and the children themselves. The damage claims from this source in a single month, on some roads, would well pay the trouble of securing the ordinance, against which not one good argument can be raised.

AN electric railway, now abandoned, running between Whitinsville, R. I., and Whittin Station, is now operated as a freight route by the Whittin machine shops. The passenger traffic did not warrant the continuance of the electric power.

It is suggested by several eastern newspapers, mainly of Boston, that street refuse and garbage wagons be dispensed with, and that the trolley garbage car be utilized. Then, too, the electric sprinkler could follow in the rear, and behind it could run the sweeper.

A READING, PA. genius suggests that in view of the alarming frequency of electric train robbers' hold-ups in various parts of the country, an electric exterminator be arranged so that the trolley circuit may also act as a protector for the passengers who carry valuables.

## SOUTH DAKOTA'S WONDERFUL POWER.

An Unique Opportunity for Electrical Development—Entirely Novel Source of Power—New Problems for the Electrical Engineer.

The idea of developing any considerable amount of power from artesian wells was heartily laughed at when first proposed, and it is very probable that a considerable number of those who read this article will scout the idea, as of exceedingly questionable feasibility. Nevertheless, work has been quietly going on in South Dakota for the past year, which proves that the artesian wells of the James River valley are as valuable and reliable a kind of water power as could be wished, and from all indications will continue to be so for years to come. Already a number of electric light and flour mill plants have been installed, and are in daily operation. These will be mentioned in detail later on.

The artesian well district of South Dakota is located in the valley of the James river, covering a tract about 40 miles wide and 200 miles long. The James river is about half way between the Missouri and the eastern boundary of the state. The water bearing rock is found at from 900 to 1,000 feet from the surface. The first and most vital question that comes up is as to whether the supply is reliable, and can be depended on to continue with its present pressure, as more wells are sunk and a greater volume of water is drawn from the underground source.

There are good reasons for thinking that the supply is practically inexhaustible. These reasons are based both on the theories advanced by the United States government geologists and on observed facts in connection with the sinking of wells. The government theory is founded on the fact that the same stratum in which the water is found, outcrops in the beds of the Upper Missouri and

Yellowstone rivers, and at the base of the Rocky Mountains. The water, sinking in this porous stratum of rock, follows it for hundreds of miles, until tapped by the South Dakota wells. It has long been believed that there is more water in the Missouri River above the Great Falls than there is thirty miles below. For twenty-five or thirty miles below the Falls the river bed is com-

posed of the same sand formation in which the South Dakota wells get their water. If this theory is correct, as it probably is, the supply of water to these wells may be looked upon as inexhaustible—at least, as much so as the sources of our Rocky Mountain streams. Another fact that would point strongly to the truth of this theory is, that during the June rise in the

Upper Missouri River, the pressure in the wells rises. No diminution in pressure has been noticed in any of the wells in the district, except by clogging up with mud, due to improper piping. The city well at Redfield has been down seven years. Its pressure has been constant, although numerous other wells have since been sunk at no great distances from it. This well furnishes a direct pressure system of water works, supplying all the domestic needs of the city, and so great confidence is placed upon the pressure and supply that the fire department requires no fire engines. The closed pressure of this well is 177 pounds, and cost for maintenance is absolutely nothing.

About a mile and a half distant is another well, used for running an electric light plant and for irrigation. A description of this well will suffice to give a fair idea of all. It is 1,000 feet deep, and six inches in diameter from top to bottom. When closed, the pressure is 165 pounds. When allowed to flow freely through the 6-inch pipe, it yields 2,027 gallons per minute, and rises to a height of sixteen feet in the air. When the water is escaping through a 2-inch pipe the well pressure is 128 pounds, and with a 2¾-inch opening 95 pounds. From this it is estimated that with a 4-foot Pelton wheel, 80-horse-power would be developed with a 2-inch opening, and 100-horse-power with a 2¾-inch. With the plain undershot wheel at present in place, 50-horse-power is developed, and it is calculated that about 15 more is available with it. The flow is absolutely steady. This well cost about \$3,000.

At Chamberlain, a 150-barrel flour mill and light plant, formerly run by steam, is now using "well power." These two plants were started in September, 1893. At Huron a well is about to be sunk by the city, for electric lighting purposes. The first electric light plant in the state, run from a well, is at Mellette, a town of 400 inhabitants. It is safe to say that very few plants in the world are

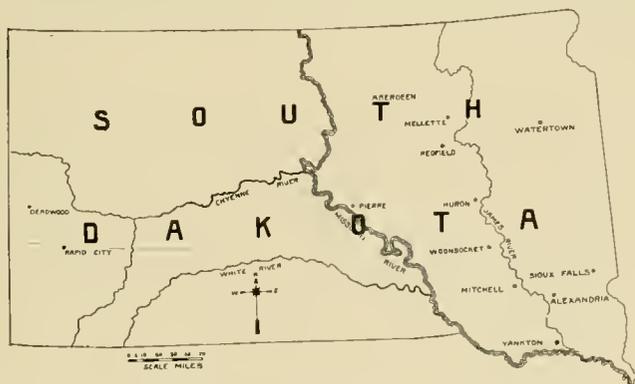

HASSELL & MEYERS' WELL, REDFIELD. 6-INCH STREAM 16 FEET.

doing a paying business in so small a place. This plant is thriving, however, and has connected 10 4-ampere arcs and 150 16-candle-power incandescents. The well is only four and one-half inches in diameter from top to bottom, but it operates besides the electric light plant, a flour mill, which grinds 150 barrels of flour a day and 50 bushels of feed per hour. This work would require an engine of 40-horse-power. The well is 910 feet deep. Its pressure when closed is 178 pounds. The flow is 1,600 gallons per minute.

### A BRILLIANT FUTURE.

It does not require a vivid imagination to see the possibilities of the James River valley. Electric railways are already being considered, to connect farms and small villages with larger railroad towns. The most feasible of the plans proposed is to take land in tracts of about four sections, and sink two 8-inch wells at the middle of the tract, which would be divided into thirty-two farms of eighty acres. The water from both these wells would be used for power and afterwards for irrigation, which latter feature, by the way, is not the least important consideration in the development of artesian wells in this district. The power from one well would light and heat the hamlet of thirty-two families, and the other would run an electric railway connecting with the larger towns. This plan may, of course, have to be modified a little, and it may be found better to sink wells so as not to have too great a drain on the underground water reservoir at one point, as this would be liable to cause a considerable drop in pressure. The prospectus seems almost Utopian, but there are plenty of good practical reasons why it will probably be carried out. The only thing that could prevent the success of the scheme would be a failure of the water supply, and we have already shown that there is no reason to think the supply limited. As regards the economy of this power over steam there is no question.

Considering that the water is used for irrigation it is probably the cheapest power for use in small quantities in the world. The outlay for an 80-horse-power well is, as was seen, about \$3,000, the interest on which would be \$2.25 per horse-power per annum. This, with the interest and depreciation on the water-wheel is the only expense for primary motive power, aside from labor. A \$300 or \$400 building gives the wheel and dynamo a good shelter.

The repairs to water-wheel ought to be almost zero, and the skill of the men employed for attendance does not begin to be that required in a steam plant.

### NEW ENGINEERING PROBLEMS.

The tendency in electrical work in the past has been steadily toward an increase in the size of stations and a centralization of power. The water power of South Dakota requires progress in the opposite direction. The

HASSEL & MYERS WELL, REDFIELD. 2-INCH STREAM 150 FEET.

question of the future electrical engineer in South Dakota will be, "How can numerous small plants situated a distance apart be utilized to best advantage?" Especially does this question come up in connection with electric railway work. The use of the storage battery has been looked to by some in this connection as a means of best utilizing the power for railway work and as an adjunct to the generating stations it may prove useful. The cost of a trolley line on a country road is not very great and ought not to be prohibitive. It is very possible, however, that for such light work as would be required at present, the storage battery on the car would be the most economical solution of the question. At all events the development of South Dakota's unique power will be watched with interest by the country at large, and it is safe to say, be attended with profit both to electrical manufacturers and the farmers of that state.

The engravings of the well which now lights Redfield and which are here presented, are due to the kindness of R. B. Hassell, a well known lawyer of Redfield, who has a large interest in the plant, and who is an active worker in the development of the new power on the farm lands of his region.

The McKeesport & Wilmerding Electric Railway, down in Pennsylvania, has begun carrying Adams express. A passenger car was boarded up on the inside, a side door cut in, and there is your express car.

## FUNERAL CARS IN SAN FRANCISCO.

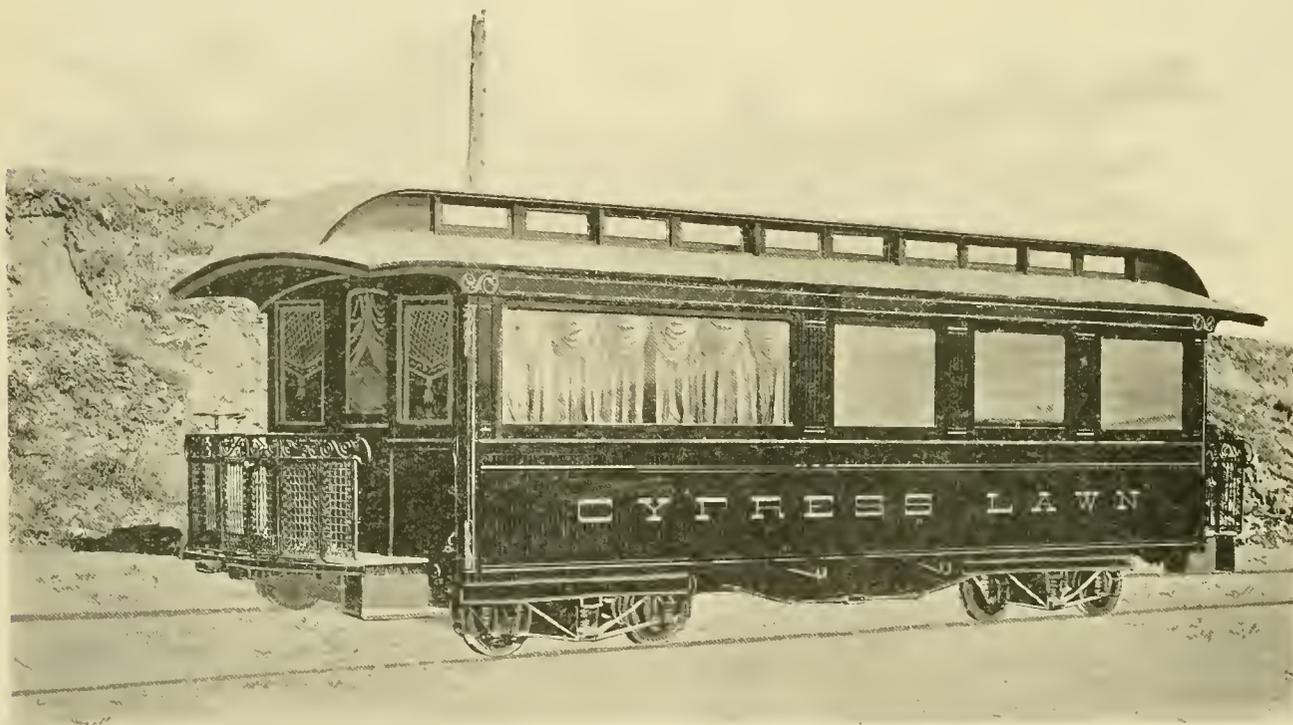

Beginning on September 17, 1893, the first electric funeral train in California, and one of the first in the United States, began regular service on the line of the San Francisco & San Mateo Electric Railway, which connects the Cypress Lawn Cemetery with the city. The distance is ten miles and the run is made in less than an hour. Switches are run into the grounds, giving every convenience for transferring.

The car, an engraving of which we are able to present, was built by J. Hammond & Son, of San Francisco, for the Cypress Lawn Cemetery Association. It is 31 feet long, divided into two sections. One part is for the

## WANTED: A NAME.

Sometimes, when the French, German, Spanish, and Italian tongues find difficulty in expressing a thought, idea or invention, the English is called upon, and the word transplanted bodily. Such has been the fate of tram, tramway, roast beef, and beef steak. The recent inauguration of an electric road at Lisbon, Portugal, has precipitated a discussion as to what it shall be called.

The "Gazeta dos Caminhos de Ferro," of that city, opened its columns, with a view to finding the best term to replace the English word "tramway," which is used in Portugal. The journal points out that the Spaniards, with their dislike of alien terms, turned "tramway" into "tran-

THE LARGEST STREET RAILWAY FUNERAL CAR IN THE WORLD.

remains and pall-bearers, while the other is occupied by the mourners. A track runs through the entire length of the car to the ends of the platform, so that the coffin can be loaded on from either end. The seats in the hearse section runs longitudinally on both sides and are of solid black walnut, in common with the rest of the inside finishing. The mourners' section has seats arranged as in palace steam cars, accommodating twenty-four people, and upholstered in dark olive plush. The exterior of the car is, of course, dark. A tariff of ten dollars is charged for the use of the car, and as many special cars for friends of the deceased as necessary may be chartered. Funeral processions may meet the train at any convenient place on the line and a hearse at the cemetery transfers to the vault or grave. The idea has been well received, and the convenience, economy and good taste of the service appeals to the wealthy as well as to the poorer classes. The car is run as a trailer.

via." The French use "tramway," but they satisfy their scruples by pronouncing it in their own peculiar way. The Germans say "strassenbahn," which is equivalent to the American "street-railway," but they also use "pferdebahn" (horse-road) and "tramway." Pending the decision of its readers, the Portuguese paper proposes "trem-via" or "carrovia." Probably the first word is as good as any that could be suggested.

NEW ZEALAND has a tramway called the Dunedin City & Suburban, which wants to apply electric traction, and a thorough investigation is in progress of the merits of this kind of traction.

THE new power house of the Neville Island & Corapolis Electric Railway, of Pittsburg, has been completed. It went into operation January 1, with eight cars, which will be increased as traffic demands.

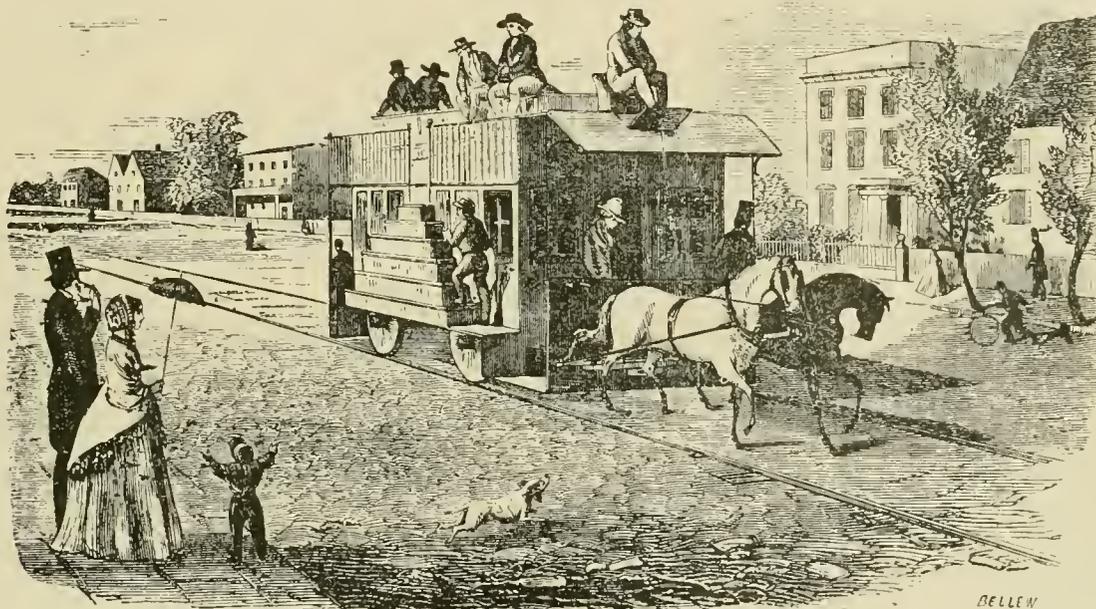

## A STREET CAR CURIOSITY.

Double deck cars are by no means spring chickens in the street car family; but when one considers how few are in use in America today, there need be little wonder that some of the earlier types failed to multiply and possess the earth. Our illustration and the following description appeared in one of the current numbers of "Bellew's Pictorial," in 1855, the original of which is kindly loaned us by J. W. Fowler, president of the Fowler Car Company.

"The accompanying engraving is from a drawing made for us at New Orleans, by Mr. Bellew, and represents the horse car in use upon the City Railroad. It is unlike any employed at the north, and will doubtless prove interesting to our readers, now that the introduction of horse railroads here is a settled thing. It will be seen that it is intended for the accommodation of both outside and inside passengers; the entrance

cemetery; and even beyond it, in the direction of New Utrecht and Bath; while another railroad, at right angles with the preceding, connects Brooklyn with Williamsburg and Greensport. We have no doubt that within a few years many of our suburban villages, which are now served with omnibuses, will be connected with the city by horse railroads."

FARMER CHARLES KLUTZ went to Brooklyn, N. Y., not long ago to "see the town." By evening he became somewhat inebriated. Then starting for a little ramble, the agricultural gentleman came across the electric railway track. At the juncture a car came along with a whizz and a rattle of trolley wheels and gong. Klutz did not attempt to get off of the track and was hurled to the pavement. He was resuscitated an hour later at a police station, and declared to the justice that he thought it was the devil after him, in retribution for his spree.

STREET RAILROAD CAR, NEW ORLEANS.

(Fac-simile of the illustration which appeared in Bellew's Pictorial in 1855.)

for the latter being at the extremities, as in the New York horse car, and the common steam car; while the upper deck passengers, as they may be termed, mount to their lofty station by a flight of steps, accessible from two sides. It is evident, that with no greater area than that of a common car, a much larger number of passengers can be accommodated, and in fine weather the roof seats must be quite pleasant. The introduction of railroads and horse cars into New York City was quite an event in the history of internal locomotion; and there, with the broad, rectangular streets, as in New Orleans, they have been found to work to a charm. The immense travel over the streets of great commercial emporiums, will always keep their surface full of irregularities, so that a passage over them in an ordinary conveyance reminds one of a run across a chop sea. All this jolting is avoided on the rail. The cars glide along as smoothly and as pleasantly as a row boat over a quiet stream. These channels of internal communication will be multiplied, till all the broad avenues of the city are occupied by them. In the city of Brooklyn, cars are running continually from Fulton ferry to Greenwood

## A REAL SCOOP.

Some people never would be satisfied. For, lo, these many days the papers have howled for a reliable safety fender, and all the inventors in the country sprang to their aid, and the host of fenders is like unto the sands of the sea, or unto car starters for number. Now they call the devices "scoops," yea, "trolley scoops," and the Bridgeport, Conn., Standard, says:—

One great advantage of this new device will be the less frequent stoppage of cars on account of accidents. When the scoop net has gathered in a lame old lady, a giggling girl, a skipping school boy, a myopic old man, and a bouncing baby, it can still continue on its course, giving the miscellaneous contents of its safety net a gratuitous ride, and at the end of the route the catch can be picked out, assorted, returned to its individual habit, or advertised in the lost and found columns of the daily papers.

THE past few month's eastern sales of the Ball engine do not seem affected by the hard times.

## WILLIAM RICHARDSON.

Almost since the inception of the American Street Railway Association, no form has been more familiar, and no voice more readily listened to, than that of William Richardson, the past president of the Atlantic Avenue Railway, of Brooklyn, the Nestor of American street railway men, and one of the best known figures in the public life of Brooklyn.

William Richardson was born in Berkhamsted, Hertfordshire, England, in 1822, but lived the first seventeen years of his life in London. Leaving school at the age of ten, he entered a barrister's office, where he remained seven years, doing an immense amount of reading and study while in this situation. In 1834, Mr. Richardson, his brother John, and their father came to America, and located in Ohio, subsequently going to Schenectady, and then to Albany, N. Y., where his first really active business career began. His twenty-five years residence in the New York state capital saw him interested successively as hotel clerk, umbrella maker, and wall paper merchant. In 1844 he married Miss Mary Freeman, the golden anniversary of which event is thus sadly precluded. Seven children were born of this union, four of whom survive, the best known being the secretary of the American Street Railway Association.

In politics Mr. Richardson took active part, and was a consistent and aggressive republican, holding various positions of state and municipal prominence, and serving the United States as additional paymaster in the U. S. army, at New Orleans, from 1861 to 1864.

The following year Mr. Richardson began the work to which we owe his presence in the street railway field, as director of the Dry Dock, East Broadway & Battery Railway, of New York City. A few weeks later he was made president, and the management devolved upon him. Trebling the receipts of the road, extensions followed, and in 1867 he leased the Brooklyn & Jamaica line, which was an uphill undertaking. However, in 1872, the Atlantic Avenue Railway was syndicated, and the story of this successful enterprise is one too well known to repeat, ending with the sale of the line last year, and its change to electricity. Mr. Richardson's

tremendous activity has thus continued to the very end. Naturally a powerful organizer and a fearless leader, he came out successfully from two of the greatest street railway strikes in the history of the craft, namely, those of March, 1886, and January, 1889. The title of "Deacon" was bestowed upon him by the daily press, for although he was always one of the most active members and workers in the Baptist church, he did not, however, hold the office mentioned.

Mr. Richardson has attended all the American Street Railway conventions since 1884, except the meeting of 1886, at Cincinnati, and has been usually accompanied by his wife and daughter. His keen observation and splendid knowledge of parliamentary usage has more than once steered a stormy business session around the rocks to a harbor of peace.

Whether serving the party of his political choice, or the government of his adoption, or the business interests with which he had connected himself, the same energy, tenacity and courage had been shown in every part of his career. As illustrative of this devotion to duty, in 1858 there was a tie in the house of representatives, of which he was clerk, and in the absence of that officer, speaker also. For six weeks Mr. Richardson sustained these two duties, but from the strain succumbed to a fever, which left his hair snow white.

He was, in truth, a remarkable man, of the cast of mind and character that makes strong friends and enemies, but all acknowledge his strength of

character, and ability and sterling worth. As an incident of the last convention, and as an evidence of the respect Mr. Richardson commanded, we recall the fact that when rising to respond to an unexpected call from the toastmaster, at the banquet, every one in the room instantly sprang to their feet, while the younger members started three rousing cheers, in which even the ladies and most dignified heartily joined.

WILLIAM RICHARDSON,  
Born 1822. Died December 31, 1893.  
(From a photograph in February, '93.)

THE Sabold Ground Rod is in use on five well known eastern roads and the result has been such that not only is there no trouble from electrolysis, but telephone troubles have been quieted. The latter is a strong argument as showing the efficiency of the system controlled by the National Electric Railway Improvement Company.

## PLEASURE RESORTS AND CREATED TRAVEL.

A Wild Ravine Becomes a Beautiful Park at Seattle—Cable Park at Cleveland.

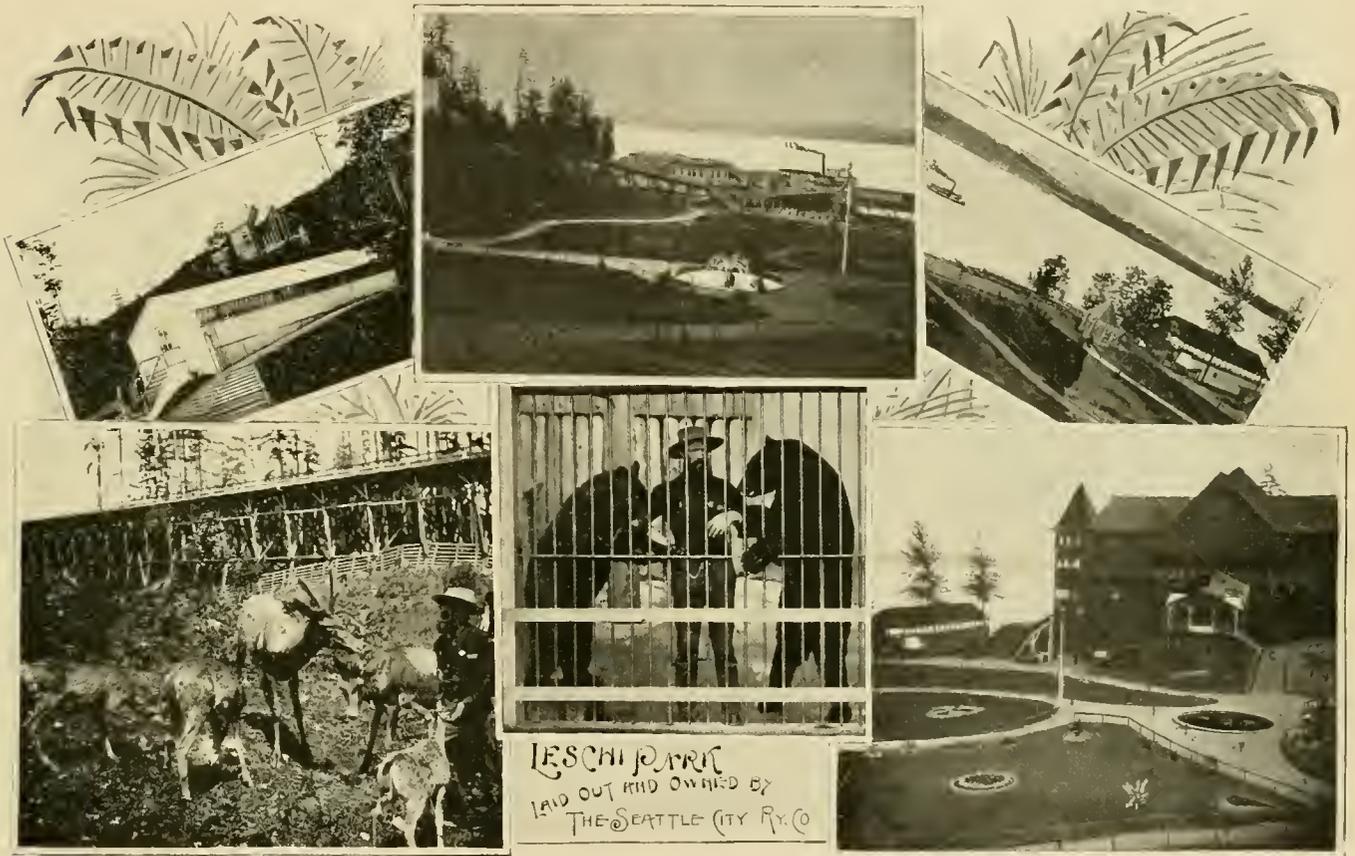

### PART II.

From the description of resorts on the Atlantic coast and in the Mississippi valley, which engaged our attention last month, we now turn to the far West.

Here we find Seattle, which has become a large city, needing public parks, by such rapid strides that its municipal government has not yet been able to provide these breathing places for the people, except by making small

more plentiful than money, they gave it as a subsidy a tract of about twelve acres, forming a gulch at the Lake Washington terminus. On a knoll at the shore edge of this gulch the power house was built, with an incline running down to the water, up which the coal and wood are hauled, but for several years the remainder of the tract was left in its primeval wild condition. It was clothed with a dense growth of timber and brush, and the narrow level stretch at the bottom was a swamp, which the lake overflowed in winter.

It was in the year 1891 that the company began the work of beautifying this tract, and transforming it into a pleasure resort for the patrons of the road, under the direction of A. F. Haas, who was then and now is gen-

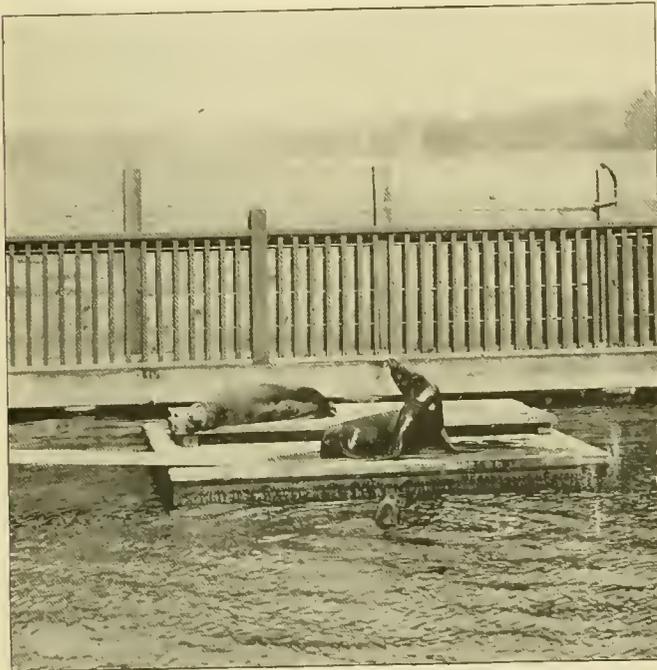

beginnings; but private enterprise has stepped in to fill the gap, and nobly has it done so. A striking feature of the city is the fact that this work has been undertaken by the street railways, and among them the Seattle City Railway Company has led the way, in laying out Leschi park.

The Seattle City Railway has the distinction of being the pioneer cable road of the Pacific northwest, and the second street railway built in the city of Seattle. Running from near the foot of Yesler avenue, on the side of the city fronting on Elliott bay, eastward on that thoroughfare to Lake Washington, a distance of two and a half miles, it turns back to Elliott bay, along Rainier street and Jackson street. The road was built in 1888, with the hearty support of the citizens, and land being then

eral manager of the road. He filled in the swamp until it was above high water, graded it, and laid it out as a flower garden, made a gentle slope of green turf on the north and south sides, cleared off the brush and fallen timber from the upper side to the west, and fenced in a deer park. To it he gave the name Leschi park, to commemorate Chief Leschi, who led the invading host of Kittitas Indians in their attack on Seattle in 1856, and who is reputed to have landed at this spot after crossing the lake. Since then the park has been improved, and its attractions have been added to, until it is now the most beautiful and most popular resort of the Sunday pleasure-seekers in the city. It looks out across the broad bosom of the lake towards Mercer Island, which stands midway between the east and west shores, and the rugged hills,

among which it rests form a beautiful setting for it. A large casino has already been built on the south side of the park, and this is now used as a skating rink, having floor space admirably adapted for the purpose. A tank has been fenced off on the edge of the lake, where four sea-lions disport themselves, to the delight of the lookers-on, who can view them at their ease from a covered pavilion. Close at hand are cages, where two bears, two coyotes, a South American puma, several monkeys, and paroquets, amuse the children. In a neatly fenced

"Where the Sea Lions disport themselves."

enclosure on the hillside are five deer and two elks, captured in the Cascade and Olympic mountains, which form a glorious background to the view from the city on the east and west. Southward along the shore, a lovers' walk extends, under the shade of the trees. Opposite the center of the park is a boat house, where the taste of the most fastidious oarsman can be satisfied. Still further north is a swimming bath, with a toboggan slide, down which lovers of aquatic sports can plunge into the water. A high trestle, which formerly spanned the gulch, to carry the cable road over to Jackson street, has been cleared away, as it marred the beauty of the landscape, and its place has been taken by a number of swings. Rustic benches are scattered through the park, and a fountain sparkles in its center. Here a band plays on Sunday afternoons, and balloon ascensions and parachute jumps draw great crowds of visitors in the summer. Largely increased patronage has proved the wisdom of these expenditures and the appreciation of the people.

A large greenhouse furnishes the thousands of flowering plants, which border the walks or are massed in great beds of fragrant beauty. The REVIEW representative, writing these lines amid the rigors of a northern

winter recalls with unusual pleasure the monster bouquet of mammoth roses, which nearly filled his arms, and which were deftly assembled by an experienced horticulturist in response to Mr. Haas' instructions to that worthy to "bring a few flowers." The natural beauty of the place has constantly been added to, and the transformation which a few years has worked seems hardly possible. It stands today as one of the most beautiful spots on the Pacific coast, and its financial success is evidenced in the crowds which constantly throng the grounds.

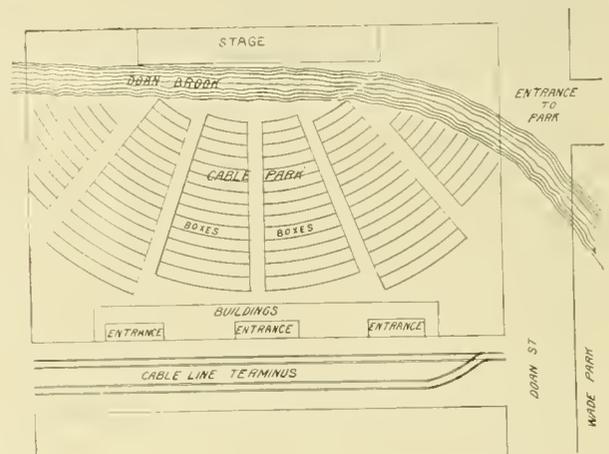

A. F. HAAS.

Nor has the useful been forgotten. A steam pump of 1,000,000 gallons capacity per day, formerly raised water from the lake to a reservoir on the crown of the hill, which shuts in the park on the east, and from which a gravity pressure supplies the fountains, power house and other buildings, and affords ample fire protection, as well as irrigation. A beautiful spring now contributes to these same purposes, and the road is thus made independent of the uncertainties of the municipal supply, and obtains water at no expense beyond the initial cost of the plant. With cars running regularly every three minutes in summer and every five minutes in winter, the public has little to desire in the way of accommodation, while the provisions for comfort, pleasure and entertainment at the park are fully as complete. Both road and park are a constant testimonial to the enterprise and good management of Mr. Haas, who can boast of a resort equalled in only one or two instances in the country.

THE CLEVELAND CITY RAILWAY

has a resort at the end of its Payne avenue line, known as Cable park. It is just across Doan street from Wade park. Cable park is on the slope of a hillside, at the bottom

CABLE PARK, CLEVELAND.

of which is Doan creek. This hillside is used as an open air theater, the stage being put on the opposite side of the creek. The Fall of Pompeii, and shows of similar

nature, are the ones principally given. The creek was dammed up, leaving a waterway twenty feet wide by four feet deep between audience and stage. In the winter it is thrown open as a free skating rink. The theater seats are arranged in boxes, holding six to ten in a box. The cheaper seats are benches and chairs. Lemonade is the only refreshment served. Seating capacity of park 8,000.]

#### THE JAMESTOWN, N. Y., STREET RAILWAY

is making quite an extensive investment at Celoron, on Chautauqua Lake. They are laying out handsome grounds, and will do extensive building; the intention being to have the resort ready for next summer. President A. N. Broadhead is the prime mover in this scheme.

### BUCKING SNOW.

At the December meeting of the Massachusetts Street Railway Association, E. C. Foster gave some of the results of his experience with snow bucking on the Lynn & Boston Street Railway. They have at present 32 electric plows of their own design, which design they have used with slight modifications for four years. The plows they built this year had 36-inch wheels, with 2 1/4-inch tread and 3/4-inch flange. Two W. P.-50 motors are connected by a sprocket chain to the axle of the plow. They prefer a sprocket to direct gear because the plow is liable to strike an obstruction and break the gears. The cabs are 12 feet long, 6 feet high and 6 feet wide. They have some plows with F-30 motors giving good service, but the capacity of the F-30 is hardly great enough to operate a plow without burnouts. When there is little frost in the air it is not hard to keep the track clear in severe storms. Last winter they had a piece of double track over a mile long which was constantly kept clear by two plows equipped with W. P.-30 motors. The repairs were not five dollars for the winter. Frost and sleet are the elements of a snow storm that make trouble, and when these are present they are taxed to their utmost to keep things moving. They have run a plow for 36 hours continuously, without a mishap. They have also a rotary sweeper with four motors, two to propel it and two to run the brushes. The amount of snow it can remove is almost unlimited, but it is hardly fit to use on city streets. They operate about 100 miles of single track and 25 miles of double. Much of the single track is along one side of the street. It is desirable in the latter case to be able to throw the snow toward the center of the street the first time over, with the plow. In most of the cities and towns they remove the snow from half the street and the city removes the other half. The road is divided into three divisions, each having a superintendent. Each superintendent has a snow plow assigned to each route of his division, and the foreman of the station from which the plow is operated, is held to account for the clearing of the tracks and the running of the plow. This responsibility makes the men more faithful. There is special work, such as cleaning switches, for which special men

are detailed during storms. The snow removed from streets is dumped in abandoned cellars, on wharves, and anywhere they can secure permission.

C. S. Sergeant, of the West End, Boston, said that they had 250 miles of track and 150 miles of streets to be kept open. Of this, 182 miles are electric. Last winter they never lost a rail or were blocked on any electric or horse line, in spite of the fact that it was the worst winter for 27 years past. To accomplish this, there were 84 electric plows, enough horse plows for the horse lines, a large number of levelers, and 372 snow sleds, with such carts as could be hired, in addition. He considered, that to contend with snow, it was necessary first, to keep the equipment in perfect repair during the snow season; second, to have plenty of reserve station capacity for the extra power; third, to have an organized system whereby the work to be done in case of a sudden storm is laid out in detail in advance. The West End system is divided into nine divisions, in eight of which there are barns from which cars are run, the ninth being the central division, in which there are no barns, and which orders its plows by telephone from the other divisions. When a storm begins, men are sent out to keep clear the curves, switches and special work. A switch wagon on each division makes the rounds, salting curves, switches and grades. The system is so large that conditions vary greatly between the heart of the city and suburbs. For this reason a night inspector is kept in the central division, ready to order out plows and men at any hour. He had found it essential to follow the snow plows on electric lines promptly with levelers. In heavy storms, plows ought to be run on at least fifteen minutes headway. In the heart of the city a plow drawn by horses and having sharp-tired wagon-wheels gauged to fit the track had been used a good deal. With this the snow is plowed aside and the plow then is turned back alongside the track, to act as leveler, thus doing two classes of work. Early plows were all too light. Their standard plow now is very heavy, with the power transmitted by sprocket chains. The motors are in the cab. The plow has heavy iron-diggers, operated by the foot of the motorman. Chains and breakable parts are duplicated. They do not use a nose plow because most of the track is double and the snow is not allowed to get deep. The secret of keeping the road open is, to keep ahead of the snow. Hundreds of men and hired teams are called into use during a storm. Special snow paymasters are appointed, and they pay the floating laborers daily. The men are identified by the foremen and by the surrender of a shovel and identification ticket. The teaming work is also covered by tickets and reports. The expense of all this work is enormous, and the company is practically doing the city's work of cleaning while getting nothing for it. They found, however, that electric cars were much better than horse cars in winter, because the electric could more nearly keep up their regular mileage, and the receipts are reduced but little as compared to horse cars.

W. W. Sargent, of the Fitchburg & Leominster Railway, also speaks from a very practical standpoint. He

## Street Railway Review

with less than 50-horse-power. Lighter equipment can not do the work on 10 per cent grades such as they have. Their plows are 18 feet from dasher to dasher, with a 4½ foot platform, giving ample room for four bags of salt on each end and what sand is required. Each plow is equipped with four shovels, bars, brooms, oil, wrenches, fuses, waste, and bolts of different sizes, as may be required to make repairs. They use the sprocket chain, and like it very much. It has never given any trouble to speak of, and the motors are inside the cab, where they should be, in his opinion, as they are not exposed to the storm and are easy to get at in case repairs are needed. He would not advise anyone to use the S. R. G. under any circumstances. They use W. P.-50.

They use petroleum on trolley wire, and keep plenty of sleet wheels on hand in case of a sleet storm, which invariably gives them more trouble than snow. In very severe sleet storms, when the sleet wheels failed to work, they have been successful in removing the trolley wheels altogether, keeping men on the cars to hold the trolleys firmly against the wire, cutting the ice with the harps or trolley forks. He would not recommend doing this, unless it was absolutely necessary. They start men out to salt and sand all switches, curves, and railroad crossings, as soon as it begins to snow, and keep men at the railroad crossings shoveling snow and keeping the rails clear. No company can afford to take any chances of getting a car stalled on a steam railroad crossing. They do not depend on salt carried on the plows, any more than to touch up bad places, but have salt cars. These were fitted up

FITCHBURG & LEOMINSTER ELECTRIC PLOW.

thinks that many snow plows on the market are useless in a heavy fall of snow. There ought to be two 30-horse-power motors to a plow, and a cab covering the entire body of the plow, in which should be the resistances, cut-outs, etc. The practice of putting the motors in the cab and gearing them to the axles by sprocket chains is absurd. If a car with motors geared direct to the axles can perform its duties during a snow storm a plow certainly should. It is unquestionably the place for the motors, and the one in which they will prove satisfactory at all times. The cab can be used to store sand, salt and tools, and furnishes a comfortable place for the men. Sleet wheels have been mostly experimental, but there are some on the market that prove a decided benefit in sleet storms. In connection with this, the use of two trolley stands, one having the sleet-wheel and carrying no current, has proved successful. To successfully handle a storm, the equipment must be ready to turn out at any moment. Salt and sand in the proportion of one part salt to ten of sand should be distributed along the surface of the rails as soon as the snow is an inch thick. Track scrapers are a great help not only for sand and gravel but for snow and ice. Those having a spring attachment allowing for the motion of the car are a great advance over the old style. Promptness and celerity with a complete equipment always in repair, are essential in handling snow.

N. E. Morton, of the Lowell, Lawrence & Haverhill Railway, began with horse-plows eight years ago and so has been through the mill from one end to the other. He spoke, however, more especially of his experience with electric plows in the last three years. His lines had never been tied up; that is, cars had always kept very near schedule time. Every car should be equipped with snow scrapers. They use the Dorner & Dutton. Each car should also be fitted with sand boxes. The latter are especially useful when a car is sliding on hills. They use principally Ellis Car Company's nose plows, with shear plows for double track. No plow should be equipped

"The cab furnishes a comfortable place for the men."

from old one-horse cars, and are arranged to couple to a motor car. They have a spout on each side, in the center, carrying salt in one end of the car and sand in the other, so that either may be used as required. Two men inside the car feed the salt or sand into these spouts, which are directly over, and within six inches of the rails. They always start the leveller when it has snowed about six inches, so as to keep the ridges back, and give the plows a better chance to throw back the snow. This also pleases the traveling public much better.

George F. Reed, of the Springfield Street Railway, agrees with the others in regard to the necessity of an early start. He had used a plow with a heavy nose of boiler iron, which gave very good results. One strong point was its weight, which gave good traction.

### MOVING HOUSES OVER RAILWAY TRACKS.

The Relative Rights of Companies and House-Movers.—The Municipal and Unwritten Law in Various Cities.

The average house-mover is about as obstreperous and irresponsible a nuisance as any which crosses the path of the much-abused manager. Of all individuals which assume to possess the earth, with the least actual inheritance against which damages are worth collecting, the house-mover is chief. With him, possession of one's tracks seems even paramount to law. Like a thief in the night, he stealthily pulls some worthless old hulk of a building from out the least suspected hiding-place, and daylight and the first tripper finds him on the street with windlass broken and horses and men exhausted. But he studiously avoids any anxiety or excitement provocative of heart trouble; he leaves all that for the manager, and complacently sits down on a wooden roller to rest and smoke, while the cars gather like snow-flakes and stretch out in what seems an eternity to the manager. The public profane violently, while a crew from the company's barns tackle the unaccustomed job, and in two or three hours have the wheels of commerce again in motion.

The blockading of tracks under the old horse regime was quite bad enough, but when it comes to cutting trolley lines and perhaps several heavy feeders, difficulties are by no means lessened. That there should be some legal protection, or what is better, suitable legal prevention, in every city, is obvious; not alone to save the company from loss entailed in repairs and travel, but to protect the thousands depending on the cars for transportation and to many of whom a late arrival at place of employment means the loss of a part or whole of the day's wage, or even loss of position. From every standpoint justice and equity declare to place very stringent restrictions on the house-mover, and it is with a view to pointing out in what way this may be accomplished that this article is written, and the views of many of the leading managers in the country kindly contributed.

Our investigation reveals the fact that what is a serious burden in one locality does not exist in others. This is explained by the reason that in some older cities few houses are moved, and in others frame buildings are a rarity. But these are the exceptions. We also find that while injunctions are generally available, there is little municipal law requiring movers to first secure consent of companies, and all know that when a building is once on the tracks, an injunction is the last and least helpful remedy, as what is then imperative is something to expedite and not delay movement. Movers avail themselves of this fact and usually carefully conceal their intentions

even where permits must be secured from some city official, and as stated, make their debut by getting in the way. Whether a mover can legally compel a company to cut its wires is a nice question of law, which will be discussed later.

AT INDIANAPOLIS.

General Manager McLean reports that a number of instances have occurred in this city, where houses have been moved across or along the line of electric roads. In each case permission was first obtained from the department of public works, and the consent of the railroad company was asked also, and obtained. The latter being given on condition that the house should only be moved upon or along the lines between the hours of pulling in the cars at night and pulling out in the morning. There is no city ordinance relating to this subject, but the board of public works has assumed control as above.

"In one instance, I am informed, where a house being moved prevented the operation of the line, compensation was awarded the railroad company for the delay."

DETROIT.

In the matter of cutting electric wires by house-movers, the common council about a year ago granted permission to a house-mover to move his house over the tracks of the Fort Wayne & Belle Isle Railway Company. The railway company applied to Judge Hosmer, one of the Circuit Judges, for a temporary injunction to restrain the house-mover from interfering with the wires of said company. The city counselor moved to dissolve the injunction, and his motion was denied by the court, which left the temporary injunction as against the city, valid. The case has never come to trial, but a temporary arrangement between the board of public works and both railway companies has been entered into, pending the making permanent of this injunction, or its denial altogether, by which said board of public works will not issue a permit to a house-mover to cross the tracks of any electric railway company, without first receiving consent of the railway company, and with the understanding that a sufficient bond or other security be put up by the house-mover, indemnifying the railway companies against any loss or damage that may result from cutting of the wires. The usual way is for the company's men to attend to the cutting of the wires and replacing them, when a house is being moved across the tracks, and render a bill for actual cost of material and labor rendered.

LOUISVILLE.

General Manager Minary says: "I regret very much we have no protection from city ordinances in reference to moving houses, which has at times caused us considerable annoyance, but we have been able to lessen this somewhat by protesting against the road being blockaded, unless they would do it at such a time and in such a manner as to cause us the least inconvenience."

"I am glad to see the matter being agitated, and I hope we will have, at some time, suitable ordinances regulating the matter."

## MINNEAPOLIS

has a protective ordinance which, says General Manager Field requires a house-mover to procure a permit from the company, and before this is granted he must make a deposit sufficient to reimburse whatever expense is incurred by the company. The ordinance reads as follows:

"In case the removal as permitted by the inspector of buildings requires the removal or displacement of any overhead electrical wires, such permit shall not be construed as allowing any removal of such building until permission is first obtained from the person or company owning or operating such electrical wires, or from the City Council.

Provided, that no building shall be permitted to be moved across any steam or street railway tracks except between the hours of one and five o'clock a. m."

## DENVER.

"There is no city ordinance here at present," says Superintendent Durbin, "which regulates the moving of houses under electric wires, but we are told by the building inspector that such matters are left entirely to his judgment, and that when a party wishes to move a house, he sends him to the electric companies to get their consent.

"The building inspector intends to introduce an ordinance relating to the matter within a short time, and we expect to have something to say about it. Up to date we have been bothered but little, probably for the reason that most of the houses here are of brick, and there is comparatively little moving. Several times, however, we have been called upon by parties wishing to move houses under our wires, and have sent our linemen out to assist; but I do not remember of a single case where it was necessary to cut the wires. The building inspector assures us, that should any person attempt to cut our wires or otherwise interfere with them we would have a right to have him arrested. We think the question an important one for street railways, and are glad the matter is being taken up."

## AT ALBANY,

General Manager McNamara has had his share of woe, and in relating his experience takes the radical, and it would seem logical, view that the moving of a house into the street is a trespass, and he contributes the following:

"While operating our lines as horse-car lines, we were very much annoyed by the movers of buildings. The annoyance became unbearable, not only to us but to the traveling public, and we served notice upon all movers of buildings that we would tolerate the custom no longer. The principle upon which the writer proceeded was, that the streets were highways, and the moving of buildings thereon was an obstruction of the highway. Buildings cannot be moved without disturbing the pavement of street and without laying special ways or tracks upon it to move them. These facts demonstrate that the moving of buildings on highways is a use of a street or highway never contemplated by law, and a use which has only been tolerated. After we gave notice to the movers of buildings, as above stated, upon special application we made arrangements for buildings to be moved across our lines at night, but never in the day-time. Since we have operated by electricity and put up wires, only two build-

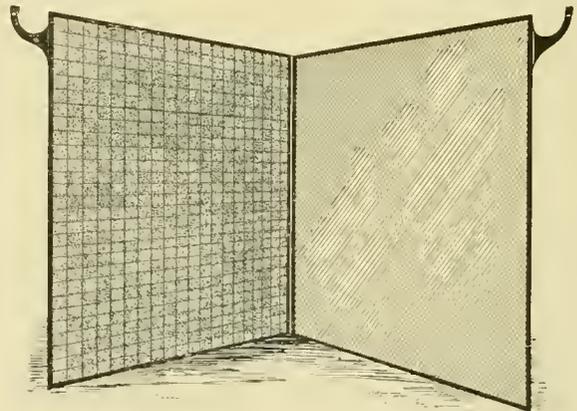

ings have been moved, one across one of our unimportant lines and near the terminus of the line, which did not involve the cutting of our wires, and another which rendered the taking down of a pole necessary, in order to enable the mover to get his building around a corner. In the latter instance, we insisted upon being paid the amount necessary to take down and put up the pole.

"There is no city ordinance in Albany in relation to the moving of buildings; that is, there is no specific ordinance permitting or prohibiting the moving of buildings. We are quite positive that if an attempt should be made to move buildings in such manner as to obstruct our tracks, we could procure an injunction and prohibit the moving."

(To be continued.)

## THE HESS STORAGE BATTERY.

This battery, which has recently been put together, at Springfield, Ohio, has the active material entirely surrounded by a porous material, to keep it in place. Each electrode consists of two plates, between which the active material is placed. The plate is then covered with the

"Each Electrode consists of two plates."

porous substance, so that there is no metal exposed except next to the active material between the plates of each electrode. The electrodes are separated by rubber strips. These rubber strips are held in place by lugs on the plates. The porous material, which is the peculiar characteristic of this cell, is said to offer no resistance other than that in an ordinary battery. It is composed of sand, and a composition for cementing the particles together. The inventor is F. K. Hess, of Springfield, O.

DURING the past year, one of the notable business successes has been the Safety Brake Shoe Company, of 620 Atlantic avenue, Boston. Although not yet a year old, the volume of business of the concern has increased fifty per cent every month, and duplicate orders testify as to the esteem in which the brake shoe is held. A Pacific coast agency, under Edwin W. Tucker, 130 Main street, San Francisco, will manufacture and sell to the coast states. Agencies will also be established at Chicago and St. Louis.

## STREET RAILWAY EVENTS OF 1893.

## JANUARY.

Last horse car runs in Toledo, January 1. Motors displace Madison, Wis., mules, January 1.  
 William Richardson, president of the Atlantic Avenue Railway, Brooklyn, retires.  
 Col. N. H. Hefst gains control of the Bridgeport, Conn., lines.  
 Connelley Gas Motor started in Chicago.  
 Tiffin, O., plant burned January 16.  
 People's Traction Company, Philadelphia, succeeds the People's Passenger Railway.  
 Amalgamated Association of Employes, at Cleveland, dies.  
 Power house of the Central Railway, at Peoria, burns January 16.  
 Temporary power house started in ten days.  
 Seattle Consolidated bought by F. T. Blunk and associates of Davenport.  
 H. M. Littell goes to the New Orleans Consolidated.  
 McMahon ammonia motor reappears in New York.  
 McKinley syndicate buys the Bay City and West Bay City lines.  
 STREET RAILWAY REVIEW celebrates its second birthday.  
 W. A. H. Bogardus elected secretary of the Brooklyn City Railway.  
 Enlarged Jefferson street cable plant of the West Chicago Street Railroad started.  
 Third annual meeting Massachusetts Street Railway Superintendents' Association, January 27.  
 Constance Crimmins starts the Broadway, New York, cable, Jan. 31.

## FEBRUARY.

Liverpool, Eng., Overhead Railway (electric), opened February 4.  
 New York, New Haven & Hartford begins fight against Massachusetts interurban trolley lines.  
 Coal famine from railroad snow blockades in many parts of the country. Snow storms of unusual severity make great trouble for managers.  
 Fly-wheel bursts in power-plant of the Union Depot Street Railway, St. Louis.  
 Street Railway Gazette bought by the Street Railway Journal.  
 New Metropolitan Traction Company, with John D. Crimmins as leader, buys 140 miles of track in New Jersey.  
 Opening Main Street Railway, Jacksonville, Fla., February 23.  
 Rapid Transit Committee, Massachusetts Legislature, visits Chicago February 25.

## MARCH.

Love conduit started to operate on the Rock Creek Railway, Washington, D. C., March 1.  
 Wheelless conduit system put in operation on the Washington & Arlington Railway, Washington, D. C.  
 Edward G. Gilbert, Troy, died March 9.  
 J. L. Valentine, secretary North & East River Railway, New York, died March 13.  
 McKee-Verner syndicate of Pittsburg gains control of the Indianaapolis Citizens' Railway and elects new officers.  
 D. A. Andrews, of Pettingell-Andrews Company, died.  
 Broadway and East Cleveland Roads combine.  
 South Chicago City Railway opens.  
 H. W. Fordyce elected president Little Rock Electric Railway.  
 Grade crossing ordinance passed in Chicago.  
 Green trolley patents bought by General Electric Company.  
 Richmond Railway & Electric Company buys the Richmond & Manchester.  
 New England Street Car Company formed by a syndicate of prominent capitalists.  
 Chicago & North Shore commences to build.

## APRIL.

Rail welding tried on the Lynn & Boston.  
 Los Angeles & Pasadena Electric contracted for.  
 Henry C. Moore succeeds Robert N. Carson as president of the Peoples' Traction Company, Philadelphia.  
 F. M. Smith, borax king, consolidates Oakland lines and fulfills the REVIEW's prophecy.  
 New power plant Peoria Central Railway started.  
 Intramural elevated electric opened at Jackson Park.

## MAY.

World's Fair opened May 1.  
 Lake Roland Elevated opened at Baltimore May 2.  
 Car barn of Grand View Beach Electric Railway, Rochester, destroyed by fire May 11.  
 First car over entire route of Broadway, New York, cable, run May 13.  
 First electric railway in South Carolina started at Columbia.  
 Orange Mountain (N. J.) cable started.  
 Moses G. Farmer died May 25.  
 Chicago City Railway electric plant starts.  
 Russell Harrison syndicate gets control of roads at Richmond, Ind., and Michigan City.

## JUNE.

Twin City Rapid Transit Company (Minneapolis and St. Paul) voluntarily raises conductors' and motormen's wages.  
 Cleveland City Cable and Woodland Avenue & West Side Railways consolidate June 1.  
 Niagara Falls Park & River Railway opened to traffic.  
 Ferris wheel dedicated June 21.  
 The Concord, N. H., Street Railway opened to traffic June 16.  
 Pittsburg, Allegheny & Manchester Street Railway absorbs the Pleasant Valley Traction and the Allegheny Traction Companies, June 14.

## JULY.

The Moving Sidewalk started July 1.  
 Mineral Ridge & Niles, O., Interurban elects officers and goes to work.  
 Many street railway men visit the World's Fair and the REVIEW.  
 Hartford & Wethersfield Street Railway authorized to change from horse to electricity.  
 Alton, Ill., elects officers for its electric line for the first time.  
 Reorganization of the Greencastle Street Railway is effected.  
 Cold storage fire at the World's Fair grounds threatens the intramural railway.  
 Toronto decides against Sunday street cars.  
 Cleveland City Railway elects officers.  
 H. H. Vreeland succeeds John D. Crimmins as president of the Metropolitan Traction Company.  
 John Stephenson died July 31.

## AUGUST.

Mobile's street railway began operations August 10.  
 The Union Depot, the Mound City, and the Benton Belle Fontaine Street Railway Companies unite at St. Louis.  
 Milwaukee Street Railway Company organized out of the old Hinsey line.  
 O. S. Buckbee, of Seattle, Wash., retired August 1, from the presidency of the Yesler Avenue Cable Railway.  
 The Maine State Street Railway Association was formed August 15, by ten Maine roads. The first annual meeting was appointed for February.  
 Bellaire, Bridgeport & Martins Ferry Electric Railway opened August 29.  
 R. D. Nuttall died August 29 at Allegheny, Pa.

## SEPTEMBER.

The Pennsylvania Street Railway Association holds its second annual meeting at Harrisburg, September 6.  
 The great Air-Ship Pennington scheme for a Chicago and Central Indiana Electric Railway falls very flat. Pennington disappears from view once more.  
 Transportation Day at the Fair celebrated September 9, by a grand parade of all the transportation exhibits, together with a display of all the chivalry of "street car" row.  
 The London Omnibus Company's barns were destroyed by fire September 16; loss \$150,000.  
 New York State Convention held its annual meeting September 19, at the Hotel Powell, Rochester.  
 Ohio State Tramway Association meets at Cincinnati, September 27.  
 Judge Reinohl, president of the Lebanon & Annville, Pa., Electric Railway, died September 24.  
 Tug-of-war, Railroad Day, at the World's Fair, between electric and steam locomotives; result is victory for steam, Saturday, September 16.

## OCTOBER.

The STREET RAILWAY REVIEW is announced as a medal-winner at the World's Columbian Exposition.

Erastus Wells, the first street railway builder in St. Louis, died October 4.

The Canadian Electrical Society holds its annual meeting and is entertained by Niagara Falls Park & River Railway.

Chicago Day at the World's Fair brings three quarters of a million people into Jackson Park, and 2,535,915 fares into the coffers of the surface and elevated roads of Chicago.

On October 11, a 700 horse-power engine ran away in the Atlantic Avenue, Brooklyn, power house, bursting a fly-wheel and killing several persons.

The Chicago City Railway suffers a fire at the Wallace street barns; 461 horses perish; loss \$108,000; October 12.

All the San Francisco cable railways unite as the Consolidated Market Street Cable Railway Company, capitalized at \$18,750,000.

October 19, 20 and 21, at Milwaukee, Wis., the American Street Railway Association held its XIth annual session. Henry C. Payne elected president, and Atlanta, Ga., named as the next place of meeting.

October 30 the World's Fair closed and demolition began.

## NOVEMBER.

November 1, the East Side Street Railway Company, of Portland, suffered an accident, the electric car Inez going into an open draw. Seven persons were lost.

November 1, the Ohio Vestibule Law goes into effect and many street railways are considerably inconvenienced.

November 4, the Lake Street Elevated, of Chicago, opened for traffic, with due ceremony.

Anthony Reckenzaun died November 11.

Samuel Little is elected president of the West End Street Railway Company, of Boston, vice William M. Whitney, resigned.

Charles A. Schieren is elected mayor of Brooklyn.

Business depression culminates in several failures of street railway companies both east and west.

November 10, first royal electric mail service begins at Toronto, Canada.

The "trolley boat" makes its debut on the Erie canal November 28.

Robert Young, of the Glasgow Tramway, dies November 16.

Stephen Wilcox dies November 27.

The first snow storm in the Central States shuts off street traffic November 30.

## TRANSPORTATION IN LONDON.

Stephen Sellon, in *Lightning*, points out that it is impossible to accommodate all classes of passenger traffic in London by underground or elevated roads. The time made on underground roads in London is not much greater than on American street railways, when the time taken in walking to stations and ascending stairs is taken into account. In Mr. Sellon's opinion, the key to the situation is in the building of plenty of electric surface roads. Underground and elevated roads are too expensive for extensive use. The main present objection to surface tramways is the crowded condition of the streets, but a thorough tramway system would, to a great extent, diminish the crowd. There would be no more omnibuses to wear out pavement and obstruct travel, as the tramways would monopolize the traffic.

## MEDALS FOR INVENTORS.

The officers of the Franklin Institute, of Philadelphia, desire to call attention to the fact that the Institute may grant certain medals to the inventors of devices contributing to the promotion of the arts and manufactures. These medals are three in number, and are granted from time to time, as the Institute sees fit. Further information regarding the awarding of these medals can be obtained from William H. Wahl, the secretary, Philadelphia.

## ELECTROLYSIS AT MILWAUKEE.

The photographs of the pipes referred to in Mr. Rau's paper on electrolysis, in the December REVIEW could not

ELECTROLYSIS AT MILWAUKEE.

## DECEMBER.

December 1, the Philadelphia Traction Company, having completed its lines on Thirteenth and Fifteenth streets, made a trial trip.

Third Avenue Cable line, New York, started, December 4.

The Sioux City electric lines and cable railway consolidate as the Sioux City Consolidated, December 13.

December 16 the first car runs over the Jersey City & Newark, N. J., interurban line, carrying distinguished party of interested people.

Judge J. J. Jacobs, of the Wheeling, W. Va., Street Railway Company, died.

The STREET RAILWAY REVIEW reviews the year with its advertisers. December 21, the Altoona & Logan Valley power house destroyed by fire, loss \$25,000.

George H. Babcock died December 21.

Engine fly-wheel of the Des Moines, Ia., street railway power plant engine bursts, December 23, wrecking the building.

The fifth scheme for North Side rapid transit comes to light in Chicago and one gains a franchise.

William Richardson, Brooklyn, dies, December 31.

be obtained in time for that issue, and are accordingly presented herewith. They show the special action that took place at the point on the pipe nearest the wire. The reference can be found on pages 768 and 769.

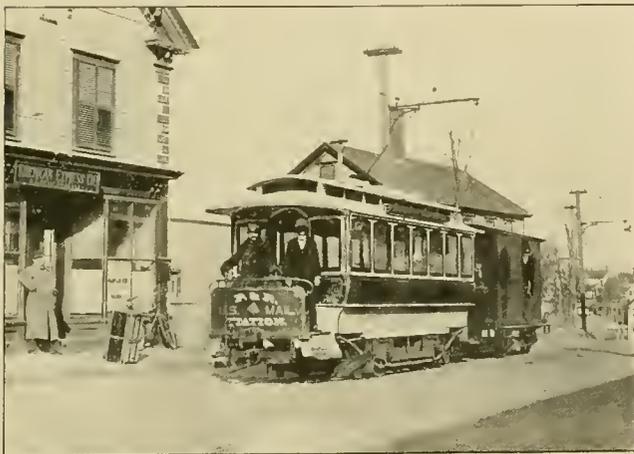

For some reason or other the Melbourne, Australia, judicial conscience is very tender, and the public sentiment much against stealing, even stealing street car fares. Recently a conductor in the afore-mentioned city, failed to register three fares. An inspector discovered the discrepancy and the accused was haled before the bar of justice, to receive a month's imprisonment. The city papers made long notices of the offense, and seemed to think the punishment a just one. The judge in sentencing, characterized the offense as a most contemptable one.

## THE MOUSAM RIVER RAILROAD.

A Pioneer in What is Destined to be an Important Field.

The time is rapidly approaching when an increase of the street railway mileage within the limits of our cities and towns will cease to be profitable, except as it accommodates the natural growth of the cities. This limit will not be reached for some years to come, and until nearly all horse roads have changed to electricity; but that being done, electric railway constructors must look to new fields, if they are to keep up their present activity. The most promising of these fields is the connection of the smaller country towns with the steam railroads.

The Mousam River Railroad, connecting the town of Sanford, Maine, with the nearest steam road, has the

EXPRESS CAR AND OFFICE.

honor of being a pioneer in this field. It is both a freight and passenger road, hauling all the supplies for the town of Sanford, which has a population of about 5,000, and is quite a manufacturing center. The distance from the Sanford mills to the freight station on the Portland & Rochester Railroad is one and three-fourths miles. The entire length of the electric railway is about three miles. Passengers are carried from Sanford to Springvale, a passenger station on the Portland & Rochester.

The track construction is exactly the same as that of a steam road with moderate traffic, and was laid under the supervision of Jed Morrill, master mechanic of the Portland & Rochester Railroad. Sixty-pound T rail is laid on cedar ties, two feet between centers, and ballasted with gravel. Bonding is Number 0 copper, and copper plates, six feet square, and sunk six feet in the ground near the river, assist in the ground return. Lock switches as used on steam roads were laid throughout. There are in all, four iron bridges over the river. The trolley is hung in mile sections, on brackets fastened to chestnut and hard pine poles. Cars were built by Briggs of Amesbury, Mass., and are models of neatness and strength. Ahearn electric heaters are used. There are two box motor cars, two open trailers, and two baggage and express trailers. The trucks were built by Bemis, of Springfield, Mass., having sand boxes that find special

favor with the management, and Dorner & Dutton track scrapers. The two motor cars have each two 20-horse-power Westinghouse motors. The expense for repairs on cars and motors since the road started, about March 1, 1893, has not been over four dollars.

### THE ELECTRIC LOCOMOTIVE.

As was mentioned before, the entire freight for the town of Sanford and its mills goes over the Mousam River Railroad. The electric locomotive is of great interest, as it is probably the only one in the world working under such conditions. It consists simply of a truck with 4-inch axles; properly housed over, and carrying two standard 30-horse-power Westinghouse motors. The wheels are 36-inch. It weighs 10 tons, 100 pounds, and is 27 feet from end to end. The cab is heated and lighted by electricity. This locomotive has been in daily use since February 28, 1893, giving excellent results. The maintainance account for it, including oil, brushes, and turning down one commutator, has been \$8.64. It hauls four loaded cars of coal up a  $5\frac{1}{4}$  per cent grade, each car holding about seventeen tons. It has started at one time 104 tons. Sand boxes and a bell, a la steam locomotive, are a part of the outfit. There are also track scrapers and pilots, one of wood and one of iron, for plowing through snow. In big snow storms a snow plow, similar to that used on eastern steam roads, is put on. This will, according to Mr. Day, the superintendent, take care of any snow storm. It is not suited to city use, however, where the paving is high.

To get some idea of the work this locomotive has to perform, it will be necessary to investigate the

### FREIGHT TRAFFIC,

which is taken care of almost entirely by it, the baggage and express being hauled behind passenger cars. At Sanford are located the famous Car Plush and Worsted Mills, employing under favorable administrations, 1,800 hands. These alone require the delivery of 300 tons of coal at the boiler room doors every day. In addition to this there is the local work for the grocery stores, etc., of Sanford, which showed an average of forty tons per working day, from March 1 to November 1, 1893. The locomotive mileage from February 28 to August 1

was 3,748 miles, nearly 30 miles per working day. Thus it will be seen that it is no light work that this locomotive has to perform. A regular price per ton is received for hauling and delivering coal to the mills. It is very much cheaper than the old way of hauling by wagon, and the management wonders why more mills in the state do not haul their coal in this way.

In addition to freight, which is hauled and delivered to any part of the city, the mail, express and baggage is brought from the railroad in the two trailers made for the purpose. The passenger business amounted to 111,725 in the eight months, March 1 to November 1, the highest record being 21,559 in July. The July freight business also was the largest during the period. The combination

#### WATER AND STEAM PLANT

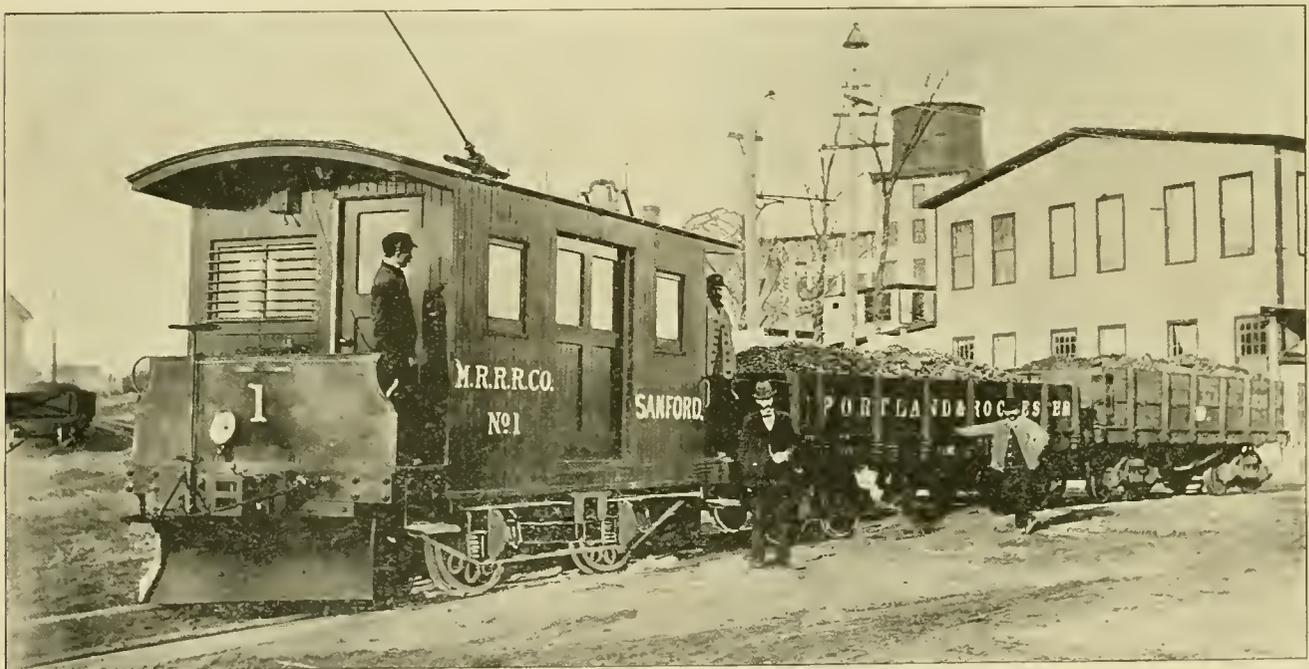

has one 70-horse-power Corliss engine and one 150-horse-power Humphrey waterwheel. The engine has a 14-foot fly wheel and the waterwheel one of 10-foot diameter. The latter is also fitted with a Pritchard electric governor. The peculiar feature of the station is that the waterwheel and engine are run at the same time. In this way the engine takes care of a great deal of the irregularity of the load, for as the current increases, the

cold water, bath room, three pits for repair and inspection and two tanks 14 inches diameter and 6 feet high, furnishing water for fire purposes here and in the engine room.

#### THE MANAGEMENT

consists of Hon. E. M. Goodall, president; Louis B. Goodall, treasurer; and Everett K. Day, superintendent. Hon. E. M. Goodall is also president of the Sanford Mills. He has had a wide business experience and is respected by all with whom he has to do, as a gentleman upright in

THE ELECTRIC LOCOMOTIVE, MOUSAM RIVER RAILROAD.

waterwheel dynamo drops its speed and voltage, and the engine dynamo has an opportunity to deliver a greater proportion of current, so keeping the load on the waterwheel nearly constant. The coal bill is very light. The two generators are Westinghouse 100-horse-power. The switchboard is of skeleton style, made of bird's eye maple. In the stock room, where, is also the engineer's office, a full supply of duplicate parts is kept. The car house is 40 by 40, with slate roof, and two tenements on the second floor for engineers. It is supplied with hot and

all business relations. Treasurer Louis B. Goodall, is a brother of the president and well known as the treasurer of the Goodall Worsted Company. Everett K. Day, superintendent, is an electrician thoroughly in love with his work. His electric career began in 1889, and he has held positions of trust with various electric railway and light companies, and with the Thomson-Houston Company. Socially he is a man of rare good character and very popular with his subordinates.

The road is purely an investment property and was

built to earn money and not to boom stock. The stockholders were well acquainted with the conditions under which the road was to operate and acted accordingly. It would certainly seem that the management is right

E. M. GOODALL,  
President M. R. R. R.

EVERETT K. DAY,  
Superintendent M. R. R. R.

in expressing the sentiment that there are many rich fields for investments of this character, scattered over the country, and especially in Maine.

**BROOKLYN BRIDGE AFFAIRS.**

For the past year the Brooklyn Bridge earned \$1,252,908, of which amount the railway paid \$1,167,497. The number of passengers carried amounted to 41,772,898 in 1892, and 42,615,105 in 1893. On the bridge, 105 accidental injuries have occurred, mainly from falling down stairs. Two sudden deaths occurred on the bridge. Six lost children were found. From the opening of the bridge to date, 304,000,000 passengers have crossed. A delay account shows that the time lost from all causes amounted to 4 hours 35 1/2 minutes.

**REWARDS AT ROCHESTER.**

The annual distribution of \$1,000 among the most proficient motor-men and conductors has been made. The classes are first, second, third and fourth, for both motor-men and conductors. The first class is awarded \$10.00 each; the second, \$7.50; the third, \$5.00; and the fourth, \$2.50. One hundred and sixty men shared in the distribution.

**MOUSAM RIVER RAILROAD.**

ABSTRACT OF FOOTINGS OF FREIGHT WAY-BILLS.

Station.							Month of _____ 189						
FREIGHT RECEIVED.							FREIGHT FORWARDED.						
From _____							To _____						
DATE OF WAY BILL.	NO. OF WAY BILL.	WEIGHT.	FREIGHT CHARGES.	ADVANCED CHARGES.	AMOUNT PREPAID.	AMOUNT TO COLLECT.	DATE OF WAY BILL.	NO. OF WAY BILL.	WEIGHT.	FREIGHT CHARGES.	ADVANCED CHARGES.	AMOUNT PREPAID.	AMOUNT TO COLLECT.

**SYRACUSE FAILURE.**

On petition of directors the Syracuse Consolidated Street Railway Company went into P. J. Mack's hands, a receiver, last month. The company was the consolidation of twelve former lines. The bonded indebtedness was \$1,250,000. Cleveland parties are largely interested in the deal, but New York capital was the most active in bringing about the receivership. The syndicate paid \$2,500,000 for the stock of the component companies. On November 1, the floating indebtedness of the company reached \$180,000. The principal creditor is T. H. Conderman, of Philadelphia, for \$100,000 advanced since January, '93. The remainder of the floating debt is for supplies, taxes, wages and running expenses. The company operates 17 3/4 miles of track electrically and 16 1/2 miles by horse power.

**TEXAS STATE ASSOCIATION.**

A second meeting of Texas street railway men has been held at Waco, and a temporary organization formed with the title, "The Texas Street Railway Association." A. Zintgraff, of Denison, was elected president, and S. A. Hobson, Waco, secretary. A meeting to effect a permanent organization will be held at the Driskill Hotel, Austin, on January 24.

**PHILADELPHIA TRACTION COMPANY ADOPTS THE BEMIS TRUCK.**

The Philadelphia Traction Company has the reputation of being not only hard to please, but insists on a high quality of workmanship as well. Hence the selection by that company of the Bemis truck, made by the Bemis Car Box Company, of Springfield, Mass., and the placing of an immediate order for 300 trucks, is a recognition of merit in which the Bemis Company very naturally takes much pride. Mr. Bemis is probably the veteran street car truck builder in this country and combines experience and good judgment in his appliances.

**POSTAGE STAMP TICKETS.**

To the getting up of new schemes for the zone system of railways and tramways there seems no end. It is stated that a new plan of railway tickets is about to be adopted in Hungary, where the zone system has apparently met with some success. The traveller will make out his own ticket, and the government will sell railway stamps and supply blank cards. The passenger will, when he desires to take a journey, write on a card the name of the starting-point and destination, and affix as many stamps as the published list of fares calls for.

## STREET RAILWAY LAW.

EDITED BY MR. FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Street Car Passenger Injured at Railroad Crossing.*

A passenger on a street car, which has stopped at a railroad crossing to permit a locomotive to pass, is not bound to be on the lookout, when the car starts, for another approaching engine.

The following is from the opinion:—The Court instructed the jury: "If Michael O'Toole upon that street car could have seen the engine and did not undertake to see it, and did not exercise reasonable care for the purpose of ascertaining whether they could proceed across the railway track in safety, then he was guilty of contributory negligence; and if, by looking up the railroad at that time, he could have learned whether an engine was or was not approaching, and could then have gotten off the car, if he discovered an engine approaching, and did not do that, then he was guilty of contributory negligence and cannot recover." Then further on in this instruction: "Had the plaintiff been walking in the street, the fact that the gates were not lowered would not be an invitation to him to cross the railroad in violation of the rule of law that he shall stop, look, and listen before crossing a railroad; and that rule is not taken away because the plaintiff happened to be in a street car."

We find no evidence which warranted this instruction. Plaintiff was a passenger of the street car company which had contracted to carry him safely. He had the right to presume that it would exercise all care required in this undertaking. When the car approached the crossing, it stopped; he was in no danger then, and had no reason to apprehend any. When it started, he had the right to believe that it did so because the crossing was clear. Running a distance of about seventy-five feet, the collision occurred. In the very few seconds which were necessary to accomplish this distance, the Court, in substance, instructed the jury that it was plaintiff's duty to be on the lookout to learn if the railroad track could be safely crossed, and if by so doing he could have seen the approaching engine, ordinary care required him to jump off. To impose such a duty upon a passenger under these circumstances, is going much further than any court has yet gone. The instruction, in substance, that ordinary care required plaintiff to perform the duties of conductor and motor-man; that practically he was to exercise the same care as if he had been driving his own horse—"stop, look, and listen"—was erroneous, and calculated to mislead the jury.

The cases of *Township of Crescent vs. Anderson*, 114 Pa. St. 643, and *Dean vs. R. Co.*, 129 Pa. St. 514, cited and relied on by appellee as sustaining the instruction complained of, really recognize the opposite doctrine. Both are cases where the plaintiff, when injured was riding in a private vehicle driven by another, and both were injured by the negligence of the driver and a third party—the defendant. In both, the decision was put on the ground that the negligence of the driver was apparent, and he was to some extent under the direction or

control of the party injured. There was no attempt, by remonstrance or otherwise, by the party injured, to restrain the negligence of the driver. The negligence of the driver was not in either case imputed to an innocent plaintiff, but the plaintiff was held to have participated in the negligence which caused the accident. *Borough of Carlisle vs. Bisbane*, 113 Pa. St. 544, is to the same effect; and the decision is expressly put upon the ground that, although the conveyance was a private one, the injured party did not to any degree participate in the alleged negligence of the driver. The plaintiff here was a passenger in a public conveyance; he conformed to the rules of the company; he relied on the vigilance and care of those in charge of the car, as his contract gave him the right to do. There was upon him no duty of moving the car with caution at dangerous crossings; no duty to watch for possible collisions and jumping off in apprehension of them.

(Supreme Court of Pennsylvania. *O'Toole vs. Pittsburg & Lake Erie R. Co.*, 27 Atlantic Reporter 737.)

(NOTE—Imputable contributory negligence which will bar the plaintiff from recovery, exists when the plaintiff, although not chargeable with personal negligence, has been, by the negligence of a person in privity with him, and with whose fault he is chargeable, exposed to the injury which he received through the negligence of the defendant. It is now the rule in the United States Courts, in England and in most of the states of the United States, that the contributory negligence of a carrier is not attributable to a passenger. But in some of the states, the doctrine that it is imputable, and will bar a recovery has been established. Yet it would seem that the recent repudiation of the doctrine of *Thorogood vs. Bryan* by the Supreme Court of the United States, and the distinct manner in which that case has now been overruled in England, indicate an entire abandonment of the doctrine that the contributory negligence of a carrier should be imputed to a passenger. 5 American and English Encyclopædia of Law 82 et seq.)

From a footnote to same, the following is taken:—"In *Thorogood vs. Bryan* 8 C. B. 115, it was held that a passenger in an omnibus, injured by the negligence of the driver of another omnibus, had no action against the latter, because the driver of the omnibus carrying the passenger, by his negligence, contributed to the injury. In *Bennett vs. New Jersey R. Co.*, 36 N. J. L. 225, it was held that the driver of a horse car was not the agent of the passenger so as to render the passenger chargeable for the driver's negligence. In speaking of the 'identification' of a passenger in the omnibus with the driver, mentioned in *Thorogood vs. Bryan*, the Court said: "Such identification could result only in one way, that is, by considering such driver the servant of the passenger. To hold that the conductor of a street car or a railroad train is the agent of the numerous passengers who may chance to be in it, would be a pure fiction. It is obvious, in a suit against the proprietor of the car in which he was a passenger, there would be no recovery if the driver or conductor of such car is to be regarded as the servant of the passenger. And so, on the same ground, each passenger would be liable to every person injured by the carelessness of such driver or conductor, because, if the negligence of such agent is to be attributed to the passenger for one purpose, it would be entirely arbitrary to say that he is not to be affected by it for other purposes.")

*Injury to Child—Care Required of Motorman—Question for Jury.*

A boy less than five years old, on seeing an electric train coming along the street, ran from the side-walk with extended arms. The motorman saw him, and shouted and motioned to him to go back. The child, however, continued to run, and, catching hold of the side

netting of the rear car, was thrown down and injured. *Held*, that the question whether the motor-man should have stopped the cars, in view of the tender age of the child and his apparent intention to lay hold of the car, should have been submitted to the jury.

(Supreme Court of Minnesota. *Mason vs. Minneapolis St. R. Co.* 55 Northwestern Reporter 1122.)

*Rebuilding Street Railway—Municipal Control of Streets.*

Under the charter of the city of Trenton, giving the city council authority to prescribe the manner in which corporations shall exercise any privilege granted them in the use of any street, or in the digging up of same, a street railway company may be enjoined from rebuilding its road without the consent of the Board of Public Works of the city, which has succeeded to the powers of the council.

(New Jersey Court of Chancery. *City of Trenton vs. Trenton Passenger R. Co.* 27 Atlantic Reporter 483.)

*City Ordinances—Contracts—Interference with Franchise Granted—Jurisdiction of Federal Court.*

City ordinances made in pursuance of law and granting to a corporation the right to build and operate street railway lines in the city, after acceptance by the corporation and expenditure of large sums of money on the faith thereof, constitute a contract protected by the Constitution of the United States forbidding states to make any law impairing the obligation of contracts.

Act of Indiana, March 6, 1891, conferred upon the city of Indianapolis the power by contract, when approved by ordinance of its common council, to grant franchises to street car companies. *Held*, that the exercise of this power by the Board of Public Works with the approval, by ordinance, of the common council, was a law of the state within the meaning of the Federal Constitution.

A Federal Court has jurisdiction of a bill in equity alleging that complainant has a valid contract with a city conferring upon complainant the privilege of laying tracks and operating street railway lines on all the streets of the city, and that the contract provides that the city shall not confer upon any person or corporation any privilege which will conflict with the rights granted to complainant; and alleging further that the city has granted the right to lay tracks and to operate street railroads on certain streets, to respondent, and that respondent cannot do so without interfering with and substantially destroying the complainant's lines, and impairing the privileges before granted to complainant.

(United States Circuit Court, District of Indiana. *Citizens Street R. Co. vs. City R. Co.* 56 Federal Reporter 746.)

*Railway in Street—Invalid Ordinance—Expiration of Legal Existence of Company.*

The city of Detroit passed an invalid ordinance to extend the right of a corporation to own and operate a street railway beyond the time to which the life of the corporation was by law limited. The grantee assigned

all its property and franchises to a second corporation. Thereafter an ordinance was passed fixing the time beyond which the tracks should not remain in the streets at the time at which the life of the grantee corporation would expire. *Held*, that the continuance of the tracks in the streets after that day was a public nuisance which a Court of Equity would abate.

The fact that such extension ordinance was accepted and quietly acquiesced in by both parties for ten years during the term of the original grant, and that the corporation expended large sums of money on the faith thereof, does not estop the city from denying the validity of the extension after the expiration of the original grant, as against the grantee corporation, although it might be estopped as against the assignee thereof by its dealings directly with such assignee, if such assignee was a corporation whose life extended beyond the period of the extending grant.

(United States Circuit Court, District of Michigan, *City of Detroit vs. Detroit City Railway Company.* 56 Federal Reporter 867.)

*Connecting Lines—Coupon Tickets—Fragment of Coupon—Refusal of Conductor to Accept.*

A ticket for a continuous ride over the whole length of a street railway and a connecting line, was of a peculiar color and print and was composed of two coupons, the upper of which was for use on the connecting line and gave the names of its termini below and the names of both lines above. *Held*, that a conductor of the connecting line was bound to accept for passage an upper fragment of the upper coupon which gave the names of the lines, on the assumption that the conductor of the other line carelessly tore off the part giving the termini in taking the lower coupon.

(Supreme Court of Michigan. *Rouser vs. North Park Street Railway Company,* 56 Northwestern Reporter 937.)

*Negligence—Car Obstructing Cross Street—Injury to Vehicle.*

In an action against a street railway company for damage to plaintiff's carriage, it appeared that plaintiff, an undertaker, occupied his carriage in front of a funeral procession; that he arrived at a street crossing about the time that defendant's car reached said crossing; that the car suddenly stopped directly across the street on which the procession was moving, and compelled plaintiff to stop suddenly within five feet of the car; that all the carriages in the rear were thus caused to stop suddenly; and that the pole of the first of such carriages came in contact with plaintiff's carriage, breaking in the panels. *Held*, that the stopping of the car was the proximate cause of the damage to plaintiff's carriage.

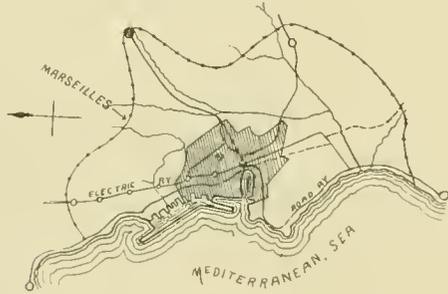

Defendant's negligence was sufficiently proved by it conceding that it obstructed the street in violation of a penal ordinance of the city.

(Supreme Court of Wisconsin, *Mueller vs. Milwaukee Street Railway Company.* 56 Northwestern Reporter 914.)

## MARSEILLES ELECTRIC RAILWAY.

Down on the coast of the Mediterranean, under the blue sky of southern France, in fact in the historic old town of Marseilles, celebrated in song and story, a new invigorating element has been introduced. It is needless to say that it is an electric railway.

Marseilles has long had the most extensive street railway system in France. Its streets are crooked, narrow, crowded and full of steep grades, all very harrowing to the French horses, and costly to the French pocket-book. The street pavement is mainly of hard and slippery por-

phyritic granite. The whole system comprises some forty miles of track, all double, owned and operated by the Compagnie Generale Francaise, which also owns the concessions of Tours, Orleans, Nancy and Genoa, (Italy). The Marseilles concession was granted for fifty years with right of purchase at the then valuation at expiration of the time. The older lines are worked by horses, the cost of which is 12.3 cents per mile. This in proportion to other cities\* is very high.

In Lyons horse traction cost.....	10.7 cents per car mile
" Bordeaux " " " .....	9.8 " " " "
" Toulouse " " " .....	9.2 " " " "
" Genoa, Italy, horse traction cost.....	8.86 " " " "
" Turin, " " " " .....	8.26 " " " "
" Milan, " " " " .....	4.64 " " " "
" Florence, Italy, " " " .....	7.62 " " " "

\*These figures are by Dr. Preller.

Under the circumstances the company tried various systems of mechanical traction, including Rowan's steam cars, Mekarski's compressed air and dummies of various patterns. The steam appliances were too costly and the compressed air system was unmanageable.

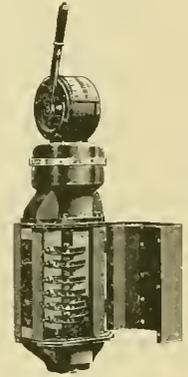

To the popular locality of St. Louis the Compagnie Generale has adopted the overhead electric system, which it is the purpose of this article to detail. Sautter, Harle & Co., of Paris, and the Oerlikon Works, of Zurich, were contractors for construction and equipment. The contractors, it is said, guaranteed that the cost of traction should not exceed 6.72 cents per car mile. This limit was afterwards raised to 8.56 cents.

The line is about four miles in length, covering the territory indicated in the subjoined map, and is double tracked throughout. It starts at the grand boulevard, the Cannebiere, and runs up the narrow rue d'Aix with grades of 5 and 6 per cent: through the manufacturing suburb of St. Lazare with gradients of 2 to 4 per cent, then through other suburbs to St. Louis, with grades of

3 to 5 per cent, thus having no single level section throughout the entire length. There are three regular stations on the route, but passengers may be picked up or set down anywhere on the line. The center of the roadway is used for road bed, except at terminals and fixed stations. The route follows streets ranging from thirty-three to forty feet in width, but the rue d'Aix is only twenty-three feet wide.

The road bed is mainly of granite pavement, laid with 54-pound girder rail. The rails are supported on steel chairs bolted to steel ties. The sleepers weigh 37.4 pounds each, or 64 pounds with chairs, and are 5.5 feet long. The additional fish plates, which are unusually heavy, make the entire weight of the steel road bed 170 pounds per lineal yard. The ties are spaced 3.28 feet apart and 1.64 feet at joints, which are broken.

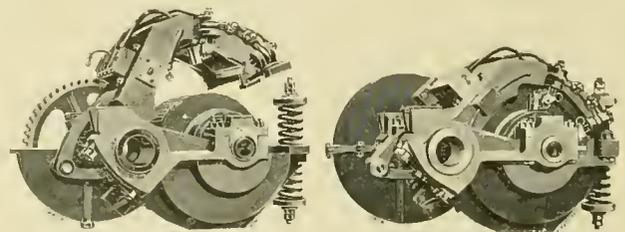

The steel construction affords good return and in addition a copper bond is used, besides a return wire, which strangely enough, is a lead-covered galvanized iron wire.

OERLIKON CONTROLLER.

The principal disturbing element in European electric railway troubles is the telephone circuit. This in Marseilles was particularly aggravated by an ancient system that damp weather alone often disarranged completely, or a proximity of often two or three feet of the telephone wire to the railway feeder. The trouble was finally settled by the installing of a metallic return for the telephone by the railway company, at an expense of \$15,000.

The power station is about midway between the termini and forms part of the great "Lazaret" depot. This depot, erected in 1891, covers 9,560 square yards and comprises a three-story office building, dwelling houses

OERLIKON MOTOR.

for the force, storage barns, machine shops, water tanks holding 200 tons, coal shed for 1,000 tons, and stabling for 200 horses. An original installation of 300-horsepower for the line proved inadequate and the plant was remodelled to 500-horse-power. Three horizontal single-acting condensing engines are in use; the larger, 22 by 48 and the two smaller 16 by 42, developing 300-horse-power and 125-horse-power respectively. These engines are guaranteed to work with a steam consumption of not exceeding 20 pounds per horse-power per hour, from full to no load, with 180 pounds boiler press-

ure. They are also guaranteed not to vary in speed more than two revolutions from full to quarter load within two minutes. They are built by Van der Kerchove's works at Ghent.

Three 100-horse-power bi-polar direct-driven generators of the original plant were replaced by belt driven four-pole Oerlikon dynamos, whose drum armatures are wound in grooves with cross connections in the commutators. The double winding is inserted in mica sheet insulation, fitted in slots of the armature core. The commutators are of hard laminated copper. The two large dynamos give 280-horse-power at 300 revolutions, while the smaller machine at 350 revolutions gives 140-horse-power.

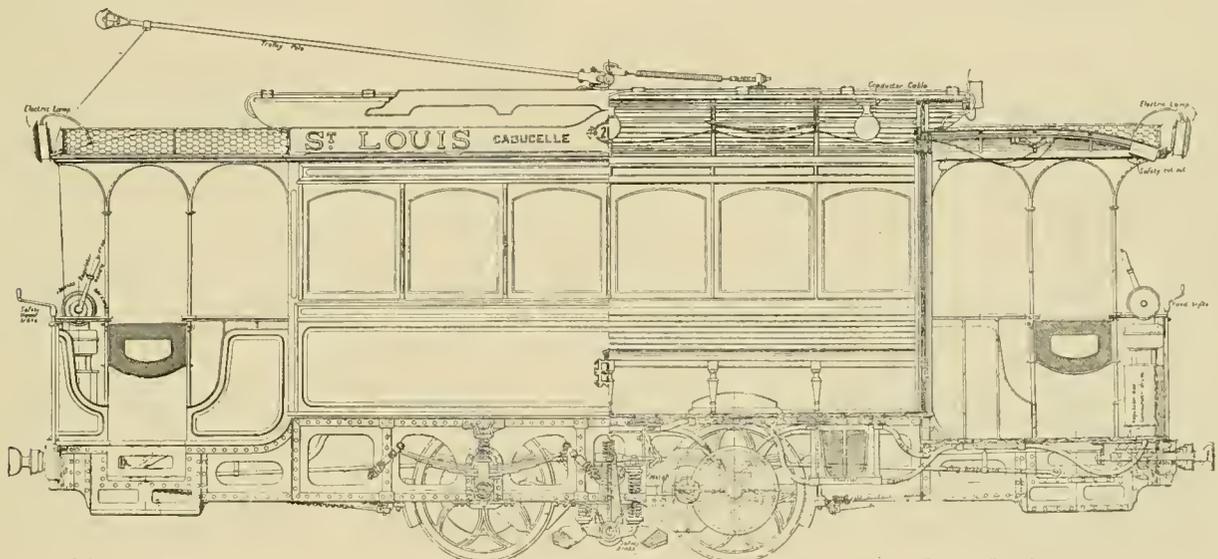

The overhead construction is similar to American practice. Number 3 silicon bronze trolley wire, is strung 16 to 18 feet above the rail, using compressed and paraffined wood insulators. Center-pole construction is usual in suburbs, with suspension from the walls of

made are in the commutator. The small pinion is of aluminium bronze and the larger of mild steel. Vertical spring suspension holds the motor to car frame. The controller is different in form from American practice, but essentially the same, with six contacts.

The brakes are ordinary hand-chain brake and a track brake, or as it is called in England, a slipper brake. These are found sufficient for all purposes, including the letter of the law.

Taken all in all the Marseilles road is perhaps the most distinctively modern electric railway in France. We are indebted to London Engineering for our illustrations.

FRANCE is taking several forward steps in electric traction. The town of Dijon has given a concession for its electric tramways to a contractor, of Lyons. The municipality of Grasse has been asked for an electric railway franchise by M. Leveque. Mouveaux will have a trolley line on an American franchise basis.

DETAIL OF MARSAILLES ELECTRIC CAR.

houses or from poles in town. The feeder system is divided into four independent sections.

Our drawing of the car in vogue, shows a four-wheeled rigid 5.9 foot wheel base car. The wheels are 39 inches diameter, and the car measures 30 feet over all. Perhaps a flexible wheel base and double truck will be introduced by some enterprising truck manufacturer. The car seats 20 people and has room for 15 on platforms, with no roof seats. The car weighs with motors 6.8; loaded 9 tons; with overload of 75 passengers, which is usual in spite of laws to the contrary, 12 tons. Lighted by five electric lamps inside and two reflectors outside.

The motors first used were bi-polar, 12-horse-power, worm geared one in fifteen pitch. These were soon replaced by Oerlikon motors, nominal 18-horse-power, but capable of developing up to thirty, driving by horizontal spur gear. These Oerlikon motors (see illustration), are four-poled. The yoke with the pole cores, which also forms the casing is of mild steel with special compound winding inserted in slots. Cross connections

### SIoux CITY'S CONSOLIDATION.

After the recent panic in which the newer towns suffered the extremes, the surface railways of Sioux City were left in bad financial condition. This resulted in the organization of the Sioux City Consolidated Street Railway Company, by John Pierce, A. E. Pierce, Peter and Chris Moller and H. A. Johns, absorbing the Sioux City Cable; the Sioux City Street Railway, electric; Rapid Transit Railway; Riverside Electric; Sioux City & Leeds Electric. The company is capitalized at \$1,000,000, with offices in New York and Sioux City. The incorporators deeded \$1,200,000 in realty to the company. It is on a firm basis.

P. H. HOVER, formerly of the Standard Paint Company as Chicago representative, has severed his connection with that concern to assume a position with the Mica Roofing Company, of New York. Mr. Hover will attend to the same branch of the trade as formerly, his new connection operating in similar lines.

## ENGLISH ROADS WANT ELECTRICITY.

Our bright contemporary, Lightning, says that the following session of parliament will be asked for a dozen mechanical traction concessions, as follows:

NAMES OF APPLICANTS.	POWERS ASKED.
Abergele and Pensarn Pier Company (Limited)	Construction of tramway. Use of electricity or other motive power.
Barrow-in-Furness Corporation	Construction of tramways. Use of electricity or other motive power.
Bristol Tramways and Carriage Company (Limited)	Construction of tramways. Use of electricity or other motive power.
Central London Railway Company to be formed	Extension of line. Construction of railway (partly underground) from South Place, Finsbury, to Walthamstow and Epping Forest Use of electricity and steam or other motive power.
Croydon Corporation.	Construction of tramways. Use of electricity or other motive power.
Croydon Tramways Company	Construction of tramways in Croydon and Streatham. Use of electricity or other motive power (except steam).
Dudley and Wolverhampton Tramways (Limited)	Construction of tramways in Dudley and Wolverhampton, and from Wolverhampton to Bilston. Use of electricity or other motive power.
Hull Street Tramways Company	Power to transfer part of undertaking. Use of electricity or other motive power.
Liverpool Corporation	Construction of tramways. Use of electricity or other motive power.
Liverpool United Tramways and Omnibus Company	Construction of tramways in Bootle and Walton-on-the-Hill. Use of electricity, or other motive power.
South Staffordshire Tramways Company	Construction of tramways in West Bromwich and Handsworth. Use of electricity or other motive power.
West London Tramways Company (Limited)	Construction of tramways in Acton, Hammersmith, and Fulham. Use of mechanical power.

All of this shows that the British public is about to awake to the necessities of the occasion. The subject of electric traction is being pushed more vigorously and practically by Lightning than by any other of the English electrical publications.

## PERFORMANCE OF A TRIPLE EXPANSION ENGINE.

Owing to the increasing interest that is being taken in multi-cylinder engines for use in large plants, we reproduce here some indicator diagrams from the triple expansion vertical McIntosh & Seymour engine, in the Elmira Illuminating Company's plant. This engine has four cylinders (two low pressure) of the dimensions shown on the cards. It is rated at 500-horse-power and is used to carry the load of lights during the heavy load hours, from dusk till midnight only. The heavy load cards were taken at six o'clock on an ordinary night, and the minimum load cards on Sunday evening, when the load was lightest. These are the two extremes of station load and the showing is a remarkably good one in both cases. The engine has a speed drop of only three revolutions from full to no load condensing. It is certainly an all around record to be proud of. The month of November, this year, gave a saving of 61 per cent in the new station

over the old one during November, 1892, or a saving of 61 per cent due to the use of well loaded triple expansion

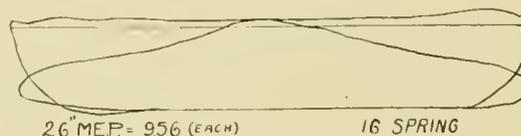

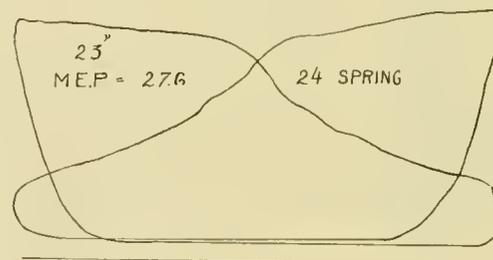

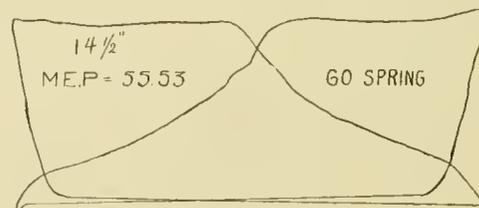

FIG. 1—MAXIMUM STATION LOAD.  
Initial pressure, 139. Revolutions, 139. Horse-power, 518.69.

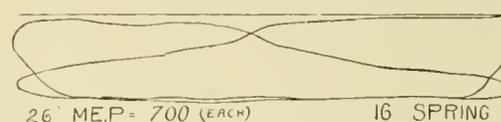

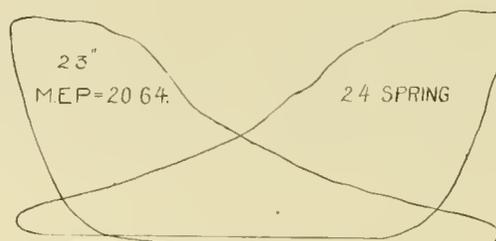

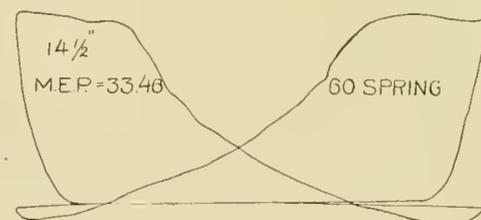

FIG. 2.—MINIMUM STATION LOAD.  
Initial pressure, 137. Revolutions, 140. Horse-power, 374.62.

engines. The vertical engine works so well that the engineers want to run it all the time. The indicator cards as reproduced are three-fourths actual size.

THE "CROWN" GLASS OIL CUP.

The accompanying engraving represents Lunkenheimer's "Crown" index sight feed glass oil cup. It is provided with an "index" for regulating the oil flow, and an indicator arm turning on the lid to mark the notch giving the desired feed. When the feed is shut off, the lever can be left standing up out of the notch, so that it can be seen from a distance that the feed is off. When there are a number of oil cups to be looked after it is almost impossible that they all should need the same feed, and it is just as impossible to remember how much each individual one requires. The use of the index for showing the proper feed relieves this difficulty, and also makes it possible to temporarily increase the feed without losing the adjustment for the ordinary run. Besides the "Crown," this company makes seven other styles for various purposes. These cups are made by the Lunkenheimer Company, of Cincinnati, and the high standard of the specialties made by them insures the "Crown" as a trustworthy appliance.

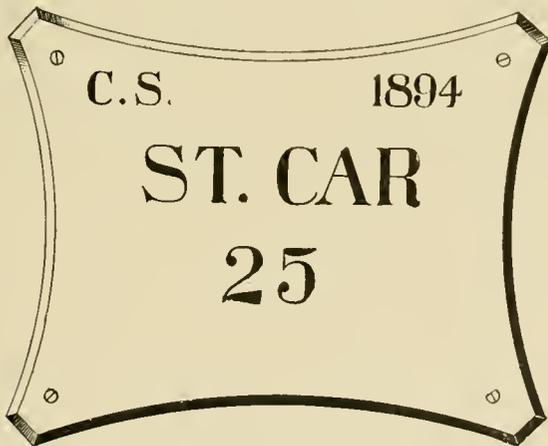

CROWN OIL CUP.

A CAR BADGE.

That conductors and drivers should wear a badge is a conceded advantage, but not in many cities must the car itself be similarly decorated.

The time honored custom at Savannah, Ga., and the city fathers, decree that no street car shall leave its barn

without a regulation badge, a fac-simile of which is shown herewith. This evidence of municipal regard is secured by the railway company on the payment, in advance, on the first day of every year, of thirty dollars for each badge. A recent interpretation of the ordinance was that a badge must be taken out for each car owned

by the company, whether in service or not. Last year the road paid \$270 for badges, in addition to usual state, city and county taxes. This year their badges will cost over \$600 for cars in actual service, but over \$1,500 if paid on all cars owned.

There is quite a question in many states as to the legal right of cities to impose what is generally known as the car license, and which is usually exacted under the excuse of being a police measure. There certainly is no justice in taxing cars not on the street, for they have already been heavily taxed as personal property. The method which has prevailed in Chicago for many years seems a much more equitable one, and is based on the number of trips actually run, regardless of how many cars the companies may own. The amount is placed at fifty dollars per car per year, payable in four quarterly installments. The number of cars on which any quarter's payment is to be made, is determined by taking the entire number of trips, long or short, run on all of any road's lines during the three months. Dividing this sum by the number of days in the quarter, (usually 91, or 92) gives an average number of trips per day, which is again divided by thirteen, which number has been agreed upon as constituting a car day; the result of this division gives the average number of cars per day for the quarter on which the license of \$12.50 must be paid. A sworn statement by the secretary of the company as to the total number of trips accompanies the voucher and check. The amount so paid into the city treasury of Chicago, aggregates about \$45,000 per annum.

At Allentown, Pa., the question of an equitable license on summer and winter cars was recently given an opinion by City Solicitor Trexler, who held thus:

"In my opinion a license tax can only be collected from each car—that is from each construction that constitutes a car. To hold that a car or truck which in winter time is surmounted by a closed superstructure and in summer by an open body constitutes two cars is, I think, unreasonable. It is the wheels and running gear and motor which, in my opinion, constitute the car."

In other words the license is on cars in the street; those in the barn are already taxed, and taxed hard. There is as much justice and sense in imposing a license on a car not in use, as on a lot of buggies and wagons on sale or exhibition in a dealer's repository.

FIFTY-THOUSAND DOLLARS FOR A PLAN.

The Metropolitan Traction Company, of New York City, has made public, and published offer of a bonus of \$50,000 to the inventor of a system of traction demonstrated superior or equal to the overhead trolley. The decision shall be left to the State Railroad Commission. No claim is made to the inventor's rights. The traction company will pay no trial expenses. The prize will be awarded March 1, 1894. The offer is made in a letter to the commission which endorses the cable for down town districts, heavy traffic and straight routes.

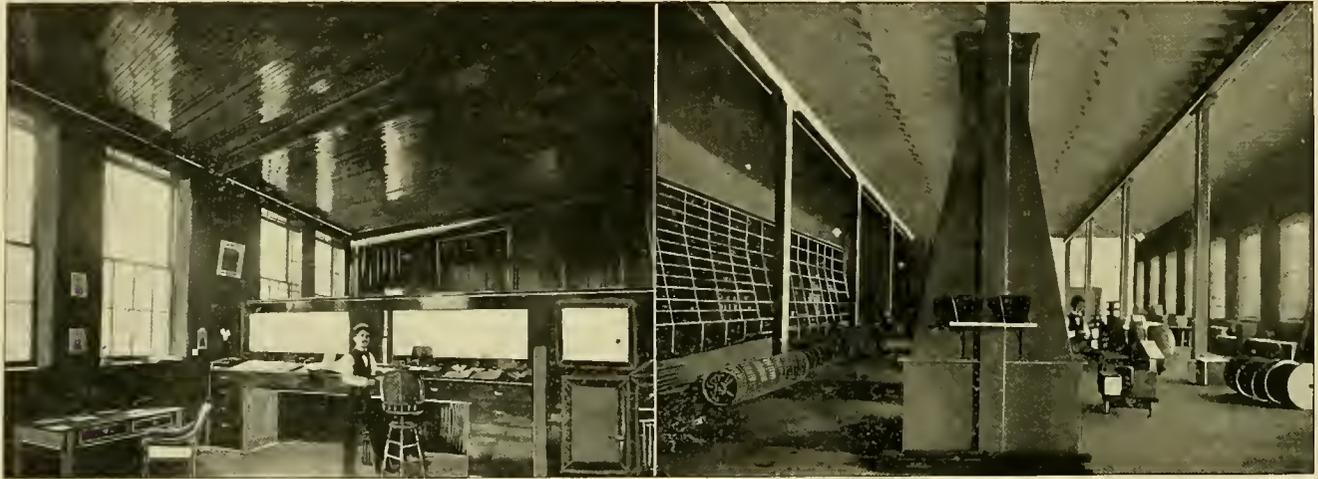

**SUPPLY DEPARTMENT OF THE MILWAUKEE STREET RAILWAY.**

The store room of the Milwaukee Street Railway is noted the world over for its completeness. The labor of the storekeeper is unusually severe, because of the great variety of apparatus in use on the road, which greatly increases the number of repair parts to be kept.

The following is the system of store keeping in use, and we believe it will be of interest to every large road.

material such as bolts, nails, screws, etc., which are classed under general headings for each line. From the "Stock Ledger" the amount and name of the materials are entered in the "Material Received Book," Blank B, under the firm name from whom purchased. The invoice is then pasted in the "Invoice Book."

Material is arranged in sections or departments as far as possible, as for example: bodies, trucks, trolleys, controllers, line tools. In placing each article in its section, facility in handling is secured by piling it in certain rows

VIEWS IN STORE ROOM AND OFFICE.

On receiving supplies they are counted, weighed or measured, as the case may be, and notice of receipt sent to the purchasing department, on Blank A. The latter department forwards the original bill to the auditor and a duplicate to the storekeeper. Quality of material is

or piles, as carbon brushes in fifties and hundreds; tape in ten and twenty pound piles, etc. Gears and pinions are numbered with steel figures on being drawn out and the number entered in the "Ledger" with the charge, thus preserving a record of the same, making it possible to tell

**MILWAUKEE STREET RAILWAY CO.**

*Purchasing Department:*

I have received this day the following goods, delivered at \_\_\_\_\_, in good order, with exceptions as noted.

QUANTITY.	MATERIAL.

WINDOW WHERE SUPPLIES ARE ISSUED.

determined by guages and measures, and in case of any doubt, notice is given to the superintendent to whose department the material belongs, to inspect the same. This occurs very seldom, as requisitions are required to be very exact in specification. The amount of an invoice is entered in the "Stock Ledger,"—each article having a separate account, indexed alphabetically, except lines of

the life of each gear or pinion. Car lights are crated in bins, holding six and twelve packages, with straw. Brake shoes are stored in racks, made of scantlings far enough apart to admit of three shoes deep and four wide, piled twenty high. The oils are stored in a fireproof room, one of each variety being tapped for the minor orders,

THE PLACING OF CAR TRUCKS FOR ROUNDING CURVES.

BY EMIL EHNBOH.

During my work in constructing street cars of all kinds, for both urban and suburban use, I have found certain details in the designing to re-occur in every instance, and as they mostly belong to the preliminary work and often had to be answered in short order, I contrived to establish certain formulas for each occasion, which would answer for any case of the same character. By having these formulas handy I have been able to answer important questions in a few minutes that otherwise would have taken hours to "lay out" on the drawing table.

The first question that occurred was the "radiation" of the axles under a four-wheel car while turning a curve. When a car on four wheels turns a curve, the natural tendency of the axles is to radiate, that is, to appear in the elongation of the radius describing the curve (see Figure 1), and the distance between the outside wheels tends to be longer than the distance between the inside ones. Certain provisions may therefore be necessary in regard to boxes, pedestals, and their fastenings, or with the brass bearings of the boxes on account of the strain that is produced. The four wheels of a truck under a double truck car act just in the same way as the wheels under a four-wheel car. The following formula gives the ratio of radiation:

$$O - I = \frac{G \times W}{R} \quad (\text{See Figure 1.})$$

Where O = Distance between centers of the outside wheels.

I = Distance between centers of inside wheels.

G = Gauge of track.

W = Wheel base.

R = Radius of the curve taken in the center of the track.

By examining the above formula it will be found that the difference between O and I or O-I decreases as either the gauge or the wheel-base decreases or as the radius increases in value. Hence the narrower the gauge and shorter the wheel-base or larger the curve, the less strain on the truck construction.

Example.—For a car with 6-foot wheel-base standard track and on a 50-foot curve.

$$O - I = \frac{4 \text{ feet } 8\frac{1}{2} \text{ inches} \times 6 \text{ feet.}}{50 \text{ feet}}$$

reduced to inches

$$O - I = \frac{56.5 \times 72}{600} = 6.78 \text{ inches.}$$

For a 40-foot curve  $O - I = 8\frac{1}{2}$ , and for a 30-foot curve  $O - I = 11\frac{5}{8}$  inches.

The first thing about a suburban or double-truck car is to lay out the "bottom" and to locate the intermediate or center sills, so as to avoid having the wheels cut, either them or the end sills, while the car is turning a curve.

The radius of the shortest curve the car has to run on is generally found by information from the railway company, and the wheel-base of the trucks is, as a rule, given. It is conceded that the longer the truck base or distance between centers of trucks the better it is.

The problem then is: first, to find the longest truck centers that will not make the wheels interfere with the end sills; second, that will permit the intermediate sills to be put far enough apart to give the "underneath" mech-

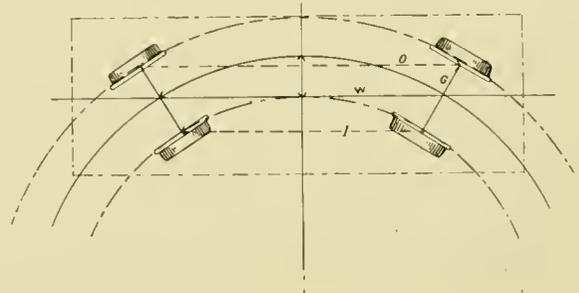

FIG. 1.

anism ample room while the car rounds a curve. If the position of the truck on the curve is found, the problem might be considered solved, and to find this position the curve or center between tracks must be laid down correctly relative to the car. The shortest and easiest way to do this is to lay off both the longitudinal center line c c and transverse 1 1 (see Figure 2), then draw end sills and side sills and assume the longest centers possible (which in this case are identical with the king bolts κ), and then by solving the formulas given below, two points, x and y of the curve or center of track are found, when a sweep

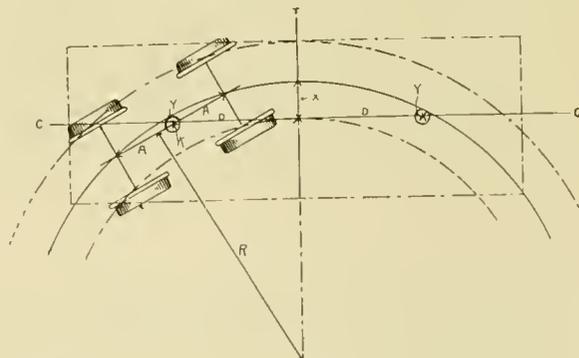

FIG. 2.

of the same radius as the curve (or proportional according to scale) can be used and the curvature be drawn correctly at once. The diagram Figure 2 explains better than words, and it is a much quicker and surer way than to bother with the trammel and finding a convenient rest for its center. In the formulas

A = half the wheel-base.

D = half the truck centers (or half distance between kingbolts.)

R = radius of curve taken in center of track.

X = the longest horizontal distance from the center of the track to the center line of the car body.

Y = the distance the kingbolt falls inside the center of track while going around a curve.

X and Y are to be found. A, D and R are given.

Then

$$X = R - \sqrt{R^2 - A^2 - D^2}$$

$$Y = R - \sqrt{R^2 - A^2}$$

For example.—Take a car body 30 feet on the corner posts and 7 feet on the side sills, and having a pair of trucks with 6-foot wheel-base and 30-inch wheels. The shortest curve has a radius of 30 feet. Then assume the truck centers to be 18 feet.

When:

$$X = 30 - \sqrt{30^2 - 3^2 - 9^2}$$

$$\text{or } X = 30 - 9 \sqrt{10}$$

reducing feet to inches

$$X = 360 - 108 \sqrt{10}$$

$$\text{or } X = 18.4716 \text{ inches,}$$

Also:

$$Y = 30 - \sqrt{30^2 - 3^2}$$

reducing to inches and solving

$$Y = 1.807 \text{ inch.}$$

This means that the center of the truck runs 18.47 inches from the center line c c and is tangent to a circle with 1.80 radius and the kingbolts for center. The curve is now correct, and if it is found that the kingbolts or truck centers are not spaced right they may readily be changed to suit.

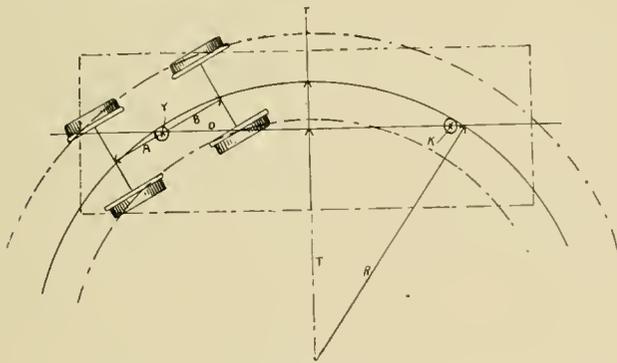

FIG. 3.

In case the truck centers do not coincide with the kingbolts as with "maximum traction" trucks, the formulas are slightly changed like this:

$$X = R - \sqrt{R^2 - A B - D^2}$$

$$Y = R - \sqrt{R^2 - A B}$$

Where

A = distance from the kingbolt to outside axle.

B = distance from the kingbolt to the center of the inside axle.

In case the kingbolt should be placed directly over one axle then

$$X = R - \sqrt{R^2 - D^2}$$

$$Y = 0$$

For very small curves and long wheel base the center of the tracks does not lie either in the kingbolt or in the center of the axles between flanges of the wheels, but the difference is so small in any possible case as to be of no account.

### STEEL RAILS.

In an address before the New England Roadmasters' Association, P. H. Dudley gave some interesting data in relation to the structure of steel rails, starting with the premise that the rails that flow least under the wheel pressure give the best service, and those that flow the most give the poorest service. The most serviceable have a fine structure and small mineral aggregate, and the reverse of the proposition is also true. Each different weight of section requires a difference in composition. The author's sections are tabled as follows:

Weight per yard.....	Lbs. 60, 65, 70		Lbs. 75, 80		Lbs. 100	
	Per cent.		Per cent.		Per cent.	
Carbon.....	0.45 to 0.55		0.50 to 0.60		0.65 to 0.75	
Manganese.....	0.80 to 1.00		0.80 to 1.00		0.80 to 1.00	
Silicon.....	0.10 to 0.15		0.10 to 0.15		0.10 to 0.15	
Phosphorus, } not to.....	0.06		0.06		0.06	
Sulphur, } exceed .....	0.07		0.07		0.07	

The ingredients in general have the following virtues: Carbon by itself, up to or over 1 per cent increases hardness and tensile strength and decreases elongation. Manganese takes up the oxide of iron (rust) formed in the bath of molten metal during the blow. Silicon makes the steel lie quiet in the moulds. It tends to make crystallization small. Sulphur and phosphorus are two very objectional impurities. Sulphur makes the steel liable to crack in rolling. The amount of these chemicals now allowed, ranges from 0.06 to 0.11 of 1 per cent.

### A HAUNTED CAR.

The haunted house has no place in ghost lore. Even W. T. Stead, of London, can't keep up haunted houses. Haunted street cars are at present the proper haunt.

In Savannah, Ga., car 26 is haunted. Every time it goes past Laurel Grove Cemetery a voice of a child can be heard crying. It isn't the curve, because it began suddenly, and other cars are unaffected, and the motor and gears being properly inspected seem not at fault. Then besides, the car makes no sound when at a distance from the cemetery.

The sound is that of a child crying in pain. It seems to come from first the top and then beneath the car. It is more human than any squeak of the machinery can possibly be, and a constant fear possesses the employes that a real accident may happen on account of the supernatural sounds from the haunted car. History relates that a fatal accident did happen under the wheels of "26."

THE Buffalo, N. Y., kicker has divided himself, some wanting heated cars and others as strenuously desiring the cold variety.

## BRICK PAVING TO T RAIL.

The question as to whether it is practicable to pave to the T rail, has apparently ceased to be a question in many towns, especially in Illinois and Iowa. Where brick paving is coming extensively into use, the T rail is almost sure to come also, and in places where it is used the question seems never to be raised as to whether paving to them is a success or not. It seems to be taken as a matter of course. Among the many places that sanction the use of T rail are Bloomington, Ill., Decatur, Ill., Ft. Wayne, Ind., Champaign, Ill., Springfield, Mass., Ottumwa, Iowa, Des Moines, Iowa, Terre Haute, Ind., Atlanta, Ga., Windsor, Ont., Roanoke, Va., and Denver, Col. In some of these places the road is principally

girder rail, and the city has changed its rules to allow the laying of T rail in the future. Where it has been laid there is no smooth iron tram for vehicles, and consequently there is

not so much tendency to drive on or near the tracks, and the wear on the company's pavement is correspondingly light. Teamsters, city officers and transfer companies claim that as far as the street traffic goes, it is a less obstruction than the girder or tram rail, and a few minutes observation of the vehicle traffic on such streets bears out this statement. The main objection to the T rail for street tracks is that the groove between the rail and paving sometimes fills up with dust and ice so as to greatly hinder the car traffic, but by the use of sweepers in summer and salt in winter this is to a great extent prevented. The commonest form of brick for paving to T rail is shown in Figure 1.

FIG. 1.

In some places however, the ordinary bricks are used and the workmen chip out pieces to make the groove for the flange and accommodate the head and base of the rail. The greater part of the brick paving in use at present is on a foundation of soft brick laid flatwise. If no chairs are used, and the rail is four inches high, the space between the ties is filled in with foundation bricks laid even with the top of the ties, and the paving bricks laid directly on these. In this case it is necessary to tamp very hard where the foundation bricks are laid between the ties, as the ties make an absolutely rigid foundation, and the paving between the ties is liable to settle. At Decatur, Ill., a cast iron block (Fig. 2) is used. It is the design of Superintendent Ferguson, and is simply a cast iron slab, flat on the bottom and paneled or hollowed on top to save iron. It is of course, laid with its longest dimension at right angles to the rail and the notches are for the spike holes. This raises the rail about three-quarters of an inch from the tie,

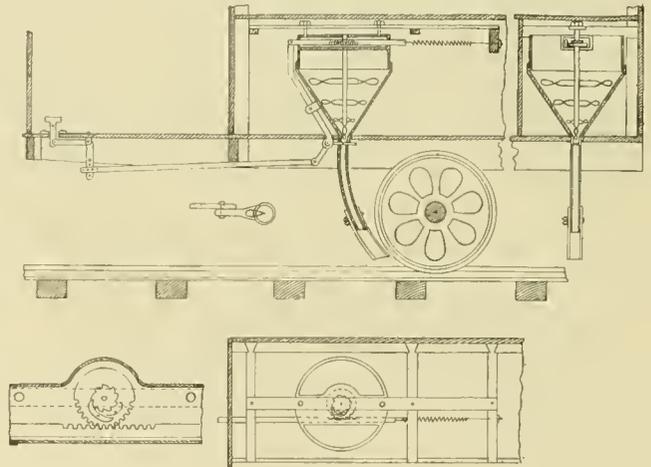

FIG. 2.

and gives room for a layer of sand between the foundation of brick and ties and the paving brick proper. The secret of the success of brick paving for use with T rail, is the fact that it furnishes a smooth surface with close joints, and the bricks can be moulded or clipped to any shape so as to make a good fit, not only with the main part of the rail, but at the joints and fishplates. A great many companies are in the habit of making their own T rail curves, the guard rail being made of a lighter section of T rail placed on blocks or chairs. This is claimed to be a cheap and durable construction, as the curves will wear as long as the head of the guard rail will last, which is of course, a good while. In many instances the guard rail is put only on the inside. When the paving is down, these rails have the appearance of being one piece with the track rail.

## HOLBERT SAND BOX.

The accompanying engravings will give a good idea of this sand box, which is the invention of C. E. Holbert. St. Joseph, Mo. It is claimed that it will pulverize almost anything short of solid rock,—wet sand, soft coal and

HOLBERT SAND BOX.

building brick proving easy prey for it. The spiral motion given by the fan shaped blades and auger shaped shaft is very persuasive in making the sand come down, no matter what shape it is in. Motion is given to this shaft by a treadle operated with ratchet and recoil spring, as a glance at the drawings will show.

## ROPE DRIVING.

William Kenyon, the English authority on rope driving, says in an article in *Lightning*, that the velocity of ropes on a rope drive should be between 3,000 and 4,600 feet per minute, though good results can be obtained with higher velocity. Horse-power can be calculated on a basis of 10-horse-power for 1,000 feet of speed with  $1\frac{3}{4}$ -inch diameter rope, and 5-horse-power for  $1\frac{1}{4}$ -inch rope.

THE Unicycle Street Railway Company, of St. Louis, is pushing forward its one-wheeled scheme.

## REMINISCENCES OF MR. RICHARDSON.

The one man that was known to every man, woman and child of the City of Churches was President William Richardson, a biography of whom is given on another page.

Mr. Richardson's varied career has been previously outlined. He was always at the front of every new movement.

In 1850 he was a Prohibitionist in politics, when prohibition was very unpopular, and was awarded the uncomfortable eminence of First Grand Worthy Associate of the Grand Division of New York. Later he was an active agitator of the "Free Soil" and "Anti-Nebraska" movements.

He was a member of the first Republican State Committee of New York and kept his allegiance to the end.

Thurlow Weed was his political sponsor, and asked him one day what he expected to do for a living when he resigned from the army. Mr. Richardson was at this time additional paymaster at New Orleans. "Anything," he replied, "anything honest—except office-holding."

In 1861 he was associate editor of the Albany Evening Journal, which line of work was familiar to him, having twice before been thus engaged.

Mr. Richardson went to Brooklyn in 1867, having forsworn politics for the nonce. He was comparatively a poor man. When he died he left a fortune estimated at \$5,000,000, all made in the street railway operations which have made him famous as a financier.

His fatal illness was an attack of grip, followed by a severe cold that developed into pneumonia, and the disease ran a quick course. He was attended by the best physicians of Brooklyn, notably his son, Dr. J. E. Richardson.

As a member of the Aldermanic Board of Brooklyn in 1870, and as an unsuccessful candidate for state senatorship, his political career closed.

Mr. Richardson was a Mason, an Odd-fellow, a member of the Masonic Veterans' Association and many civic societies, besides a Baptist of many years' standing.

## THE TROLLEY ON THE CANAL.

The report of the state engineer on the electrical propulsion of canal boats and the experiments made on the Rochester-Brighton division of the Erie canal, is not an unqualified commendation of this application of this transmission of power. After explaining that storage batteries are unavailable, and that, mechanically, there is no doubt of the feasibility of the methods, the engineer says: The main question is a purely economic one, and the proposition is, "can the electric power be furnished to each propeller at less cost than that of steam power." If the water-power of Niagara be utilized, the engineer says that method will be the cheapest. If power-houses are to be built, as in railway practice generally, "it might be possible, with the conditions obtaining on the canal, by using the best and most modern machinery, to obtain one indicated horse-power per hour for two pounds of coal,

but we can surely not hope to get below this limit. It is found that in passing the power from the steam chest to the dynamo, 8 per cent is lost; in passing through the dynamo and into the wire at the power-house, 10 per cent; in transmitting current a distance of eight miles, 15 per cent; and in passing it through motors to point of application on axle, 30 to 40 per cent; so that if canal experience should be similar to that of railway, if we succeed in developing in the engine cylinder one horse-power per hour with two pounds of coal, we would have a consumption of coal, to obtain one horse-power per hour, applied at a distance of eight miles from power-house, of from four and one-half to four and three-fourths pounds."

To just what degree the practices on water and on the railway, will resemble each other, and how "similar" they may be, is still a question to be decided by practice. The easier start, the smoother course, and the constant journey of the canal boat, will seem to the observer to be all in favor of economy, to say nothing of the ingenuity of our electrical inventors, who will find another outlet and will bring to the surface any number of smouldering ideas on motors especially adapted to canal traction.

The figures quoted by the engineer, are fair, with the exception of the last, which range from 5 to 8 per cent too high for a conservative estimate.

In concluding the report, he says:

"I recommend this subject to the legislature's careful consideration, and hope that, in view of the fact that the advantages to be gained by the successful solution of the problems involved are so manifest, you will adopt the necessary legislation to assure the continuance of the investigations and experiments required to reach a conclusion."

Superintendent Hannan of the State Department of Public Works, says in regard to canal propulsion, that last year, operation and repairs cost \$726,036. He thinks that by using the power-house system 210 days in the year for canal propulsion and the remainder of the year for factory power, that electricity will cost not over 5 cents per boat per mile. If factory power cannot be supplied, the cost will be doubled. "It will be therefore seen," says the report, "that the claims of electricity for this method of propulsion are extremely well founded."

## THAT OLD, OLD JOKE.

It was wild midnight. The lightning's flash, thunder's roar and dashing rain, mingled with the buzz of the trolley, as the electric car dashed madly along.

The solitary passenger approached the conductor. "Aren't you afraid of the lightning on these electric cars?"

The conductor's eyes glittered with a baleful light. "No," he answered; "lightning never strikes a good conductor, you know." The stranger reeled, fell over the railing and was speedily crunched under the car following close behind.

"One more," hissed the conductor, as with fiendish glee he bit a fresh nick in the brake handle.—Life.

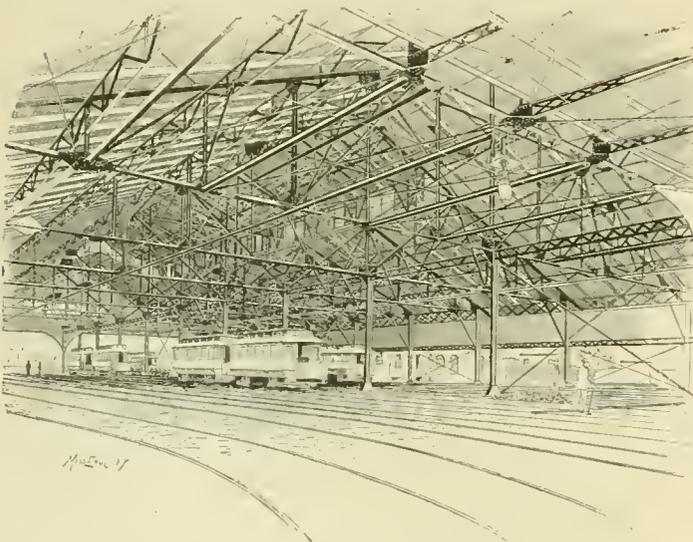

### CABLE ACCIDENTS IN GREAT BRITAIN.

During a recent enquiry before that powerful organ, the British Board of Trade, David McGill, the general manager of the London Tramways Company, gave the following statistics on cable accidents as against horse car catastrophes. In the first six months of the former the number of accidents was 6.23 per car as against 4.21 occurring with horse power, while in the second six months the proportion of accidents was 1.75 cable and 4.75 horse power. The use of cable power was governed by strict regulations among the employes. There had only been one cable replaced since the instalment of the system, and that was in July, when horse power was resorted to during replacement. The reference made is for a time between July 1 and December 10.

WHILE the inhabitants of 135th street, New York, slept, the Union Railway Company laid a double track along that classic thoroughfare of Harlem, Christmas Day, and the day preceding being Sunday, gave a good space of 48 hours in which to do the work, in consequence of which the Huckleberry Railway is in and the enjoiners are out. The fortunate junction of Sunday and New Year's Day made the stringing of wires possible.

### FIREPROOF BUILDINGS ON THE NEW ORLEANS & CARROLLTON.

The accompanying illustrations are of the fireproof car shed and power house, designed and built by the Berlin Iron Bridge Company, of East Berlin, Conn. It adds another notable piece of electric power station and car

CARROLLTON CAR SHED, NEW ORLEANS.

barn work to the great number already constructed by that company. The car shed is 126 feet in width and 300 feet in length. Light is secured through the side windows of the monitor. The sides of the building for a distance of ten feet from the ground are left entirely open. A building can be constructed this way in the south,

because the climate never necessitates a closed structure. The power house is similar in construction to the car shed, except that the side walls are brick. The particular feature, however, of this part of the plant, is the portable crane, shown in the foreground. This crane is so arranged that it can be easily moved to any part of the building, and is of sufficient capacity to raise and lower the machinery in and out of place. In the case of this

N. O. & C. POWER STATION, NEW ORLEANS.

power house, a traveling crane of the full width of the building would be an expensive matter, and owing to the general arrangement of the steam pipes and belts this construction would be inexpedient and inadvisable. To meet this necessity the crane illustrated and shown in the above illustration was designed and built by the Berlin Company, and has proved a great success. The construction of both buildings is a credit to the builders, as well as to the New Orleans & Carrollton Railroad Company.

### HOW THEY WILL DO IT IN STREATOR.

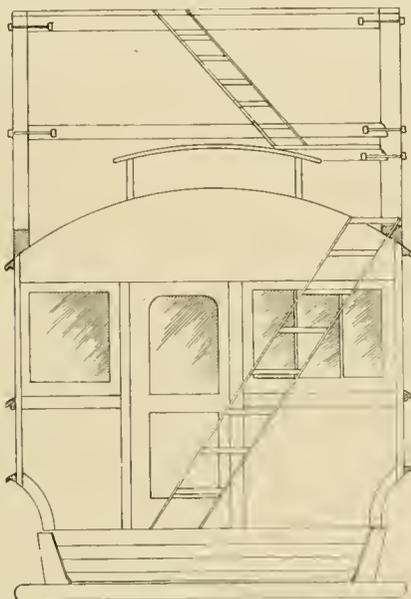

"Mr. W. H. Greener," says the Streator Times, "has invented and patented a scheme to run street cars by water power, without the use of steam or electricity. The water is in a tank on the top of the car, and operates on the principle of a water motor. The machinery is beneath the car. When it has served its purpose for propelling the car, the momentum of the car forces it back to the tank and saves the liquid."

Oh, Mr. Greener, Mr. Greener! Thou oughtest to sell thy patent right to a large syndicate, and out-Keeley-Keeley.

A NEW company, capitalized at \$40,000, has been organized at London, to construct tramways and operate same in Spain or elsewhere. G. St. John Mildmay, Broad street avenue, Blomfield street, London, E. C., is the principal, with H. V. Rudston Head, W. C. Tyndale, L. Earl et al., as associates.

A TOWER AND TOOL CAR.

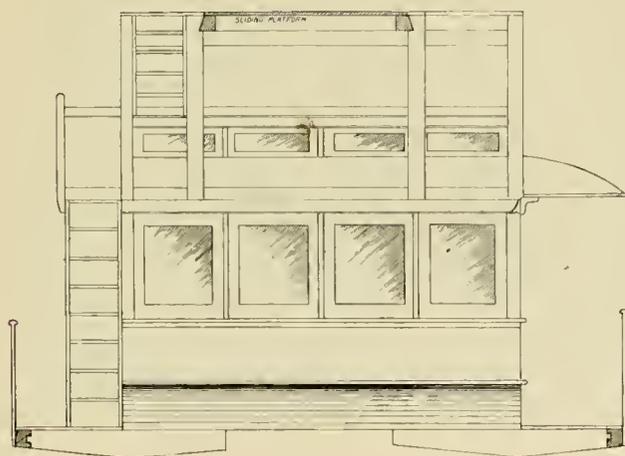

The latest device for the lineman's comfort is a combined tower and tool car. The one of which the plans are here presented, was built by Thomas Winn, of Altoona, Pa., for the City Passenger Railway, of that city. The car has a 14-foot body, and is seven feet wide. It will be seen that there are two platforms, one on the car deck and the other above, on which the lineman works. The top platform is fifteen feet from the track. The nominal height of the trolley line is twenty feet. To make it, an old horse car was taken and the hood cut off one end. The frame for the tower is

END VIEW OF TOWER CAR.

3 by 3 inch ash, fastened with wood screws  $3\frac{1}{2}$  inches long. On the lower deck large tools are kept.

The middle of the lineman's platform on top is made sliding, it being possible to run it out four or five feet on either side with safety. There are also drop rails on this

SIDE VIEW OF TOWER CAR.

platform, not shown in the illustrations. They are lowered when the car is taken into the barn. The sliding platform makes it possible to reach the poles, so that a ladder is unnecessary for line work. Inside, the car has a full supply of line tools and material, a work bench, and stove. In fact, it is a regular traveling shop. The lineman has simply to go "downstairs" to find anything he needs. It is not to be wondered at that the boys on the line at Altoona appreciate this car.

EXPERIENCES OF A SUPERINTENDENT.

By C. P. Young, Superintendent Chattanooga Electric Railway.

PART II.

The ideal superintendent of an electric railroad should possess the following qualifications, which are essential to his success. He must be an expert machinist and mechanical engineer, an expert electrician, a first-class street railroad man, a good track and lineman, must be a good judge of human nature and manager of men, must possess an inexhaustible memory, must be amiable yet firm and strong of character, understand making his word law, and stand like the captain of the ship. Everyone looks to him for advice and information in case of trouble and difficulty. Such a man should be given full freedom to act and should not be harrassed by owners of the road or by petty officers and relatives. The best horse in the world will be ruined by an ignorant man at the reins; so, a well-informed and dutiful superintendent may have his work ruined by an ignorant president or manager, who may possess more money than he, but less brains.

The superintendent should also act as purchasing agent and know every firm that manufacture goods of any kind for electric roads. Not only should he know prices of all kind of materials, as coal and oil, but detail parts of cars, trucks, motors, power station, line and track materials. He must possess good business tact, so as not to fall victim to a smooth-talking supply agent. The superintendent must also understand how to handle the public, from the mayor down; he must have a special face and words sweet or sour according to circumstances; he must investigate every accident, every complaint; know how to handle each to the best advantage. He must also gain the respect not only of every employe but of every man, woman and child in the city, and that he can only do by respecting himself, and conducting himself as a true gentleman.

He must never use vulgar language toward any one. If an employe has done wrong or violated a rule, take him in the office, talk to him as a friend, pointing out the various consequences that might have happened, and you will make that employe not only a better and more careful man but a friend to the company as well. The constant changing of employes and discharging some for slight violation of rules is a costly mistake. When a man is well trained and understands his car and division, he is a very valuable man, and as such should be taken care of. My experience teaches me that every new man costs the company no less the five hundred dollars before he becomes a safe man. Now, some roads change their men just as the fool is beginning to be made wise, and another takes his place. Then the president wonders why his road has accidents and break-downs, and repair bills spring up so heavily, and is worried to death by law suits. No one would be foolish enough to look for a shoemaker in charge of an ocean grayhound, or a whitewasher in charge of an art school. The writer knows from observation that freight conductors, telegraph operators, civil

engineers, linemen, yes, even dry goods men and farmers, are in charge of electric railroads, and then the directors wonder why their road is a failure; and when they meet they sing, "God hath given, God hath taken away, blessed be God's name." There is no business of modern times that is as many-sided as electric railroading, and the men in charge must be as wide awake and smart as any in the world to day. When the history of the nineteenth century is written by the future historian, he will pay a higher tribute to the men who developed electricity as a motive power than to any other geniuses in this age.

Dynamo and motor manufacturers have been partially to blame for losses in electric railroading, for this reason. When they first began to put their machines on the market, they were too light in design and the armatures and fields too poorly insulated. But their glib-tongued agent persuaded the directors of horse and mule lines into converting lines which would not warrant the change; and owners thought to economise by putting in the cheapest possible construction, which soon gave out and the lines speedily came to grief.

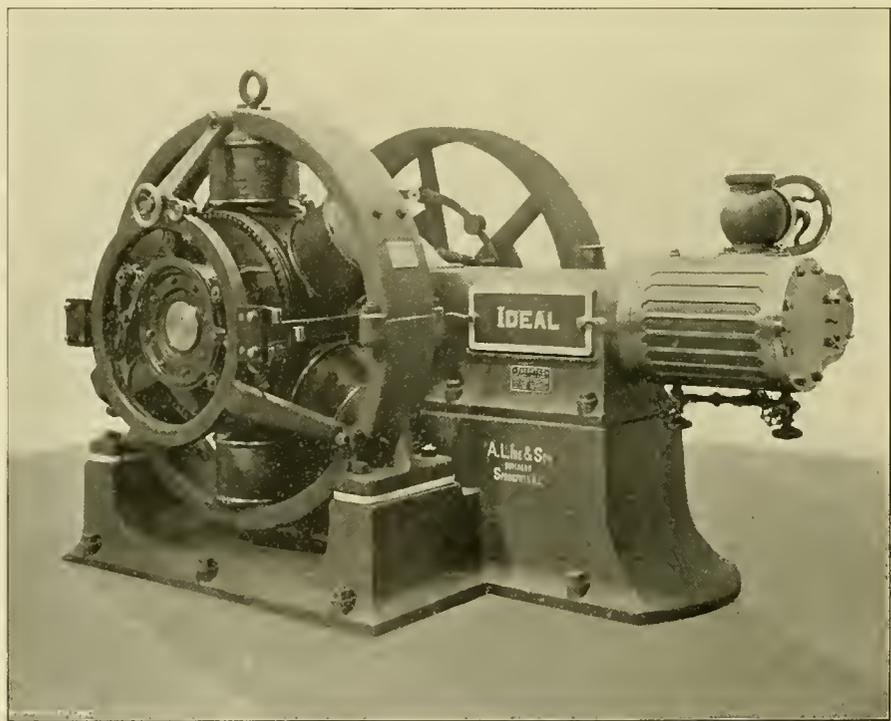

Then often manufacturers, when appealed to for brains, to run their broken-down roads, sent out college dudes filled with high-flown electrical formulas and wearing patent leather shoes, with a silk hat on top of an empty head; empty at least as far as an electric railroad was concerned. These young men spent thousands for roads and in many cases left them poorer and worse off than they found them. When the change of motor power began, some roads had nothing in the treasury, as year after year dividends had been declared. Money had to be obtained at any cost, and bonds went flying in the air like snowflakes on a wintry day, and not a few roads assumed too great liability; in fact, more than some were able to meet. As time went on, accidents became more numerous. Not on account of electricity, but by increase of speed, ignorance of motormen, superintendent, and other officers; and damage suits together with interest and repairs, began to play havoc with the nickels. And we wonder why the stockholders are disappointed. We may as well wonder why a paralyzed man does not walk. Too many high-toned pets are employed whose work is small but pay large. Especially is this true in the office. Too many relatives of directors, stockholders, and others, have been allowed to creep into soft berths. Too many bosses exist with most roads. They all represent various experiences, and one gives an order for this and another for that, and they all differ and are jealous of each other.

In the meantime the employes get confused and do not know what to do nor how to distinguish between right and wrong, and as a consequence, everybody from top to bottom is working at a disadvantage.

The superintendent should have absolute charge of the mechanical, electrical and operative departments, and should be responsible only to the president for his acts. He should hire and discharge, educate and assign to their duties all employes, from the chief engineer in the station down to the track cleaner and greaser. The superintendent should have a talk with the president every day in regard to what was done the day before. Any faults found and changes desired should be discussed, and a general understanding should exist between them, so as to constantly improve the road and plug up leaks, allowing nothing to run down, and yet reducing expenses.

#### IDEAL ENGINE FOR DIRECT CONNECTION.

The demand for direct connected engines is daily on the increase, and while at first it was thought practicable to drive only the larger sized dynamos in this way, the capacity of direct connected engine and dynamo units, has been steadily on the decrease, and now very small dyna-

IDE DIRECT CONNECTED ENGINE.

mos are so driven without sacrificing economy to any great extent. Small direct coupled units for ship lighting have been in use for many years, but in that case economy of space was more to be considered than economy of steam or repairs. A. L. Ide & Son, of Springfield, Ill., have re-designed their well known Ideal, so as to make it specially adapted to direct driving. The engraving is of one of three engines that are to light the Southern Hotel, St. Louis. All were regulated to run at 275 revo-

lutions. A direct connected engine must be heavy enough to stand short circuits without breaking itself, and this condition is fully complied with. The coal and repair bills with this type will of course be no more than with the regular Ideal, used for direct belting. The engine in the engraving is 14 by 14, and is rated at 125-horsepower. The armature is of General Electric make and is keyed to the shaft. The Ideal system of self oiling makes it impossible to throw oil on the armature when the engine is taken care of. The engine and dynamo can be put in a box 68 inches high, 81 inches wide and 10 feet 3 inches long.

**THE LOUISVILLE TRUCK.**

The Invention of a Practical Railway Manager.

There are trucks, and trucks. Some are dividend makers and some are dividend takers. In fact, consequent upon the increasing exactions of mechanical traction, no department of supply work has shown such a marked improvement.

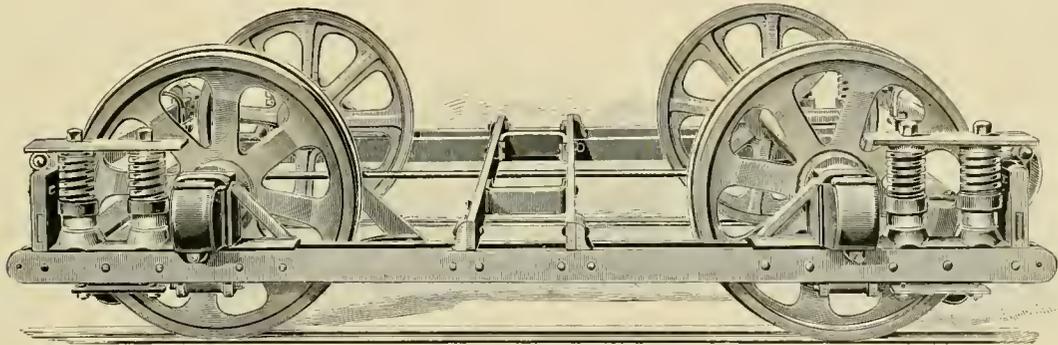

To this class of dividend makers has been added within the last two years, another individual known as the

The company also manufactures an elliptical spring truck of exceptional merit, and a trail car truck which has met with great favor by buyers.

The official heads of the Sheppard Manufacturing Company are A. B. Du Pont, president, and S. C. Sheppard, general manager. Mr. Du Pont has been a practical street railroad man for a number of years, and is at present engineer and electrician of the large system of the Louisville Railway Company. He is the inventor of the trucks manufactured by the Sheppard Manufacturing Company, and it is largely owing to his familiarity with the necessary requirements for a good truck, that such high merit is possessed by those being made by his company. The manager will cheerfully answer any inquiries or make estimates for any motor equipment, for any wheel base, for any gauge, and for any number of trucks.

**BRISTOL RECORDING VOLTMETER.**

There is an increasing tendency on the part of large railways to use recording instruments on their switchboards. The accompanying engraving is of the Bristol

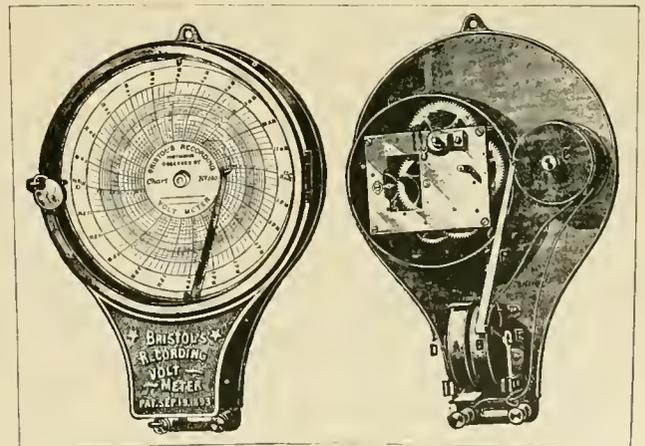

"The truck frame is free from bolts."

"Louisville Truck," made by the Sheppard Manufacturing Company, 313, 315, 317 Ninth Street, Louisville, Ky.

A reference to our engraving will show the observer how the claims of simplicity, rigidity, and ease of motion are substantiated. The truck frame is free from bolts, having no separable parts. Rivets are used exclusively, thereby insuring rigidity and strength. The position of the springs is outside the oil boxes for the sake of stability, and the spring base is thus made long relative to the wheel base. A low car floor is allowed for, if desired, by placing the side bar of the truck frame unusually low. This, however, still allows room for the play of springs and the arrangement of the motor.

As to the parts and qualities of the Louisville Truck, it is sufficient to say that a thorough test on the Buffalo Railway, Buffalo, N. Y., the Louisville Railway, Louisville, Ky., and the Southern Electric Railroad of St. Louis has given them the approval of the well known managers of these lines. They are also in use on a number of other lines, and have invariably given entire satisfaction. The oil box used and the dust guard are devices of merit and are appreciated.

recording voltmeter, made by The Bristols Manufacturing Company, of Waterbury Conn. It has the movable coil A and stationary coil B, the current being conducted to

the movable coil through the springs D and E. The divisions are on an increased scale in the vicinity of the normal voltage. The 110 volt instrument here shown, plainly indicates a change of one volt.

## T RAILS FOR STREET RAILWAY USE.

BY JOHN A. BEELER,  
Denver Tramway Company.

Nothing can be plainer to street railway men than that the old style of track construction is a thing of the past. The heavy motor cars of the present day are as much

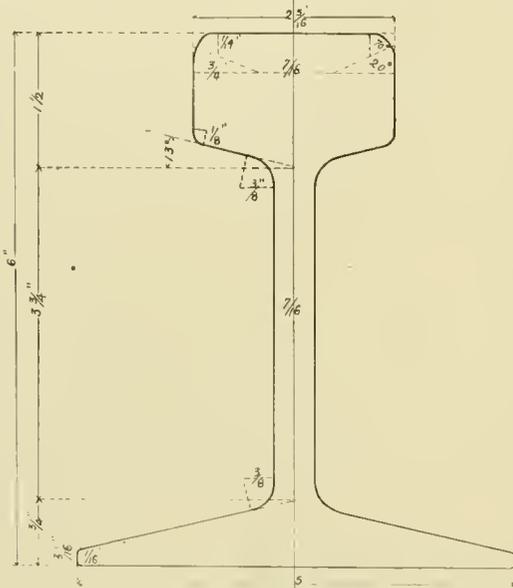

FIG. 1.

72-pound "girder T," specially designed for the use of electric roads on paved streets.

out of place on the old flat rail as the palatial sleepers and great mogul locomotives of to-day would be on the light iron rails of thirty years ago. Heavier cars and

economy and smoothness of track. The only objection to T rail for street use is the supposed impossibility of paving up to it and having as good a surface for ordinary traffic as can be had with other forms of rail.

The 72-pound "girder T," illustrated herewith, was designed by the writer to meet all the requirements of street traffic, causing as little interference with the street surface as any other type of rail and giving the very best results for car traffic. This type of rail, not only in first cost but in ultimate cost, is much less expensive than a girder rail. This rail is six inches high, with a 5-inch base and a broad flat head, the upper corners of which are rounded at one-fourth-inch radius merged into three-fourths-inch radius on the sides. This gives the largest possible contact for the

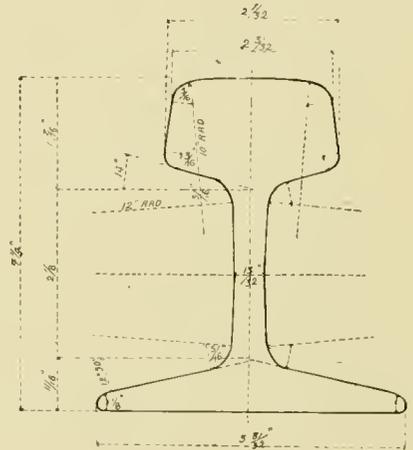

FIG. 5.

Old style 56 pound T used by Chicago, Milwaukee & St. Paul Railway, with general rounded contour of head.

wheels, the importance of which can not be overestimated. The angles of the under portion and the upper portion of the flange are 13°, which affords the angle bars a good bearing. The neck is sufficiently thick to

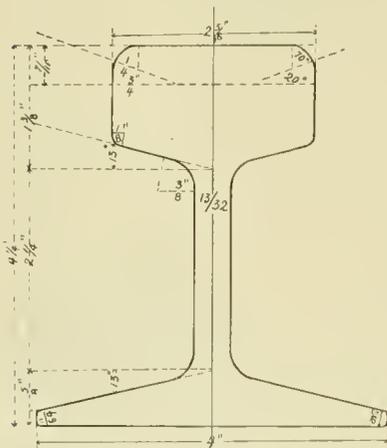

FIG. 2.

56 pound T, designed for electric service in unpaved districts.

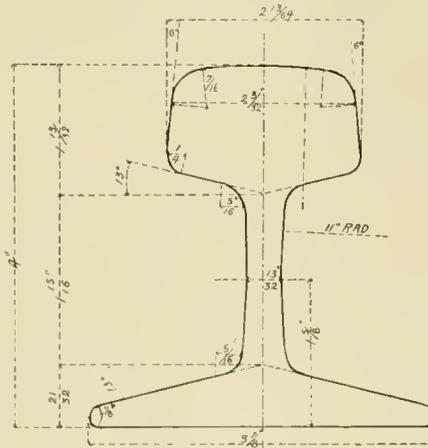

FIG. 3.

Old style 56-pound T used by Union Pacific Railway. Head generally rounded with sloping sides.

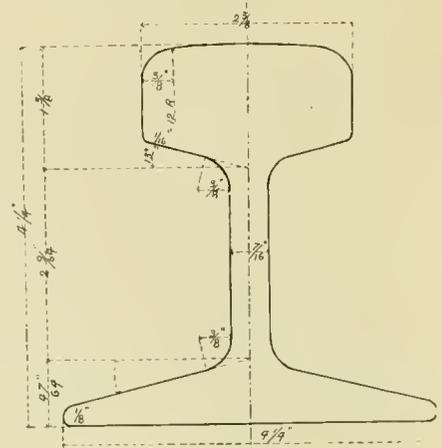

FIG. 4.

New style 60-pound T used by Union Pacific Railway. Head more rectangular; perpendicular sides; sharper corners, and more bearing surface than former style.

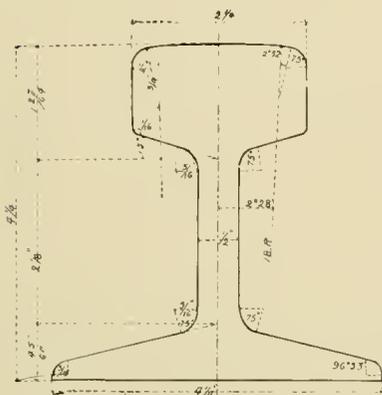

engines not only necessitate heavier rails, but better road beds. In the construction of a steam road it is necessary only to consider road bed and rails, but in street railways there is added to these problems that of non-interference with ordinary street traffic. If it were only a question of car traffic the rail question would be settled at once, as T rail is the universal standard for strength, durability,

stand the heaviest electric traction, and the base wide enough to keep the rail in good alignment.

The metal is so proportioned as to give a minimum amount of "cold galling" or straightening of the rails after rolling, which is very large with girders. This process distorts the metal and consequently shortens the life of a rail.

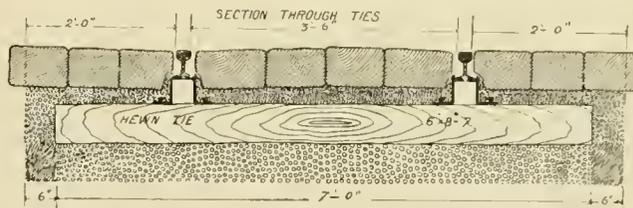

This 72-pound "girder T," as far as strength and durability are concerned, is equivalent to a 100-pound girder rail. One mile of girder T, 113 tons at \$30 per ton, will cost \$3,390, while one mile of 100-pound girder, 157 tons, at \$45 per ton, costs \$7,065. Thus not only is

the first cost of the T rail about one-half of that of the girder rail, but the ultimate cost, owing to the greater life of the metal in the T, is still further reduced. This rail should be rolled much harder than the ordinary T for steam railroads. It will be noticed, that of late years the tendency of steam roads even, has been to a T with a much more nearly square, or rectangular shaped head, than formerly used on the same roads. This type of head gives the very best results in the construction of crossings and switches, which is a very difficult and expensive matter with most girder rails.

New style 60 pound T used by Chicago, Milwaukee & St. Paul Railway. General squaring up of head; sharper corners; perpendicular sides.

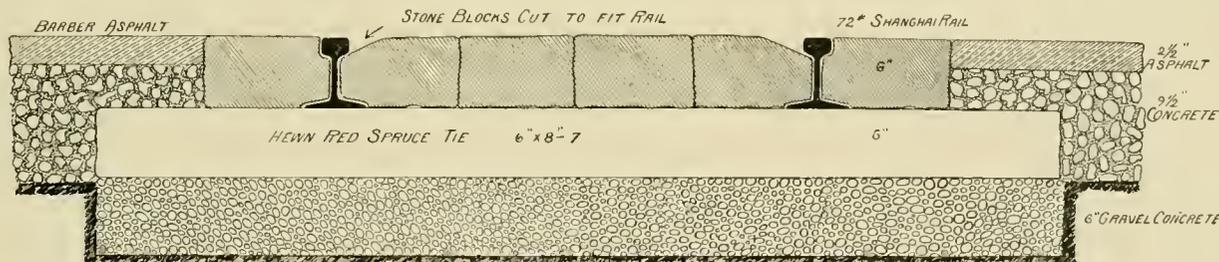

for the space between the rails. Both sides of the "girder T" should be paved up to, either with stone blocks cut to fit as shown in Figure 7, or with oak strips as shown in Figure 8. The latter must be thick enough, on the inside of the rail, to leave a clear space for the wheel flange. If there is a joint between the wood and the blocks directly under the wheel flange, dust and sand will be forced into it and the paving will eventually be bulged

Ordinary T rail on chairs, with stone block pavement, (or asphalt, with toothing). Blocks between rails eventually bulge up from action of wheel flanges, forcing dust and sand under blocks, and consequent action of water and frost.

upward. If the blocks of wood and stone, or stone alone, are arranged as shown in the foregoing illustrations, with the joints of the blocks abutted closely, properly filled with hot fine sand and coal tar, the blocks will be held perfectly secure and cannot settle or bulge.

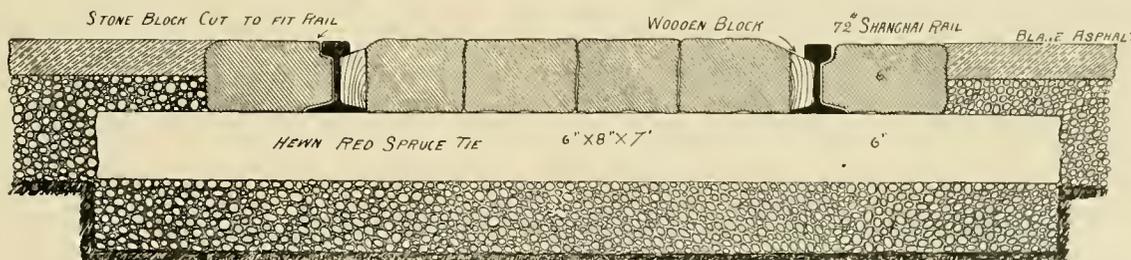

The cost of properly shaping the blocks to fit the "girder T" is no more than the cost of properly fitting blocks to any other rail, (indeed to properly fit blocks to

72-pound "girder T" rail, in stone block granite or asphalt. Blocks cut to fit rail, making it impossible for them to bulge or settle.

Permanent pavement and a solid track require a good foundation. A continuous bed of concrete the full width of the tie and at least six inches deep, distributes the load over a large area, is waterproof and makes the most

some girders is an impossibility). Given a track constructed as above described, there is a great saving in the wear and tear of cars and motors, as well as in the maintenance account, but a gain of still greater magni-

72-pound "girder T" rail, in stone block granite or asphalt. Oak strip fitted next to rail between ball and flange; narrower strip not to project beyond ball; may be fitted on outside of rail; stone blocks abutted closely, making bulging of pavement impossible.

permanent foundation. The space between the ties should be filled with concrete also, making a foundation for the pavement.

Block pavement has been found the most satisfactory

tude is made in the saving of electrical current necessary to operate the system. To the above may also be added the gain in traffic that comes with comfort and ease in riding. Nothing but prejudice can prevent the ultimate

adoption of this, or a similar type of rail, by all our street railways. Municipal legislation may stand in the way for a time, but practical demonstration, backed by economy of cost, will very soon drive out prejudice.

The public are entitled to and should have, as easy and comfortable transportation to and from their homes, by means of their conveyance, the street car, as have the comparatively few who can afford the luxury of a private carriage.

THE large number of letters we are receiving from street railway men throughout the country on the question of pleasure resorts as a means of creating travel, is at once surprising, but shows what interest the articles in the REVIEW on this subject have occasioned. Now is the time to make leases of grounds and get them cleared and all preliminary work done, and next summer the crowded cars will make you glad, while the returns from the refreshment concessions will be a real power in the financial community of your road.

ELECTRICAL toys this season were well in demand. Launches were popular, and even a miniature electric railway was bought by a few far-seeing parents, that little Willie might grow up to be a street car magnate. The complete toy railway comprised a motor car, three trailers, and some track. A small battery actuates the motor, which is single reduction, 7 to 1, and requires half an ampere at six volts.

#### A DISTINGUISHED CANINE.

Ponto, whose portrait we present to the dead-head fraternity, with our respects, is perhaps the only four-legged dog owning a pass on a street railway. Ponto is a big shaggy canine belonging to the Newfoundland breed and to Civil Engineer Farnsworth of Kansas City, Mo. One day, Mr. Farnsworth, accompanied by Ponto, boarded a Metropolitan street car, the conductor of which promptly ejected the dog with the aid of a switch-hook. Ponto took the matter philosophically, but Ponto's master didn't. The latter went immediately to the officers of the company and laid the indignity suffered by Ponto before the manager. The manager was struck with Ponto's worth, and immediately issued a pass to Mr. Ponto, who is thus blessed above all dogs of Kansas City, both

PONTO FARNSWORTH.

"Pug dogs, terriers, beagles,  
hounds,  
And curs of low degree"

The consequence is, that Ponto travels on a pass which hangs from his collar. Ponto is a well-known Kansas City character, good natured as a kitten, and never makes a mistake as to a Metropolitan car.

#### THE WALKER MANUFACTURING COMPANY.

The surprise occasioned by last month's announcement that the Walker Manufacturing Company, of Cleveland, was to enter the field of manufacture of electric street railway motors and apparatus, was as widespread as the confines of street railwaydom.

It is true, nevertheless.

H. McL. Harding and J. L. Barclay, of Chicago, both well-known in the street railway field, from the beginning, are associated with Mr. Walker's energy, enterprise and capital in this new undertaking. Both Mr. Harding and Mr. Barclay have served long apprenticeship in the old Sprague, and later, with the Westinghouse Company.

Readers will remember the REVIEW's write-up of the Walker works and their fine facilities, two years ago.

Mr. Barclay will manage the Western business from Chicago, while Mr. Harding will make his headquarters in New York.

#### THE BROOKLYN L AND THE ELECTRICS.

The annual report of the Brooklyn Elevated Railroad Company shows that the surplus at the beginning of the year was \$195,295, of which \$117,380 was earned in 1892. In the year, three miles of track and nine new stations were completed, making twenty miles in all. In 1892 37,314,640 passengers were carried, and in 1893 only 35,926,359, a drop of 3¼ per cent in spite of the extensions. The surplus has been reduced to \$178,180. The report pathetically says, in substance, "We attribute one-half the falling off to business depression and the closing of factories. The other half is attributable to the increase in the number of trolley cars, which run at such reckless speed. We think that, not the use but the abuse of electric traction is responsible for our loss. It should not be allowed on the streets of a great city." New directors were elected in the persons of Albert A. Drake, Austin Corbin and Henry Seidenberg.

The Kings County Elevated reports a deficiency of \$37,000 to the railroad commission for the quarter ending September 30. The figures are:

	1893	1892
Gross earnings.....	\$160,589	\$195,740
Operating expenses.....	125,428	128,654
Net earnings.....	\$35,161	\$67,086
Other income.....	-----	144
Gross income.....	\$35,161	\$67,230
Fixed charges.....	93,549	91,039
Loss from operations.....	\$58,388	\$23,809
Cash on hand.....	\$65,472	-----
Profit and loss, deficiency.....	37,151	-----

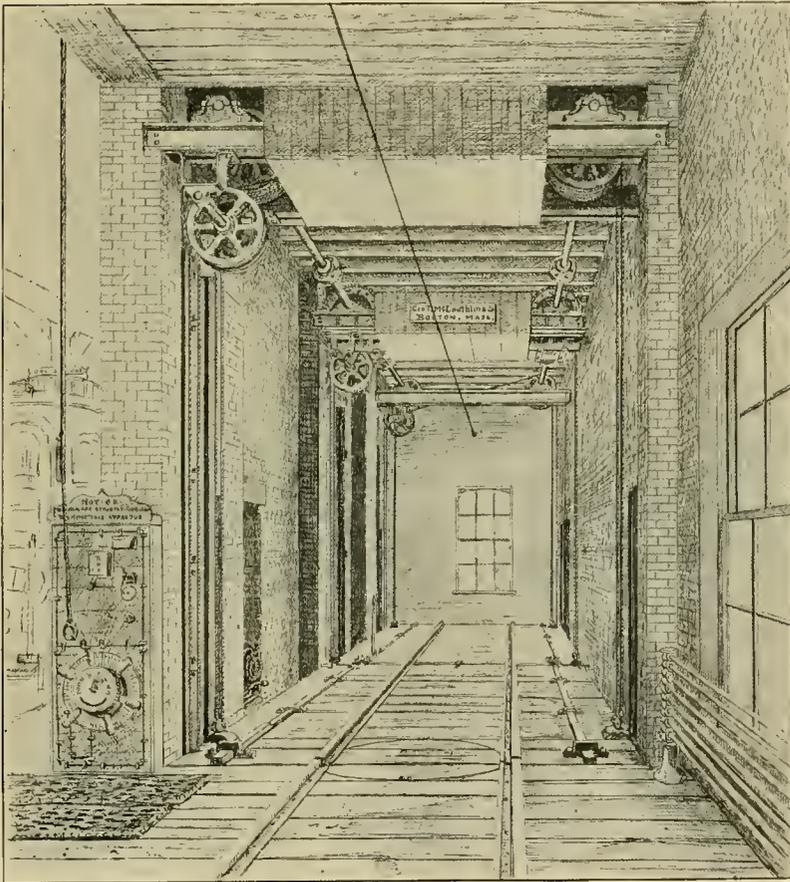

The cause is, electric railways paralleling and crossing the routes of the elevated, with the greater comfort of the latter bidding against all the advantages of the former.

THE Galveston, Tex., roads threaten to resume horse traction if a 7-mile speed ordinance is passed.

## BIG CAR ELEVATOR ON THE WEST END.

An interesting electric car elevator here illustrated, was designed and constructed by Geo. F. Lauthlin & Company, Boston, for the Bartlett street car house of the West End Street Railway Company, where it is now in regular use, raising the completely equipped electric cars, which weigh about 20,000 pounds. The platform of this elevator is 40 feet long, 12 feet wide, weighs about six tons, and carries a system of locks which support the platform at the floors, rendering it rigid while running on and off the heavy cars.

The machine is supported on eight 10-inch I beams

ELECTRIC CAR ELEVATOR.

directly over the wellway. This machine comprises two 4-inch steel drum shafts, carrying six drums and driven by four worm gears, two of which are keyed to each shaft and arranged in such a manner that there are no thrust strains. The pinion shaft is provided with a simple and efficient brake. Power is communicated to this shaft by an 8-inch leather belt from a 25-horse-power Thomson-Houston car motor. Twelve  $\frac{5}{8}$ -inch hoisting cables are connected to the platform at six points, and the power applied to move the load is thus distributed over the whole area of the platform. Three heavy counterbalance weights are so connected that these weights may very considerably overbalance the platform and very materially reduce the amount of motor power required to raise a given load.

The rheostat is secured to a conveniently located switchboard and is operated by the right hand while the brake connection is held in the left hand. The movements of the platform are under the perfect and instant control of the operator.

This design of elevator was accepted by L. Hirt, the master mechanic of the West End Street Railway Company as the best of the several competitive designs submitted; its operation has proved particularly satisfactory.

THE Paterson & Little Falls Electric Railway began carrying mail to the latter place January 1.

## THE SAME OLD TOWN.

He was coming down Broadway, doing the prodigal act of the returned old resident, says the New York Herald.

"Oh, yes; the town has grown," he admitted, "but it's the same old place after all. It's nearly forty years since I lived here, but things look as familiar as though I left but yesterday. A little improved, but still the same old town."

The new Opera House was called to his attention.

"Jes' so. Same old place. New building, to be sure, but same old location. When I was a boy we used to come here to"—here the strains of a brass band attracted his attention.

"Ah, ha! Old friends again. Same old outfit, tune and all. Used ter play that when I was a boy to"—

His attention was riveted on one of the fine new hotels on upper Broadway.

"Dear me! How little time does change. New building, of course; but same old make-up; news-stands, lunch-counters, bar, office; the same throughout. Would have known the place in the middle of Asia. Now, when I was a boy we used to"—

He was crossing the street as he spoke, and in spite of his companion's efforts, a cable car

lifted him from his feet and landed him several rods ahead on the pavement. When a policeman hurried forward to help gather up his remains the old man rose and exclaimed:

"Same old trick, by gum! Them coasters never will yell 'track' in time. Gosh! how we used to sail down that hill when I was a boy. It makes me young to think of it again," and he went on down street, murmuring, "Same old town. Same old town."

A TEXAS genius has acquired notoriety as the inventor of a new rapid transit bicycle, which, of course, will "revolutionize the world." The inventor claims that sixty miles an hour is rather slow speed on good roads.

## CRADOCK ROPES BREAK ALL RECORDS.

If there is any road in the country which demands good quality and construction in its cables, it is the North Chicago Street Railroad, and of all its lines that of its down town loop, which passes under the river through the La Salle street tunnel is the most severe. Not only must this loop handle all the cable cars of all the lines on the north side, but must operate around four severe curves and make the depression at the bottom of the tunnel, all under very heavy tension. The short life of all other makes of cable did not discourage the George Cradock Company, of Wakefield, England, from entering this discouraging field. The third of their ropes has just been taken out and the records are as follows: one ran ninety-three days; the next, seventy-eight days, and was then in good condition when ruined by a careless grip-man; the third, the record-breaker, ran ninety-eight days, from August 27 to December 2, and hauled all the heavy business which marked the last two months of the Fair, including the ever famous "Chicago day." This rope is 9,760 feet long; ran at seven miles an hour, and the first splice ran eighty-three days. The American ropes in this loop have averaged thirty-five days, while the average use of the Cradock rope has been a fraction over eighty-nine days, and the last, after ninety-eight days'

THE RECORD BREAKER RAN 98 DAYS.

work, is still good, and will be again put in service on the south Clark street section, which has no curves and where it promises still further good returns. The rope is 1 3/8 inches diameter, of the well-known Lang lay, and is composed of six 10-wire strands wound around a tough hemp center. Our illustration is a section of the ninety-eight day rope, and is a fair representation of the condition of the entire rope. It will be noticed there is not one broken wire, and our own examination of the cable shows very few wires worn thin.

The North Chicago road has just placed an order for five new ropes of the Cradock make, to use on the tunnel loop already mentioned, and also one rope of 22,000 feet to go on one of the main lines. J. E. Hartley, the splicer, reports there were no delays whatever arising from any fault of the rope during the entire ninety-eight days, and even hopes for a better record in future, although Superintendent Roach will doubtless feel satisfied if history will only repeat itself.

A THOMASTON, ME., man, has been awarded \$1,000 damages for being ejected from a street car for alleged profanity. The conductors are now very careful about sifting out swear words from ordinary conversation.

## BOSTON'S SUBWAY SCHEME.

The general topic of the good citizen of Boston, now-a-days, is the "coming" subway, as it is denominated in the papers.

Various schemes for relief, in the congested districts, have been promulgated, all based on the following tabulation of traffic:

	Population.	Steam Ry. Passengers.	St. Ry. Passengers.
1871.	515,000	17,000,000	34,000,000
1881.	665,000	25,000,000	68,000,000
1891.	850,000	51,000,000	136,000,000

Not only is the above table instructive, but the following shows that rapid transit increases the trips per inhabitant:

	Trips per Inhabitant.	Trips per 100,000 Population.
1871.	99	19
1881.	140	21
1891.	220	26

The above calculations are based on the metropolitan area, that is, within ten miles of the old state house.

The "best authorities" have, for several years, been debating rapid transit, while the world-famed West End Electric Railway has been giving the Bostonese satisfactory transportation. The elevated railway system sanctioned by the legislature, has failed to secure enough

money to enable it to build. The underground scheme has dismal prospects. In fact, the solution of the problem is not yet worked out by any trustworthy plan.

The proposed subway, which promises relief by tunneling under the busiest part of the city, has so little to commend it, that it is doubtful if anything more than talk will come of it.

Meanwhile the West End carries the people.

ONE of the queerest sights, at the now dismantled Jackson Park, is the odd idea of the Intramural railway hauling itself away. The road is changed into a freight line, and flat cars haul the timber and rail to the south loop as fast as they can be broken up. A motor car with an enclosed cab does duty as a freight engine.

Carl Rohl-Smith's statue of Benjamin Franklin has been taken from the south entrance of electricity building and shipped to Philadelphia, to which city the director's presented it.

ALL the talk about the consolidation of the Paterson N. J., and the Central Street Railway Company is said to be false alarm.

AN OTTAWA, CANADA, INCIDENT.

(Written for the REVIEW.)

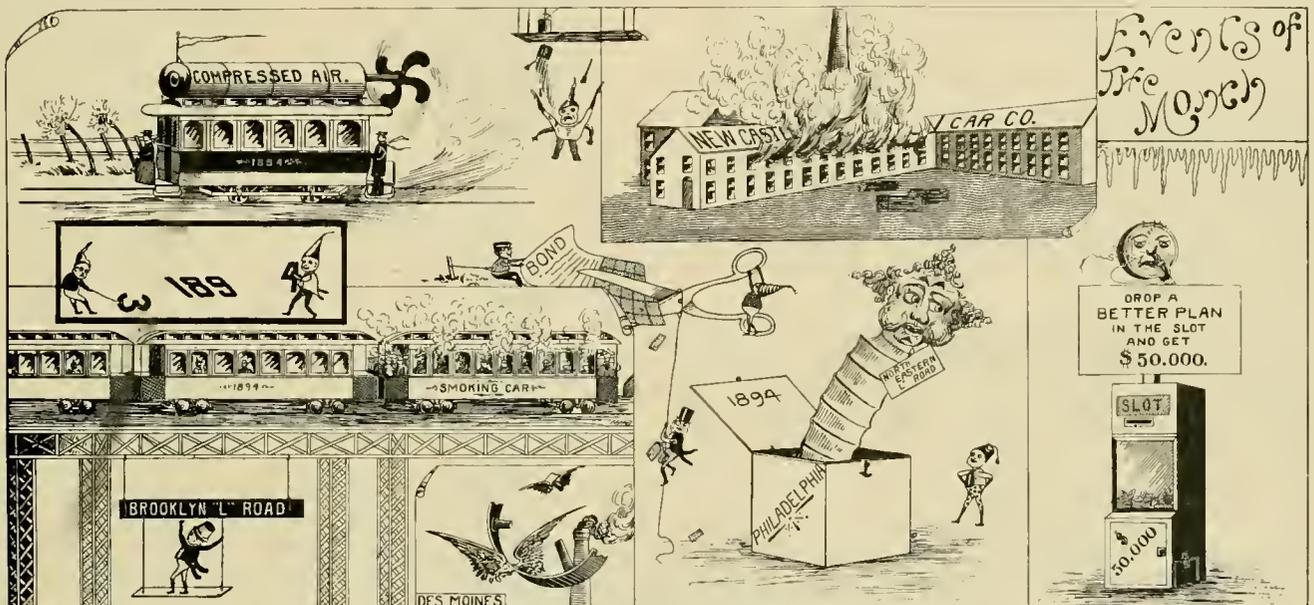

She was a meek looking woman of about thirty-five, and enquired at the outside office in a semi-apologetic manner if I was in. I gave her a chair. She said, with apparent embarrassment and hesitancy, which proved, however, to be only apparent, that of course I had heard of it. I assured her in an interrogative tone that I had not. Her eyes, which had been intently fixed on the floor, were now raised and glanced at me with a look full of doubt; then without further hesitation her tongue was unloosed, and, sans commas, sans periods, sans everything but words, she told me all about it.

"I always take the cars they are so convenient and the conductors and motormen so civil with their buttonhole flowers and the bells ringing at the crossings and indeed

had rights being Yankees not that I have anything against them for I lived in Watertown two years and do you think the company will pay for Mary's shoes and fixing the buggy?" \* \* \*

BEARDSLEY'S INSULATING OIL PAPER.

Another addition to the list of first-class insulating materials has been made in the form of a high-grade oil paper for use on armatures, fields and converter coils. It is made in sheets 21 by 30 inches and can be folded or formed to the work without cracking or tearing. As a matter of course, it is waterproof and will resist the stress of high voltages. The maker is the Beardsley Manufacturing Company, of 234 Lake street, Chicago. Samples can be had on application.

PICTORIAL EVENTS OF THE MONTH.

DAVIS TOWER WAGON.

The accompanying illustration is of the tower wagon, manufactured by W. S. Davis & Son, Concord, N. H. While capable of being raised to nearly the height of the wire, it is when lowered but very little higher than the

driver's head. It is raised by a crank and chain, the crank being over one rear wheel. The working platform is roomy and the wagon is fitted with tool chest, brakes, and everything necessary for ordinary line work. The excellent quality of everything coming out of the Davis factory insures that this tower wagon is something reliable.

sometimes where there isn't any but this morning said I to Mary we'll take the mare she's well bred and the boss when he bought her from Mr. Johnson didn't know her feet was tender men selling horses don't tell all and as we turned in near the fence where Rogers is building his store and his prices were high enough in the old one she stepped tender and slow like and all the men on the street said he didn't ring his bell and the carriage man says it will cost thirty-five dollars to fix it and her new shoes only got Saturday night a week ago were cut right across and out she went like a ball for it was a mercy we weren't killed and the conductor taking the names of everyone who saw it and I wouldn't mind the loss if we hadn't to put in a foundation to raise the house higher for the boss gave it out by contract to different trades and the man that was to put in the foundation didn't turn up until the others had finished and the plaster near the back stairs is all cracking and when we were moving in the shooters in the Electric Park fired a bullet through the window and what would I have done without my boy with two eyes if he had been near the window and they said they

## BUCKLAND'S BIG BID.

George G. Buckland applied for extensive franchises to the board of supervisors, January 3, at San Francisco. The rights wanted are very extensive, and the promises made for the return of the compliment are very liberal.

Mr. Buckland pledges himself to begin work in thirty days, to spend \$50,000 in sixty days, \$200,000 in ninety days, \$500,000 in six months, and to have the whole road in operation in three years' time. In addition to the 2 per cent gross annually, to which the city is now entitled from the earnings of a cable company, he offers to pay to the city 5 per cent weekly of the gross earnings, as a bonus for a fifty-year franchise.

## THE WEIR FROG COMPANY.

Some of the most intricate special track work in the street railway field has been designed and made by the Weir Frog Company, of Cincinnati, O., manufacturers of Fred C. Weir's improved steel rail frogs, crossings, switches and special work. Some notable contracts among street railways are found on the lines of the Baltimore City, the Lake Roland Elevated, of Baltimore, the New Orleans & Carrollton, of New Orleans, the Alley L and the Calumet railways, of Chicago, and the Consolidated, of Cincinnati.

The improved track work resulting from rapid transit is fully provided for at the Weir factory, by a complete equipment of special machinery, some of it of their own design.

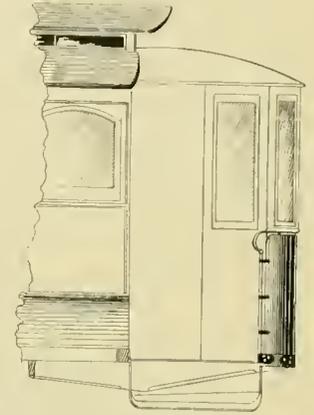

"The first section carried twenty-seven cable cars"

## COMMON CARRIERS CARRIED.

When the West Chicago Railroad some time ago wanted fifty new cars, they placed the order with the American Car Company, of St. Louis, and one condition of the order was that the new cars were to be gotten out in short order and all delivered at one time. President Sutton was as good as his word, and when the cars were completed, chartered a special train for shipment. On account of its length and weight, it became necessary to run the train in two sections, the first of which, carrying twenty-seven large cable cars, we present in our engraving.

## VESTIBULES AT DU BOIS, PA.

The accompanying illustration is of the vestibule put on the Du Bois Traction Passenger Railway by Superintendent S. R. Smith. Mr. Smith's views on the vestibule question are, that during the cold winter months they not only protect the motormen, but give the cars a comfortable appearance, while on the other hand, in hot weather they look cumbersome and uninviting. For this reason he has had vestibules made so that they can be removed and put away in the car barn in the spring. The vestibule is made in three sections or parts; one section on the front and one on each side. They are fitted together nicely and firmly fastened to the car.

Each part is numbered so that there will be no trouble in replacing them after being removed. With one exception, the vestibules are made of ceiling costing \$15 per car. Vestibules of paneled work cost \$25 per car. They weigh 70 or 80 pounds.

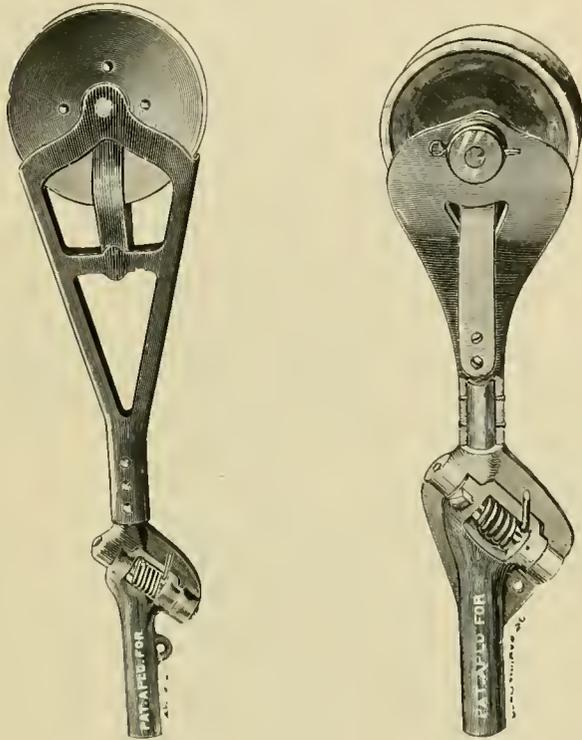

H. P. PAGES, has been reinstated as superintendent of the Salem division of the Lynn & Boston Street Railway Company.

## ACCIDENTAL DEATHS IN CINCINNATI.

The coroner's office at Cincinnati made "crown's quest" of 311 cases of accidental death in 1893. Suicide claimed 65; drowning, 48; railroad accidents, 61; faith cure, 3; cable cars, 3; horse cars, 5; electric cars, 19; death by falls, 26; run over by wagon, 9; burned, 13; suffocated in bed, 10. Thus it would seem that the "deadly faith cure" is on a parity with cable cars; while the "deadly bed clothes" are twice as fatal as horse cars, and of the hundreds of thousands of people carried on the electric lines, only 19 were fatally hurt, while of the few using steam cars, 61 required the coroner's attention.

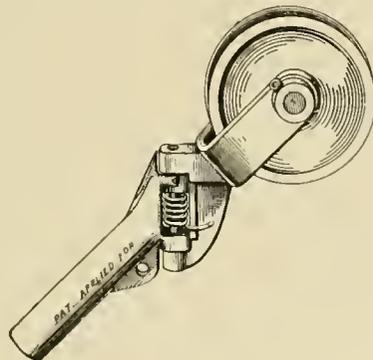

THE KNAPP SWIVEL TROLLEY FORK.

That the swivel form of trolley fork is a valuable and trolley-wheel saving device, many who have tried it will testify, and it is therefore gratifying to learn that Arthur S. Partridge, of St. Louis, has put one on the market, so that all will be able to try the unquestionable merits of this style. With a swivel fork the wear on the trolley wheels is confined to a narrow groove instead of being greatest on the flanges. Of course, with this condition of affairs the wheel will last much longer. The engravings

of the Knapp swivel forks fully explain themselves. The fork is kept from swinging around too freely by the spiral spring at the joint. Thus the fork is kept in line and at the same time allowed play enough to turn any curve. How well the swivel trolley does its work is judged from the way the wear comes on the wheel as mentioned above. This proves that the wheel always adjusts itself to the wire on curves or with crooked poles. The wear on the overhead work as well as the wheel is thus lessened. The swivel fork can be attached to any trolley pole with slight cost. The Knapp forks, after being tested for several months, have been adopted by both the Lindell Railway Company and the St. Louis & Suburban Electric Railway Company.

The destiny of the new device is in first-class hands, and its fame is rapidly becoming known.

MAYO'S AUTOMATIC TROLLEY CUT-OUT

The accompanying drawings show the action of an automatic trolley cut-out, invented by H. N. Mayo, of 206 Columbia building, St. Louis. It is adapted for use with bracket construction. Along the length of the trolley line are signal and cut-out wires as indicated by 4,4, in

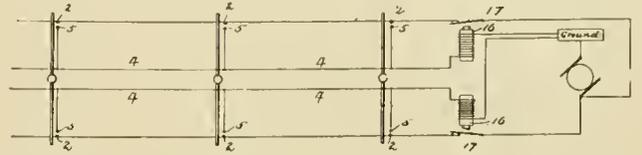

FIG. 1.

Fig. 1. These wires are connected through trolley circuit breakers to the ground. When contact occurs between these wires and the trolley lines 2,2, the trolley circuit is, of course, opened. Over each trolley hanger is a bridge consisting of a short piece of wire. When the

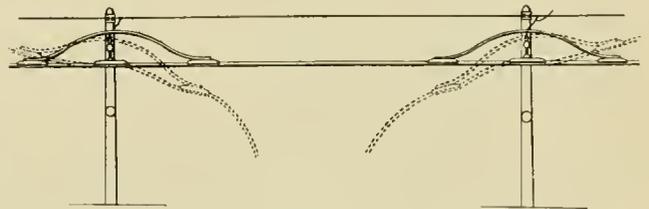

FIG. 2.

trolley line breaks, this bridge is pulled down so as to make contact with the cut-out circuit, as in Fig. 2. If the trolley line is sectioned the cut-out circuits may be brought to a station annunciator so as to tell on what section the break is.

A GREAT SCHEME.

LOAFERS at the street railway power house at Aurora have become so numerous and bold that even a lock and bolt were forced, in order to open up to the warm room for the benefit of tramps. Now, engineer Hadin is a kind hearted man, but even his patience has an end. It did in this case, and his remedy was effective if violent. To the brass knob of the door, he fastened from the inside, a live wire from the trolley circuit. Now the occasional gentleman of leisure, who is not cognizant of the scheme, gets a notice to "keep out" and the impetus to acrobatic feats all at once.

THE West Chicago gave its usual ten days furlough, or cash equivalent, to 40 men. Mr. Crawford approves the plan warmly. The North Chicago gave four gripmen, \$75 first prizes, and twelve \$25 second prizes, for freedom from accident. Mr. Roach thinks the method is beneficial to the service.

THE first season of the Niagara Fall Park & River Railway shows a good record. Since May 24, 417,908 people have ridden over the line. The double tracking of the road is about finished, and the work of constructing new bridges progresses well.

## A STREET RAILWAY ELECTRIC PARADE AT HOUSTON, TEX.

It was arranged by the business men of Houston and the steam roads entering that city that Houston should on December 7 be the Mecca of a holiday excursion from all neighboring towns, and when the program of entertainment for visitors was arranged one of the prominent features was an electric street car parade. It proved to be a drawing card, and the largest crowd of people ever brought together in the streets of Houston to witness any street attraction, was the result. In fact it was difficult to get the regular cars through the crowd. The city was in holiday attire and all cars were decorated with flags, bunting, boughs and flowers. The operating plan of the street railway company is such as

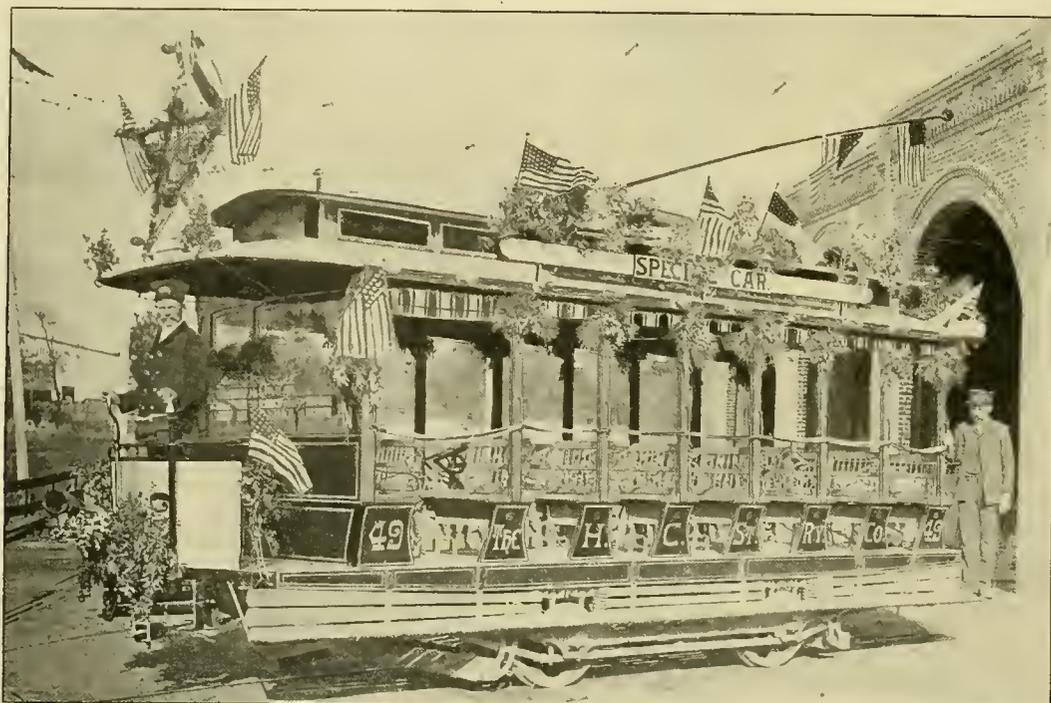

amid music and the fitful glare of Roman candles and burning powder, presented a weird and picturesque effect.

SUPT. MUNDES.

Superintendent Frederick Mundes, whose portrait is here presented, gave the details of the display his personal supervision. Mr. Mundes has worked up from the position of driver in the short space of eight years, having been appointed to his present position in 1889. The conception and promotion of the street railway parade

scheme is due to General Manager MacGregor. The parade was a much greater success than any one anti-

to make the display specially effective. All cars from the thirteen lines run around a loop ten blocks long, in the business district. The day parade consisted of a train of special cars which were filled with visitors, and operated around the main loop together, followed by the regular cars. The special cars were then distributed over various lines to enable the visitors to see Houston Heights, the industrial establishments and the residence portion of the city.

The night display was most attractive. The special cars were decorated with various colored incandescent lights. The head car had a Texas star on the bonnet, covered with electric lights arranged to flash different colors. A band of music occupied the front car. The electrician was ornamented with an electric light projecting from his hat, one on each shoulder and one for a shirt stud. The electrically decorated cars, gliding along

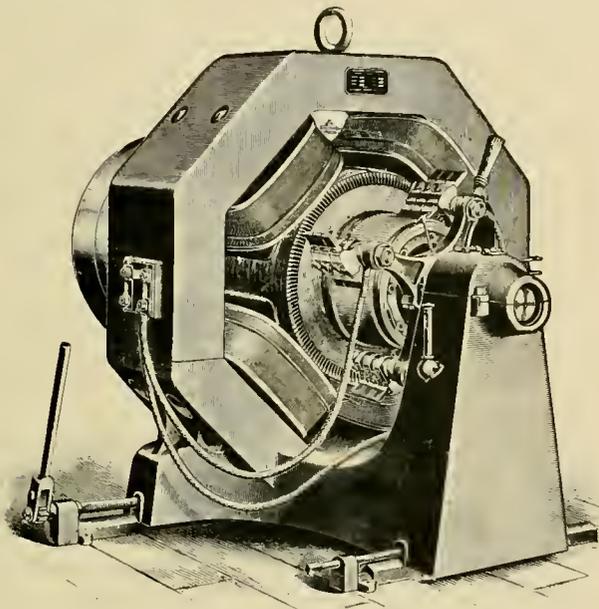

pated and Mr. MacGregor thinks that doubtless such exhibitions will become a feature of many public entertainments in the future.

### A NEW BRIDGE.

A scheme to bridge the Kill von Kull will connect New Jersey with Staten Island. The Consolidated Traction Company, which owns all the near-by lines, and certain Philadelphia parties, are concerned in the matter. John D. Crimmins represents the undertaking. Among others interested in the project are said to be: A. J. Cassett; Frank Thompson, vice-president of the Pennsylvania Railroad; C. A. Griscom, Senator William J. Sewall, B. M. Shanley, Thomas DoJan, P. A. B. Widener, William L. Elkins, William C. Whitney, John S. Waterbury, Senator James Smith, jr., and John D. Crimmins.

### THE EDDY MULTIPOLAR GENERATOR.

The Eddy Electric Manufacturing Company has recently brought out a multipolar generator in capacities between 52 and 360 kilowatts. The frame is of cast iron, to which the soft steel pole pieces are bolted, the bolt heads all being below the surface of the frame. The field coils are wound on insulating spools, and these spools are sup-

EDDY GENERATOR.

ported so as to leave an air space between the coil and core. The pole pieces have enlarged ends. The shunt and series coils are in separate compartments. The armature core has ducts through which the air is drawn from the center by centrifugal force. The conductors are rectangular copper bars embedded in grooves. The end connections are made with flat copper ribbon.

### INDIANAPOLIS.

The city of Indianapolis is enjoying rapid transit service of the highest type, under the direction of Thomas McLean. The management has labored through much trouble to a full understanding with its employes, who had become tired of the ring rule of certain of the so-called labor leaders, and finally the local "union" of employes was dissolved by consent of its members. This action completely unsaddled the agitators to the great joy of the employes. The agitators, with their occupation thus gone have had, as may be supposed, no love for the management of the railway or for law and order. Manager McLean received several threatening letters, an account of which appeared in December's REVIEW. The company now thinks that only by the vigilance of the detective service has it escaped damage to its property. At least, it is said, a plot was discovered to ground the current at various points and to otherwise interfere with the running of the system. Dynamite was talked of by the conspirators, but lack of courage seems to account for the plans not being executed. The

city papers were appraised of the scheme and the police department has the conspirators under surveillance. Faithful employes will have no occasion to regret their loyalty to Mr. McLean, and the citizens of Indianapolis may hope for the complete electrifying of remaining horse lines as a sequel to a now highly satisfactory service on the trolley system. In bringing discipline out of disorder and in establishing good management, Mr. McLean has made a notable record.

### TELEPHONE PATENT TO EXPIRE.

On January 30, 1894, what is believed by experts to be the last of the fundamental patents on the modern telephone will expire, and one of the most offensive monopolies in the history of the electrical business will be broken. As to its influence on present telephone exchanges in large cities, there is a difference of opinion, but there can be no doubt that its use in private exchanges will be greatly increased. On street railway systems, especially, the installation of private instruments ought to receive a new impetus. In September, 1892, we published an article by Superintendent C. K. Durbin, of the Denver Tramway Company, describing the system of car starting by telephone as practiced on his lines, and it was shown to be incomparably superior to either the starter or the time card system for roads of any size. In addition to this, there are many other places around railways, both large and small, where telephones could be used to great advantage. That a road should have its own private system is obvious. It has poles, linemen, and everything necessary to install and maintain a private exchange with but little expense. Such being the case, it is useless to pay to help maintain a city exchange. It is often of great value to have telephone lines for testing purposes. The drop in potential in both overhead lines and ground return can be more easily determined in this way than in any other. Since it will not be necessary to pay a yearly tax on each instrument, there need not be as much hesitation about incurring the expense of a few telephones in possibly useful places, as formerly. The value of the telephone as a time saver in emergency cases cannot be overestimated. Telephone boxes instead of alarm boxes could be installed with advantage on some large systems, so that the wrecking force at the barns would know what to expect. A large number of companies are now placing telephones on the market, and 1894 will undoubtedly see a great activity along this line.

The Western Telephone Construction Company whose advertisement appears elsewhere, are making specially arranged apparatus for street railway service. Among the features of it are the outlying stations, much the same as the present police patrol house, within which the instruments are located. The apparatus has automatic switches in connection with the lines, so that each station can communicate with any other without operating service.

## ANNUAL MEETINGS OF CHICAGO ROADS.

The transportation companies of the city all hold their annual meetings near the close of the calendar year, and of those already held we give a condensed report below. The Chicago City holds its election January 16.

## THE WEST CHICAGO REPORT.

The Columbian year on the west side showed gross earnings of \$5,235,633, an increase of \$615,408. The operating expenses were 55.25 per cent of the gross earnings or \$2,892,982, an increase of \$205,671, leaving a net of \$2,342,651, an increase of \$409,736. After deducting the coupon interest, rent of leased lines, fixed charges, the balance applicable to dividends was \$1,400,901, of which \$991,559 was so applied, carrying \$409,342 to swell the surplus to \$1,862,851. Mr. Yerkes said that the Lake street L drew only from the horse lines, which were the least productive at any time. He believed the west side would earn 9 per cent in 1894. The passengers carried were 107,053,461. Of the stock 90,000 shares were represented. The prospects for the tunnel at Van Buren street were, that it would largely increase traffic at that point and be in operation within two months.

## NORTH CHICAGO STREET RAILROAD COMPANY.

January 9, Mr. Yerkes stood before 39,306 shares of stock of the North Chicago Street Railroad Company and rendered them the account of the stewardship, and it was a good record. The tabulation is somewhat as follows:

## RECEIPTS.

Total passenger receipts,	- - -	\$3,014,789.50
From other sources,	- - -	86,358.75
Total,	- - -	\$3,101,148.45

## DISBURSEMENTS

Current operating expenses,	-	\$1,412,755.80
Railroad rentals, taxes, insurance, etc.,	533,874.63	
Total,	- - -	\$1,946,630.43
Net earnings,	- - -	1,154,509.82
Dividends,	- - -	618,574.50
Credit balance January 1, 1894,	-	1,264,344.56

The passengers carried were 50,419,457, an increase of 9,892,216 over last year. It costs 1.788 cent per passenger on the cable lines and 3.414 cents on the horse lines. The percentage of operating expenses to gross receipts were 45.55, an excellent record.

## THE LAKE STREET L.

Ninety-one thousand six hundred of the 100,000 shares of Lake Street L stock were represented at the annual meeting January 9. President Roche read his annual report. The reason for the Madison street terminal on Market street was given as the best available place, and the branch line ordinances explained as meaning two branches to the north and north-western parts of the city. The new structure to West Forty-fourth street has its work carried forward, and iron is distributed to Fifty-second street, so that by April, 1891, the line will be

operated to that point. On the line operated from Madison street to Hamlin avenue 30,000 people are carried per day, paying all operating expenses, with a balance in the bank. The report was adopted.

## FROM A MASTER.

At the annual meeting of the North Chicago Railroad Company, Mr. Yerkes spoke very freely on a few topics of interest to every manager, and coming from that master of the craft, authoritative. Mr. Yerkes said:

"I do not think that any elevated railroad which will be built on the North side will hurt the business of our system. Though the total business of December and that of the first eight days of this month was less than the corresponding periods a year ago, yet the operating expenses have been reduced more than enough to offset it, so that the net income is larger than it was. In operating a business like ours nothing that you can do will increase the income very much; that practically takes care of itself. But the operating expenses are all in our own hands. We are constantly making improvements that materially reduce these expenses. We keep gaining experience and dexterity. For instance, in the mere matter of grip shoes we have made such improvements that whereas formerly a grip shoe lasted only an average of a day they now last an average of two or three weeks. Of course we have not made corresponding improvements in everything, but we are constantly making improvements somewhere. This applies, however, in the main only to the part of our system operated by cable. We can't reduce expenses much on the horse-car lines."

Mr. Yerkes believes in inducing pleasure riding, as is evidenced by the right given the directors to improve the attractions of Lincoln park by several expensive additions.

A LA CROSSE impediment to traffic lately, was a thick coating of ice on the trolley wire. To overcome this trouble, a motor car with the trolley wheel pressing the wire was pushed forward by another car. The first trolley cut the ice so that the following car could get a contact. The fight was kept up nearly all day, with the odds in favor of the storm. Vaseline must be dear in La Crosse.

A CHATTANOOGA cigar firm advertises a free cigar to every conductor and motorman who will call for it, the object is, of course, to have the men talk the special brand to passengers. It might be suggested that an advertisement in the cars would pay the company better.

THE reorganization of the National Electric Company, of Eau Claire, Wis., has been effected. A. L. Ide, of Springfield, Ill., takes the presidency; Peter Truax, of Eau Claire, vice-president; William A. Rust, treasurer. The paid up capital of the new company is \$50,000.

FRANCIS STEWART, the oldest street car driver of Hartford, died January 3. He was 75 years of age, and a motorman at the time of his death. He drove the first Hartford horse car, and has been an employe in transportation lines for fifty years.

THE Tacoma Railway & Motor Company says it built fifteen electric cars in 1893.

## NEWS FROM THE CITIES.

 WILLIAM J. RICHARDSON, SECRETARY AND TREASURER, Brooklyn.  
 The next meeting will be held at Syracuse, on the third Tuesday in September 1894.

### Pennsylvania Street Railway Association.

H. R. RHOADS, PRESIDENT, Williamsport.  
 R. L. JONES, FIRST VICE-PRESIDENT, Reading.  
 S. P. LIGHT, SECRETARY, Lebanon.  
 WM. H. LANIUS, TREASURER, York.  
 Next meeting at Reading first Wednesday, in September, 1894.

### Arizona.

PHOENIX, ARIZ.—Geo. W. Hoadley has been appointed receiver of the Phoenix Electric Light & Power Company. Reorganization is to be made.

TUCSON, ARIZ.—Ten miles of narrow gauge rail for the Tucson, Globe & Northern Railway, now abandoned, has been sold to the Los Angeles Consolidated Electric Railway Company.

### Arkansas.

LITTLE ROCK, ARK.—The Thomson-Houston attachment suit against the Little Rock street railway has begun. It involves the legality of claims aggregating \$300,000. The company is now in receivers' hands.

HOT SPRINGS, ARK.—Col. Fordyce says that the street railway extensions will be made as soon as material is purchased.

The Hot Springs Incline Railway & Casino Company has gained right of way for construction of inclined railway on West Mountain. Ex-Senator Geo. W. Baxter, John D. Ware, Leslie Webb, get the grant. Work to be completed July 1, 1894.

### California.

POMONA, CAL.—C. G. Baldwin says, that C. W. Foote, of Cleveland, is back of his scheme for the Claremont road, and that it will be built at once if the proper subscriptions are made.

POMONA, CAL.—The bids for the franchise for the electric road to Claremont have been opened. C. G. Baldwin, the only bidder, received the award for \$1.

SAN FRANCISCO, CAL.—H. E. Huntington succeeds to Leland Stanford's place on the Central Pacific Railway directorate. Mr. Huntington's election will not affect street railway affairs in Frisco.

OAKLAND, CAL.—President Meyers, of the Alameda, Oakland & Piedmont Electric Railway, says that the improvements that will be made before April 1 will cost \$100,000.

LOS ANGELES, CAL.—T. D. Hoskins withdraws his petition for franchise, in order to amend it.

SAN DIEGO, CAL.—Dwight Braman is proceeding with the organization of his rival railway. Ralph Granger, J. M. Hill et al, are on his papers and the organizers think that the line will go.

SACRAMENTO, CAL.—G. P. Kingsbury, superintendent of the Central electric system, under the new management, says that the construction and improvement contemplated will all be finished by February 1. Service will be materially enlarged.

LOS ANGELES, CAL.—W. J. Brodrick has gained franchise for a cross town electric line, which will be immediately prosecuted.

LOS ANGELES, CAL.—The Redondo Railway Company has filed its petition for a franchise in the city, to run fifty years.

### Canada

WOODSTOCK, ONT.—Application is made for a charter for the Woodstock Street Railway, by Geo. P. Patullo, J. M. Grant, John White, D. W. Carn and R. Ball. It is the intention of the company to use the Niagara Falls power.

TORONTO, CANADA.—The Street Railway Company will increase its horse-power by 3,000, and build new power house.

TORONTO, CAN.—The Toronto Street Railway will buy additional power equipment.

NIAGARA FALLS, ONT.—Hamilton, Grimsby & Beamville electric road is about to be connected with the Niagara Falls, River and Park line. Some supplies already bought. To be operated next July.

VANCOUVER, B. C.—D. Openheimer, of this place, takes party of capitalists over electric line. F. Nicholls, of the Canadian General Electric, and H. P. Dwight, of the Western Union Telegraph, were among the number.

WINNEPEG, MANITOBA.—A company is said to be organized to build a street railway from Rat Portage to Keewatin.

### Chicago.

CHICAGO.—The Central Construction Company, which is to build an elevated down town loop for the connection of all L roads, organizes thus: E. S. Pike, O. F. Aldis, E. K. Butler, W. E. Hale, C. N. Fay, B. A. Eckhart, and H. P. Hurd. The directors at once elected Mr. Hale president, C. N. Fay, vice-president, and Byron L. Smith, treasurer. The road will be built for cash, and the stock will not be watered.

CHICAGO.—The Lake View Transit Association has formed; officered as follows: Wm. Grace, president; J. L. Flannery, vice-president; J. E. Tilt, secretary; John McConnell, treasurer. They represent property holders, owning on Evanston avenue, between Diversey street and Lawrence avenue.

CHICAGO.—D. H. Louderback, the Rookery, president of the Chicago North Shore Electric, and Samuel Insull, president of the Chicago Edison Company, are prime movers in an extensive system of electric railways for the North and North-west Sides.

CHICAGO.—The mayor's amendments are adopted and the North-western L ordinance is passed as amended. This is the third consideration and is said to be acceptable to both parties.

CHICAGO.—Another report from the Alley L officials, says investigations as to the feasibility of electric power are being made. The Alley L minority stockholders fail to get control of the board.

Mayor Hopkins vetoes Northwestern Elevated franchise, but recommends amendments that will probably be agreed on.

CHICAGO, ILL.—The ordinance for the Northwestern Elevated Railroad passed the council. This is the first of the numerous North Side "L" ordinances to pass council. The directors are, as before announced: Edward W. Russell, Chicago; Walter M. Anthony, Evanston; Bion J. Arnold, Chicago; Harold Sturgess, Chicago; Frederick Sargent, La Grange, Ill.

CHICAGO.—The Chicago Suburban Rapid Transit Company is incorporated at \$500,000, by W. E. Gehring, 111 Monroe street; E. G. Henkel, 138 Loomis street, both stenographers, and C. A. Jackson, 1605 Ashland Block, and L. E. Sauter, R. 607, 84 La Salle street, lawyers. The road will connect DuPage and Cook counties.

CHICAGO.—The North Chicago Railroad Company reports increase of \$493,277 over last year, at increase of expense of \$78,703. Left for fixed charges, dividends and surplus to income account, \$1,602,133.

The West Chicago earned \$5,235,623, at an expense of \$2,892,982. Mr. Yerks reports that Lake Street L competition has not hurt the cable lines, drawing only from the horse lines.

### Colorado.

FLORENCE, COL.—Ex-Senator J. A. McCandless revives the Florence & Cripple Creek Electric Power & Light Company. It will soon begin active work on the railroad.

### Connecticut.

WEST HAVEN, CONN.—The West Shore Railway Company, of which Israel A. Kelsey is secretary and manager, will begin to build March 1. It is a cross country road, and has bought no supplies as yet.

WALLINGFORD, CONN.—The Meriden Street Railway will be extended to this place, and a pleasure resort of considerable prominence located here.

HARTFORD, CONN.—W. H. Goodrich, W. H. Bulkeley, of the Hartford & Middleton; David Henney, P. H. Quinn, of the Windsor & Suffield; W. H. Bulkeley and P. H. Quinn, of the Hartford Suburban, all recently incorporated lines, it is said will consolidate and equip electrically, making a large electric system.

HARTFORD, CONN.—The Hartford & West Hartford Electric Railroad Company, David Henney, president; W. E. Goodwin, secretary, has let contract for its two new lines.

### District of Columbia.

GEORGETOWN, D. C.—W. N. Lynch, W. M. Elleson, John Hammond, M. E. Church and J. C. De Putron are leaders in a determined effort to build a line from Falls Church to Washington.

WASHINGTON, D. C.—An electric railway between Marlboro and the District is contemplated in a new bill before the house.

### Florida.

TAMPA, FLA.—T. C. Taliafero has been appointed receiver of the Tampa Street Railway & Power Company.

### Georgia.

ATLANTA, GA.—Consolidated Street Railway Company defaults its January interest on bonds. The bondholders agree not to ask for receiver if the stockholders will pay \$17 a share and raise floating debt.

### Illinois.

LA SALLE, ILL.—The Interurban Electric Railway is organized at \$250,000, by C. W. Palmer, R. W. Gardner and M. C. Van Vleet.

ALTON, ILL.—General Manager J. F. Porter, of the Alton Electric Railway, is making estimates for a North Alton line, and says it will be built early in the spring. No material bought yet.

PEORIA, ILL.—The Central Railway Company has announced that employes will, hereafter, be required to work fifteen instead of twelve hours. Pay to remain the same.

PEORIA, ILL.—The Peoria Terminal Railway people contemplate building a bridge across the Illinois river. It is said that it will also accommodate the new Peoria-Pekin Electric Railway line. It is claimed that no action of congress is necessary to gain rights.

BELLEVILLE, ILL.—Belleville Steel Company will resume operations.

BELLEVILLE, ILL.—Belleville Electric Railway incorporated, capital, \$300,000. Messrs. J. H. Atterbury and John W. Griswold, Litchfield, Ill.; Paul W. Abt and R. Ross, East St. Louis; and John J. McLean, Hillsboro, Ill., incorporators. The object of the company is to construct an electric railway from the eastern limits of Belleville to the western limits of East St. Louis.

QUINCY, ILL.—President W. S. Warfield, says that the extensions on the Quincy Electric Railway will not be built until the fifth year of the time allowed.

ROCKFORD, ILL.—The Rockford Street Railway Company elects officers: Judge Baylies, president; H. W. Price, vice-president; Mr. Maxham, secretary.

WAUKEGAN, ILL.—Waukegan Electric Railway Company petitions for an extensive franchise in the town of Waukegan.

### Indiana.

INDIANAPOLIS, IND.—A. A. Anderson assumes the management of the Youngstown, O., road.

TERRE HAUTE, IND.—R. B. Harrison has issued attachment at New York against the American Casualty & Insurance Company, for \$1,000.

INDIANAPOLIS, IND.—The street car Brotherhood has voluntarily surrendered its charter to the National Federation, and is declared locally defunct.

ELWOOD, IND.—Citizens of Elwood, Frankton and Logansport are endeavoring to connect the towns named with an electric railway. A preliminary meeting has been held.

MUNCIE, IND.—The Muncie electrical works are placed in J. N. Cropper's hands as receiver, in order to adjust partnership difficulty.

BRAZIL, IND.—Brazil Rapid Transit Company elects R. N. Bayless, president; John D. Sourwine, vice-president; G. Van Ginkle, secretary.

### Iowa.

COUNCIL BLUFFS, IA.—The franchise of the Omaha & Council Bluffs Bridge & Railway Company in this city, was declared forfeited by Judge McGeo, of the superior court,—the result of a 5-cent fare fight.

OTTUMWA, IA.—Superintendent F. Wayland Brown, of Youngstown O., is said to be the accepted manager of the railway and light plant here.

KEOKUK, IA.—Judge Bank, of the Superior Court, has appointed H. C. Reiner receiver for the Gate City Electric Street Railway, on application of the Central Trust Company, New York.

TOLEDO, IA.—The Toledo-Tama Electric Railway is being revived, by L. H. Ong, of New Sharon, Ia., and L. B. Bradley, of Peoria, Ill., who have secured the franchise. The new owners of the franchise will put up a forfeit.

COUNCIL BLUFFS, IA.—L. C. Besley, Alex Wood, H. G. McGee, et al., form association for fighting the motor company, and promoting a new company, to run in the first ward.

SIoux CITY, IA.—The Consolidated Street Railway was organized here by John Pierce, A. E. Pierce, P. and C. Moller and H. A. Johns. It absorbs the Sioux City Cable. All Lines will now be united therewith, namely: the Sioux City Street railway, the Rapid Transit lines, Riverside Electric and Sioux City and Leeds Electric—into one electric system with forty-five miles of lines. Company is capitalized at \$1,000,000 with New York and Sioux City offices. The incorporators deed \$1,200,000 worth of property to the Company.

BURLINGTON, IA.—Geo. O. Ray, and others, have their franchise for a new electric railway, admitted to a full reading in the council. The company must begin construction within six months.

DAVENPORT, IA.—W. E. Davis, an electrician, has a scheme for an electric railway from Davenport to Clinton, using the Mississippi river as power.

SIoux CITY, IA.—The Consolidated Street Railway Company elects John Pierce, president; A. L. Pierce, vice-president; Pehr Moller, secretary and treasurer.

INDEPENDENCE, IA.—C. W. Williams, the horse man, executes deed of trust to R. Campbell for \$106,600, of which the Independence Electric Railway is considered \$35,000.

## Kansas.

LEAVENWORTH, KAN.—Receiver Erb and the city council have come to an agreement on an ordinance, and the change to electricity will probably be made.

LEAVENWORTH, KAN.—Citizens' committee, headed by Hon. A. Caldwell, et al., will assist Newman Erb in getting a rapid transit franchise.

WICHITA, KAN.—J. W. O'Neil and Fred W. Sweet, of this place, have received word that their street railway franchise at Perry, Okla., has been granted.

## Kentucky.

LOUISVILLE, KY.—It is fully determined to abandon the Daisy Electric service, substituting steam on the K. & I. bridge.

LOUISVILLE, KY.—Frank A. Hodges has been appointed general electrician for the Kentucky & Indiana Bridge Company.

LOUISVILLE, KY.—Receiver John McCloud, of the K. & I. Bridge Company, files his report that gross earnings between October 14 and December 22, 1893, \$2,721.04 net \$190.98.

## Louisiana.

NEW ORLEANS, LA.—There is a rumor that the Traction Company will buy the St. Charles Street Railway.

## Maine.

BATH, ME.—Charles Gahan has been made superintendent to succeed W. B. Hayden of the Bath Street Railway.

## Maryland.

BALTIMORE, MD.—The Baltimore & Washington Turnpike & Tramway Company, to build between Baltimore and Washington, has organized with the following board of directors: David M. Newbold, President; Robert T. Carswell, Charles B. Calvert, John J. Dobler, William L. Elkins, Peter B. Widener, Thomas Delan, T. Edward Hambleton and Howard Munnikhuyzen.

TOWSON, MD.—The Pikesville, Reisterstown & Emory Grove Railway Company file articles of incorporation at Towson, through George R. Webb, John Cowan, Oscar T. Crosby, Thomas J. Elliott, Reister Russell and Richard H. Cox, incorporators.

BALTIMORE, MD.—E. Pratt, F. C. Latrobe and Robert Bennert, trustees to the Wenstrom Electric Company, have taken rights, property and franchises of the Wenstrom Consolidated Dynamo & Motor Company.

## Massachusetts.

FALL RIVER, MASS.—The Fall River & Stone Bridge Electric Railway Company in Tiverton, elects the following officers: President, D. P. Church, of Tiverton; Corporation clerk, M. G. B. Swift, of Fall River; Treasurer, N. B. Church, of Tiverton; Directors, D. P. Church and N. B. Church, Tiverton; George W. Slade, Weaver Osborn, M. G. B. Swift, Robert Goff, Fall River; Frank S. Stevens, Swanzey. The company is capitalized at \$100,000 and the work will begin shortly.

WORCESTER, MASS.—The Worcester Consolidated elects as directors: C. B. Pratt, A. G. Bulluck, F. H. Dewey, of Worcester; E. J. Moore, Philadelphia; and T. C. Barr, of New York. Mr. Pratt is made president; A. H. Stone, secretary.

WORCESTER, MASS.—The North End Street Railway will not appoint a man to succeed Superintendent West. Electrician Townsend will do duty as superintendent.

BROCKTON, MASS.—A scheme is on foot to consolidate all the street railways in Brockton. Seven suburban lines, Bridgewater, Holbrook, Whitman, Stoughton, East Side, East Bridgewater, are in process of changing charter. The Brockton Street Railway asks to amend charter, to increase capital, and lease and operate. Electrical extensions are contemplated.

NEW BEDFORD, MASS.—The Union Street Railway Company asks permission of the State Railroad Commission to increase capital stock \$240,000 and issue \$500,000 first mortgage bonds.

NEW BEDFORD, MASS.—Chas. S. Mendall is appointed superintendent of the New Bedford division of the Union Street Railway.

BOSTON, MASS.—A Lewiston, Me., dispatch to the Boston Herald, says that Hon. Frank Jones and Arthur Sewall are forming company to build, from Portland, Me., to Boston, an electric railway.

## Michigan.

ST. JOSEPH, MICH.—L. O. Ives and Wm. Ottman, of Chicago, who have gained franchise for electric railway recently, are here making arrangements for the road and real estate investment.

SAGINAW, MICH.—The Union Street Railway Company will extend its lines two miles up the river in the spring, and open up a pleasure resort of 100 acres.

DETROIT, MICH.—Chas. C. Cadman et al, of Detroit, claim that they represent English capital, and want a franchise for a street railway. They have already optioned a factory to be used as a plant and have deposited \$10,000 guaranty. Thirty-year lease asked.

DETROIT, MICH.—Col. J. M. Clark is at the head of the new company, which will build a street railway line from Windsor to Sandwich, Ont. The incorporation will be made at the next session of the Ontario legislature. Some of those interested in the scheme besides Col. Clark, are: William McGregor, M. P.; J. D. Bourke and Thomas Ouellette, of Windsor; Mayor Mullen, W. D. Ballour, M. P., and John A. Auld, of Amherstburg. The new line will be called the Detroit, Windsor & Amherstburg Railway.

MUSKOGON, MICH.—G. P. Kingsbury, formerly general superintendent of the street railway system here, will take management of the Sacramento, California, system on February 1.

DETROIT, MICH.—Mayor Pingree says, that he has a syndicate behind him that stands ready with \$10,000,000, to take up purchase of the street railways.

ISHPEMING, MICH.—A. B. Miner is elected secretary of the Ishpeming & Negaunee Street Railway Company, vice E. R. Hall, resigned.

BATTLE CREEK, MICH.—Edward C. Hinman, of Battle Creek, has been appointed receiver of the Battle Creek Electric Railway Company under bond of \$15,000.

ISHPEMING, MICH.—The Ishpeming and Negaunee Street Railway Company has suspended operations for the winter. Heavy storms and light business is the cause alleged.

BATTLE CREEK, MICH.—Edward C. Hinman, receiver of the Battle Creek Railway, says that he will attempt to put the road in good shape and improve the service.

## Minnesota.

MINNEAPOLIS, MINN.—The labor commissioners will enforce the adjustment of vestibules to all street cars.

ST. PAUL, MINN.—H. M. Bylesby is elected president and general manager, vice W. S. Morton, resigned, and H. C. Lewis is elected vice-president of the St. Paul & White Bear Electric Railway.

DULUTH, MINN.—The new machinery for the incline at Seventh street is about ready for action, and a winter resort business is being done. Allis engines, Walker drums, and Roebing Wire Rope Company's ropes are used.

DULUTH, MINN.—The City Council has granted franchise to the City Railway Company recently organized.

ST. PAUL, MINN.—The Williams General Manufacturing Company has been incorporated at \$10,000,000 to build motors and the Dent telegraph type writer. D. H. Dent, of St. Paul Park, is president, F. M. Johnson, secretary, both of St. Paul.

DULUTH, MINN.—The council passes ordinance requiring transfers, and strikes out 7 per cent grade requirement, on the strength of the experience of other cities.

### Missouri.

KANSAS CITY, MO.—The West Port city council will pass ordinance allowing the Kansas City Electric Company to run a street railway line down Main street in West Port, to make valuable connections.

KANSAS CITY, MO.—The Merriam Park, Rosedale & Kansas City Electric Railway elects A. A. Pearson, president; B. F. Hollenbeck, vice-president; S. W. Brown, treasurer; and T. J. Wilson, secretary. The line will be six and one-half miles long.

KANSAS CITY, MO.—Robt. Gillam, representing bond holders of the Northeast Electric Railway Company, says that the company will pave next spring.

ST. LOUIS, MO.—The National Unicycle Electric Railway Company, through Councilman Anderson, introduces request for franchise throughout the city. The promoters are, J. L. LaPrelle, E. F. Williams, Oscar Reid, H. Daughaday, D. W. Caruth, J. O. Talbot, Geo. L. VanBeek, J. J. Worshave and a dozen others. Usual conditions and tax of \$3,000 a year to city are volunteered in exchange for rights.

SEDALIA, MO.—Superintendent Carroll, of the Electric Light Railway plant, suffered the wrecking of one of his engines.

ST. LOUIS, MO.—J. D. Houseman, John Pitman, Jeremiah Fruin, Geo. L. Edwards, et al., have been granted fifty years franchise in Kirkwood for the Merrimac Highlands Electric.

ST. LOUIS, MO.—County Court grants the St. Louis, Kirkwood & Merimac River Electric Railway until April 20, 1894, to deposit \$5,000 guarantee to fulfill conditions to work franchise of railway granted some time since.

KANSAS CITY, MO.—C. E. Moss and Robert Gillam have secured consents for proposed extension of the L electric road. Work begins in March.

KANSAS CITY, MO.—Merriam Park, Rosedale and Kansas City Electric Railway is organized at \$50,000 by A. A. Pearson, E. G. Bartherger, Dr. J. C. F. Maloney, B. F. Hollenbeck, T. J. Wilson, John R. Foster, George Branham, D. R. Mattney and C. W. Brown.

KANSAS CITY, MO.—Franchise is granted W. W. Kendall and Theo. S. Case, by the Westport city council, for electric line, to connect cable line and the suburb. Hugh T. McElroy and Preston Roberts are directors, and the grant is for twenty years.

### Montana.

BUTTE, MONTANA.—The Butte Street Railway is refused its petition to suspend operations until next May.

### Nebraska.

GRAND ISLAND, NEB.—A. H. Baker, president, gives bill of sale for all personal property of the Street Railway Company to A. W. Ockahock, of Portland, Ore. Consideration was \$11,333. Instrument covers all rolling stock, horses, etc. Superintendent Lamon is in charge.

BEATRICE, NEB.—The United States Circuit Court is trying to settle the troubles arising from the failure of the Beatrice Rapid Transit Company.

### New Hampshire.

LAONIA, N. H.—It is rumored that the Lakeport & Laconia Street Railway will be sold to Philadelphia capitalists, and changed to electric.

EXETER, N. H.—Hon. E. G. Eastman is leader of the Electric Railway scheme which is now being brought to a point of operation.

### New Jersey.

TRENTON, N. J.—The New Jersey Railway Company, incorporated recently, makes known its plan. The scheme is to build an electric road from New York to Philadelphia. Power stations will be located at Philadelphia, Trenton, Bound Brook, Elizabeth, and other points. E. Chamberlain, builder of the Port Reading railroad, is the engineer. Joseph H. Reall, of Bloomfield, is the projector of the enterprise, and associated with him are Charles E. W. Smith, of Morristown; J. H. Baldwin, of Orange; George S. Forbush, of Boston, and Major John Runk. It is given out that the Pennsylvania railroad is back of the enterprise, and that the franchises have been secured.

NEWARK, N. J.—Suburban Traction Company has executed all contracts for equipment electrically. Robin's safety fender and Brill cars adopted.

BRIDGETON, N. J.—The West Side Railway recently organized, elects William Welsh, Jr., Philadelphia, president; J. Pemberton Newbold, Philadelphia, vice-president; Walter H. Bacon, Bridgeton, secretary and treasurer.

The Bridgeton, Cedarville & Port Norris is incorporated by Osgood Welsh, New York; Richard W. Clay, Philadelphia; Charles R. Newbold, Thomas U. Harris, William O. Garrison, and John Smalley, Bridgeton.

HOBOKEN, N. J.—The Fort Lee, Leonia & Hackensack Electric Railway has been placed in receiver's hands by chancellor McGill. It is said the company owes \$9,000, mainly in labor. Its assets consists of real estate.

NEWARK, N. J.—The line between Newark and Jersey City is now in efficient operation.

### New York.

NEW YORK CITY.—The Jarvis-Conklin syndicate will soon be rehabilitated. The capital stock will be reduced from \$3,750,000 to \$2,500,000. All liabilities will be merged into one series of debenture certificates bearing 4 per cent.

SANBORN, N. Y.—The citizens of Sanborn raise money to procure extension of the Buffalo & Tonawanda Electric Railway to this place.

BROOKLYN, N. Y.—Brooklyn City will equip all cars with safety fenders.

NEW YORK CITY.—The Twenty-ninth Street Railway Company has been sold under foreclosure, to F. C. Linde, for \$50,689.

PORT JARVIS, N. Y.—A. T. Perry, T. J. Fallon, et al, of Port Jarvis, as a citizen's committee, recommend that the Port Jarvis & Suburban Street Railway, be given rights to build electric railway system in Port Jarvis.

NEW YORK CITY.—Broadway Railway Company consolidating articles gives additional mileage and another name. Those consolidated are the Houston & West Street and the South Ferries Company. Metropolitan Railway Company is the new name. H. H. Vreeland is, of course, president.

AMSTERDAM, N. Y.—Amsterdam Street Railway Company re-elects old board of directors.

BROOKLYN, N. Y.—A committee, consisting of H. B. Hollins, H. Seligman, D. F. Lewis, and S. L. Keeney, decide on consolidation of Long Island Traction Company and the Broadway Railroad Company, of Brooklyn.

GLEN FALLS, N. Y.—A. S. Crabel retires from the superintendency of the Glen Falls & Ft. Edwards electric line. The capital stock of the road has been increased from \$120,000 to \$150,000. A second mortgage has been placed for \$50,000.

NEW YORK CITY.—A bridge across the Kill von Kull from New Jersey to Staten Island is to be built by the Consolidated Traction Company. John D. Crimmins, of New York, represents the builders, and much heavy capital is interested.

ROCHESTER, N. Y.—O. W. Powell, it is said, will build one mile of electric railway to be in operation before July 1.

SYRACUSE, N. Y.—The old Steam, Heat & Power Company, already owning extensive boiler plant, are in the field to compete for furnishing electric power, and perhaps street railway power. The existing company will fight the franchise

NEW YORK CITY.—The Metropolitan Street Railway Company capitalizes at \$8,200,000 and elects H. H. Vreeland, president; D. B. Hasbrouck, vice-president; Hans S. Beattie, treasurer, and C. E. Warren, secretary.

GLOVERSVILLE, N. Y.—The Gloversville Electric Railway and the Cayadutta Electric Railway have consolidated and capitalized at \$350,000.

NEW YORK CITY.—Charles R. Henderson, president of the United States Trust Company, has been elected president of the Metropolitan Traction Company.

TROY, N. Y.—The Gilbert Car Works having finished all contracts have shut down indefinitely until reorganization.

BROOKLYN, N. Y.—The Brooklyn City Railway has some large extensions in mind.

## Ohio.

TIFFIN, O.—The recent decision of the supreme court encourages the Electric Railway & Power Company to put in third rail, relay one rail of the Tiffin Street Railway track, and run its cars over the latter's right of way. Fine points of the law are involved, and a hearing is set for January 27.

TOLEDO, O.—Toledo and Maumee Valley Railroad Company organized to build extensive electric railway system. Capitalized at \$300,000 by W. B. Taylor, Josiah D. Cook, Geo. G. Metzger, Parks Foster and Grant Williams. Principal offices at Toledo. King and Tracy, solicitors.

CLEVELAND, O.—Ohio Construction Company assigns to B. M. Barr. It was incorporated at \$10,000. The assets are \$3,000, and liabilities \$5,500.

SANDUSKY, O.—Receiver J. C. Gilchrist, of the Sandusky, Milan & Norwalk Street Railway, has been discharged.

MIDDLETOWN, O.—Middletown & Madison Street Railway Company is appraised at \$13,507, and Receiver Bundy so notified. One and-a-half miles of track, six cars, all horses and real estate included in estimate.

PORTSMOUTH, O.—The city council have turned the city lighting contract over to the street railway.

TIFFIN, O.—The incorporators of the Tiffin Interurban, as the new road is called, are: Thomas B. Williams, New York City; Charles F. Shaw, New Bedford, Mass.; F. W. Brightman, Fall River, Mass.; Nelson W. Miller, Meshech Frost, Amandus Betts and Rollo W. Brown, Tiffin, and Dr. Rosendale, Fostoria.

FREMONT, O.—Jas. H. Hunt, solicitor, and Louis Gormley, of the Fremont city council, are working at framing a franchise for change of power on the Fremont horse railway.

TOLEDO, O.—The Maumee city council has extended the franchise granted T. B. Brown, John Kumlner and Coleman Keeler. J. K. Tillotson holds the franchise and interest and says that the road will be built next season.

CLEVELAND, O.—Report is generally believed that the Walker Manufacturing Company plant will be turned into an electric railway factory. Bentley and Knight are said to be concerned in the deal, and the combination will be a strong one.

HAMILTON, OHIO.—D. B. Bundy is appointed receiver for the Middletown & Madison Street Railway Company on petition of S. Margrum, trustee.

TIFFIN, O.—The Consolidated promoters will build a line from Tiffin to Melrose and Sycamore, and have increased capital to \$400,000 to raise the money. They will incorporate in a few days. The Tiffin-Fostoria line will operate next spring.

LIMA, O.—Extensive improvements and additions are outlined for the Lima Street Railway during the coming season. Superintendent W. H. Thompson, resigns, to take effect February 1, and will be succeeded by H. M. Ingold, a brother-in-law of the president. Mr. Ingold comes from Pittsburg.

NORWALK, O.—Sandusky, Milan & Norwalk Electric, elects Geo. H. DeWitt, president, and W. E. Gilcher, S. E. Crawford, T. B. Taylor and J. D. Parker, as a committee to take charge of affairs, buy supplies and act as superintendent. The line is to be extended early in the spring.

ZANESVILLE, O.—Messrs. Chapman and F. A. Sieberling, of Akron, Ohio, are prime movers in the street railway and light proposition for Zanesville and claim that active business will begin soon. A big power plant will be built.

COLUMBUS, O.—Columbus & Clintonville Electric Railway and the Worthington lines, are said to be about to consolidate.

DAYTON, O.—The City Railway, a combination of the former lines, asks stockholders to vote on a proposition for \$600,000, 6 per cent bonds, which sum is to be used in equipping it with electricity; Wm H. Simms is secretary.

COLUMBUS, O.—Tiffin, Fostoria & Norwalk electric railway organized at \$300,000 by Thomas B. Williams; Charles F. Shaw, N. W. Miller, M. Frost, A. Betts, R. W. Brown and T. R. Rosendale.

WOOSTER, O.—The city council takes action, instructing the city solicitor to forfeit the \$5,000 bond given by O. H. Barr, of Cleveland, to secure a street railway franchise in the town.

NORWALK, O.—Treasurer A. W. Prout, of the Sandusky, Milan & Norwalk Electric Railway, has sold eighty-three shares of stock at \$50. This is the remaining stock, and the work of construction will now go on smoothly.

NORWALK, O.—J. H. Stewart, of the Lake Erie Engineering Company, from Sandusky, has been here looking up possibilities for an electric railway in the southern part of the county. Attorney J. H. Williamson is the local enthusiast and promoter.

NILES, O.—Superintendent Honecker resigns and is succeeded by Mr. Donnell.

## Oklahoma.

PERRY, OKLA.—G. E. Clafin, of Kansas City, has gained an electric light franchise at Perry.

## Oregon.

PORTLAND, OREGON.—It is said by men who ought to know, that the General Electric Company, of Portland, is about to build new lines and extend old ones, until a continuous electric road is finished, via Oregon City to Astoria. Water power is to be used, and freight is to be carried principally. The Southern Pacific has the money that backs the scheme.

East Side Street Railway goes to Jos. Simons, as receiver. Creditors: Northwest General Electric, German Loan & Savings Association, of San Francisco.

## Pennsylvania.

McKEESPORT, PA.—The Dravosburg Electric Street Railway Company will build immediately four and one-half miles of railway. The company is capitalized at \$27,000, and the officers are: Herman Laub, of Pittsburg, president; directors, Ira J. Wilson, James P. Wilson, of Pittsburg, and Homer H. Swaney, of McKeesport. This line, it is asserted, will connect with the Second Avenue, Pittsburg, line at Homestead, making a continuous electric line from McKeesport to Pittsburg. The latter road will cross the river by a bridge to be built by the Glenwood Highway Bridge Company at or near Glenwood, in order to get into Homestead.

NEW CASTLE, PA.—The planing mill and machinery of the New Castle Car Manufacturing Company were destroyed by fire December 21, but will be immediately rebuilt and operating within thirty days. They are in the market for a new engine and machinery equipment. F. A. Hoyer is the manager, and will receive bids.

PITTSBURG, PA.—The Braddock street railway is about to be revived, the road supervisors agreeing to the demands of the line.

PITTSBURG, PA.—Pittsburg Elevated Railway Company is chartered at \$100,000, to build a ten mile line from Pittsburg to Wilkinsburg. John H. Dalzell is President. The directors are Joshua Rhodes, W. B. Rhodes, G. B. Hill, J. D. Nicholson, R. S. Frazer and A. M. Neeper. The Northside Elevated Railroad Company, capital, \$50,000, was also chartered with Mr. Dalzell, president, and G. B. Hill and Joshua Rhodes directors.

POTTSTOWN, PA.—The Pottstown, Boyertown & Reading Electric Railway has let its contract for the line between the first named place at \$100,000 for the seven miles. The officers of the company are: President, James B. Craighead, Philadelphia; Secretary, Mahlon G. Taylor Pottstown; Directors, James B. Craighead, J. M. Zook, Philadelphia; Charles K. Spatz, Boyertown; Mahlon G. Taylor, Pottstown.

PHILADELPHIA, PA.—It is said that the Fifth and Sixth Streets Passenger Railway Company will make a trial of compressed air on the North American Pneumatic Car Company's plans, invented by Frank H. Cathcart. The Traction Company operate the line, and the majority think that the compressed air talk is "all wind."

PITTSBURG, PA.—It is reported that Geo. W. Elkins will retire from the active management of the Pittsburg & Duquesne Traction on account of age. His son, W. L. Elkins, will succeed as president, but superintendent McDowell will be active head.

ALTOONA, PA.—Altoona & Logan Valley Railway power house burned, with total loss of machinery and ten cars, on December 21. Value of property destroyed, \$25,000.

PITTSBURG, PA.—Reports that the Duquesne Traction Company wants to break its ninety-nine-year lease with the Pittsburg Traction, vigorously denied.

### Rhode Island.

PROVIDENCE, R. I.—Interstate Street Railway Company goes into the hands of receiver. William G. Roelker, of the United Traction Company of New York asks it. Cornelius Sweetland is the receiver. The Interstate will be absorbed, probably, by the Union Company. Many franchises have been obtained but not many operated. President Daggett alleges the hard times as the cause of the failure.

PROVIDENCE, R. I.—January 2 the plant of the Inter-State Street Railway Company, at Farmersville, was destroyed by fire. Loss, \$100,000; insurance, \$60,000. One hundred men are thrown out of work.

### Tennessee.

NASHVILLE, TENN.—United Electric Railway Company elects officers as follows: T. W. Wrenne, President; M. M. Gardner, Vice President; E. G. Connette, General Manager; G. W. Cunningham, Secretary and Treasurer. Mr. Gardner takes the place of Isaac T. Rhea, who resigned from the board of directors.

NASHVILLE, TENN.—The United Electric Railway has been placed in the hands of the Nashville Trust Company and Thomas W. Wrenne as receivers. Hard times seem the cause of the failure. The earnings for 1892 reached \$342,000 and in 1893, \$334,000. The line embraces 50 miles of track, and is in good mechanical condition.

MEMPHIS, TENN.—W. R. Hall, general manager, is appointed receiver for the Raleigh Springs suburban line. Assets, \$384,000; liabilities, \$138,718. Principal creditors, local banks, General Electric Company and B. L. Drake, of Durham, N. C.

CHATTANOOGA, TENN.—Mr. Adams, of Corinth, Miss., succeeds S. W. Devine as president of the Chattanooga Electric Railway. A rumor that superintendent Young is to resign, is without foundation.

NASHVILLE, TENN.—T. M. Steger, and one Mr. Bannard, of New York, have gained control of the Rapid Transit Company. The line is a valuable one. Improvements will be made at once.

WINCHESTER, TENN.—Winchester, Paint Rock & Tennessee River Electric Railway elect Ellis Days, president.

### Texas.

DALLAS, TEX.—Stables and barns of the Consolidated Traction Company burn, destroying 30 cars and 60 mules. Receiver S. P. Cochran, places the loss at \$55,000; insurance, \$31,000.

WACO, TEX.—A. Zintgraff, Denison, is elected president of the Texas Street Railway Association. A theater circuit is agreed upon, to open May 1 and close October 1. Adjourned to January 24 at San Antonio.

### Utah.

SALT LAKE CITY, UTAH.—H. M. McCartney is granted a franchise for an electric or cable railway north-west from Capitol Hill. Two other franchises were quashed, and it is doubtful if the one passed will stand unless amended.

OGDEN, UTAH.—The pioneer Electric Power Company, of Ogden, has its ordinance passed.

### Washington.

SPOKANE, WASH.—The Chelan country is said to be about to boom, a the Northern Pacific and the Great Northern are both to put in branch lines, and interconnect with electric railways.

PORT TOWNSEND, WASH.—Dan Starrett has bought the street railway here and is improving the line considerably.

### West Virginia.

PARKERSBURG, W. VA.—Parkersburg Street Railway Company, horse, has sold its franchise to the American Construction Company of Boston. It will be changed to electric and \$200,000 expended on it before May 1st.

### Wisconsin.

MADISON, WIS.—W. H. Lamprecht, of Cleveland, O., is elected president of the Street Railway Company, and H. C. Welch secretary and treasurer, Geo. H. Shaw, superintendent. The directors recommend continued improvement of the line.

OSHKOSH, WIS.—E. E. Stevens, G. C. Tyrrell and A. C. McComb are officers of a real estate men's organization, to see that the town has an electric railway line by next year.

MILWAUKEE, WIS.—The formality of electing officers for the Hinsey line has been gone through. The Villard people, H. C. Payne, et al., were made managers.

FT. HOWARD, WIS.—It is rumored that Edward Morton, of New York, wants to build a street railway here, and to connect with Green Bay.

## NORTHWESTERN ELECTRICIANS.

The Northwestern Electrical Association will be held January 17-18, at Milwaukee, at the Hotel Pfister. A number of interesting papers will be presented. W. W. Low, of Chicago, will discuss "New Things in Electricity;" Prof. D. C. Jackson, Madison, "Essential Station Instruments;" "The Economical Use of Transformers;" W. Foreman Collins and P. J. MacFadden, Chicago; "Corliss Compound Engines;" E. L. Debell, Sheboygan; "Advantages of Direct Connection," W. N. Stewart, Chicago; "How Shall Members Buy Supplies," H. C. Thom, Madison.

### Only One Night Out to Florida.

The morning train via the Monon Route connects at Cincinnati with the 7:00 p. m. Through Vestibuled Train, on the Queen and Crescent Route, reaching Jacksonville at 10:50 p. m. the following day. The service of this popular line is unsurpassed by any line to the South. For rates, address City Office, 232 Clark street, Chicago, or Frank J. Reed, G. P. Agt., Monon Block, Chicago.

## PATENT OFFICE GOSSIP.

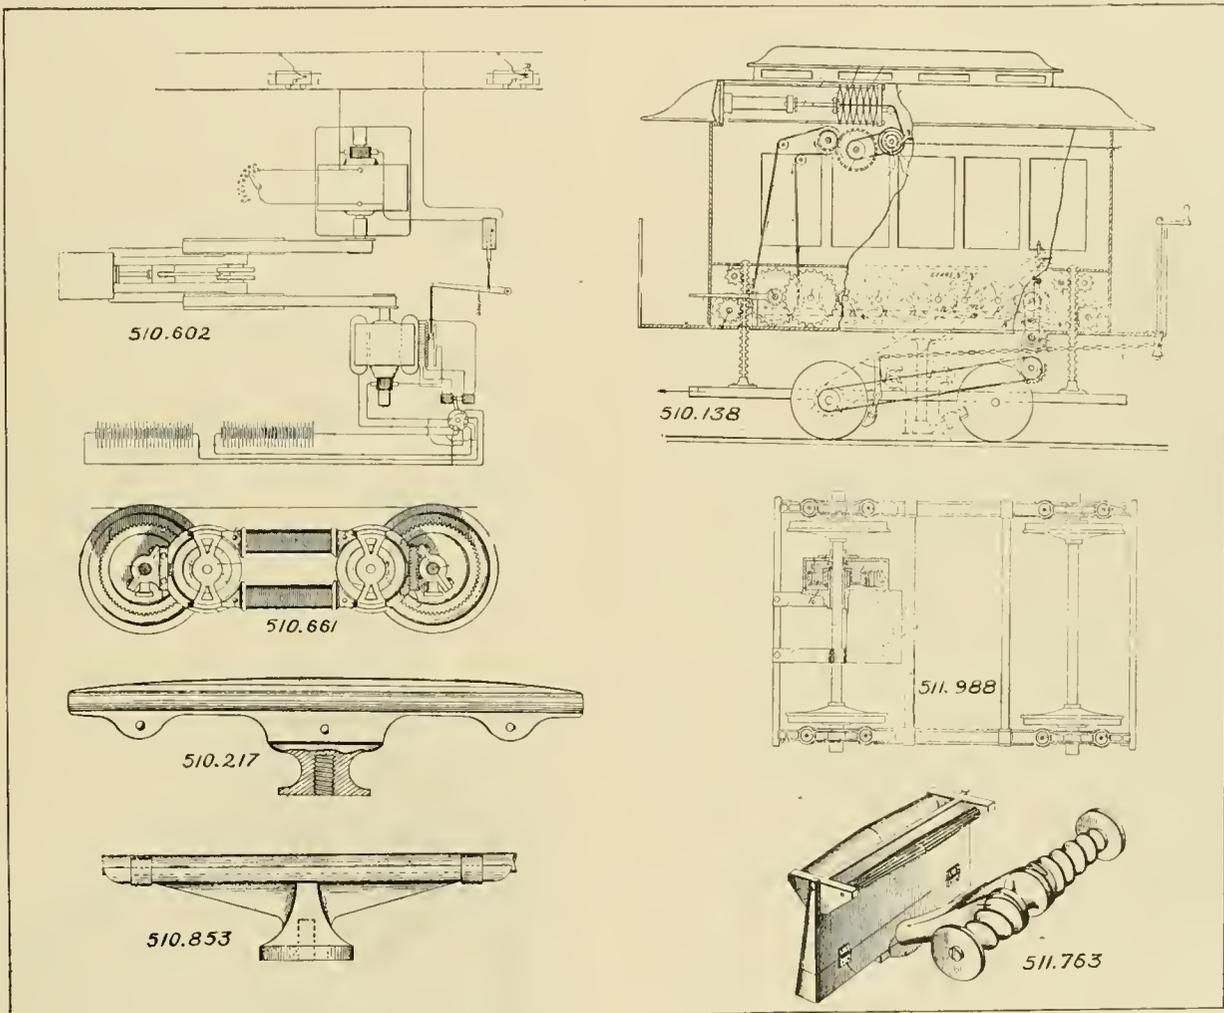

THE REVIEW said last month that the monthly list of fool inventions in the street railway field was steadily on the decrease. While we still believe this to be true there is occasionally an issue that shakes this optimistic view of affairs. This occurred when our eyes were for the first time feasted on the drawings of Number 510,138. After recovering from the dizzy feeling that the first glance caused, it appeared that it is an automatic governor and brake combined, with a spring motor for storing up energy when going down hill. It can safely be said that the novelty of this patent will never be questioned. There has never been anything like it.

THE support for trolley wires, (510,217), invented by Mr. Walker, of Denver, is a trolley clamp, which is not without merit, although it dif-

CHAS. F. WINKLER'S electric car truck, (510,661), has been attracting considerable attention, recently, because of its having been put on the market. It consists of two armatures revolving in a single magnetic circuit. See illustration.

THE electric locomotive (510,947), is the same as the foregoing, except that the field magnets are flexibly jointed to allow of independent motion of the armatures on a flexible truck.

THE Columbia & Donegal Street Railway Company, of Columbia, Pa., wishes to make the line a regular United States postal route. Frank S. Given, the live superintendent, is pushing the matter.

fers radically from those now in use. The wire is entirely enclosed by the clamp instead of being left bare on the under side, as is usual. The lip *d* is intended to provide a smooth path for the wheel over the clamp. With the clamp entirely surrounding the wire, it is almost impossible for the wire to drop out.

MR. HUNTER'S dynamo electro regulator, (510,602), is a novel method of utilizing storage batteries in central stations. The engine is connected to two machines, one of which is a motor, the other the regular railway generator. When the load is below average a part of the generator current is charging a set of secondary batteries. When load rises above average an automatic switch worked by the current flowing to the trolley line turns the battery current into the motor so that it helps the engine.

A DESCRIPTION of 510,469 can be found in the REVIEW for October, 1893.

THE SAFETY BRAKE SHOE COMPANY, of Boston, W. W. Whitcomb president, reports constantly increasing demand for their composite brake shoe, and have shown us abundant evidence that a great many street railways are adopting it for their standard shoe. The company has made arrangements with Wm. E. Tucker, 130 Main street, San Francisco, for the manufacture and sale of their shoes on the Pacific coast. They have also established an agency with Arthur S. Partridge, Bank of Commerce building, St. Louis, and will undoubtedly have one in Chicago before long. The company's office in Boston is at 620 Atlantic avenue.

## STREET RAILWAY PATENTS.

Compiled by the Street Railway Review.

ISSUED DECEMBER 5, 1893.

Car fender, Frederick W. Brown, Cambridge, Mass.....	509,996
Conduit electric railway, William R. De Voe, Shreveport, La., assignor of seven-twelfths to C. W. Dawley, Dallas, Tex., and Patrick B. Cash, Shreveport, La.....	510,061
Emergency wagon for electric line work, Edwin S. Breed, Water- bury, Conn.....	510,113
Street car, Henry W. Hooton, Salt Lake City, Utah.....	510,138
Conduit railway trolley, Paul C. Just, Chicago, Ill.....	510,142
Cable crossing, William W. Bailey, New York, N. Y.....	510,151
Trolley and trolley switch, David V. B. Smart, Troy, N. Y.....	510,201
Support for trolley wires, James E. Walker, Denver, Col.....	510,217
Sanding device for cars, Herbert H. Hennegin, St. Louis, Mo.....	510,258
Electrically operated railway switch, Henry L. Falco, Brooklyn, N. Y.....	510,384

ISSUED DECEMBER 12, 1893.

Crossings for railways and tramways, John E. Billups, Cardiff, England.....	510,399
Cable tramway, William N. Colam, London, England.....	510,469
Trolley wire support, Leroy F. Pfouts, Canton, O.....	510,485
Signal for cable roads, Margaret A. Edwards, San Francisco, Cal., administratrix of Edward W. Edwards, deceased.....	510,593
Dynamo electric regulator for an engine driving a generator, Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company of Connecticut.....	510,602
Electric railway conduit, William R. De Voe, Shreveport, La.....	510,634
Conduit electric railway, John P. Michieli, San Francisco, Cal.....	510,647
Electric car truck, Chas. F. Winkler, Troy, N. Y.....	510,661

ISSUED DECEMBER 19, 1893.

Elevated railway system, Burr F. Barnes, Circleville, O.....	510,878
Fender for street cars, William B. Miles, Holyoke, Mass.....	510,922
Electric locomotive, Chas. F. Winkler, Troy, N. Y., assignor to the United Columbian Electric Company of New Jersey.....	510,947
Electric railway switch and crossing, William W. Hendrix, Bowl- ing Green, Ky.....	511,01
Electric railway trolley, William W. Hendrix, Bowling Green, Ky.....	511,018
Electric railway trolley, William W. Hendrix, Bowling Green, Ky.....	511,019
Street railway track, William C. Wood, Brooklyn, New York, assignor to the Lewis & Fowler Girder Rail Company, same place.....	511,068
Signal for cable railways, Joseph Sachs, New York, N. Y.....	511,163
Electrically operated railway switch, Chas. A. Stone, Newton and Edwin S. Webster, Boston, Mass.....	511,173
Elevated railway, John N. Valley, Jersey City, N. J.....	511,179
Electric regulating switch, Edwin A. Barber, Watertown, N. Y.....	511,187
Sanding device for cars, James R. Dougherty, St. Joseph, Mo.....	511,199
Closed conduit electric railway, William S. Smith, Berkeley, Cal.....	511,254
Power transmitting and speed regulating mechanism, William Cooper and Geo. P. Hampton, Minneapolis, Minn., assignor by mesne assignments to the Cooper-Hampton Electric Company, same place.....	511,289

ISSUED DECEMBER 26, 1893.

Cleaning device for railway conduits, John C. Love, Philadel- phia, Pa., assignor to the Love Electric Traction Company, Chicago, Ill.....	511,341
Conduit railway trolley, John C. Love, Chicago, Ill., assignor to the Love Electric Traction Company, same place.....	511,342
Trolley for conduit railways, John C. Love, Chicago, Ill., assignor to the Love Electric Traction Company, same place.....	511,343
Trolley wire crossing, Henry Geise, Philadelphia, Pa., assignor one-half to Edwin Jaquett Sellers and Horace Pettit, same place.....	511,419
Automatic railway switch, Chas. S. Hoenes, Milwaukee, Wis.....	511,425
Life guard for street cars, Chas. W. Howe, Waltham, Mass.....	511,428
Electric locomotive, John G. McCormick, Louisville, Ky.....	511,448
Conduit for electric railways, Henry D. Oler, Paterson, N. J.....	511,452
Car fender, George E. Cates and Diederrech Reuschenberg, Brooklyn, N. Y.....	511,586
Cable railway, Charles I. Earll, New York, N. Y.....	511,596
Cable railway, Charles I. Earll, New York, N. Y.....	511,597
Fender for street cars, David Flanders, Watertown, Mass.....	511,604
Radial car truck, Louis J. Hirt, Boston, Mass.....	511,615

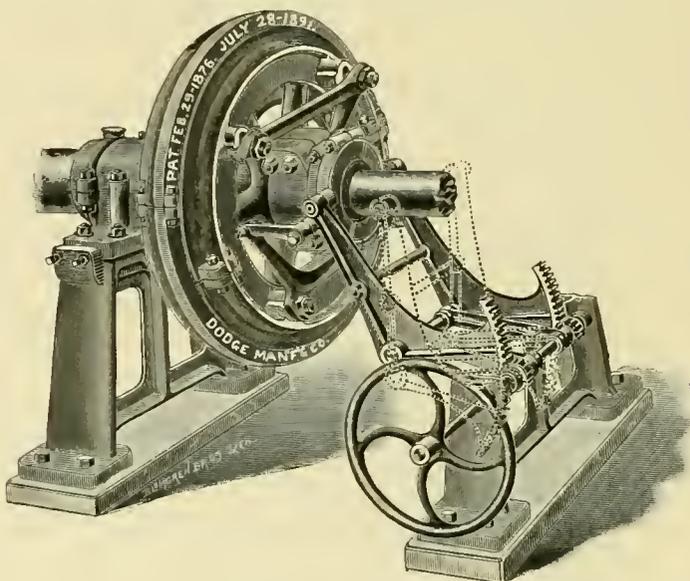

Electric railway switching mechanism, Chas. J. Kintner, New York, N. Y.....	511,627
Trolley base, James L. Maudlin, Cleveland, O., assignor of one- half to Frank J. Lewis, same place.....	511,634
Car fender, James W. McKinnon, New York, N. Y., assignor of two thirds to Sarah B. McLeod and Ann M. Downs, same place.....	511,640
Motor for cars or other purposes, David P. Sanders, Williams- port, Pa.....	511,652
Truck frame for motor cars, Chas. E. Canfield, Chester, Pa., assignor one-half to Henry Cochran, same place.....	511,680

ISSUED JANUARY 2, 1894.

Trolley, William T. Duncker, Steelton, Pa.....	511,763
Trolley mechanism for electrically propelled vehicles, Curtis H. Veeder, Lynn, Mass., assignor to the General Electric Com- pany of New York.....	511,824
Street railway special work, William C. Wood, Brooklyn, N. Y., assignor to the Lewis & Fowler Girder Rail Company, same place.....	511,831
Trolley wire support, Chas. T. Lee, Boston, Mass., assignor to the Johns-Pratt Company, Hartford, Conn.....	511,853
Electric locomotive for elevated tracks, Charles H. Roberts, Hart- well, O.....	511,862
Section insulator, Henry M. Brockbank, Brooklyn, N. Y.....	511,928
Trolley catcher, George E. Gay and John H. Parsons, Augusta, Me.....	511,941
Electric locomotive, Edward M. Bentley, Boston, Mass.....	511,988
Roadway and vehicle therefor, Elmer O. Evans, Boston, Mass.....	512,174
Safety guard for railway cars, William J. Foster, Hoboken, N. J.....	512,181
Overhead trolley wire switch, George W. Mackenzie, Moses B. Sloan and Thomas C. Sloan, Beaver, Pa.....	512,201

## THE DODGE CLUTCH SHIFTER.

The Rice Machinery Company has upon the market a new gear, made by the Dodge Manufacturing Company of Mishawaka, Ind., for moving friction clutches into and out of action. It is particularly adapted for floor stands but can be used on independent standards. Reference to the engraving tells the story of the action. The trun-

DODGE CLUTCH SHIFTER.

nions in the Dodge shifter are held in bearing holes in the end of the bell crank arms, which are part of a rigid frame. These bell crank arms, with the links that tie them to the pinion shaft, constitute a clutch that increases in power as the resistance increases. The bell crank arms end outwardly in a gear segment, meshing with pinions that are easily and firmly operated by a hand wheel.

**ECHOES FROM THE TRADE.**

SARGENT & LUNDY, with present work, are very busy. The Harrison street lighting station absorbs the most of Mr. Sargent's time.

THE FALLS RIVET & MACHINE COMPANY says with a smile, "Two or three big orders in view; will see you later on the subject."

ROBERT WETHERILL & Co., Chester, Pa., will make eight Corliss engines and ten boilers for Philadelphia, Pa., Traction Company.

THE RIES ELECTRIC SPECIALTY COMPANY, of Baltimore, reports business exceedingly good, and their factory running day and night.

THE Chicago agent of the Ball Engine Company, Mr. McBrier, says that he looks forward to an awakening of business within the next few months.

THE American Electrical Works, of Providence, R. I., are now established in their new quarters at East Providence and find every convenience there.

TAYLOR, DEE & MACK, formerly Taylor, Goodhue & Ames, of 348 Dearborn street, begin the new year with bright prospects and an increased clientage.

AMONG recent changes by addition, we note that J. W. Parker & Co, 41 North Seventh street, Philadelphia, will act as sales agent for the Ball engines, of Erie, Pa.

PECKHAM'S truck has been distinguished lately by a description in the London paper, *Engineering*. Coming from such a source, this may be considered a great compliment.

WILEY & PHELPS, at 1422 Monadnock, will handle the De Laval steam turbine and electrical goods. The firm is well known to the electrical fraternity and will be well received.

WALTER S. MCKINNEY, 225 Dearborn street, was the captor of the power plant contract for Sandwich, Ill. The bid calls for two horizontal tubular boilers, pump, injector, heaters, and engine of 120-horse-power.

THE ALTOONA MANUFACTURING COMPANY, which makes the Green automatic cut-off engine, has issued a striking bit of literature in the form of a folder, containing descriptions of the engines and users of them.

THE CONSOLIDATED CAR HEATING COMPANY have begun suit against the Chicago & West Michigan Railroad for infringement of the Sewall hose coupling used on the steam heating apparatus of the latter's cars.

BABCOCK & WILCOX have settled their Western offices in an elegant suite in the Masonic Temple, where Mr. Palmer sways the sceptre as of yore. The offices are much more convenient, light and agreeable than the old stand.

THE GENETT AIR BRAKE COMPANY, Chicago, has not stopped stopping cars. The good reports of the efficiency of the Genett brake are unvarying, and a constant stream of enquiry keeps the office as busy as the proverbial bee.

THE AMES IRON WORKS reports from its western agent, W. E. Jones, at 18 South Canal street, that business is as lively as can be expected under the circumstances, and that the prospects for the Ames engines in the near future are bright.

THE CONSOLIDATED CAR HEATING COMPANY, Albany, N. Y., has received a second order from England for direct steam storage heating equipments. These equipments are so arranged that the temperature in each compartment can be separately regulated.

J. S. DENNISTON, 911 Monadnock Building, says, that the Nuttall gears and pinions are still holding their place with the western trade, and that the Davis car shade is the coming feature of western cars; a recent order from a prominent car builder called for 300 of them.

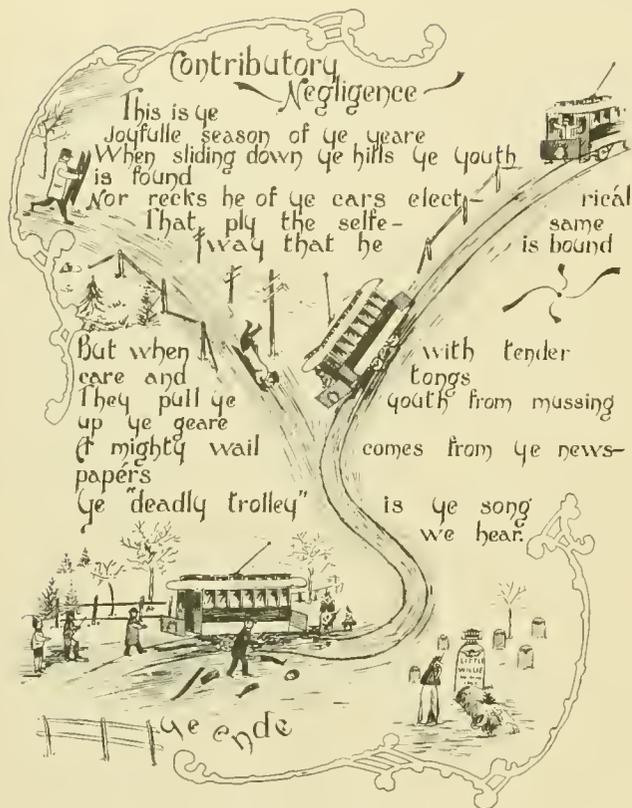

THE CARD EQUIPMENT COMPANY, of Mansfield, Ohio, is the latest bidder for street railway patronage. The company is said to be well backed for the manufacture and sale of the apparatus designed by Geo. F. Card, and the specialties will include street railway motors and equipment.

THE M. C. BULLOCK MANUFACTURING COMPANY, 1170 West Lake street, Chicago, is making rapid progress toward the marketing of the Willan's Central Valve Engine, a description of which was given recently in the *REVIEW*. The enquiries received show that interest on the subject has been wide-spread.

WILLIS L. ADAMS, 84 Adams street, hopes for better times in the near future, and thinks himself as well blessed in the matter of trade as anyone. A fire in the building recently caused the firemen to bring a hose through Mr. Adams' office, which mussed up his new carpet and smashed his door glass.

A. G. HATHAWAY, of Cleveland, has just shipped four of his well-known transfer tables to London, Eng., six to various points in South America and one to Paris. The latter will be equipped with General Electric motors. Few American street railway specialties are known to a wider circle than the Hathaway transfer table.

GOODHUE & LINCOLN, at 1564 Monadnock block, are new dealers in electrical material. Mr. Goodhue was formerly of Taylor, Goodhue & Ames. The firm handles Wagner motors and dynamos for direct and alternating currents. Mr. Lincoln is well known to the telephone and railway fraternity, and comes from the Hub.

THE STANWOOD MANUFACTURING COMPANY, Chicago, has a recent order for fifty car equipments of the well known Stanwood steel step. The success of the Stanwood step as an accident saver, and consequently as a dividend saver, is too well known to require much mention beyond that fact that more managers than ever appreciate the fact.

THE GENERAL ELECTRIC COMPANY, in common with the smaller concerns, finds railway business quiet, but expects a large increase of trade within a month or six weeks. The unusual caution of street railway financiers and the hard times, combine to arrest the progress of railway building for the present. The subject of elevated electric railways is the present subject under the most interesting discussion.

THE STANWOOD MANUFACTURING COMPANY has the best of reports from the use of the Stanwood steel step, and the opinion of managers of the larger roads in adopting them speaks volumes for the economy and comfort of knowing that the passenger's foot has a firm foundation, no matter how careless the owner of the foot may be. A single order to equip fifty cars was one of the features of the past week.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY reports little doing in large enterprises for the immediate future, but otherwise the business is as good as can be expected under the circumstances. The future for supplies will be one grand rush when everything about the repair shop and supply room has been used up,

and summer traffic requires more cars and facilities. The lighting business is reported active in certain directions.

THE ELECTRIC RAILWAY EQUIPMENT COMPANY, of 81 and 83 East Front street, Cincinnati, in placing a handsome bronze electric car on the editorial desk, says: "In presenting our compliments of the season, we beg to place on your desk one of the products of our foundry, in the shape of a souvenir paper weight, trusting that it may hold down many pleasant lines which help make up for you a Merry Christmas and Happy New Year."

WARREN WEBSTER & COMPANY'S agent, W. D. Pickels, says that the Webster vacuum feed water heater and purifier business is booming, and that greater interest than ever is being taken in the subject of feed water purification. Several recent equipments of electric plants of from 1,500 to 4,000-horse-power have been installed. The inland power users are waking up to the economy of recent methods, and the Webster vacuum heater and purifier is doing its best to hurry forward the procession.

THE COMPLETE ELECTRIC CONSTRUCTION COMPANY has established its western office, under the well known engineer, Clift Wise, at 1,401 Monadnock Block. The company takes contracts for complete construction of street railway plants, and has a complete corps of engineers and experts. The main offices are at 121 Liberty street, New York. The president and general manager is John A. Seeley; vice-president, W. H. Baker; secretary-treasurer, C. O. Baker, Jr., and auditor Mills H. Landon.

THE Laconia Car Company, Laconia, N. H., among the largest builders of steam railroad equipments in New England, are now building street railway cars of all kinds, electric, cable and horse. The reputation of this company as builders of highest grade of cars is sufficient proof that their street railway cars will be of the very best workmanship. Their facilities are unsurpassed for turning out cars at low prices, and giving prompt and reliable deliveries. The company employs between 600 and 700 men, and has the best skilled labor. Their street railway department will be in the charge of F. E. Huntress, 8 Oliver street, Boston. The Laconia Car Company will build according to specifications, or will duplicate any cars now in service to the satisfaction of patrons.

THE STANDARD PAINT COMPANY, of New York City, begins the current year with bright prospects, judging from their past record for the recent depression. They write: Notwithstanding the exceeding depression of business this year, we have sold more P. & B. compound, tape, and armature varnish to street railways than any previous year, which shows that the electric roads appreciate our material. We have this year supplied a very large number of electric roads in the United States

W. C. BAKER, 143 Liberty street, New York, the inventor of the Baker street car heater, is adapting a hot water system for street railways.

THE HEINE SAFETY BOILER COMPANY, of St. Louis, has, among recent orders, a commission for eight boilers of 375-horse-power each, for the Midwinter Fair.

OUR Milwaukee correspondent says that the Milwaukee Street Railway Company has five Lewis & Fowler sweepers, and that the tracks are kept in splendid condition.

THE P. WALL MANUFACTURING COMPANY, of Pittsburg, is doing a good business. A recent shipment to Australia shows that foreign roads appreciate the dulcet tones of the Wall gong.

SAMUEL LEWIS, 10-18 Larrimer street, Brooklyn, N. Y., is the maker of wood mats for street cars that are used by half a dozen big builders. The mats are convenient, strong and cleanly.

THE VALLEY STEEL COMPANY, of Belleville, Ill., is the successor of the Belleville Steel Company, which failed recently. The new concern is capitalized at \$400,000 and began running with 800 men.

A. E. DEMANGE, one of the projectors of the Peoria-Pekin Electric Railway scheme, has bought the McLean County Fair Grounds and all its buildings, paying for it \$9,050. He will turn it into a summer resort for the railway.

THE R. A. CRAWFORD MANUFACTURING COMPANY, of Pittsburg, has reason to be proud of the reception of their fender accorded by the many different roads now using them. Second orders have been given in every case, and the universal word is, that the saving in accidents compensates the expense of their application.

WM. HAZELTON, III., has opened offices in the Have-meyer building, New York, as the agent for the United States of the Societe Anonyme Industrielle des Etablissements Arbel, Rive-de-Gier (Loire), France. The company makes wrought iron and forged centers for all kinds of wheels and had an extensive display at the World's Fair. The Arbel wheels are to be congratulated upon their introducer.

F. R. CHINNOCK, who for the past two years has been the general eastern agent of the Ball Engine Company, of Erie, Pa., has resigned his agency with that company and will again enter the electrical field, in which industry he was so long and successfully identified. Mr. Chinnock will surely be successful in the larger and broader field of electricity, in which line he was formerly known as the agent of the Edison General Electric Company for eight years.

## PERSONAL.

TREASURER D. C. McMARTIN, of the Austin Dam Railroad Company, of Austin, Tex., spent the holidays in Des Moines, Iowa.

WILLIAM ERSKINE has been elected president of the Wheeling Railway Company, Wheeling, W. Va., vice Judge J. J. Jacobs, deceased.

THE daughter of P. E. Hall, the street railway owner, of Cedar Rapids, Iowa, is announced as engaged to Charles W. Higby, of Minneapolis.

O. J. WINN, the manager of the Grand Island, Neb., Street Railway, was presented with a magnificent gold watch by his employes on Christmas.

JAMES S. HAGERTY, of Baltimore, a prominent director of the Traction Company, was married last month in Chicago to Mrs. Marie Lawrence, of the latter city.

THE retiring assistant superintendent, M. E. McCaskey, of the Birmingham Traction Company, of Pittsburg, was presented with a beautiful diamond ring and pin by his employes, January 1.

E. M. CAMPBELL, superintendent of the Ottumwa, Iowa, street railway, and Miss Rose Metzger, of Independence, Kansas, were married Christmas Day, at the home of the bride's parents.

G. J. MELMS, formerly receiver of the Hinsey street railway line, of Milwaukee, has left for Europe. to be absent about six weeks. He will go to Switzerland, and Mrs. Melms will return to Milwaukee with him.

D. W. HIGGINS, for five years president of the Victoria, B. C., Electric Tramway & Light Plant, has been succeeded by Major C. T. Dupont. Mr. Higgins resigned to give all his attention to the electric light part of the concern.

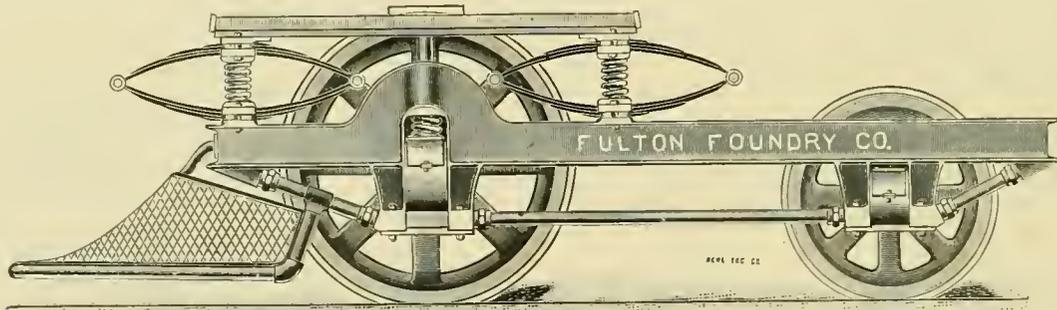

BEN WILLARD, of the construction engineering force of the General Electric and Thomson-Houston Companies for the past eight years, has accepted the post of constructing engineer of the New Orleans City & Lake Railway Company and assumes the office January 1.

JOHN D. CRIMMINS has a hobby for collecting autograph letters. He also is an enthusiast on the history of New York city, and intends to write a history of the metropolis, before many years, and then give his already magnificent collection of data to a library or institution.

THE Consolidated Traction Company, of Newark and the South Orange & Newark Railroad Company, have entered into a binding agreement to withdraw all passes. At least 1,000 such favors were in use. If there are any persons legally entitled to free rides the companies will supply them with new 5-cent pieces.

## FULTON "IMPERIAL" TRUCK.

The Fulton Truck & Foundry Company is the successor of the well known Fulton Foundry Company, of Cleveland. In addition to its works at Cleveland, a plant is now being erected at Mansfield, O., for the manufacture of trucks, crossings, switches, and other street railway supplies. The latter plant will be very complete. Not the least interesting of the new developments in connection with this company is the announcement of two new steel trucks. The Fulton people have previously made only wooden trucks, and still make them, but will now be able to give their customers the advantage of a choice between the two kinds.

DOUBLE STEEL TRUCK "IMPERIAL."

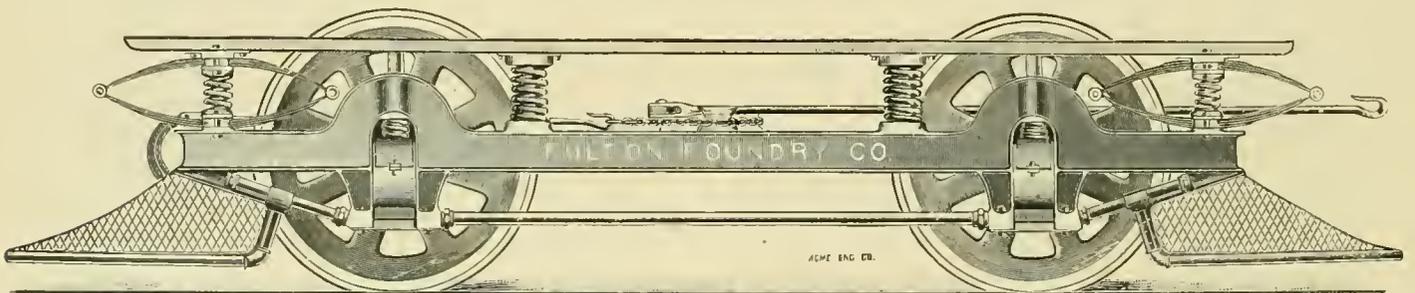

The "Imperial" steel trucks are the design of the president and general manager, W. E. Haycox, of thirteen years experience in street railway work. Both the single and double trucks are here shown. The main frames are cast steel I beams, cross connected with rolled steel I beams, the joints being made with fish plates and rivets. The side frames of cast steel are bent at the corners, and joined to the rolled steel cross beams about ten inches from the corner, making the joint on a straight line, and the truck much more rigid than if it had corner joints. The pockets for receiving the springs and the lugs for the under truss are cast with the frame. In fact, very few bolts and rivets are used in the assembling of

The strong and simple form of fender put on these trucks is also shown in the engravings. A new equalizing brake is used on single trucks, and when desired, trucks are supplied with double tread wheels, having separate brake rims. It is claimed that the practical use of these demonstrates the theory that the brake shoe on the ordinary wheel shortens that wheel's life 60 or 75 per cent.

## MONTREAL PARK AND ISLAND RAILWAY OPENED.

January first was the date of the trial trip on the Montreal Park & Island Railway. The road is at present laid between Montreal and Sault au Reccollet, on the north

side of Montreal Island. It is the intention to make it a belt line, completely encircling the island. There is good prospect that the project will be a paying investment, as it taps the suburban territory of Montreal, and it is the intention to carry freight and all kinds of supplies to the residents of the district. This freight business alone will made a large item of income, as the present rates are very high. With this road reaching every town on the island, development will undoubtedly be rapid. The system, when completed, will comprise 125 miles of track. Those present on the trip were the Hon. J. R. Thibaudeau, W. S. Williams, managing director, A. J. Corriveau, R. Stanley Bagg, A. E. Lewis, James Quinn,

SINGLE STEEL TRUCK "IMPERIAL."

this truck. The combination coil and elliptic springs at the end are adjusted to prevent strain on the elliptics, by having the spirals take the greater part when the elliptics have reached the point of overload. A heavy steady pin runs from the subsill over the journal box into the main frame. This is one of the prominent features of the Fulton trucks, and contributes not a little to their success.

Roy and Marble, the engineers in charge of the construction, and the press representatives.

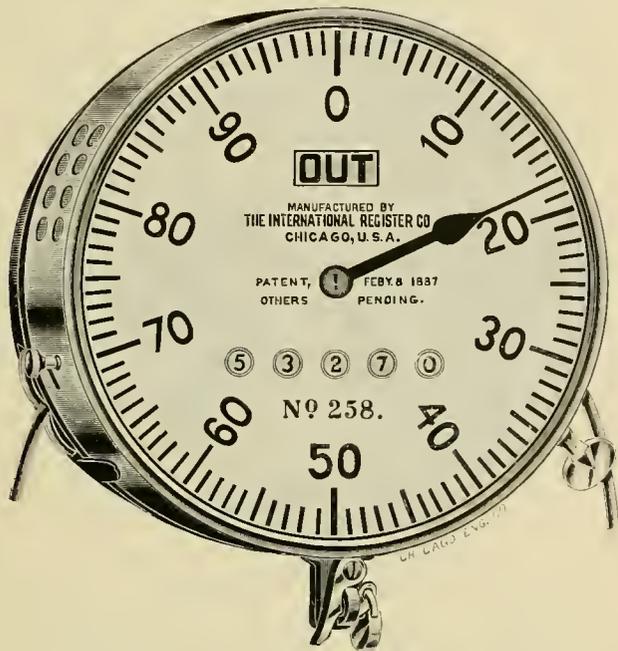

PHILADELPHIA's new trolley lines on Thirteenth and Fifteenth streets report traffic augmented one hundred per cent. Many are curiosity riders. It is reported that the cable line will be electrified next year.

AN ALUMINUM REGISTER.

The man who said that the next age would be the Aluminum Age probably had a prophetic eye on the elegant fare register made by the International Register Company, of 300 Dearborn street, Chicago, and illustrated herewith. It is called "The Aluminum."

It may be seen from the engraving that the register is of double clock face, stationary, design, having a permanent register, with a capacity of 100,000, and a trip register, capable of being turned back to zero.

The permanent register is made entirely of cut gears, without spring or pawls, thus giving strength and durability. It cannot possibly be moved backward or for-

THE ALUMINUM.

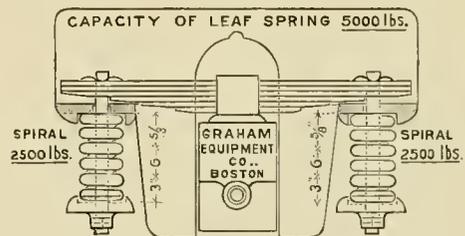

ward without pulling the cord, and actuating the entire mechanism. The makers claim that even if the case, dial and all be removed, the total cannot be changed except as described, an advantage not requiring discus-

from ringing up fares accidentally when meaning to signal the driver, as it will not operate with a short, quick jerk. Pure aluminum dials make the register's face a pretty and durable one, retaining its luster at all times, not cracking or corroding, and making it look new at all times.

The register is of the standard 12-inch size, finished in full nickel, and operated by cords and pulleys or by rods. In fact, Manager Englund has every reason to be proud of his elegant, durable and efficient handiwork.

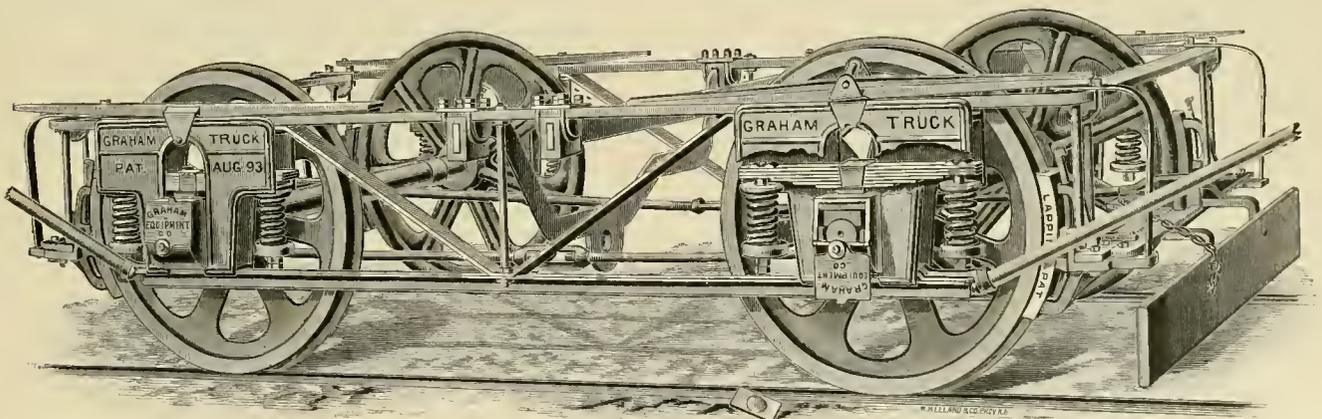

GRAHAM'S DIVIDEND EARNER.

The truck is an important factor in the wear and tear of rail joints and switches, and this must be considered in selecting an equipment. The peculiar feature of the Graham truck, here illustrated, is that the load is, so to speak, suspended over each wheel. In other words, the entire spring is between each wheel and the truck frame, instead of between the truck frame and car body, as with the majority of trucks now on the market. The inequalities of the roadbed are taken by the wheels individually.

ELEVATION OF SPRING SUSPENSION.

The weight of the car and its load, up to fifty passengers, is taken by the spiral springs. Beyond that point the spirals are inactive, and the leaf springs take the load. But twenty-four bolts are used, all of them 5/8-inch. The car body is held by four bolts. Another desirable feature is that the body is only twenty-three inches from the ground. The Graham people are using a 5-inch steel I beam for trucks to go under open cars, and extending the

GRAHAM'S "DIVIDEND EARNER."

sion. Another feature is the long stroke, 7 1/2 inches, by means of which the quick and indistinguishable jangle of four or five fares at once is avoided, and each fare rung up distinctly and slowly. This also prevents passengers

frame out from twelve to eighteen feet, as required, giving the sill a rigid support. The 5-inch steel I beam is supported by a special brace of 3-inch channel steel, making a cantilever truss for the sills.

## DISASTEROUS CONFLAGRATION AT ATTLEBORO, MASS.

**ONE** CHEAP hand-lantern, worth about half a dollar, exploded, January 2, at the Interstate Electric Railway power house at Attleboro, began an \$80,000 fire, tied twenty-four miles of electric railway, left a town without street lights, checked incandescent lighting in three large villages, and threw one hundred men indefinitely out of employment. The insurance was \$56,000.

The plant was shut down at 12:30 a. m., as the last car comes in at that time and Attleboro is shrouded in the robes of night, and all its pious citizens go to bed. The engine-wiper was crawling over the big engine and through the fly-wheel, making his pet's morning toilet, when the little hand-lantern that afforded him his only light, exploded and ignited a pile of oily waste. The flames found free fuel, and fanned by a stiff north breeze, the whole building was soon a roaring furnace. The morning was bitterly cold and the firemen worked under great difficulty.

The dynamo room, 105 feet by 45, and an ell 20 by 20 feet went first, destroying two 250-horse-power compound condensing engines, one 100-horse-power, one 600-horse-power engine, four railway generators, one 2,000 light alternator, eight arc light machines and considerable large repairs. The remainder of the plant soon followed. Since this date the only facilities of Attleboro, North Attleboro, Wrentham, Seekonk, Mass., and Pawtucket, R. I., have been oil lamps and horse cars.

### OBITUARY.

HENRY W. GILLER,

for over a quarter of a century cashier of the Brooklyn City and Newton Railroad Company, was stricken by apoplexy at his desk December 20. Mr. Giller was born in 1844, and was in railway work all his life. He leaves a widow and two children.

The long, intimate career of Geo. H. Babcock and Stephen Wilcox, ending in their decease within a month of each other, is a coincidence worthy of the extended comment occasioned. Mr. Babcock died December 16 and Mr. Wilcox November 27, 1893.

STEPHEN WILCOX.

Mr. Wilcox was born in Westerly, R. I., to which town Mr. Babcock removed when a boy, from New York. While still a young man, Mr. Wilcox became interested and intimately connected with the development of the steam engine, and to this end studied all types of caloric engines, inventing one that antedated Ericsson's, besides spending considerable time and money on researches into oil and gas engines. All this investigation convinced him that the steam engine was the only practical solution for the problem.

GEORGE H. BABCOCK.

Mr. Babcock, whose experience was perhaps more varied than that of his distinguished compeer, began his mechanical career in a woolen mill, afterwards going into newspaper publishing at Westerly. As the first inventor of the polychromatic printing press his first fame was acquired. He was also the inventor of a printer's bronzing machine and devoted considerable time to the young art of photography. Following this mechanical career came several years' experience in the office of a patent lawyer, and an engagement as mechanical draftsman. While in this latter capacity the cut-off engine known as the Babcock & Wilcox was invented, and Babcock and Wilcox first became associated in business. The year 1867 saw the Corliss patent public property, and the Babcock & Wilcox engine became too expensive to build.

In 1856 Mr. Wilcox had invented the original of the inclined water-tube style of boiler. This was improved

GEO. H. BABCOCK.

STEPHEN WILCOX.

on, however, by both the men and their employed engineers.

In 1868 they came to New York to push the engine business and started the manufacture of small engines, as the New York Safety Steam Power Company, but withdrew in 1878 to give all their time to the development of the since famous boiler. In 1881 a stock company was formed and Mr. Wilcox dropped active business, leaving Mr. Babcock at the helm for several years longer.

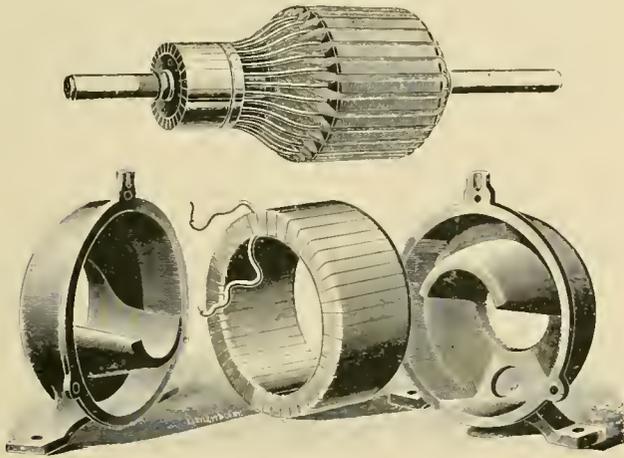

Both men were of remarkably forcible intellects, both valued citizens of their own towns and both benevolent to a high degree. Mr. Babcock was a forcible writer and lecturer on his specialty and a competent literary critic.

To few men comes the honor and fruit of early genius and industry in such abundance as to these pioneers of stationary engineering, and few inventors have had greater reason to be satisfied with a life's work; "and in their death they were not divided."

At Logansport they call it the International Electric Railway at the World's Fair. The Logansport Reporter also remarks that as an engineering feat it was successful, but that it lost money. "It cost \$1,000,000, earned over \$5,500,000, and paid 25 per cent to the Exposition people." Pretty good for losing money.

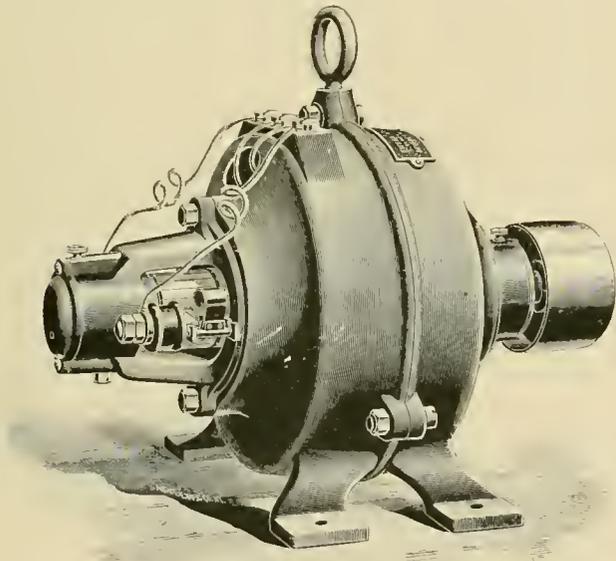

LUNDELL STATIONARY MOTORS.

An unique form of field magnet is embodied in the construction of the Lundell dynamos and motors, which has attracted some attention recently. There is but one field

LUNDELL MOTOR—PARTS.

coil and it encircles the armature in a plane perpendicular to the armature journal. The nature of the magnetic circuit can best be understood by a glance at the engraving, which shows the field coil in the center and the two

THE LUNDELL MOTOR.

halves of the field magnets on either side. The result of this peculiar arrangement is to make a compact machine with an iron covering nearly encasing it.

THE NORTH-WESTERN L.

The most absorbing topic of rapid transit interest in Chicago of the past month has been the North-western Elevated, as it is called, which proposes an elevated railway line from Randolph street, between the lake and Market street, to the North Side, taking a westerly direction.

FOREIGN FACTS.

AN electric railway is to be opened between Bordeaux and Bouseat, France.

WILLIAM WALLACE DUNCAN, the well known stock-broker and tramway expert, and author of "Duncan's Tramway Manual," died recently.

EARTHENWARE ties are an innovation into Japanese railway practice, and the results are said to be fairly good. The method of making is not announced.

THE electric railway in Villa Borghese, Rome, has been opened by Captain Cattori, the manager. The system is on the underground conduit plan.

BOMBAY kickers are still kicking about the admission of hospital cases into the cars, and now want cars to begin running at 4:45 a. m., to accommodate early risers!

THE stirring of life in Cuba is begun. An electric tramway is projected for the town of Cienfuegos. The project has been submitted to the Minister for the Colonies, and is now under consideration by the Council of Santa Clara.

THE number of tramway bills introduced into parliament since 1884 range from thirty in that year to thirteen in 1891, with an average of twenty per annum. The length of miles proposed ranged from 173 in 1884, to 24 in 1891. From the fact that so few were built, it would seem that favorable legislative action was not easy.

THE Zeitschrift fur Kleinbahnen is the first street railway journal in Germany. It proposes to be universal in its scope, and is published by the Prussian ministry of public works. Dr. Kollman has an article on American practice in the first number. The title of the magazine literally translated means, magazine for light railways.

DURING a riot in Bombay lately, in which it was necessary to mass a few troops at a certain point, the street cars were utilized to the great convenience of the guardians of British liberty and the dismay of the rioters.

THEY WERE SCARED.

AN Italian fruit peddler recently brought a large bunch of "banans" on board an Indianapolis car. He laid the bunch on the seat, as the car was not crowded, but a little later was compelled to take it up again, to make room for another passenger. As he raised the fruit a piercing yell sounded from his next neighbor, and seven people and a little girl tried to get out of the rear door at once, all because a big, woolly tarantula had crawled on to the seat. Finally a brave man stepped on the spider, and quiet reigned once more.

## NEW PUBLICATIONS.

THE ELECTRICAL TRANSMISSION OF POWER, by Philip Atkinson, STREET RAILWAY REVIEW, Chicago. Price, \$2. The reputation of Mr. Atkinson as a writer on electrical subjects would alone be enough to secure the success of this work. It is just what a certain class of beginners has long been looking for, namely, a simple treatise on the fundamental principles of the electric motor, followed by a description of the commercial apparatus used in the electrical transmission of power.

FIRST PRINCIPLES OF ELECTRICAL ENGINEERING, by C. H. W. Biggs. Biggs & Company, 139 Salsbury Court, Fleet street, London, E. C. Price, \$0.60. This is a new edition of a very thorough work, by the editor of the London Electrical Engineer. It has been partly rewritten and extended, and treats the first mathematical principles very fully.

AERONAUTICS, the new paper brought forth by the congress on that subject, last summer, contains in its January issue, an interesting paper by Professor Langley, of the Smithsonian Institute, on "Aerial Navigation."

CASSIER'S MAGAZINE, for January, has two very sensible articles on the commercial element in engineering. One entitled "Engineering Economics," shows that the element of relative cost is the one that must oftenest be solved by the engineer of today. The other, dealing with "The Commercial Element in Technical Education," shows that it is as necessary for the engineering graduate to know prices as to know the higher mathematics.

ONE HUNDRED CITIES AND TOWNS WANTING INDUSTRIES, is the title of a pamphlet published by the Illinois Central Railroad. Those looking for a manufacturing site would do well to investigate.

THE MCGUIRE MANUFACTURING COMPANY have issued a neat 60 page book of testimonials, containing a fine half-tone engraving of cars on their trucks on the road from which each testimonial comes. It also gives a list of the McGuire patrons, and a short description of the different styles of trucks.

THE OSBORNE MANUFACTURING COMPANY have just issued a neat 26 page catalog of their steel wire brushes and brooms.

FISH BROS., Racine, Wis., are out with a handsome annual catalog, which shows their tower wagon for electric railways.

STANDARD TABLES FOR ELECTRIC WIREMEN, by Chas. M. Davis. Revised by W. D. Weaver. W. J. Johnston Company, Times Building, New York. Price, \$1. The third edition of this popular work was exhausted within a few months, and the fourth and present edition was delayed that it might contain the latest revision of the insurance rules of the Underwriter's International Electric Association.

SECRETARY RICHARDSON has issued the Association Law Reports, Numbers 7 and 8, Volume X, giving opinions in the cases of Harry Benton against the Baltimore Traction Company, and William H. Owens against the People's Passenger Railway Company.

THE tired business and professional man turns to such a number as Lippincott's January, with positive pleasure and relief. No labored philosophical articles to tax his brain, but pleasurable romance of a high order, in which he forgets the day's cares, and turns the last page with regret, to rise rested and refreshed.

PICTURES FROM NATURE AND LIFE. Poems, by Kate Raworth Holmes. A. C. McClurg & Company. Price, \$2.50. It would be hard to find a more attractive book than this, in which the delicate sentiment of the verse is matched by the unusual illustrations. The opening poem is one of those delightful, sunshiny reminiscences, whose romance sung in musical numbers, haunts the memory like a chapter from one's own experience. The other poems are all in keeping with this, and are unusually happy in mood and expression.

THE superintendent of the Marquette, Mich., Street Railway, after Monday's storm, said: "If Job had attempted to run a street railway up here during the winter, his book would never have been written."

## RAILWAY EQUIPMENT COMPANY ASSIGNS.

The Railway Equipment, Chicago, made an assignment January 3, to George O. Fairbanks. The liabilities are placed at \$30,000 and the assets at \$50,000. The company have from the start handled a very large trade in railway supplies, and its friends will learn of its embarrassment with regret, and hope for a speedy solution of its difficulties. The expectation is to resume very soon.

A GALESBURG, Ill., motorman, who says he doesn't drink, has had a hard time of it lately from queer sights on his last trip, which ends at midnight. At a certain point of the line a black calf appears, seemingly out of the ground, and keeps just ahead of the car, whether going fast or slow. The electricity twister says he'll kill that calf or throw up his job.

THE West End, of Boston, on its Ashmont & Milton branch, which crosses several wide steam road tracks, requires the conductors to light the electric lights in the car, as an additional safeguard. The operation is said to have saved several accidents, as the most careless conductor can keep watch for failure of current by that means.

SAN FRANCISCO street railways have, since 1889, been compelled to pay 2 per cent of their gross receipts to the city. The Metropolitan Electric and the San Mateo lines have not done this and \$10,000 is now due the city from them.

PASSENGERS for Boston who take the steamers of the Norwich Line are not subjected to any delay on account of rough weather, as the route of these steamers lies entirely within the quiet waters of Long Island Sound.

FOR sweet charity's sake the Ft. Wayne Street Railway carried 12,393 passengers on Christmas Day, or 10,792 passengers net, and turned over \$540 to the associated charities.

THE New York & New England Railroad Company offers great inducements to all those desiring suburban homes. Low fares, rapid transit, excellent train service, it excels in all.\*

ALWAYS ask for tickets via the New York & New England Railroad. It has connections for all parts of the country, and its train service is unexcelled.

THE attraction at the Midwinter Fair, at San Francisco, to do the Ferris wheel act, is the Firth wheel, a smaller affair on the same scheme.

## Map of the United States.

A large handsome map of the United States, mounted and suitable for office or home use, is issued by the Burlington Route. Copies will be mailed to any address on receipt of fifteen cents in postage, by P. S. Eustis, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW

269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.

FEBRUARY 15, 1894.

NO. 2

THE longest and hardest contested strike in several months has been settled at Bridgeport, Conn. Both sides made concessions.

THE "trolley howl" has nearly howled itself out and almost all the decent dailies, which have been arrayed against progress, are heartily ashamed of themselves and have changed front.

THE commissioners of the District of Columbia, in their new "Model Railway" bill, have the fairness to insert a protective clause, which makes the willful blockading of street railway tracks or injury to company's property or passengers punishable with a fine of from twenty-five to one hundred dollars.

A LEADING evening paper of this city advocates at considerable length the construction in Chicago of the Greathead underground system of London. Underground transit in this town has been pretty thoroughly thrashed out, and it is safe to say will not come in the next fifty years at least. The London underground referred to is neither a public or financial success.

THE recent annual report of the labor commissioner of the state of Missouri, shows the interesting fact that the wages paid street railway employes during 1893 amounted to 41.20 per cent of the gross earnings, or the

sum of \$2,872,893. This is for employes only, and does not include salaries of officers, who received 3.23 per cent. or \$107,950. After paying for wages, salaries and improvements, the stockholder has 8.62 per cent of earnings out of which to pay interest on bonded debt and declare dividends.

THE franchise to the electric roads in Brooklyn stipulate a speed not in excess of ten miles an hour. While there have been numerous accidents there, many of them are directly traceable to a lack of reasonable care on the part of the public. Mayor Schieren has instructed the police department to admonish all motormen palpably violating this condition, and where disregarded to report the car number. The police have no authority to make arrests for high speed running and are posing very much in the attitude of scare-crows.

AN interesting decision comes from the Supreme Court of Georgia. The corporate limits of the town of Rome were extended so as to take in a bridge which had been built by the county. The street railway thereupon obtained permission from both town and county to lay its tracks over this bridge. A flood carried the bridge away, which the county replaced, but on its completion demanded compensation of the railway before allowing rails to be laid thereon, and sought an injunction against the company. The court holds that the bridge had become a part of the street, and its destruction and reconstruction does not dispossess the company of the rights enjoyed by it prior to and at the time of the accident.

ONE of the most important contracts ever let, as far as the street railway industry at large is concerned, has been closed by the Baden Railway of St. Louis, an extension of the Broadway cable, which is to be changed from horses to electricity next spring. The contract calls for welding the joints of three and a half miles of double track. The line is almost straight, and it is the intention to make each rail perfectly continuous for the three and a half miles. This is to be practically the first fair trial given the continuous rail, and the results will be of immense importance to the business. Much has been learned from the experience gained in welding track on the West End, at Boston, last summer, and the fact that the welding company guarantees no trouble from breaking at the welds, is indication that the minor difficulties developed in the first welding at Boston have been overcome. If this is the case, the sole question at issue is as to whether the factor of expansion will make trouble. This experiment has everything in its favor, as the track is to be laid new, and hence the joints have not been pounded low, as was the case on the West End. A year from now it will probably be definitely determined whether the continuous rail is a success on an ordinary street railway track. It is to be earnestly hoped that it will, and all will be glad that the experiment is to be tried. Even if this case should be a failure, it is possible that a

modification of present tie fastenings would make it successful. The current (300 amperes at 500 volts) is to be furnished by the railway company.

IN the matter of the unprecedented prize offer of the Metropolitan Company of New York, some anti-electric inventors claim to think it was only a scheme to unfairly force a recognition of the trolley, and that those who offered the alluring prize have or had no expectation of being called on to ever pay over the amount. We are disposed to accept the offer as made in good faith, and certainly the Metropolitan officials have acted in a perfectly fair and impartial manner, having entirely placed out of their own hands any voice in the selection of the better system, should there be any such named. From a purely business standpoint the Metropolitan could not make a better investment than the paying of \$50,000 for evidence which could save them the mistaken expenditure of several hundreds of thousands. On the other hand, the prize is of sufficient size to preclude the sneers of a prejudiced press and public, which have been decrying the trolley and lauding this method and that, of which they know practically nothing, to the skies. It is a great day for the crank inventor who is thus privileged to enter the conspicuous circle of public attention, who would otherwise never have been seen or heard outside the confines of his native Podunk; and though his name receives but a passing notice, and before the summer sun again blisters the pavement, he will have been lost in oblivion, still he will ever remain one of the sights of the village, as the man who entered for the \$50,000 prize. In these days, however, any device or system which promises the slightest hope of improvement or economy in street railway operations cannot long hide its head under a bushel, for the efforts of the technical press are indefatigable in searching out, studying and revealing the merits, good or bad, of all new inventions, and many times before the owner has any idea his secret is not his own. Hence it is hardly to be expected that any very radical departure will be evolved in this modern arena, and we predict the overhead trolley will, in this engagement at least, come out victorious.

THE assignments of subjects, and committees to report on same, at the next annual convention, have been made. As usual, the selections will be satisfactory to members, although the several failures last year occasioned considerable criticism. There are, of course, unforeseen causes which arise between the acceptance of the assignments by committees and the following meeting, and, while there were unusual demands upon the time of certain members of committees for 1893, which relieve them of blame, yet the allotted time of ten months should be all sufficient to either prepare a report or advise the secretary in season to make a new appointment. Of course, in a business which changes from day to day as rapidly as has street railroading during the past three years, a paper prepared in June might be obsolete by October. But this does not prevent the writer from an immediate

study of his subject and laying out the skeleton of his report, which is really where the most thought is required. It is an honor of which anyone may well be proud, to prepare a report for the American Street Railway Association, and it is to be hoped the gentlemen chosen this year will appreciate their obligation of the distinction extended them. The danger of a hastily prepared report was illustrated at last convention, in the case of one paper written on the train and read the following day, in which a given economy was claimed on the cost of an item at \$8,450, which a few weeks later was discovered should have read \$84,500, and which changed economy to loss. These reports are in a measure official, and, if the standard of the Association is to be maintained, must be greatly improved. The papers also should in every case be in the secretary's hands at least two weeks in advance and mailed all members. The reading of a single paper last meeting occupied nearly three hours, and there was not a man in the room, including its author, who was able to discuss it without the manuscript, there being but one copy. We insist on improvements in our roads, now let the committees make a record this year for excellence of text and promptness.

THE very radical and aggressive position assumed by fire insurance companies of late, in raising rates and in some cases refusing to write policies on electric railway property and buildings, where motors are supplied from railway circuits, has aroused action in many parts of the country. It is not at all unlikely that the underwriters may not have to live long to regret their present, in most cases, unjust discrimination. The question of mutual insurance is not a new one to the street railway fraternity. It was discussed and considered at considerable length in ante-electric railway days, but was dropped for the reason that the economy of self-insurance at that time was not sufficiently large to make it any special object. But now that insurance lines are refused and rates raised, the problem is no longer one of economy only, but becomes an actual necessity. One thing is certain, if the street railway fraternity is forced to the organization of a mutual insurance there will be no object in returning to their former customers. The American Street Railway Association is far-reaching, and a very strong organization. Its members are well acquainted each with the other; the jealousies which existed ten years ago no longer prevail, and all the machinery is at hand to form one of the strongest combinations ever made for this purpose. That such is the trend of ideas is evidenced in the recent meeting of the Maine State Association, and the Texas Association; and it is made the special subject of consideration before the meeting of the Massachusetts State Association next month, and is also slated for a full report and recommendation by strong committees, for the annual convention of the American Street Railway Association in October. We are in almost daily receipt of correspondence from leading managers in all parts of the country on this question, and as stated, if it is found necessary in self-protection to do our own insuring, it will be

carried out on a scale so far-reaching and extensive that its results will stagger those underwriters who evidently do not realize the power of organized street railway capital. The street railway association has never failed in a single undertaking, and the men whose business sagacity and energy have accomplished financial and mechanical miracles in the development of the modern railway, will not be found very far behind the band when the procession moves toward mutual insurance.

THE Supreme Court of California has handed down a decision in which it is held that a passenger is not bound to tender the exact fare, though the tender must be a "reasonable one" and the conductor must accept such tender and furnish change to a "reasonable amount." The court goes on to hold that a five dollar gold piece tendered by a passenger who has no smaller change is such a "reasonable one," and that the passenger cannot be ejected in the event of conductor being unable to furnish change for that amount. The question naturally arises as to what the court would consider an unreasonable tender, and we draw little comfort or satisfaction from its opinion that "a hundred dollar bill for example" would be unreasonable. Well, we should say it was; or fifty, or ten, or even five. Twenty passengers is not an unusual load for a half trip in any part of the country. Suppose half of them only, were disposed to take advantage of a law making the limit five dollars, then the conductor would have to furnish forty-nine dollars and fifty cents change to those five persons. Were it possible to have him carry that amount, each conductor would require from fifty to one hundred dollars change money, and this multiplied by the number of cars on the road, instantly amounts to several thousand dollars, and on large roads to many thousands. To carry any large amount is exactly what a well-informed manager strives to avoid, for obvious reasons; while the danger of assault and robbery, especially at night and on remote runs, would be immeasurably increased. The unwritten law of custom has for years settled on two dollars as a "reasonable" limit for which change would be given on the car, and many roads carry signs in their cars announcing this fact, and it is manifestly large enough. It rarely ever occurs but that the passenger can, if he will, tender very close to the necessary amount, and where it is known that bills of denomination of five dollars or more are not changeable on the cars, the change is procured before making the trip. We regret the fact, but such, nevertheless, it is, that the dear and generally supposed to be much abused public, contains in its body politic, schools of sharks, in numbers unguessed and inconceivable. Some wear garments which bear the marks of toil, but the great working majority is composed of those who are above soiling their gloved hands with manual labor, or are mantled in seal skin, but who are not above the disgraceful petty theft of a five cent fare. Unlikely as it might seem to the general public, not a manager of a month's experience but knows full well what a horde of the genteel riders would take advantage of a law or rule making the tender

of a large bill legal; and that the attempt to ride free on a ten and twenty dollar bill would be an immense success from the standpoint of the rider. A recent New York decision is quite the opposite of the Pacific case, and holds that five dollars is unreasonable tender, and a conductor who was arrested for retaining a five dollar bill until he could reach the company's office and get change, was not only discharged, but on his own suit was allowed \$110 damages against the passenger for unlawful arrest.

### MAINE'S MEN MEET.

The First Annual Meeting of the Maine, Street Railway Association—A pleasant and Profitable Time.

The first Wednesday in February, was celebrated by the street railway men of the state of Maine, as the first annual meeting of their recently formed association.

At 2 P. M. February 7th, therefore the following gentlemen gathered at the Cumberland Club rooms, of Portland: President William Wood, president of the Portland Horse Railway Company; secretary and treasurer E. A. Newman, general manager of the Portland Horse Railroad Company; E. H. Banks, president of the Biddeford & Saco Railroad; A. P. Gerald, president of the Waterville & Fairfield Street Railway Company, and general manager of the Bath Street Railway Company; E. K. Day, general manager of the Mousam River Railroad Company, Sanford; Chas. P. Prescott, treasurer Biddeford & Saco Railway; E. T. Berry, of the Portland Street Railroad; and A. K. Baylor, visiting engineer of the railway department of the General Electric, and Fred. S. Kenfield, business manager of the STREET RAILWAY REVIEW. The latter two gentlemen were elected honorary members of the association.

Besides the pleasant acquaintances formed and fostered, committees were appointed on various subjects. After the reelection of the same officers. The two most important committees were on "Mutual Insurance" and "Taxation." The former is to consider the advisability of mutual insurance, since Maine underwriters have begun to "want the earth." It will probably result in the formation of a mutual protection scheme.

The committee on Taxation has a more difficult task, namely, to go before the legislature to arrange on a different basis, the present unjust taxation. The rate for horse road taxation was made many years ago, and finding no special act covering electric railways, the intelligent commission rated them the same as steam roads. This is manifestly unjust, as the rate of fare remains the same for electrics as for horse lines. The rate for horse roads is less than one per cent, while that of the electric roads is three per cent of gross earnings. The Portland Railway Company has paid the amount of taxes due on a horse-road basis and will let the state collect the balance if it can do so.

The next meeting of the association will be held at Rockland, on the date during August, that the executive committee may see fit to place.

In Paris, the cabs and omnibusses are heated by charcoal fires. Many deaths have resulted but no legislation on the subject has been made.

HARPER & HENDERSON, consulting engineers of the Hobart Tramway Co., Tasmania, have been making a series of tests of a contract entered into with Siemens Brothers. They found that two cars with a full load of passengers attained a speed of 12 miles per hour on a level road, and 7 miles per hour on a grade of 1 to 17.

THE HAMBURG (Germany) TRAMWAY COMPANY is operating electric cars on their circular line of route, which runs round the main part of the town. The overhead system will be employed, and the installation is being carried out by the Berlin Union Company, while current will be obtained from the Hamburg establishment of Schuckert & Co.

In Bombay, tramways require to move the heterogeneous population of the Indian metropolis, 170 cars and 870 horses. The horses are half Asiatic and half Australian. The former stand the work and climate better than the Australian and are cheaper both to buy and feed, but they have not sufficient weight to start cars singly without overstraining themselves. Each horse averages  $13\frac{1}{2}$  miles a day and lasts eight years. All directions and rules in the cars are printed in three languages to accommodate patrons.

THE increase in street railway mileage in England, as compared to American industry, is but a drop in the bucket. The following table comprehends a period of fifteen years:

	1878.	1893.
Paid-up capital	£4,035,464	£13,708,349
Length of line open (miles)	269	960
Horses	9,222	30,225
Locomotives	14	563
Cars	1,124	4,098
Passengers carried	146,001,223	598,289,509
Gross receipts	1,145,465	3,606,095
Working Expenses	868,315	2,837,446
Net receipts	230,956	768,649

What might have been, had electric traction been allowed to work out the salvation of some of these awfully congested districts of the larger cities may only be understood by those cognizant of the blessings of the trolley in America.

He fell from off the Broadway car  
At her feet, but said; "Madam,  
Excuse me, as I came this way  
I must be your cablegram."

## HIGH VS. LOW SPEED ENGINES FOR RAILWAY WORK.

We are in receipt of a letter from President Green, of the Altoona Manufacturing Company, builders of the M. A. Green automatic cut off engines, which is as follows:

ALTOONA, PA., Feb. 6, 1894.

Editor Street Railway Review, Chicago, Ill.

DEAR SIR:—I see on page 789 in your December (1893) issue, an article headed "The Experience of a Superintendent of Street Railways." In his statement he says that any engine running over 120 revolutions per minute should not be used for street railway purposes. Now, if Mr. Young is right, that a slow speed engine will stand the sudden shocks and changes of load better than a high-speed engine, then up to this time science has been a failure. I would like to ask Mr. Young, through your paper, what roads he has superintended, how many in his life time he has had charge of (of both slow and high-speed engines) and the makers of the engines; also, why a slow-speed engine is better for railway work than a high-speed engine. He must remember that in making such an assertion the public will expect him to give his theory and data for same. I would be very much pleased if he will answer through your paper.

Hoping to receive same, I remain yours truly,

M. A. GREEN, President.

DANIEL S. REGAN, of San Francisco, has invented a gas motor for street railway work which is being tried on the lines of the Market street system for service in hauling the owl cars. It is said to mount 10 per cent grades with ease, and to be very economical and powerful in its operation.

THE suit of Professor Rowland, of Johns Hopkins University, against the Cataract Construction Company, of Niagara Falls, for \$30,000 for services in connection with the design of plant, has been decided for the professor. The jury awarded him \$9,000, including \$3,500 already paid him. The charge to the jury lasted an hour and a half, and the jury deliberated the same length of time.

SAN FRANCISCO'S electrical interests are now being augmented by the building of the City railway line on Mission street. Twenty cars are built, local establishments doing the work, and the line will be operated April 1. The consent of property owners has been secured, and it is expected that the mayor's opposition to overhead wires will be shortly overcome. The cars bear the legend: "Twenty-ninth Street to the County Line." The car-house has been built and all the electrical equipment is ready.

THE changes in the personnel of the Brooklyn City have been numerous in the last year. The latest changes makes W. A. H. Bogardus, who has been secretary of the Brooklyn City Railroad for a year, general manager, owing to the increase in the number of lines caused by recent consolidations, and Cyrus P. Smith will succeed him as secretary. There will be two superintendents instead of one, hereafter. Superintendent Cameron will have charge of the lines in the central and southern parts of the city, and William Morrison, who has been superintendent of horses, will have charge of the eastern district lines.

## HALF FARES.

Interesting Facts from all parts of the Country, Boiled Down for Busy Readers.

THE Baltimore Traction Company refuses to pay a real estate tax upon its tracks in the public streets of that city.

THE Denver Tramway Company is chartering special cars for funeral parties, the casket being carried in a hearse.

THE Consolidated Traction Company of Jersey City has ruled that all mail carriers must hereafter pay fare on all lines.

MANY street railways are hauling laborers free to and from the work given them by the city. At Indianapolis, 100 men a day are taken six or eight miles.

OREGON CITY, Ore., protests against the East Side Railway Company of Portland carrying freight. An ordinance placing a license on every freight car has been passed.

ON account of the depressed conditions of general business in Boston, the West End street railway directorate reports a resolution to reduce the regular dividends from eight per cent to six.

THE Columbia & Donegal Electric Railway was formally opened January 3, by President William B. Given and a party of distinguished guests. The trip ended with a proper banquet for twenty-three.

"TROLLEY FOOT" is the name of a trouble that affects the new motorman, who rings the gong with one foot continually. It results in nothing more than lameness, for a few days, but it is nevertheless "trolley foot."

RUINS OF CAR HOUSE—SAVANNAH ELECTRIC RAILWAY.

ONE, Antonio Delatorre, an Italian, of San Francisco, is the latest discoverer of perpetual motion. Antonio's scheme is a feather spring motor actuated by weights.

RESIDENTS of Sussex street, Ottawa, Canada, publicly thank the street railway company for keeping the street in such good order during the winter. *Mirabile dictu!*

THE Brainerd, Minn., Street Railway Company, has a home made snow plow, the invention of Superintendent F. S. Parker, that is said to be both effective and handsome.

A SCHEME is on foot to build an electric railway to connect the town of Manassas to the battle field of Bull Run. A charter is applied for to the Virginia legislature.

THE Winnipeg (Man.) Electric Street Railway will reduce its fare to two cents a trip, or twelve tickets for twenty-five cents. It is a case of two roads each trying to knife the other. The competing road has reduced fares to one cent.

MANUFACTURERS of steel rails, says the Iron Age, held prices steadily at \$30 per ton until November, when they fell to \$28, and in December were cut to \$25. Average price for the year was \$29.50 against \$31.17 for 1892, \$31 in 1891, and \$34.50 in 1890.

WHILE a crowd was watching sixteen horses pulling a spool of cable up Market street, in New York City, recently, the truck broke and fifty-one tons of cable was spilled into the street. A panic ensued and the crowd scattered materially. The rope was 22,000 feet in length.

## FROM CABLE TO ELECTRICITY.

One section of the Piedmont cable road in Oakland Cal., will soon be changed to electricity. The road is in a receiver's hands, and the consent of both court and stockholders will have to be secured, but it is not anticipated any trouble will be found in obtaining the necessary authority, as the line carries a business whose volume hardly warrants cable operation. Then, too, the electric lines which parallel the cable can operate at a much higher speed, which has seriously cut into the revenue of the cable line. The section operating over the Piedmont hills has heavy grades and here the cable will not be abandoned. Electric power will be generated at the cable station, and can be installed at no very great expense.

## LIGHT THAT FAILED.

There is one young couple down in Tennessee that has been well but severely schooled in the uses of electric light. They had been married but a few days and one of their first experiences was a ride on the electric railway of their native town together, in the capacity of husband and wife. It was in the evening, and it happened that several acquaintances sat on the opposite side of the vehicle. Everything went quietly enough until at a bridge approach the trolley wheel was pulled from the wire and the electric lights in the car went out with a suddenness that would have startled ordinary people, but when a second later the pole struck the wire the brilliant incandescents showed his arm around her neck and a bright red spot on her near cheek, where a great big smacky kiss had struck her. And they don't try to kiss each other any more on the electric cars, even if the lights do go out.

THE Picayune, of New Orleans, in its issue of February 5, says of the REVIEW: "STREET RAILWAY REVIEW for January is stuffed full of all sorts of information on all sorts of subjects connected with its field, and with a large number of fine illustrations. If one want to keep up with the procession of improvement and invention in this line, he cannot do it better than by reading this charming magazine. It has it all." Coming from the most discriminating journal of the South, we appreciate the compliment,

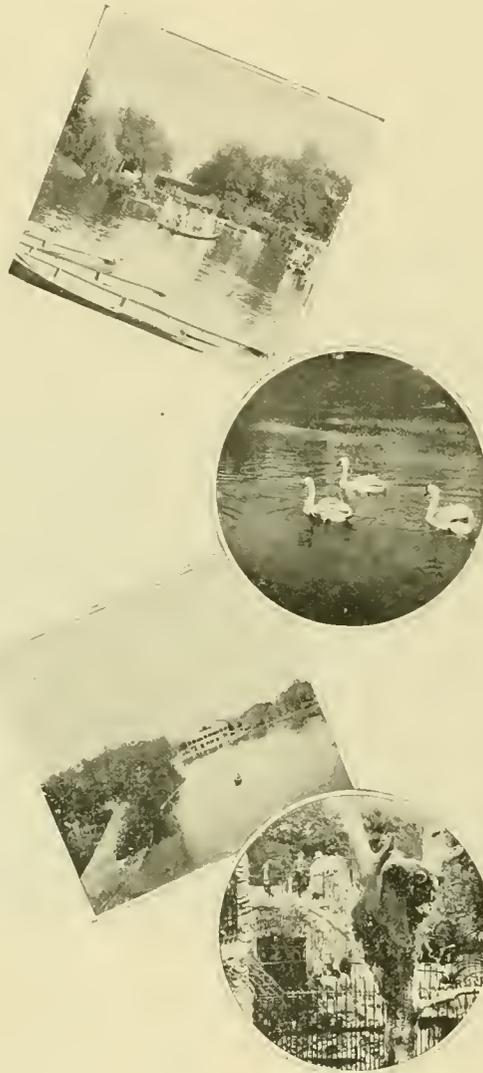

## PLEASURE RESORTS AND CREATED TRAVEL.

Lincoln Park as a Summer Resort—Some of the Attractions.

## PART III.

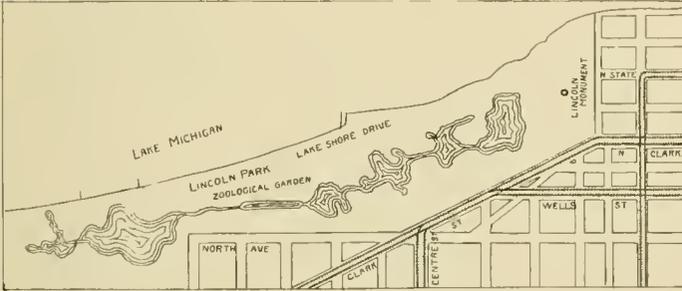

The park system of Chicago, extensive and beautiful as it is, has an added charm from the wide and generous policy pursued by the management of the Park Commissioners. Chicago parks are essentially the people's play ground, and, excepting Paris, there is probably no city in the world where the privileges are better appreciated by the world's workers. These breathing spaces become every Sunday one great mall, wherein the tired shopmen, saleswomen, and artisans may breathe air untainted, and look upward to something besides heavy rafters or dirty skylight. Mothers with their children, whole families of from four to a dozen individuals, pour forth on holidays and Sundays, to sprawl on the grass or sit on the numerous rustic seats, listening to the best of music from some well known band or orchestra. The little groves are alive with children, and shady walks, more or less frequented, give Mary and John a chance to carry on their love making with some degree of comfort. The heterogeneous Chicago foreign population is always spread out here on Sundays, one vast sociological panorama. The Italians come with great baskets full of spaghetti and jugs of cheap wine; the Germans bring cables of wienewurst and bales of sauerkraut; the Bohemians, Poles, Scandinavians, "bond and free," all provided with viands of their own peculiar national taste, make up the rest of the array. These foreigners are the earliest on the ground, often filling the last trip of the owl car with their gustatory conglomeration, and the conductor's sense of smell with woe. They are there for the day, and camp down on the green sward, tether the children, and light the cigarette or pipe, as national custom bids.

As the day advances the crowd grows denser. By three in the afternoon every available seat is filled, and the endless line of vehicles is at full tide around the beautiful drives. Coupes, broughams, family carriages, phaetons, omnibusses, delivery wagons, bicycles, baby carriages—every conceivable carry-all, except wheel-

barrows, assist the street railways in carrying the crowds. To Lincoln Park, which is, without doubt, the most interesting in the city, the most Sunday and holiday traffic comes. Situated on the lake shore, two and a quarter miles from the post office, it is reached from all quarters of the North, Northwest and far Northern city, by lines of the North Chicago Street Railroad Company.

The sketch map shown gives the general location of the park, north of North avenue and south of Diversey

street, skirting the Lake shore. The feeding lines of Chicago avenue, State street, Evanston, Limits horse cars, and several lines connecting are not shown, but all passengers to the park must finally take the cars on the lines marked.

The increase in traffic on Sunday consequent on the attractions at the park during the summer months is from 30 to 40 per cent, and appreciable even with the tremendous daily traffic of these great arteries. On the nights of

Yerkes has brought into the coffers of the company many thousands of dollars.

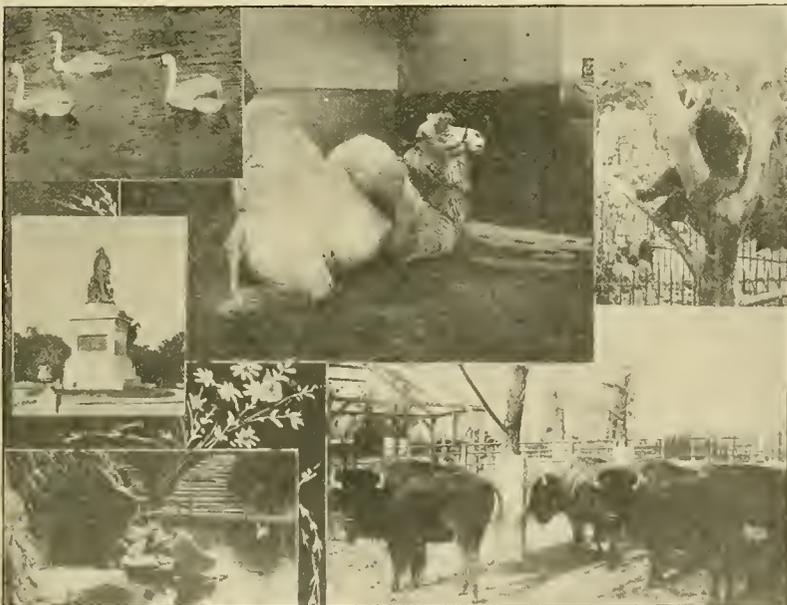

The menagerie indicated on the map is one of the best zoological collections in the county, and is constantly being added to by the liberality of the park commission. Many monuments and groups of statuary decorate the

LINCOLN PARK IN WINTER.

grounds, and whatever may be said of them from an artistic standpoint, they certainly attract great attention. The magnificent Grant monument, and the truly imposing bronze of Abraham Lincoln, are the most noted. The floral attractions, hot houses, and ponds full of aquatic treasures, at the north center of the park, are very popular. The new Chicago Academy of Sciences, and the proposed improvements in other directions, will still more induce next year's traffic. The boats on the various lagoons in summer, and the Daily News Sanitarium for poor children, bring many to the park who would not otherwise come. Skating is the main attraction in winter.

The day the Grant mounment was unveiled, the North Chicago Railroad Company carried 253,379 persons. The day before Chicago Day, October 8, 1893, 326,876 people saw Lincoln Park.

GLIMPSES OF LINCOLN PARK.

the week that the Yerkes electric fountain plays, it is estimated that forty to sixty thousand people are gathered at the park. The "fountain nights," from June to October, are Mondays, Wednesdays and Fridays, and the display lasts from seven to nine o'clock. Aside from the philanthropy, the beautiful, costly and tasteful gift of Mr.

THE City Railway of Richmond, Va., has had a pole cut from the swamps for a mast in the erection of its power house smoke stack. The pole in question is 85 feet in length, measures 29 inches at the base, and 11 inches at the top. It required the combined efforts of eight men and twelve mules to safely carry this large piece of timber over the rough roads and land it where it was used in raising a smoke stack, which will be 5 feet in diameter and 120 feet in height and weighing eight tons. This is one of the largest in state, and is a very handsome piece of work.

## PERSONAL.

PRESIDENT D. G. HAMILTON, of the National Railway Company is on a two months trip to Egypt,

BENJ. SIBERT, for twenty years superintendent of the Jacksonville (Ill.) street railway has resigned.

JOHN J. NASH, formerly of the cable service of the West Chicago Company, has taken charge of the Olive street cable at St Louis,

ALBERT J. ELIAS, president of the Third Avenue, has been appointed by Mayor Gilroy as member of the board of education, vice Adolph L. Sanger, deceased.

WILBUR F. DAVIDSON, the electrician hurt last year on the Illinois Central Railway, has gained \$43,000 damages against the railroad. He sued for \$100,000.

CARLTON B. TARBELL, shipping clerk for the Northwest General Electric Company at St. Paul, and his wife, were overcome by fumes of a gas stove, both dying.

JOHN PIERCE, of the Sioux City Street Railway Company was a January visitor in Chicago, making contracts for the change of the Sioux City cable line to electric.

PROFESSOR EDWIN J. HOUSTON, has long been a lay preacher, active in church work. He received the honorary degree of Doctor of Divinity last May, at Princeton.

EDWARD E. HIGGINS, well known to the railway fraternity, is settled at 26 Courtlandt street, New York City, as "Expert in Street Railway Values and Economics."

PRESIDENT WILLIAM A. MCGUIRE, of the McGuire Manufacturing Co., is absent on a six-weeks western tour and Midwinter fair visit. Mrs. and Miss McGuire accompanied him.

I. D. BARTON, formerly superintendent of the Long Island Railroad, has been chosen superintendent of the Brooklyn Elevated system by the directors, and at once accepted the place.

ROBERT S. GOFF, treasurer, and John H. Bowker, superintendent, of the Globe Street Railway Company, of Fall River, Mass., were presented with a meerschaum pipe and a cigar holder by their employes not long ago.

R. C. CRAWFORD, secretary and treasurer of the West Chicago Street Railroad Company for the past seven years, has resigned to go into the brokerage business for himself. George Yuille is his successor. Mr. Yuille has been connected for many years with the Chicago Gas Company and used to corporation business in all details. Mr. Crawford will leave soon for a five months' stay in California. The street railway men of the country will miss Mr. Crawford from their circles.

W. C. BAKER, the famous Baker Car Stove inventor, said in a recent interview that the late A. B. Pullman was the originator of the idea which was afterwards carried out by Mr. Baker's ingenuity. His car heater for street railways is also becoming well known.

SUPERINTENDENT STONE of the Quincy (Ill.) Street Railway Company, had a post-mortem examination held on a horse that was supposed to have been killed by the current of his line. The veterinary surgeon found that the animal had died of a ruptured blood vessel.

MOODY BOYNTON has carried the war into Canada. A. Sydney, N. B., law firm, of which Mr. Gillies, M. P. for Richmond, is the head, applies for the incorporation of the Boynton Bicycle Electric Railway Company, of Canada, to run from Winnipeg, N. S. to Louisborg, N. S.

F. S. TERRY, well known as the former manager of the Ansonia Electric Company, has severed his connection with that establishment and has accepted the secretaryship of the Star Electric Lamp Company, whose new lamp we mention elsewhere. Mr. Terry will devote all his time to his new duties.

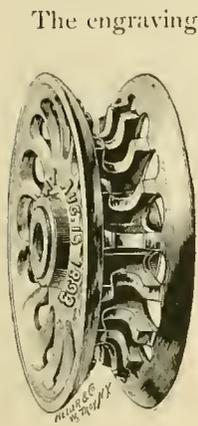

W. S. JEWELL, formerly of the Indianapolis Street Railway Company, has accepted a position under Manager Albion E. Lang, of the Toledo (O.) Consolidated Street Railway Company. Mr. Jewell's complete experience in street railway work is well known, and his new connection will be as happy as it is deserved.

CHARLES A. JOHNSON, formerly head of the banking house of Johnson, Kelley & Miller, Wall street, has opened offices at 80 Broadway, and will devote his time exclusively to street railway securities. Mr. Johnson is president of several street railways in New Jersey, and thoroughly familiar with street railway values.

C. P. YOUNG, the efficient superintendent of the Chattanooga Electric Railway, resigned February 1st. The Times says: "Mrs. Young is a cultured woman, who will be much missed from Chattanooga society and her husband will be a loss to its business and social world. Mrs. Young will spend some time in Washington, before joining her husband in New York."

THOMAS J. DURNIN, secretary and manager of the West Side Railway, of Milwaukee, until its recent consolidation with the Villard system, was the recipient upon his retirement, of a handsome gold watch, chain and charm, from his former employes. Mr. Durnin has held every position in the office, from office boy to manager and although flattering offers are made him in other circles it is hoped that he may remain in the street railway field, but for the present his health will not permit it. The good wishes of all his friends accompany him on his present well earned vacation.

**THE HAIGHT & CLARK SLEET TROLLEY.**

The engraving of the sleet cutting trolley wheel herewith presented shows better than words, the construction and action of this wheel, which is made by Haight & Clark of Albany, N. Y. It is somewhat similar to the Sturges wheel described in our columns last winter. It is simply a wheel having spokes with a groove which nearly fits the wire. The sleet is cut and broken by the shoulders on the edges of the groove.

It has been tried and not found wanting on a number of roads.

**EAST BROADWAY AND BATTERY ELECTION.**

At the election January 9, 1894, for directors of the Dry Dock, East Broadway & Battery Railway Company, of New York City, the "opposition" ticket comprising the following named gentlemen was elected: Richard Kelly, George H. Prentiss, A. S. Rosenbaum, Simon Danzig, Solomon Mehrbach, John H. Waydell, Henry Steers, E. W. Sumner, Marshall S. Driggs, W. Lansing Zabriskie, Henry A. Morgan, M. Feuchtwanger and John Bryns.

At the meeting of the newly elected board of directors on January 10, Richard Kelly was elected president, John Bryns, treasurer, and E. T. Landon, secretary. Mr. Kelly has been secretary and treasurer of the company for about twenty-five years, resigning from that office last May, when John Bryns was elected to fill the vacancy. Mr. Bryns has been a director for the past ten years. E. T. Landon, the secretary, has been connected with the company for the past twenty-one years as its book-keeper, and for the past ten years as auditor.

**UNCLE SAM'S MODEL RAILROAD BILL.**

The Commissioners of the District of Columbia have completed what they term a "model bill" for the regulation of street railroads in the District. It is not quite as unreasonable as would be expected—coming from that source, but it has restrictions enough, so that the building of electric lines will probably not be very active under it. Half the cost of widening the street for railroad purposes is to be charged to the railroad, and where a highway is less than sixty-six feet wide, the railway must be built entirely outside the highway. The space between, and two feet each side of the tracks must be kept in good condition as the Commissioners may direct. Companies using overhead wires must maintain such lights along their routes as the Commissioners require, without cost to the District. No overhead wires are to be allowed within the city limits. The District may at any time change the grade of any streets, and the railway must change its grade to

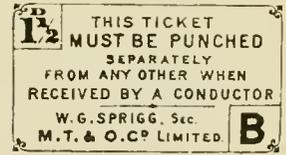

correspond. Any motive power but steam may be used. Permission is kindly granted to erect power houses along the routes, but said power houses must be completed in a time specified. Numerous other details in the organization of the companies and their method of doing business are required. Every subscriber to stock must pay five per cent at the time of subscribing.

**TICKETS AND TRANSFERS AT MELBOURNE.**

The Melbourne Tramway & Omnibus Company is laboring under the double disadvantage of hard times and the keen competition of cable and suburban railways. It therefore finds it necessary to try every practicable

plan to induce traffic. To meet competition on one of its lines, round trip tickets have been issued, which are good going before 9 a. m. and returning at any time during the day. This proved to be a good move. The price

of these tickets is 6 cents. Another plan is to sell 8-cent tickets on an omnibus feeding line, which are good for the whole distance. These tickets are sold by the bus drivers, who tear off a coupon from each ticket. The drivers deposit these coupons in the fare boxes which are on each bus. Thus the fare box acts as a fare register. The passenger is, of course, given the other half of the ticket, which is used to pay his fare on the cable train. In going the other way, the passenger pays 6 cents in the car and is given the transfer, which, with 2 cents ("one penny"), is accepted as his fare on the omnibus. To induce riding on the part of the business men and workmen, "city tickets" are issued. These are sold for 3 cents, and are good within a space of about one square mile in the business part of the city only.

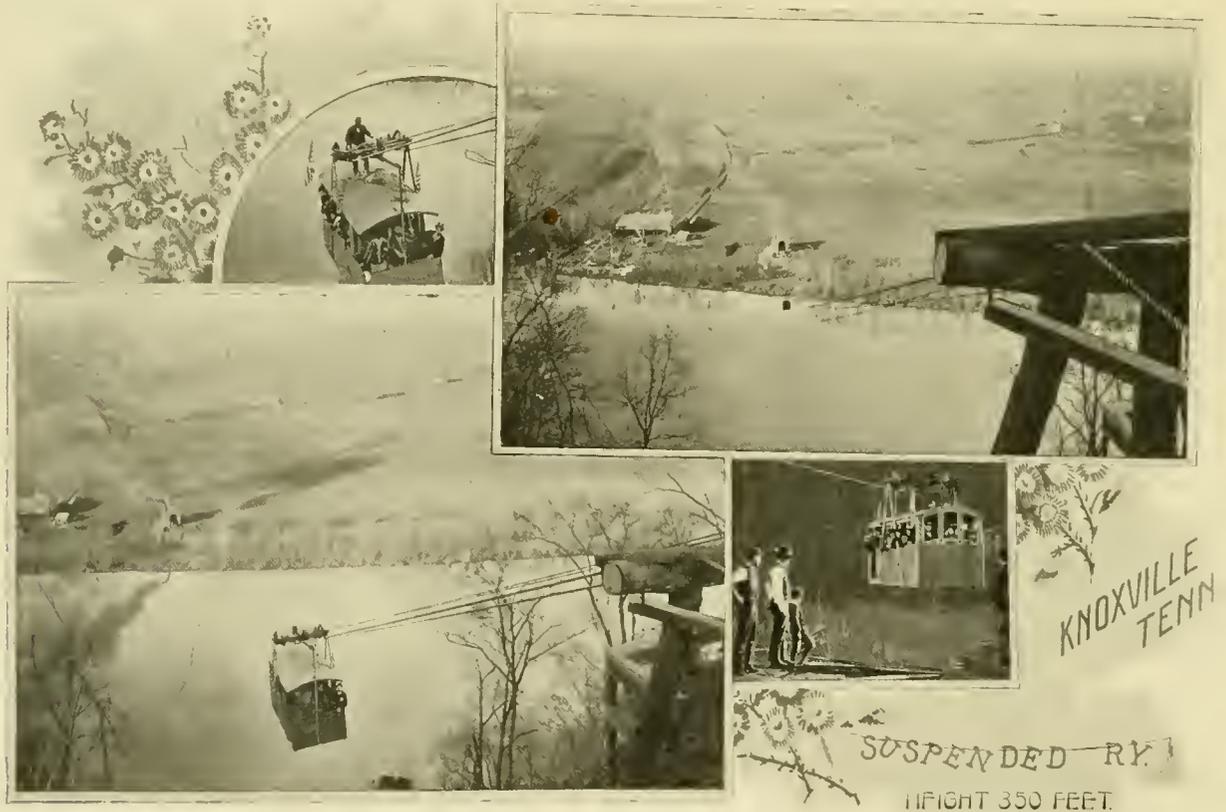

It is claimed that the law requiring Minnesota street cars to be vestibuled is unconstitutional.

## KNOXVILLE'S SUSPENDED RAILWAY.

Three Hundred and Fifty Feet Above the Water;—More Hair-Lifting Than the Ferris Wheel.

Although aerial rope tramways have been extensively exploited for light work, it is with something of a start that one learns first of the suspended railway when erected for such heavy work as the one now spanning the Tennessee River at Knoxville. Perhaps few of the novel schemes outlined from month to month in the REVIEW have more suggestion in them than this. The line is the property of the Unaka Park Company, and, besides being a feature which in itself attracts many people, it furnishes means of transportation to a beautiful pleasure resort.

engraving. These timbers are 14 feet long, and are placed behind partitions of 6-foot plank. The connecting bars are 12 feet long and  $1\frac{1}{4}$  inch thick. The staples to which the cables are fastened have 24 inches of threads to take up slack. The cable furnishing the motive power is  $\frac{1}{2}$  inch in diameter and is permanently fastened to the car. The anchor at the upper end consists of iron plates fixed in the rock. The supporting cables each have a breaking strain of 60 tons. The power is furnished by two 20-horse-power engines in the power house at the lower end. The car empty, weighs only 1,200 pounds. It has a 14-foot body and 3-foot platforms, and is 6 feet wide, by  $6\frac{1}{2}$  feet high. The seating capacity is sixteen passengers but more are often carried. The up trip takes about three and a half min-

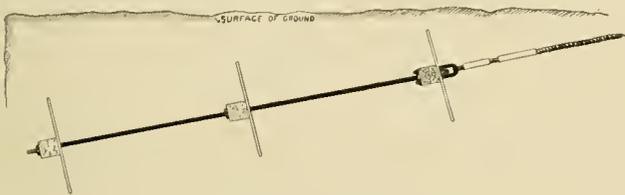

Taking a West End car in the center of Knoxville, the visitor is carried to within a five minutes' walk of the depot at the lower end of the bridge (by which name the inventor calls his device), at which place is also the bridge power station. From here stretch upward two  $1\frac{3}{8}$ -inch cables to the top of the opposite bluff, 350 feet above the starting point, the length of the span being 1,060 feet. In other words, the grade is about 33 per cent. Before getting aboard, the careful man naturally wishes to know something about the strength of the affair, and what are the probabilities of his taking a deep dive in the Tennessee River before reaching the top. The two  $1\frac{3}{8}$ -inch cables which compose the rails of this system, are anchored at the lower or Knoxville side, by bolting to 12 by 12 inch oak timbers, as shown in the

utes. The descent is made in half a minute by gravity.

Once at the top the passenger has the freedom of Unaka Park, a romantic spot of ground commanding a magnificent view of the surrounding country. In fact, the owners of the property, who also own the "cable road" and collect the toll of five cents for crossing their bridge, had very little to do to make the park attractive. About 50 feet from the summit is one of the peculiarities of this region, namely, a "blowing cave" where cold air is continually emitted. The hills in the vicinity are honeycombed with caves. Longstreet Heights, as this mountain is called, is famous, not only as the one presenting the best view of the surrounding country and mountain ranges, but has become one of the classic spots of the late war. Thirty-nine of General Long-

street's rifle pits are still to be seen on the mountain side. The Unaka Park Company owns 133 acres on the mountain, over all of which cool spring water is piped. This water is elevated by a hydraulic ram, the source being a spring on the premises.

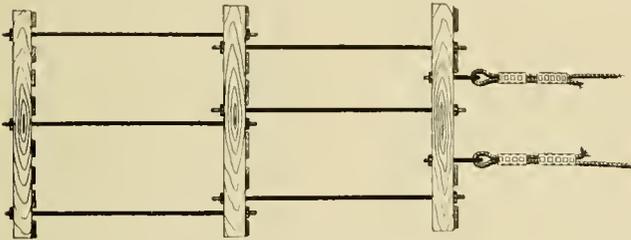

Certainly if any road has a right to be called a cable road this does, as the rails, roadbed and motive power

SIDE VIEW OF ANCHOR.

are all cables. The car is provided with automatic brakes, which stop the car in case the propelling cable breaks or slips on the drum.

On this cable road there are no low joints to threaten the sanity of the manager, nor is there dirt on the track to rattle the sashes. As a consequence, the 1,000 foot journey is a remarkably still one and the sensation almost that of the balloonist. As a matter of course the visitor feels a little shaky when swung off into space at a height

PLAN OF ANCHOR.

of 350 feet, but the feeling of exhilaration evidently finally overbalances this in a majority of cases, judging from the patronage of the bridge. The road started in the spring of 1891. The plans are those of B. J. Gagnier, of Detroit, to whom the patents belong. The idea commends itself to street railways as a means for providing attractions at favorable points such as exist in many places. This form of railway can be used in some places as a cheap substitute for a bridge. It does not begin to take the outlay either of time or money required to erect the ordinary bridge structures.

### A GOOD RECORD.

The York, Pa., Street Railway Company finds that rapid transit makes an emphatic difference in the receipts of the line. The last year the road was operated by horses was 1891. The year and the dollars run thus:

1889,	-	-	-	-	-	\$13,304.44
1890,	-	-	-	-	-	16,710.00
1891,	-	-	-	-	-	18,673.06
1892,	-	-	-	-	-	23,032.07
1893,	-	-	-	-	-	38,559.68

Many did not think that there was traffic to draw upon. but the figures prove the contrary.

## MOVING HOUSES OVER RAILWAY TRACKS.

Ordinances in Boston—State Law in New York.—And Individual Arrangements Which are in Vogue in Several Cities.

### PART II.

That a city ordinance can be passed to protect the rights of street railways, and that when passed it will do its work efficiently is shown in the history of house-moving in Boston. The success in that city should encourage every manager who is subject to this annoyance, to secure similar legislation in his own city. As the benefits can be shown to be so largely in the interests of the traveling public, local papers and city fathers should be interested in the merits of the measure, per se. As set forth last month, the house-moving nuisance is governed largely by the age of the city and the prevailing material used. Thus in Baltimore no difficulty is reported as one seldom sees a house moved in that city, and at Cincinnati, while no city ordinance exists to protect the companies, yet on account of the many hills upon which the city is built, troubles from this source are inconsiderable and have not called for relief measures. But in the city of

### TOPEKA

much annoyance has been experienced and as yet the city has not taken steps to protect the roads. Joseph M. Patton, general manager of the Topeka Railway Company, writes as follows:

"I can not give you much light upon this subject as we are sufferers in this city by lack of ordinance governing this matter. The only mention made in the ordinances of the city in relation to the moving of buildings is that the person moving the building must first get a permit from the chief of fire department. The chief of fire department here has held that he has no authority for refusing any one making application for the permit. The result has been that we have been repeatedly annoyed in the operation of our line by the moving of buildings across our tracks; and, in some instances, have been obliged to unhook our trolley wire from the span wires for a block each way from the intersecting street and to lay the wire on the ground to allow the building to pass over it. In such instances as this it is quite a difficult matter, and especially so with our feed wires. We have never had recourse upon the parties moving the building for expense incurred thereby.

I am exceedingly glad you have taken this matter up, and trust much benefit may result from its discussion, and if possible, by concerted action and agitation in the different cities where electric railways are operated.

It seems manifestly unjust that an individual should have the privilege of annoying a large number of other persons, passengers in the cars; and always cause great trouble and annoyance to the street railway company for the sake of their own personal gain. In Boston, I believe it has been provided by ordinance for many years that no building should be moved upon or across the tracks of

any street railway company until the consent in writing from such company had been obtained, and said certificate duly filed.

The practice of moving old and worthless buildings in western cities is a great and frequent annoyance, and in its abatement I think the telegraph, telephone and electric light companies will be nearly as much interested as the electric street railway companies.

If all interested in this matter would combine, I think the much-needed legislation might be obtained. I shall watch with much interest for the results of your agitation of this subject, and trust much benefit may be derived from it."

All who are acquainted with the extensive and magnificent system of the West End Street Railway,

BOSTON,

will readily appreciate the evils resulting from a delay of this kind in that city, where the streets are for the most part narrow and crooked, and in large districts few cross streets are available into which a building can be set during the day, with the intention of resuming the route again at night. Once started it must run its course, hence suitable restrictions have prevailed for some years there, and the result has been highly satisfactory to the public, and in fact everyone interested except the house-mover. The city ordinance of Boston provides that buildings may only be removed by permit from the superintendent of streets, when authorized by the mayor and aldermen,

"And whenever it appears that the moving of a building under the provisions of this section will encumber the tracks of any railroad shall be given by the board of aldermen upon the subject, before such permit is authorized."

This consent by the city is also made contingent upon the consent of the railroad company whose tracks it is intended to cross, and practically the same arrangement prevails in the immediate suburbs through which much of the West End system extends. This consent from the company can only be obtained after the parties desiring same have signed an agreement of which the following is a copy:

BOSTON,.....189

MR. C. S. SERGEANT,  
General Manager West End Street Railway Company,  
Boston, Mass.

Dear Sir:—I desire to move.....building.....feet long,  
.....feet wide.....feet high, from.....via.....to.....  
on.....189..

In consideration of permission being granted me by your company to cross its tracks with said building, via above-named route, I hereby agree to move said building at such time of day as may be agreed upon between Division Superintendent.....and myself. I further agree, in case of detention or interruption of any of the cars or lines of your Company, to bear the full amount of expense incurred by your Company, caused by such detention and interruption, also to pay all expenses for labor and material in case it becomes necessary to cut or remove any of the wires, track or other property belonging to your Company or used by it in the operation of its cars. And I also agree to use the utmost dispatch in

removing said building from its position whereby it interferes with, or interrupts in any way, the cars or lines of your Company.

But even this agreement is not accepted without a detailed statement which General Manager Sergeant sends to each division superintendent in whose territory the building will move, and which reads thus:

BOSTON,.....189..

Mr.....Division Supt.

Dear Sir:—.....this day makes application to me for permission to move a.....building.....feet long,.....feet wide,.....feet high, from.....via.....to..... What lines will such moving interfere with?..... To what approximate expense will the Company be put to if such permission be given, and if so, upon what day and at what hour of the day will it the least inconvenience you to have such building moved?.....

Yours truly,

Div. Supt.

Gen'l Manager.

When the division superintendents have reported favorably, a moving schedule is made out for the applicants, which must be strictly observed, and when the agreement is accepted the company issues the following permit:

WEST END STREET RAILWAY COMPANY.

GENERAL MANAGER'S OFFICE,

81 MILK STREET.

BOSTON,.....189..

Your permission from this Company to move a building from.....via.....to..... provided such moving is done in strict accordance with your agreement with me, dated..... 189.. and agreement with..... Division Superintendent, dated..... 189.. copies attached hereto.

Under this system complications, expense and delays have been reduced to a minimum, and while none of the rights of the house-mover—if he has any—are lost, he is made responsible for expenses which but for him would never have occurred, and what is quite as important, for the loss of revenue from travel, which by his obstruction the company is prevented from earning.

As far back as the '70's, house-moving in

BROOKLYN

became so frequent as to very seriously interfere with the operation of the horse cars, and at the solicitation of the late William Richardson, the matter was made the subject of legislative enactment, the bill reading as follows:

CHAPTER 764.

An Act to prevent obstruction to travel in the city of Brooklyn, passed April 26, 1871.

SECTION 1. It shall not be lawful for any person to move any building of any description through or on any street in the city of Brooklyn which has a railroad track laid thereon, unless the same is done in such a manner that cars running on said track are not obstructed thereby.

SEC. 2. In case any building is moved across the tracks of any railroad, the same shall only be done between the hours of eleven o'clock at night and three o'clock in the morning.

W. J. Richardson, secretary of the Atlantic Avenue road, says:

"You will see that the operation of the road is interfered with as little as possible, and we have sometimes made a special arrangement for a money consideration to modify the law in an individual case, but it is unusual. House-movers are very careful to notify us of an intention to cross our tracks and are very certain to make sure that they will not transgress the law. We have had no case of the moving of a house across our tracks since the road has been operated by the overhead system of electricity. Any interference so caused, such as cutting of the wires, we should expect to be recompensed for."

One of the most interesting chapters in the history of house-moving is contributed by W. S. Norman, general manager of the lighting and railway companies at

#### SPOKANE

and who relates the following experience:

"Replying to your letter of the 27th ulto., we have had a great deal of trouble in the matter of house-moving across our streets. Some four years ago a large building was moved against our lighting wires, and we got out an injunction, and succeeded in preventing the man from cutting through our lead. When our street railways were put in, an instruction was issued to the board of public works by the city council, that in case any contractor wished to move a building he must make his necessary arrangements with the company, and all house-movers now, before taking a contract to move a house, invariably figure with us and find out what it will cost them to take care of our wires, and we make them put up a deposit to take care of any damage to our property. A short time since we had a man who ignored this condition and started to pull a house across our tracks, but we prevented him from doing so by stalling a car in the vicinity, and by going before the court and asking for an injunction, whereupon he quickly conformed with the rule. We have never thoroughly thrashed out the issue in the courts, for the original suit mentioned above never came to a final hearing.

The lower court, however, held that the moving of a building on a public street was not an ordinary and legitimate use of the street, but was exceptional traffic, and such a mover had no right therefore to injure property which was being maintained in the street in conformity with the law, and in conformity with franchise passed by the city. We fought the issue out in another way with the steam railroad company, which was in the habit of running its pile driver through the city without reducing it to bridge height. They would run the pile driver at the height of 30 or 40 feet, and run through a lot of telephone lines which crossed the track, and we compelled the company to lower its pile driver to the height which it should have to be in passing under any of its own bridges.

It seems to me that the street railway people, largely to avoid hostile anti-corporation sentiment, have avoided the settlement of this question of house moving, until it has reached very large proportions, and involves a considerable expense to the companies and loss to the public. I believe that we should fight it out upon the broad principle that streets are made for public travel, and that the companies are the creatures of the public, and that their travel must not be impeded by the uses of the public streets for any other than public purposes. The removal of houses is not a public convenience, nor a public necessity, and I believe the principle of house moving has no place in the history of any other civilized country than the United States.

I hope the plan which you have started upon may lead to some concerted action on the part of the street railway men, so that we can take some one case, on its merits, to the Supreme Court, and get the entire issue adjudicated."

At New Haven, there is no ordinance, but the roads have always managed to protect themselves by friendly relations with the city officials, who decline to issue a permit until the applicant brings a consent from the manager of the line to be crossed.

#### IN CANADA

no serious trouble is reported, as in Montreal, and elsewhere, stone and brick constitute the favorite building material. Chas. E. A. Carr, of the Toronto Railway Company, reports that while there is no municipal law, the custom for years has been to secure consent of the city commissioner, who requires the applicant to stand responsible for all damage consequent on the removal, including any repairs necessary from cutting railway wires.

#### WAGES IN BOSTON.

The agreement of employes and the company in Boston has been signed, sealed and delivered for 1894. The agreement contains twenty-four articles, and is signed by President Little and General Manager Sergeant for the West End and representatives for the men.

The agreement is for not more than ten hours work in twelve. Payment of regular men at the rate of \$2.25 a day for platform work. Extra men shall be paid at the rate of 27½ cents an hour up to five hours in twelve when the rate shall be 22½ cents. Overtime by reason of accident or otherwise shall be paid at the rate of 24 cents per hour in addition to these amounts; for ten minutes or less 4 cents, for over ten and less than twenty-one 8 cents. Men doing schedule work (not to exceed 7½ hours) on night cars shall receive \$2.25. All chartered cars starting previous to 10 p. m. shall be paid 30 cents an hour. Conductors and drivers of such cars, starting after 10 p. m. and before 5 a. m., shall be paid \$1.00 for the first two hours and at the rate of 50 cents an hour thereafter. The whole agreement contains twenty-four articles.

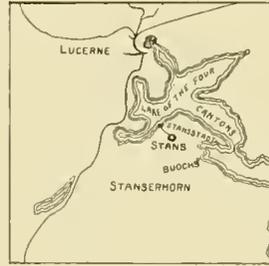

## BY CABLE TO THE CLOUDS.

The Romantic and Scenic Cable Life Up the Stanserhorn.

Among the four beautiful mountains surrounding the Lake of the Four Cantons, within excursion distance of Lucerne, the pyramidal Stanserhorn is the most commanding. The great interest that it has always possessed is now enhanced by the ease of access to it, made possible by the opening of the Stanserhorn mountain railway during the last summer. The road leads from the neat little village of Stans (at the foot of the mountain) to the summit, 6,232 feet above sea level.

After embarking from Lucerne, a thirty minutes' steamer trip brings the visitor to Stansstadt, an ancient

turbine station at Buochs, which also furnishes power for the trolley line. Every precaution for the safety of passengers is used, including automatic track brakes, and the passengers are spared the click and rattle of a cog or rack system.

The journey up the mountain is made in three sections, the ascent occupying altogether forty-five minutes. The first section is almost in a direct line to Kalti, the first station, through green meadows to the height of

2,342 feet. Here the second section begins with a change

little place redolent with memories of Arnold von Winkelried and his brave compeers who dwelt and fought and died in the tight Canton of Unterwalden.

In the midst of these reflections the familiar buzz announces the arrival of an electric car, nay, by your leave, a trolley car, which conveys the visitor to the mountain's foot and prepares his mind for the ascent via the mountain railway.

The transfer from the trolley car to the mountain road occupies but a short time, and the traveler finds himself in an ordinary inclined-plane car in the form of a set of steps. Each step or seat is capable of accommodating eight persons or 32 to each car. The system of propulsion used is the cable, after the plan usually followed, but actuated by electricity instead of steam. One of our illustrations shows the motor and a part of the winding drum. The power for the motor comes from the central

of cars and two minutes' wait to view the landscape. Then on to the second section through a deep ravine, pine-clad and silent. Now it crosses a mountain torrent on a stone bridge, now through a cut at a grade of 60 per cent and the visitor lands at Blunatt station, in an alpine meadow 4,005 feet above the sea. Again a change of car, and the third section begins. The scenery is more rugged, and tunnels, cuts and fills, show the engineer's skill and the builder's strength. Finally the long viaduct, shown in our illustration, leads to the terminal station, Stanserhorn Hotel, 6,070 feet above the Atlantic's level. Accommodations at the hostelry for 100 guests add comfort to the tourists' thoughts of a long return and dinnerless journey. One hundred and sixty feet further by foot brings the visitor to the top point of the Stanserhorn, and there the magnificent view amply repays the journey. All about the serried ranks of the

Alps; Rigi, with its mountain railway; the Wetterhorn, the Jungfrau and the rest of the notables; toy villages in the valleys and the cities grouped on tablelands, all is stretched out, a panorama of old Helvetia, and the wonders of the railway are forgotten for a time until a sharpened appetite calls the mind from scenery to supper.

The other railroads climbing mountain peaks, mainly by rack roads, are the Rothorn, 7,386 feet; Pilatus—previously illustrated by the REVIEW—6,776; the Wengern Alp, 6,773 feet; Mount Washington, 6,293, and the Stanserhorn, 6,232. Then comes the Rigi, 5,740; Monte Generosa, 5,376; Murren Alp, 5,284; Visp-Zermatt, 5,277; Vesuvius, 3,887; San Salvatore, 2,896, and the Uetliberg, near Zurich, 2,696. Of all these the outlook from the Stanserhorn is said to be the widest and most satisfactory.

**ANNUAL REPORT OF THE CHICAGO CITY RAILWAY.**

When the record is balanced by the coming great historian of Chicago's municipal preeminence, the street railway systems of the city will get the credit for their many hard fought battles, the slogan of which has been, "the greatest good to the greatest number."

And looking at the daily press, it would seem not until then.

Ad interim, the railways go on beautifying the parks, adding to real estate values, and hauling passengers ten miles for five cents.

The Chicago City Railway, at its late meeting, of January 15, gave to the Field Columbian Museum the \$100,000 of World's Fair stock, and authorized a cash donation of half that amount if the museum remain at Jackson park. So much for the city.

The president's report gave the following results for the Columbian year of 1893:

Number of passengers carried	- - -	120,506,270
Increase over 1892	- - -	32,578,409
Total earnings	- - -	\$6,059,989
Operating expenses, 56.75 per cent of income	- - -	3,422,040
Interest	- - -	199,237
Total	- - -	\$3,621,278
Net earnings (28.69 per cent of capital)	- - -	\$2,438,711
Cash dividends paid, 24 per cent	- - -	2,100,000

As compared with 1892, it will be remembered that the net earnings were 19.01 per cent, and the dividends paid 12 per cent.

In 1893 the mileage was 26,304,090, an increase of 5,483,380, as follows:

MILEAGE.	RECEIPTS PER CAR MILE.	EXPENSE PER CAR MILE.
Cable, 19,713,610	19.965 cents	9.921 cents
Horse, 5,053,050	31.050 cents	24.863 cents
Electric, 1,537,430	34.148 cents	13.660 cents

The admirable results of electric traction are obvious. The increase in receipts per day over 1892 was \$4,494, a percentage of increase of 90.69 during the World's Fair period, and of 9.31 during the balance of the year.

The stockholders gave the directory power to issue, during 1894, at any time they saw fit, new stock to the amount of \$1,000,000.

The re-election of the old board and officers showed the high appreciation of the stockholders for the magnificent management of the Chicago City Railway during the trying period of the Columbian year.

**WILL WORK OUT ITS OWN SALVATION.**

A gentleman in an eastern city, but who is not personally interested in the road in question, said to our correspondent: "The papers here, with no exception, are simply roasting our new trolley road. It is outrageous. I have written two or three open letters to them, but they are hide-bound and will not pay any attention. To show how far they carry it: not more than ten days ago a man had both legs cut off by the cable road and they made a short paragraph of it in an out of the way corner of the paper; whereas a collision between a trolley car and a baker's wagon in which no other damage was done but to knock the wagon off the track, was given a double header on first page as a "Deadly Trolley Accident." As I wrote to the — if the editors of the papers would try to educate the public to the fact that increased rapidity of traction cars means increased watchfulness on the public's part they would soon lessen the number of accidents instead of always painting the ideal transit as a juggernaut. In the case of the accident above referred to, the motorman was ringing his bell, but the wagon was "tracking" and would not turn out. But I presume the hue and cry against the "deadly trolley" must run its course the same as all new transits, for the papers here years ago raised almost a veritable riot when horse cars replaced the old omnibuses and stage coaches. Oh, for an honest and fair treatment of the trolley, instead of the hide-bound opinioned and water-proof insulated statements of the general press."

**THE ARTESIAN WELL DISTRICT OF SOUTH DAKOTA.**

Since the publication of the article on the artesian well power of South Dakota, which appeared in our January issue, and attracted so much attention, we have received a letter from President W. M. Blackburn, of Pierre University, stating that doubtless the artesian well district extends west as far as the Rocky Mountains. The wells at Pierre and Chamberlain are in the Missouri valley, and, while no wells have as yet been sunk in the western part of the state, it is gratifying to learn from geological authorities that the area probably extends over so great a territory. South Dakota's mine is much richer than we represented.

A RECENT decision of the Supreme Court declares that the street railways of Massachusetts are responsible for accidents caused by the overhead work of their construction, and liable therefor.

## ANNUAL REPORT OF THE CITIZENS TRACTION, PITTSBURG.

A Model Statement, Containing Much Valuable Data for  
Reference and Comparison.

The very interesting and instructive annual report of the Citizens Traction Company, of Pittsburg, for the year ending October 31, 1893, has just been issued, and is a great credit to the management, of which John G. Holmes is president, and J. E. Rugg superintendent.

The secretary shows the total receipts from passengers to be \$707,895, with total operating expenses of \$335,979. The per cent of expenses to receipts, 74 per cent, nearly.

The superintendent reports 12,999,478 passengers carried by the cable, and 1,848,373 by the electric system, with a total car mileage of 2,037,262 for the former, and 459,223 for the latter method of traction. The per cent of receipts for operating were: For the cable, 53 per cent; for the electric cars, 68.6 per cent; average, 54.8 per cent. On the cable line the receipts were 30.80 cents per mile, and the expenses 16.33 cents, leaving a profit of 14.47 cents. On the electric system the receipts per mile were 17.51 cents, and the expenses 12.02 cents; profit, 5.49 cents. The taxes paid were:

State, \$32,471; county, \$53; city, \$7,192.

The fuel and water account of the cable power house is as follows:

Nut coal, 3,671 <sup>3</sup> / <sub>4</sub> tons, at \$1.40	\$5,220
Nut coal, 584 <sup>3</sup> / <sub>4</sub> tons, at \$1.35	789
Slack coal, 4,348 <sup>1</sup> / <sub>2</sub> tons, at \$1.03	4,479
18,784 gallons of water, at 7c. per M	1,314
Total	\$11,803

Daily expense for operating cable power house (725-horse-power) reads:

Oil, grease and waste	\$ 2.31
Fuel	28.74
Water	3.60
Labor	27.16
Total	\$61.81

Cost per horse power, 20 hours - 8.50 cents.  
Cost per horse power per hour - .42 cents.

The electric power station required fuel and water as follows:

Nut coal, 1,067 tons, 622 lbs., at \$1.40	\$1,494
Nut coal, 254 tons, 1,210 lbs., at \$1.35	343
Slack coal, 1,332 tons, 496 lbs., at \$1.21 <sup>1</sup> / <sub>2</sub>	1,618
5,095,995 gallons water, at 7c. per M.	356
Total	\$3,813

The daily expense for 22 hours per day for 216-horse-power was:

Oil, grease and waste	\$ .56
Fuel	9.47
Water	.98
Labor	8.96
Total	\$19.97

Cost per horse power per day - 9.20 cents.  
Cost per horse power per hour - .41 cents.

The detail of cost of motive power per car mile, for cable and electric, appears as follows:

CABLE.	ELECTRIC.
Coal.....8.45 lbs, cost $\frac{5.1}{100}$ cents	11.36 lbs, cost $\frac{8.00}{100}$ cents
Oil, waste and water.....cost $\frac{1.00}{100}$ cents	cost $\frac{1.00}{100}$ cents
Labor.....cost $\frac{4.9}{100}$ cents	cost $\frac{7.0}{100}$ cents
Total cost..... $\frac{11.0}{100}$ cents	Total cost $\frac{16.0}{100}$ cents

The daily expenses of the year averaged as follows: Pay roll, \$694, or 35.82 per cent of earnings; supplies, \$249, or 12.87 per cent of earnings; total, \$944, or 48.69 per cent of earnings. The average daily receipts were \$1,939.52.

The road equipment consists of 68 cable cars and 20 electrics, the latter equipped with two 20-horse-power motors, with the necessary accompaniments of snow sweepers, sprinkling carts, etc.

The machine shop equipment consists of 2 lathes, 2 drills, 1 boring machine, 1 slotting machine, 1 bolt cutter, 1 wheel press, emery wheels, and smaller tools.

The employes number 309, divided thus:

TRACK DEPARTMENT: 8 flagmen, 8 oilers, 2 switchmen, 2 curve sweepers, 1 wagon driver, 2 cart drivers, 1 paver, 1 rammer, 4 laborers, 1 day foreman, 1 night foreman. Total, 31.

POWER HOUSE DEPARTMENT: 4 engineers, 2 oilers, 5 firemen, 3 stokers, 4 vault men, 8 grip examiners, 1 porter. Total, 27.

MACHINE SHOP: 2 machinists, 4 jobbers, 2 blacksmiths, 2 helpers. Total, 10.

CAR REPAIR DEPARTMENT: 1 foreman, 4 carpenters, 1 blacksmith, 2 painters, 2 brake repairers, 1 scrubber. Total, 11.

STABLE DEPARTMENT: 2 hostlers, 1 watchman, 1 wagoner. Total, 4.

CAR BARN: 1 shedman, 2 watchmen, 15 car cleaners. Total, 18.

ELECTRICAL DEPARTMENT: 2 day motor and line inspectors, 2 night inspectors; total, 4. Besides these there are 20 unclassified, as follows: 1 mechanical engineer, 1 civil engineer, 1 electrician, 1 rope splicer, 2 assistant superintendents, 1 paymaster, 2 record clerks, 1 stenographer, 6 dispatchers, 2 receivers, 2 inspectors.

There are 91 conductors, 71 gripmen, and 20 motor-men.

The repair account is of great interest. The record for Nov. 1, 1892, to October 31, 1893, for electric and cable lines reads as follows:

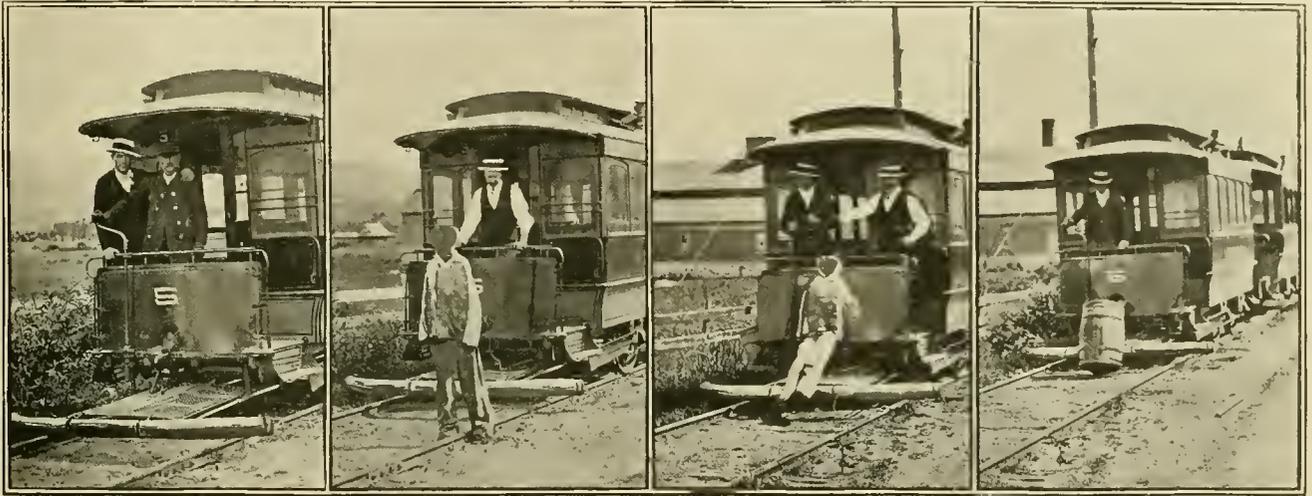

Cost of car repairs on	
Butler street (8-wheeled cable cars)	\$5,866.35
Cost, average, per car	209.51
Cost, average, per mile	$\frac{7.3}{100}$ cents
East Liberty street (cable)	\$9,267.13
Cost, average, per car	243.87
Cost, average, per car mile	$\frac{7.5}{100}$ cents
Sharpsburg line, suburban (4-wheeled elec.)	\$1,210.05
Cost, average, per car	110.00
Cost, average, per car mile	$\frac{3.8}{100}$ cents
Frankstown line, suburban (4-wheeled elec.)	\$100.86
Cost, average, per car	40.09
Cost, average, per car mile	$\frac{2.8}{100}$ cents

A FEW FACTS ON FENDERS.

It is to be hoped that the flood of car fenders with which the patent office has been deluged will bring about more material results than the similar floodings that office has received from car couplers, car starters and alternate current motors. At present it almost seems as if managers were so dazed by the multitude of these devices that they are unable to choose any of them. In spite of this, the number of cars equipped with fenders is no doubt daily increasing. It is the purpose of the present article

which canvas is stretched. The lower pipe of the frame is covered with rubber to relieve the shock on the individual struck. It is normally held up against the dashboard and falls by its own weight when released as needed.

As might be expected, one of the biggest fool-suggestions comes from a New York daily newspaper. It is to have a foot-board and a grab-handle around the end of the car so that the person on the track could do the switch-engine-brakeman-act and quietly step onto the foot-board. It is exceedingly improbable that the people

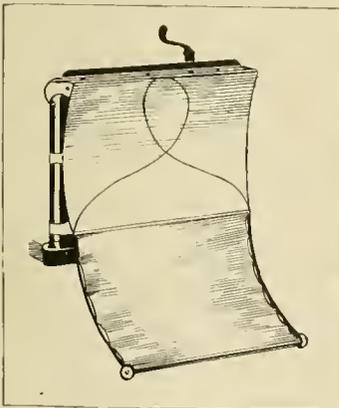

WORKING EXHIBITION OF THE BRAGG FENDER.

to briefly describe and illustrate a few styles of fenders not before shown in our columns.

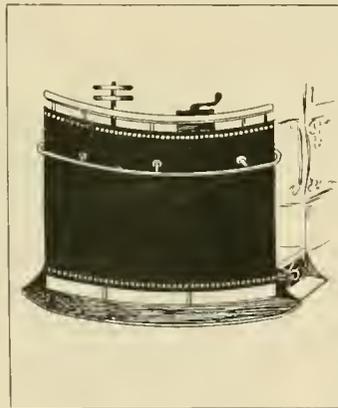

First on the program comes the Bragg fender used on the Hoosac Valley electric road. It is the invention of F. A. Bragg and T. W. Richmond, of North Adams, Mass. It consists essentially of a frame on which is stretched wire netting and has a pneumatic tire for a cushion around the

ordinarily victims of an accident would have the skill and the presence of mind necessary to use this.

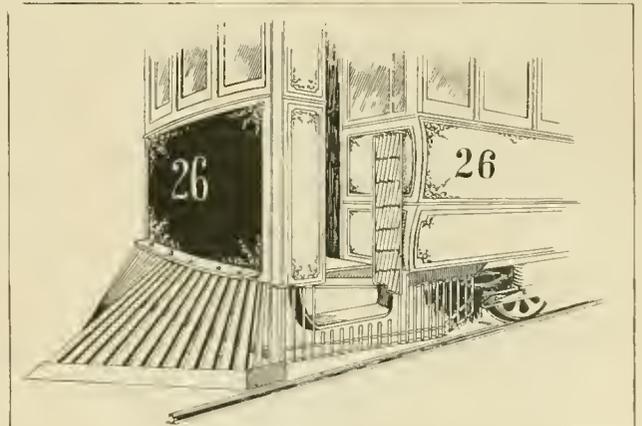

Superintendent Crosby, of the Vallamont Passenger Railway, Williamsport, Pa., has put a "cow-catcher" on one of his cars. The running gear seems pretty thoroughly fenced in. The fender is carried about four inches from the track and let down by the motorman.

CURTIS FENDER.

N. Y. HERALD.

CROSBY FENDER.

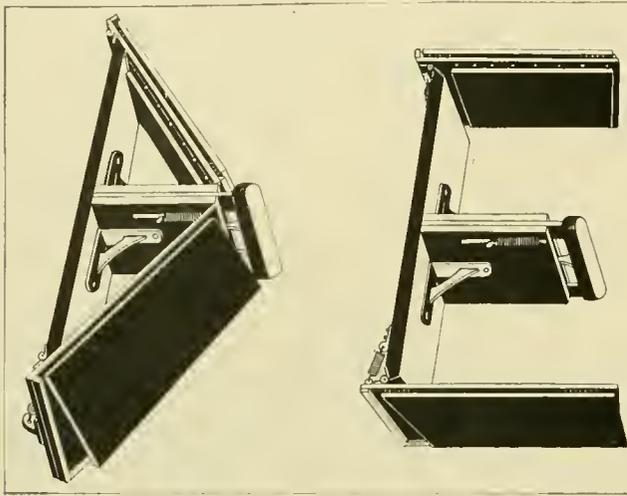

front edge. In the latest form the rubber tube extends clear around to the steps and the netting covers the entire space inside. The guard is normally back under the car but is shot forward some distance when touched off by the motorman.

C. H. Curtis, of 222 Elm street, Cincinnati, has a fender consisting simply of a frame of gas pipe over

One day when Superintendent Crosby was on the car this fender had a very unexpected practical trial. A delivery wagon suddenly turned into the track and the horse was struck, its leg being broken by a twist. The fender was unscathed.

A brand new idea is that of Thomas Barnes, of 90 Graham street, Lowell, Mass. The guard is normally

as shown at the left. When anything strikes it the sides fly out, as shown at the right, and the person is pushed out of the way.

THE BARNES FENDER.

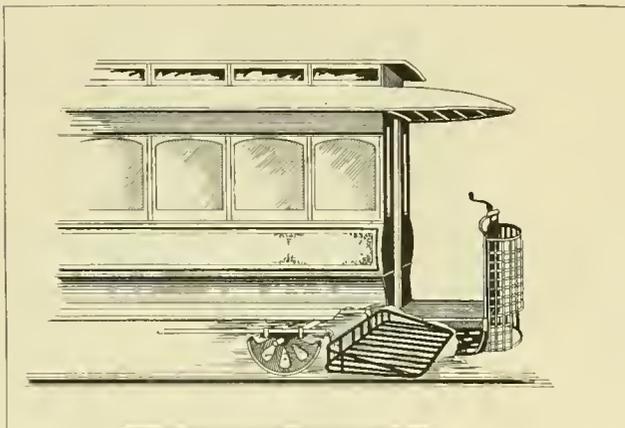

The Moore fender eliminates the uncertain "human element" in the motorman, by automatically cutting off the current and applying the brakes. The brake used is

MOORE'S METHOD.

a kind of block, which drops in front of the wheels. The whole mechanism is operated by an object striking the fender.

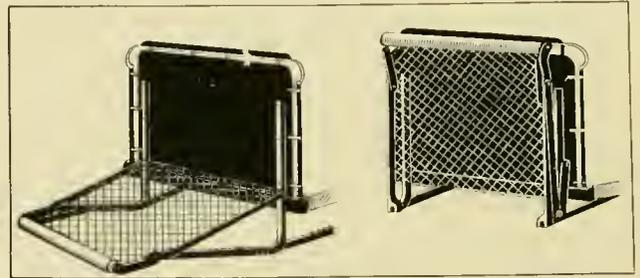

R. T. White's fender differs from the foregoing in that it is carried by the boxes on the car axles instead of being

WHITE'S WRINKLE.

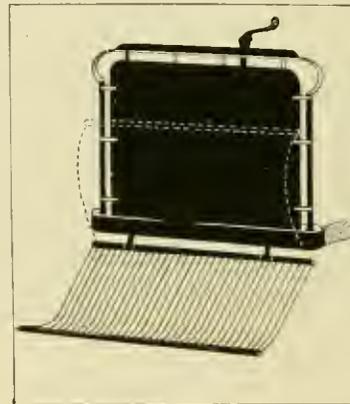

hung from the car body. This prevents up and down movement of the fender to a great extent, and it can consequently be carried nearer the pavement without striking obstructions,

The Thomson fender has been tried at Montreal on the St. Catherine Street line. Its construction and operation can be seen from the engraving.

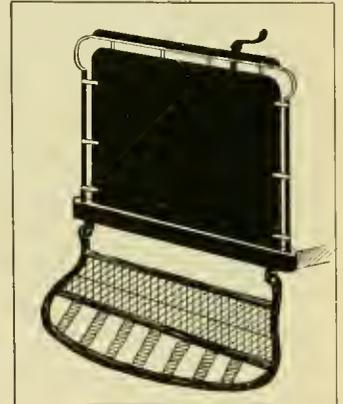

THOMSON'S PLAN.

The Lynn & Boston and Leonhardt fenders are also shown and can be easily understood.

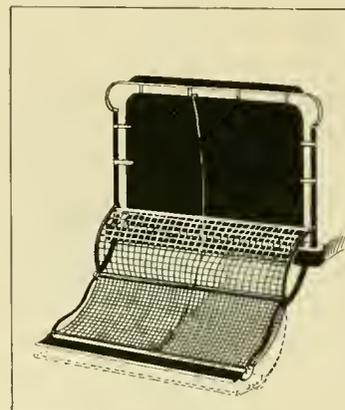

LYNN & BOSTON.

LEONHARDT FENDER.

T. C. Rice, of Worcester, Mass., owns a patent on the fender here bearing his name. It is intended to be carried one or two inches from the rail.

One of the most noteworthy of the proposed devices is Padrovonski's North American electro-pneumatic life saving apparatus. An air pump under the car creates a vacuum in an auxiliary reservoir. When a person gets in the "field of influence" in front of the car, the auxiliary reservoir is automatically opened and the air rushing into the funnel on the front dashboard draws the individual safely in.

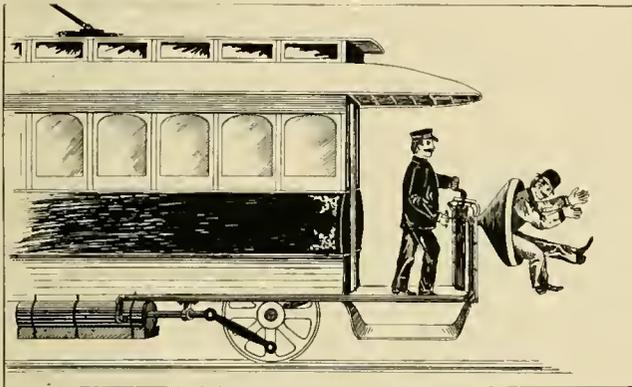

RICE PATENT.

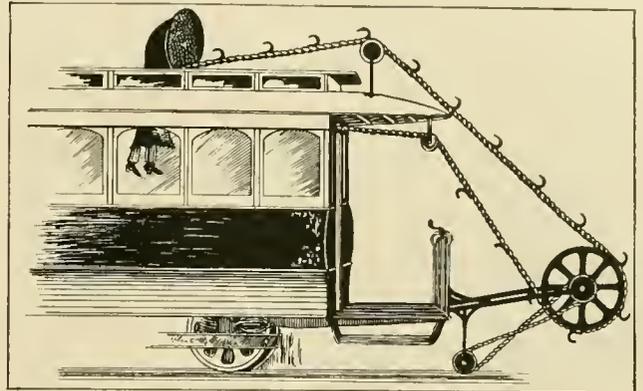

One advantage of this plan is that it is necessary that people wear electric belts in order to be saved by it. Thus a road could collect a large royalty from electric belt makers as a return for adopting this life-saver. As the electric belt makers' profit is large, it is reasonable to think that this could be made a source of a good-sized revenue.

There remains two fenders, which eclipse all those previously described. One is the design of John Jackson, 1518 Byrd street, Baltimore. The franchise for the other is owned exclusively by the STREET RAILWAY REVIEW. They are both unparalleled in the history of the globe, and while it is usually hard to have to divide

the car and automatically rings a bell, warning the conductor that there are new arrivals from whom fare must

ELECTRO-PNEUMATIC LIFE-SAVER.

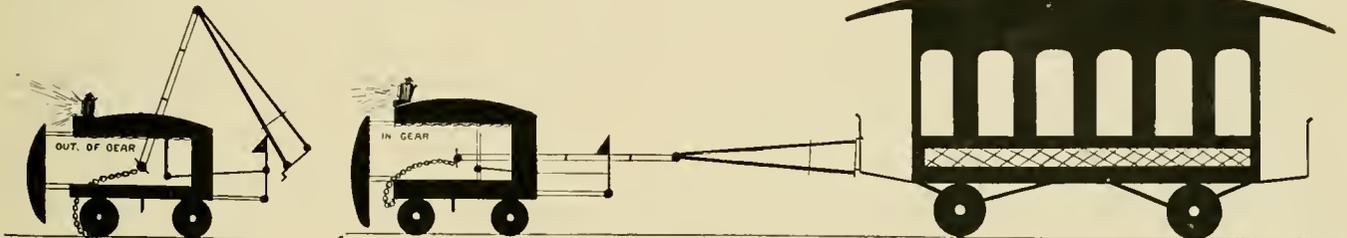

ALL OUR OWN.

be collected. Royalty rates for the use of this fender will be furnished on application.

## TOLEDO'S TRACKS.

the glory with another, we gladly do it in this case. The scheme of the gentleman from the city of fenders is to have an advance guard preceding the car at a respectful distance, which stops on coming in contact with a pedestrian. The said pedestrian is thus made aware that a car

The report on street railway tracks shows Toledo, O., to be lavishly supplied with the steel bands. The Consolidated Company proper has 86.20 miles of tracks. The Metropolitan branch has 15.48 miles, and the Cen-

THE JACKSON SYSTEM, BALTIMORE.

is approaching and is expected to adopt measures to get out of the road. If he does not the mechanism between the advance guard and car begins to fold up in the manner shown and chains are automatically dropped in front of the guard's wheels. The motorman thus becomes aware that some one is on the track ahead and stops the car.

All of the devices heretofore provided are manifestly incomplete. The REVIEW fender performs all the functions which a fender should. Last month we published an extract from a Bridgeport paper, describing the way in which some of the present fenders might scoop up a whole nestful of people. These would be carried to the end of the line without paying fare. The REVIEW fender obviates this, while at the same time giving the fender victims a more comfortable place to ride. A series of rope drums are geared to the axle of a pair of driving wheels, run on the track in front of the car. Over these drums run a number of ropes provided with teeth. When persons are struck, they are carried up this "grain conveyor," and shot into a chute, which delivers them in

tral Passenger line 11.63 miles. This gives the Consolidated Company a total of 113.31 miles of tracks in Toledo. The Robinson system has 20.05 miles.

## OAKLAND'S PRIZES.

The Oakland Consolidated Street Railway offered a number of prizes for the most riding, giving to each passenger a check. The one turning in the most checks at the end of two months received the first prize; the next largest, second prize, and so down to \$4. By pooling the tickets the Associated Charities came first with 92,391 tickets and the \$60 prize; the second, third and fourth prizes also went to charity. It was considered a success by the company and the populace.

MANAGER BLACK, of the Niagara Falls Street Railway, was refused right of way through South Niagara Falls. The consequence is that the railway will not touch the village territory in going to Falls View, and the majority of the villagers execrate the council.

## BRAKES ON ELECTRIC ROADS.

Strange to say the street railways of some of our crowded eastern cities do not seem to be answering the demand of some people who ought to know better, for brakes that will stop a car within half its length from a speed of ten or fifteen miles an hour. We would suggest to those companies that a stick of cordwood or two carried on the front platform, and thrown in front of the car, would probably comply with this demand in about as neat a manner as anything. It would certainly be a cheap and simple method. True, it might half kill several people in the car, besides smashing the car and motors, but this would be no object if only a quick stop could be made.

In discussing this question from a common-sense standpoint it might as well be considered first as last that there is a practical limit under which a car at a given speed can not be stopped without injury to car or passengers. There are a great many accidents that are unavoidable by the motorman, occurring, as they do, in a less space of time than it takes to throw off the controller, to say nothing of putting on the brakes. With such accidents, of course the shortcomings of the brakes have nothing to do.

The question is not entirely one of emergency stops. It is one of both service and emergency stops. As air brakes made possible a fast suburban service on steam roads, so improved brakes on street railways ought to quicken the service as well as decrease accidents. There are plenty of small roads where the present ratchet brakes with long levers are good enough for present uses. At the same time there is no doubt but that the present crank and chain brakes can be improved on. The trouble with the common brake is not wholly with the force of application, but with the quickness. It is possible to skid the wheels with the majority of brakes now in use and this fact indicates that the force of application is even greater than necessary; but it takes several seconds to wind up the ordinary brake, so that the very time the application ought to be the heaviest, it is the lightest. Experiments on braking power show that the retarding effect of brakes is less the higher the speed, and that the friction between wheels and rails does not decrease in the same proportion. This means that the hardest application possible without skidding the wheels is at the highest speed. Some years ago, Mr. Westinghouse devised and tried an automatic apparatus for use in connection with the air brake, whereby the pressure on the brake shoes was made as hard as the wheels would stand without skidding, at high speeds, and then automatically decreased as the speed fell off. In this way the full braking power possible was realized. The automatic device was too complicated for every day use but it helped to illustrate the principle that the hardest application is needed at first. In addition to this, in street car work, it must be considered that, the liability of accident to persons is principally at the higher speeds. It is not so much a question of the total distance in which a car

can be stopped when there is a person on the track ahead, as it is how quickly speed can be reduced enough to allow that persons to get out of the way. These problems may appear to be the same, but they are not. If a car is going ten miles an hour the main question is, how soon the speed can be reduced to five miles an hour. It is easy to reduce it from five miles an hour to zero, and the probabilities are that this latter would not be necessary in the majority of emergency cases.

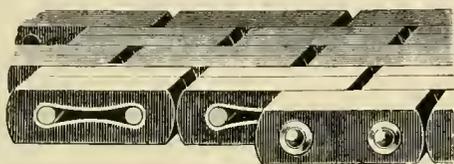

There is then a double reason why the brakes, of whatever kind, should be applied with their maximum force at first. This should hold not only in emergency but in service stops, for a much quicker service stop could be made if this principle were carried out. Air brakes are about the only ones that fulfill these two requirements at present, and those who can afford to put them on do so with the assurance that they will have something reliable.

There remains one other method that has been given enough of a practical every-day trial to make it worthy of consideration. We refer to the use of motors as dynamos. This method has been talked of ever since the beginning of electric railways but seems never to have been put into actual service with the one exception which is noted here. I. B. Walker, superintendent of the Sioux City Street Railway Company, has fitted out the cars which run over heavy grades on his line with this device, and the experiment has proved quite satisfactory, as was mentioned in a short description of this electric brake in the REVIEW, over a year ago. The cars, as wired by Mr. Walker, have a small switch in a box beside the controlling stand. When this switch is thrown, the trolley connection to the motors is cut off and the motors are connected with the controller in such a way that the rheostat is thrown into the motor circuit,—the amount of resistance in circuit being regulated by the controller as when the motors are drawing current from the trolley. Thus, when the controller is on the first point, the motors are sending current through the entire resistance, and with the controller on the highest or last point the motors are short circuited. The braking effect is greater the higher the speed and the less the resistance in circuit. When the speed is very slow the braking effect is so small as to be almost zero. For this latter reason it is not practicable to depend on the electric brake to make the entire stop. The use to which they are put at Sioux City, and the one to which they are best adapted, is to keep the speed down on grades. At that place a certain car goes down a 12 per cent grade two blocks long every twenty minutes, eighteen hours a day, the hand-brake never being used except to bring the car to a standstill. This grade formerly gave much trouble, and flat wheels were taken off a car every few weeks and sometimes every few days. Besides this, two accidents occurred owing to the wheels becoming locked. The wheels slipping, the car ran away down the hill. The braking power with slipping wheels is only one-third what it is just before the slipping begins. After the two accidents Mr. Walker put on the electric brakes.

With these, it is, of course, impossible to slip the wheels, as the instant a slip occurs, the motors which are acting as dynamos, stop and cease to generate. When the wheels again turn the motors resume their braking function. It is this automatic action which constitutes one of the chief beauties of this method of braking. At the same time it is absolutely reliable. The only objection that could be found is that it works the motors and rheostats at a time when they would otherwise be "resting." It would seem that this method might with advantage be given a trial in helping make regular service and emergency stops. As was pointed out, what is needed is heavy braking power at first, and this is just what the dynamo brake affords. Hand-brakes would of course be necessary to complete the stop after the electric brakes reduced the speed, but there is no doubt that the time of stop would be much reduced. The motorman could throw on the electric brake and have it in powerful operation at least two seconds before he could wind up a hand brake to where it would begin to do some good. The electric brake once on, the motorman would have time to put on the hand-brakes, which latter would be very efficient to complete the stop after the speed was reduced. Whether the motors would suffer unduly can only be told by actual experience. Various combinations of electric brake, switch and controller, suggest themselves, and it remains for the electrical manufacturing companies to put something of this kind on the market. The system is at least worth a trial and it need not be an expensive one, as it could be put on only one or two cars at first, and it could then be determined whether a more extended use of such brakes is desirable.

WALTON'S LINK BELTING.

The marvelous amount of "stretch" to be found in some link belts may fairly be compared to the contractive tendency of the proverbial woolen shirt when washed. A new link belt, in which such difficulties are said to have

been eliminated, is the "Imperial Driver" of Walton & Sons, City Leather Works, Glasgow. In each link is an eye of weldless steel tube, forming the bearing surface of the pins. These also prevent wear, and their shape gives a slight spring action so that some of the characteristics of the link belt are preserved.

The Chicago City Railway Company distributed \$1,410, among its employes, as prizes offered last January for the best service during the Exposition period. The results, Mr. Bowen thinks, were satisfactory, and 20 men participated.

FRANK S. DE RONDE.

The general sales agent of the Standard Patent Company, Frank S. De Ronde, was born at Englewood, New Jersey, in 1870, and is consequently twenty-four years of age. Youth, in his case, he can "neither palliate or deny." After finishing school at Englewood, he took a business course in New York City. At the age of fifteen he went into the employ of a chemical house to learn the business. A year later he left this place to become office boy in the Standard Paint Company's office. His rise in this position was remarkable, going on the road in less than two years as salesman. His success as a salesman was no less remarkable, and at the age of twenty, in 1890, Mr. De Ronde was made general sales agent, with full charge of the traveling men and oversight of dozens of selling agents in branch houses.

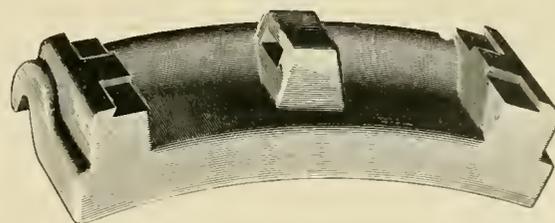

F. S. DE RONDE.

In spite of his many business cares, Mr. De Ronde finds time for social duties and is a great lover of sports, keeping a number of fine horses. In addition to this, Mr. De Ronde takes an active interest in politics, following his brother, who was assemblyman before he was thirty and is now a state senator.

THE SCHOEN BRAKE SHOE.

The Schoen Brake Shoe Company of Pittsburg are putting on the market brake shoes of mild steel, one of which will, according to their tests, outlast eight cast iron shoes. This is accounted for in two ways. The actual wear on cast iron is greater than on mild steel, and the steel shoes can be worn thinner without breaking than can the cast iron. The steel used is very low carbon. That is, it approaches near to malleable iron. This

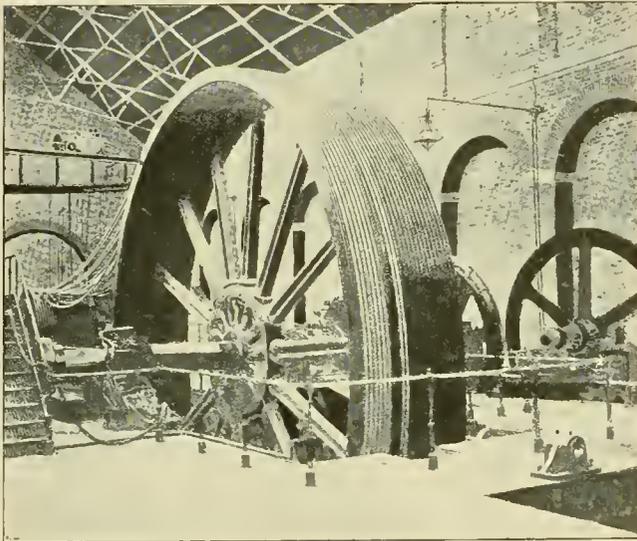

grade of metal is said to be the cheapest in the first cost. The shoes are forged by hydraulic pressure into any of the forms now in use. Shoes are absolutely uniform in quality and dimensions. As the wear of the steel shoe is so much slower, the labor of inspecting, cleaning and adjusting is much less. It goes without saying, that the amount of brake shoe metal necessary for a given service is not nearly what it is with cast iron. Roads which have used this shoe are pronounced in their expressions of satisfaction, and a trial is in nearly every instance, followed by a second order.

**THE KENSINGTON & STREATHAM CABLE RAILWAY.**

After many changes and vicissitudes the cable railway in London, England, between Kensington and Streatham, is now pronounced by the conservative Englishmen a financial and mechanical success. The plant was designed by Mr. Colam, C. E., of Edinburgh, and is very complete. The power house, an interior view of which we show, is a fine brick structure of sufficient size to admit of more power as it becomes necessary.

The engines used are a pair of compound non-condensing with cylinders of 20½ inches and 32 inches. Dr.

“The Driven Drum is 30 feet in diameter.”

Proell's automatic, variable expansion valve gear is used on the high pressure cylinder while the low pressure is fitted with Corliss valve gear of the modern type. The fly-wheel is 16 feet in diameter. A rope drive is used, the driving pulley of which is 10 feet in diameter, grooved for 24 ropes of two inches diameter. The driven drum is 30 feet in diameter built up in segments with 14 arms. The shaft is 18 inches of forged Siemens' steel carrying friction clutches of special construction. The winding machinery is of the usual design and operates smoothly and efficiently.

**MAKING THE POLICE USEFUL.**

When in a Western city recently, the manager of the electric line spoke of the very great annoyance caused him in the past by boys stealing rides on cars. “But,” said he, “it's different now. At my request the chief of police occasionally arrests and locks up for a few hours a boy when seen trespassing on our cars. I make it my business, when a new chief of police comes into power, to explain to him that it is a part of his duty to have his men watch the boys who make it a practice to hitch on the cars, and to make an example of some of them, occasionally, by arresting and locking up for a few hours. This generally lasts for several weeks. As this is all

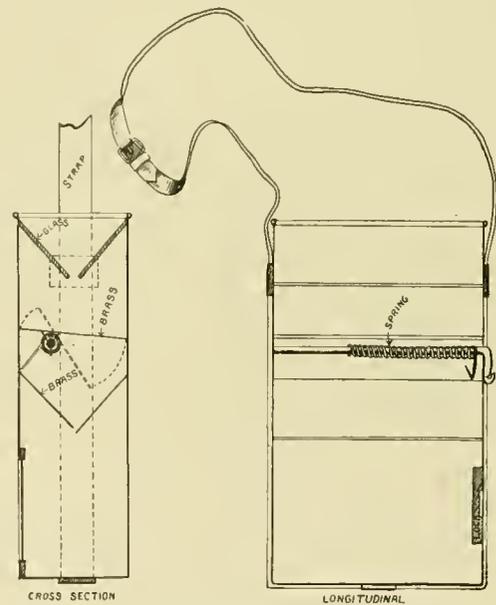

we get out of the police for their rides, we do not feel we are asking anything out of the way. Besides, I consider it their duty to keep the boys off, if only as a safety measure to the boys themselves.”

**MILEAGE AT AUGUSTA, ME.**

The trolley wheels of the Augusta, Hallowell & Gardner Railroad rubbed against 579,819 miles of wire in 1893. Some of the conductors rode 40,000 miles during the year, or an average of 109 miles every day, supposing that they worked every day. But one person was killed. Over two million were carried.

**THE SEVEY FARE BOX.**

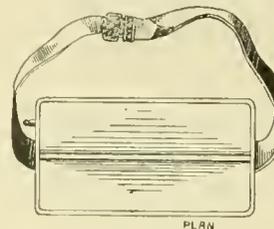

While northern roads have settled down to the fare register as being the best available check on the honesty of the conductor, New Orleans roads have been experi-

THE SEVEY FARE BOX.

menting with the attempt to make some improvements. One of the devices proposed, is the invention of W. S. Sevey. It is a fare box, to be carried by the conductor.

The passenger is expected to deposit the fare in the box. It falls into an upper chamber, as shown in the cross section. It is then in full view. The conductor turns the brass bottom of the upper chamber into the position shown by the dotted lines, and the money is emptied into the lower, where it can only be get at by unlocking a Yale lock. The intention is to have the boxes made of aluminum.

The intention is to have the boxes made of aluminum.

FIVE motormen of Racine Street Railway Company have been discharged for hugging girls on the cars and visiting saloons while on duty.

## MAINTENANCE OF ROLLING STOCK.

Am I spending too much on the maintenance of my rolling stock and motors? Am I employing too many men around the barn and in the repair shop, or are there not enough to do the work properly? These are questions that appeal to the manager of every electric railway. Along with these questions come others, as to how often motors and trucks should be overhauled, and how many repairs are usually needed with a given mileage. In two previous articles in the October and November REVIEWS, entitled the "Electrical Inspection Department," the methods used on two roads were described in brief. In the present article the practices of a number of representative roads will be described more in detail.

DECATUR, ILL.

The City Electric Company owns in all eighteen motor cars. Of these eleven are equipped with single Thomson-Houston F-30 double reduction motors. Eight have Westinghouse single reduction motors of 25-horse-power, three being furnished with double and

five with single equipments. While only a little over half the motors are required in the regular operation of the road during dull times, the existence of several pleasure resorts on the lines, and the fact that on special occasions enormous crowds are handled, makes necessary the large reserve. Two men are kept on the repair force. These men do their work entirely in the day-

time. The night inspection force consists of an engineer and fireman who go on duty at midnight and work on the cars until starting time in the morning when they start the power station machinery and run it until noon. There is also a man on duty in the car barn from 7 p. m. until 6 a. m. He acts as a watchman the first part of the night and receives the cars as they are brought in by the motormen. To him falls the duty of sweeping and cleaning. Another man working from noon till midnight does all-around-work on the line, in the barns, and anywhere else he may be needed. The engineer and fireman becoming inspector and helper, when at the barns, look over the cars each night. This inspection and oiling is thorough enough to make sure that everything about the motor is all right and no periodical overhauling is practiced. If anything is found wrong it is fixed immediately or the car is left in for the repair men to fix the next day. Trolley poles are made in the barn, of ordinary gas pipe. The eight Westinghouse equipments, consisting of eleven motors were bought in May, 1892. The record of electrical troubles on these motors is summed up in the grounding of one field coil and one armature. The gears of the three double equipments have not been renewed. Those of the single have. Some commutators on the road have lasted four years, and it is no uncommon thing to have one last a year without needing to be turned down. Brushes are soaked in oil. The presiding genius of the car barn and repair shop is G. J. Nitsche, who appreciates the fact that prompt attention to small troubles is the way to make a good record for motor maintenance, and governs himself and his men accordingly. The accompanying card has been used to act as a check on motormen. It is self-explanatory, the motorman being required to turn one in with his car every night.

BLOOMINGTON, ILL.

The Bloomington City Railway has two motor cars equipped with two Short single reduction motors, two cars singly equipped with Westinghouse single reduction motors and seven cars with double Westinghouse motors, making in all eleven cars. Nine are in regular use making a reserve of two cars. No inspecting or repairing is done at night, the reserve making it easily possible to do all necessary work during the day, when the light is good and conditions favorable to do thorough work. Two men are employed to do the repair work, both in the barn and on the overhead lines. An all-around-man cleans the commutators on the cars twice a day as they are waiting at the point of transfer in the center of the city. The night watchman at the barns and power house sweeps and cleans cars. It is arranged so that each motor is thoroughly overhauled every week by the electrician and his assistant. The nine Westinghouse cars went into use September 10, 1892. General Manager Patterson says that not a cent has so far been spent in repairs on them, with the exception of the renewals of controller tips. It is the custom during the summer to change the proportion of double and single motor cars by taking motors from the double equip-

ments, as the summer travel requires more cars and the conditions are not so trying as in winter.

#### SOME MASSACHUSETTS PRACTICE.

A considerable part of the time at the January meeting of the Massachusetts Street Railway Association was taken up by this subject, with special regard to maintenance in winter. Robert C. Brown, who represented the West End Company, of Boston, said that the inspection in their shops followed a routine which was much the same winter and summer. The entire equipment was W. P.-50 motors, all the old F.-30's having been thrown out. A hasty inspection of brushes, leads, etc., is made every day. Every third day each car is taken over the pit, and inspected from top to bottom. Every other third day the brush holders are taken out and cleaned, and the motor wiped. Once a month each motor is taken apart, the oil wells and everything about them being thoroughly cleaned and put in shape. The motors are then given a thin coat of asphaltum paint, which preserves the iron and makes it easier to keep clean. This monthly overhauling takes two men 2½ hours. The foreman gives this work his personal attention. There is scarcely any trouble from water on the motors. The openings on each side are fitted snugly with canvas, and a piece of canvas is also hung from the car body at the commutator end. E. C. Foster, of the Lynn & Boston Street Railway, said that his road had fifty F.-30 equipments, and seventeen Sprague No. 6. It also has a few W. P.-30, W. P.-50, and G. E. 800. The F.-30 give a great deal of trouble. The cost for labor and repairs to keep them in running order is about three times that of the W. P. The W. P.-30 are not heavy enough to do the work required on this road; hauling 10-seat cars with trailers over 5 per cent grades. It is merely a lack of capacity, however, as the W. P.-50 are very satisfactory. The G. E. 800 is a step in the right direction, being 1,000 pounds lighter than the old type, besides being more speedy and of greater capacity. They are greatly pleased with the type K controller. P. F. Sullivan, of the Lowell & Suburban, spoke of their early trials, caused by a lack of inspection. They use nearly the same system as the West End. They adopt a standard of car mile expense, and if the figure falls below it the foremen are given reason to expect a present at the end of the year. There are also prizes for motormen who make the best records with their cars, as regards expense and delays. While being trained, motormen are employed as helpers around the barn. Loss of mileage by any cause is traced directly to its cause. The Lowell, Lawrence & Haverhill Street Railway, represented by N. E. Morton, employs three night men in the car barn. Two of these do inspection work. If anything is wrong that cannot be fixed that night, a sign is hung on, "leave this car in." The greatest trouble they have is from wet track.

#### CENTRAL RAILWAY, PEORIA.

The Central Railway, of which C. E. Flynn is electrical engineer, was the first electric road in the state

of Illinois and, consequently, one of the first in the country. As with all other pioneer roads, the repair bills have been high, but under Mr. Flynn's able guidance they are being gradually reduced. The rolling stock of motors is as follows; Nine double W. P., 50; five double W. P., 30; eleven single F-40 (double reduction); sixteen double F-30 (double reduction); seven double Edison No. 4, single reduction, making a total of 48 cars. The regular number on the road is 32. All inspection is done during the day, each of the double reduction motors being run into the barn at some time during the daylight hours and looked over by a man kept there for the purpose, and the crew given another car. The W. P. motors are inspected and cleaned only once a month. There is one inspector at each of the two barns. These inspectors are assisted by three wipers at one barn, and two at the other. The repair shop force, which once numbered fifteen men, has been reduced to seven, and is still on the decline. This only goes to show what intelligent supervision and a proper system will do toward reducing expenses. The repair shop force is divided as follows: One foreman, one armature winder, one armature winder's helper, two roustabouts, one all round man. Nearly all repair work is done in the company's shop, very little being bought outside. Armatures of the type F, double reduction motors, seldom burn out when rewound in the shop; those shop wound being supplied with extra insulation between coils. It has been found that steel gears will last nearly as many months as cast iron will days, and, although the steel costs nearly three times as much, they are by far the most economical. Motor brushes are soaked in oil, and commutators are easily kept in good condition. Mr. Flynn favors keeping track of repairs by opening a separate account for each motor part, thus having one headed "fields," another "armatures," another "gears," etc. In this way the changing of motors and armatures from one car to another does not interfere with the accounts.

#### FORT CLARK HORSE RAILWAY, PEORIA.

This is a neat little electric line owning thirteen double W. P. equipments, of which eleven are in regular service. These are all looked over every night, and one of the motor equipments is taken apart every night. The round is thus made in eleven or twelve days, so that each motor receives an overhauling in that time. The principal repairs have been on gears and gear cases.

#### CHAMPAIGN, ILL.

The Urbana & Champaign Electric Railway keeps three motor cars on the road and four in reserve. They are Westinghouse, single reduction. Each crew is kept permanently with a car, and, when on every fourth day a crew is given a day of rest, the car is run into the barn and overhauled. The idea is that a crew will take better care of a car if they run it regularly, and if a car breaks down with uncommon frequency, it is known on whom to lay the blame. Two men are kept around the barn, and the work is done principally during the day.

## THE MONTHLY MASSACHUSETTS MEET.

The regular monthly meeting of the Massachusetts street railway association was held February 1st, at Young's Hotel, Boston, at six o'clock P. M. A special reception room was made headquarters, and the members found the social intercourse as pleasant, as the discussion was profitable.

Those sitting down at the banquet were: President Cunningham, of Plymouth Street Railway Company; Secretary A. E. Butler, of Lawrence; C. S. Sargeant, of the West End; Waterman Stone, of the Union Street Railway Company, New Bedford; Hon. E. P. Shaw, of Newburyport; B. J. Weeks, of the Quincy & Boston; Assistant Manager P. Winsor; Roadmaster R. H. Hapgood, and R. C. Brown, electrician, of the West End; General Manager E. C. Foster, and Maurice Hoops, electrician, of the Lynn & Boston; A. A. Glasier, and Charles S. Clark, of the Lowell & Haverhill; Gilbert Hodges, of Hodges & Harrington, railway experts; Geo. C. Moore, Rochester Car Wheel Company; J. F. Duggan, of the Burnham & Duggan Appliance Company; Jas. F. Shaw, manufacturers' agent; Charles Clark, New England agent of the Pennsylvania Steel Company; W. S. Key, of Electricity, and Fred. S. Kenfield, business manager, of the STREET RAILWAY REVIEW.

After the walnuts and coffee, Charles Clark read an interesting paper on "Rails and Track Laying," followed by discussion, in which the following took prominent part: Mr. Hoopes, on bonding; Mr. Winsor, on rails; Mr. Brown and Mr. Hodges, spoke on rail bonding. The discussion was informal but instructive. The next meeting will be held March, 1st, when mutual insurance for street railways will be discussed.

### HIS FEELING.

He could sit for hours and speak  
Things sublime in classic Greek,  
And, of the modern languages,  
He had mastered half a score.

He was gentle in his manner,  
He could play the grand piano,  
Of all his many virtues  
I can't tell half them o'er.

But a fatal trouble thrust him  
Far from humans, who all cussed him  
Because he was a fresh-air crank,  
And would not shut the car door.

## CANAL BOATS BY TROLLEY IN FRANCE.

On the canal between the Seine and the Saone, there is reported an interesting application of electric power to the propulsion of canal boats. It occurred to M. Galliot, an engineer at Dijon, to utilize the water power of the fall of water at the lock sluices to drive turbines and dynamos for this purpose. This scheme is said now to be actually realized, and an efficiency of thirty per cent between the turbines and the canal boats is said to be attained. The turbines are placed on the falls with

their spindles vertical, and are each capable of developing from fifteen to twenty horse-power. The vertical shaft of the turbine is geared by bevel wheels into the horizontal shaft of a dynamo. The electric power is conveyed along the canal by means of a phosphor-bronze overhead wire, 8mm. in diameter. Each motor boat is provided with a motor, which is driven by power taken from this trolley line. In addition to working the canal boats, the electric power is partly utilized to light up the interior of a length of tunnel through which the canal passes. The propulsion of the towing boat is effected, not by means of propellers on the boat itself, but by a train of gear wheels connecting the motor to a chain which extends along the bottom of the canal, and by means of which the boat drags itself along. Just how successful it is we cannot vouch, but the English Electrical Review says that it is actually the case.

## TAXES IN PROVIDENCE.

The Journal of Providence, R. I., has the following note of the taxes paid by the Union Railway Company, to the city:

"Recently the town has received \$800 from the Union Railway Company for one quarter's mileage, the contract being that the company shall pay to the town such part of one and one-half per cent, of the gross receipts from the entire plant as the miles of track in the town bear to the company's total mileage of rails. The receipts of the last quarter show that the town will derive over \$3,000 per annum from this source, which is considerably more than was anticipated. The company also pays taxes to the amount of nearly \$1,000 to the town and fire districts, which makes a total of fully \$4,000 per annum. It would seem that the town could afford to be somewhat generous to this company; \$4,000 is 5 per cent interest on \$80,000, which is a good deal more than the town has been obliged to expend on account of the railway being located here."

## THE COLUMBUS METHOD.

The city council of Columbus, Ohio, has set its seal of approval on good behavior in the street cars of their city, by passing the following ordinance:

"Whoever being requested by any employe of any street railway company of this city, or by anyone operating said road, to desist from smoking on or in any street car, fails to immediately do so, or uses obscene, profane or indecent language, or engages in any quarrel on or in such street car, or without permission takes a dog on, or in such car, or fails on demand to pay the proper fare on such car by delivering the money or ticket or depositing the same in a fare box, as he may be required by such employe, shall, upon conviction thereof, be fined in any sum not to exceed ten dollars with cost of suit, and be imprisoned until such fine and cost is paid; provided, that on demand of such fare, the person may immediately leave the car instead of paying such fare.

In Hungary considerable progress is being made in electric railway business. The Budapest Tramway Company has decided to convert about ninety kilometers of its horse tramway into an electric line, and is demanding an extension of the concession granted by the municipal authorities for a period of twenty-five years. An electric railroad is proposed at Carlsbad, to run from the railway station to the Kaiser Park. Work has been taken in hand in connection with the construction of the Baden-Voslau electric tramway. An electric tramway between Brux and Johnsdorf is proposed.

## MUNICIPAL OPPRESSION AT BALTIMORE.

A prominent firm of bankers and brokers of Baltimore, Md., in one of its circular market letters says of the new rapid transit regime and enterprise in Baltimore: "One not acquainted with the facts might suppose by the way the city officials talk that the street railway companies of Baltimore pay nothing for the privilege of using the streets, when, in fact, they pay the enormous amount of 9 per cent upon their gross receipts as a franchise tax. Is there any other business in existence which could pay such a tax and live? Very few, we think. Of course, those who had invested their money in Baltimore had no philanthropic intentions. They expected to make money, but they did not expect to be treated as aliens and that the city government should seize upon every pretext for increasing their tax bills. The city officials are probably feeling uncomfortable under the development of \$1,200,000 floating debt and a probable increase in the tax rate. The street railways pay now at least \$300,000 to the city in taxes, and will in a few years pay \$500,000 per annum. But the city officials are not satisfied, but are trying to kill the goose which lays the golden egg. How easy it is to dispose of other people's money! The projectors and builders of the Baltimore Traction Company came to Baltimore and transformed the antiquated and almost unbearable horse car lines into a system of rapid transit. They did more than that. They roused Baltimore from a sleepy village existence into bustling activity. Their enterprise not only added largely to the income of the city, but by bringing outlying districts into quick communication with the business center of the city, very greatly increased the value of real estate. They spent millions of dollars at Baltimore and gave and are still giving employment to large numbers. The people appear to appreciate what the Traction Company has done and is doing, but the city officials only recognize the company as fair game for exorbitant and excessive taxation and the City Collector says: 'The stockholders are foreigners who came here to escape taxation and who should be made to pay.'"

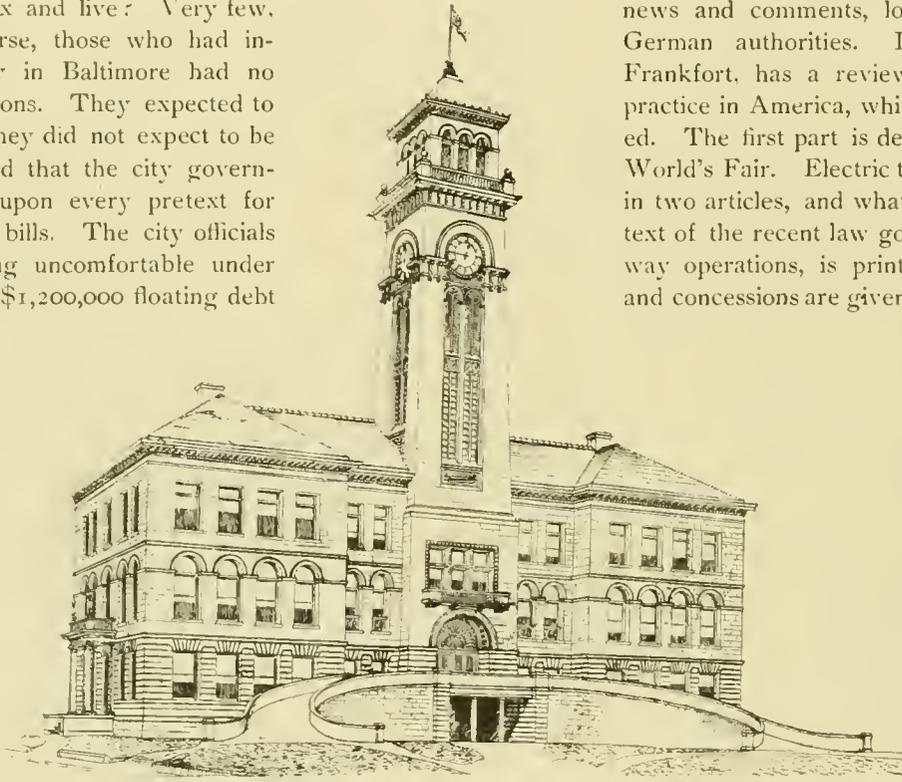

THE Cleveland Street Railway Employees Beneficial Association done magnificent work the past year, paying out 1,000 in sick benefits, and having \$800 on hand.

## A NEW TRAMWAY MAGAZINE IN GERMANY.

The Zeitschrift für Kleinbahnen, has made its debut at Monbijouplatz 3, Berlin, N., Germany, under the management of the commissioner of public works. The first number contains 64 pages of clearly printed matter, illustrated as necessity requires. It is in magazine form, 6 by 9 inches, and is devoted to the industrial railway, street railway and tramway interests of the world. The first number contains, besides a fairly complete review of contemporaneous literature, and industrial news and comments, longer articles from German authorities. Dr. Kohlmann, of Frankfort, has a review of street railway practice in America, which is to be continued. The first part is devoted mainly to the World's Fair. Electric traction is treated of in two articles, and what is evidently a full text of the recent law governing street railway operations, is printed. New projects and concessions are given a prominent place.

We are glad to welcome our latest contemporary, and wish it long life and much prominence.

An elegant calendar is the contribution of the Graham Equipment Company, of Boston and Philadelphia, to the New Year's list of remembrances of the editor.

PERSPECTIVE.

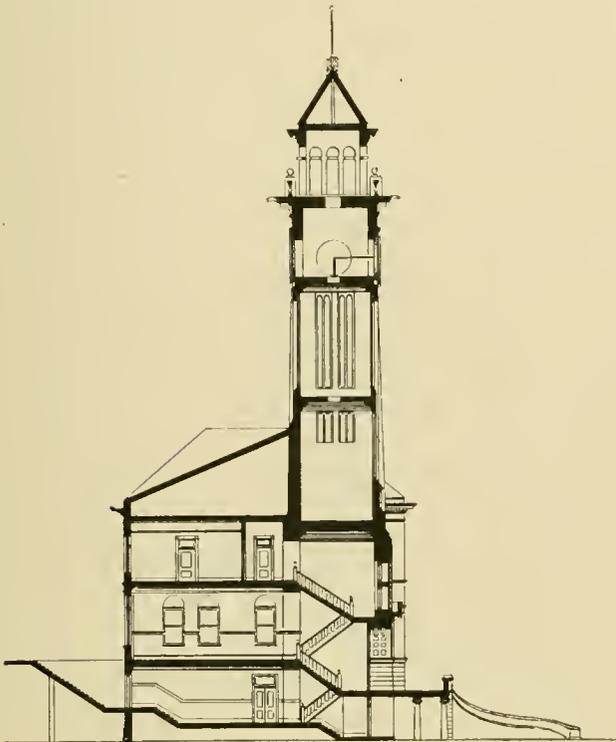

BLACK AND GOLD is the combination of the cover of the folder sent out by the Baltimore Car Wheel Company containing two illustrations of the well-known Lord Baltimore truck. The specialty is neat and attractive.

## AN ELEVATED RAILWAY TERMINAL DEPOT.

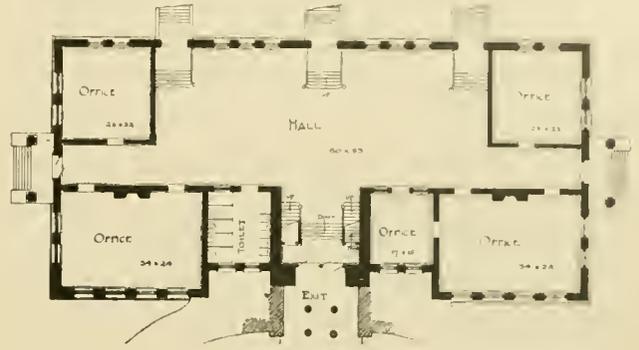

At a recent competitive examination of the Chicago Architectural Sketch Club, the problem given was that of an elevated railway terminal station. Among the designs distinguished by honorable mention was one that commends itself on the score of simplicity and economy of space and the practicability of its method of handling the crowd. It is the design of Architect Henry K. Holsman of Chicago. The perspective shows a three-story building with a tower and entrance on a slope, thus accommodating with absolute safety large crowds without danger of injury by falling down steps. The section shown gives the general plan of the entrance of the passengers to the elevated structure of the railway, the incoming passengers

descending by means of the stairway shown and finding exit beneath the main entrance and at the sides of the building, thus in no case interfering with the out-going traffic. This advantage is readily seen and accomplished without

may be handled in very large number without mixing those in coming and those out-going.

ELEVATION.

PLAN OF FIRST FLOOR.

THE NATIONAL RAILWAY COMPANY'S REPORT.

The National Railway Company, of Illinois, owning and operating five of the St. Louis street railways, comprehended under the Cass avenue and Fair grounds system, held its annual meeting, January 23. The principal owners are Chicago men.

The report reflects great credit on the management in general, and upon Capt. Robert McCulloch, in particular.

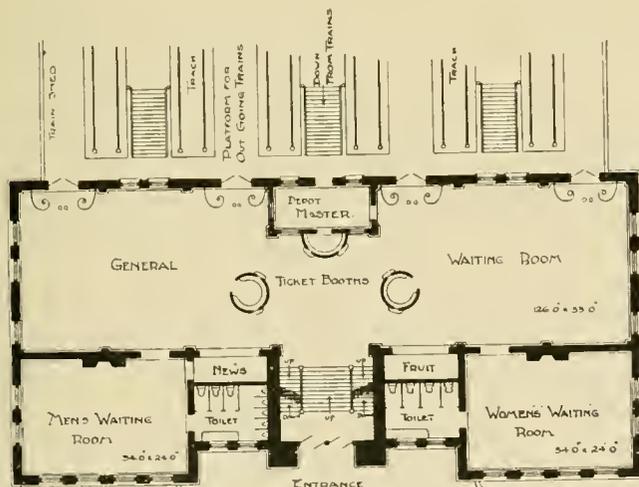

The net gains of the property were, \$199,947, or 9.0885 per cent on the stock, against 10 per cent earned in 1892. The receipts decreased 1.4 per cent. The operating expenses were 60.12 per cent of receipts, or, \$851,851. The net receipts were, \$564,966. The number of trips, last year, was 877,302, a decrease of 16,989; car mileage, 11,844,031; passengers carried, 28,313,504. Gross receipts of the cable lines, \$1,035,445; decrease, \$50,987; gross receipts of horse and electric, \$381,372; increase, \$30,258. The cable lines operating expenses were, 59.4 of the income; of the horse and electric, 64 per cent. The cost of operating cable, per mile, was 7.32 cents; including interest, 9.34 cents; cost operating horse and electric, 11.09 cents; including interest, 13.11 cents. The passengers carried, per car mile run, cable, 2.257; horse and electric, 3.082; total expenses, cable, 82.11 per cent; horse and electric, 85.05 per cent.

During the year, new construction cost, \$1,212,356, all paid. This includes 32.37 miles new track, 33.20 miles overhead equipment, together with new car equipment and remodeling of old cars, plant, etc.

The stockholders reelected the same management, with D. G. Hamilton as president, and E. Buckingham, vice-president.

THE rapid transit scheme of R. T. Wilson & Company for New York City is about to take aggressive form. Mr. Wilson's plan is for an underground railway electrically operated, lighted and heated, the city to loan \$30,000,000 for the plan, The company will supply \$15,000,000. Heretofore the constitution forbade the loan, but an amendment is to be submitted asking that the right to loan be given to the city.

exposure of passengers in the meantime. The ground floor may contain offices and storage rooms ad libitum, as shown in Figure 4. The second floor, Figure 3, is self-

SECOND FLOOR PLAN.

explanatory and the third floor is supposed to be devoted exclusively to offices, executive or otherwise. Six tracks are designed for the station shown. The special feature of the design is of course the ease with which passengers

## STREET RAILWAY LAW.

EDITED BY MR. FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Reasonableness of City Ordinance Regulating Speed—  
Circumstances of Locality—Questions for Court and  
Jury.*

The reasonableness or unreasonableness of a city ordinance regulating the speed of engines or cars on the streets, is a question of law for the Court, and is not a question for the jury, unless it depends upon the existence of particular facts, which are disputed. Such an ordinance may be reasonable as applied to one locality, and unreasonable as applied to another. Although it may be reasonable as to populous parts of a city, it may not be so with reference to uninhabited districts near the corporate limits. If the nature of the locality is a matter of dispute, the Court should furnish the jury with the test by which the reasonableness of the ordinance, as applied to the particular locality, is to be determined; and it would be for the jury to say whether or not the ordinance was reasonable and applicable, according as they might think these conditions to exist or not. In the present case the Court charged that it was for the jury to decide upon the validity of the ordinance; yet no issue of fact had arisen which would require the submission to them of the question of its reasonableness in its application to the locality in which the injury took place. This we hold to be error.

(Supreme Court of Georgia, Metropolitan Street Railway Company vs. Johnson, 16 Southeastern Reporter 49.)

*Agent Employing Physician for Injured Person.*

Evidence that an agent of a street railway company was authorized by it to see that injured persons were taken where medical aid could be given, justifies the conclusion that the agent was authorized to employ medical aid in such cases.

In rendering the opinion the Court said: While a boy was getting off one of defendant's street cars, his arm was broken. He was taken by an agent or servant of defendant, one Shaw, to the plaintiff's office, he being a physician and surgeon. He performed the necessary surgical services, treating the boy until recovery. By this action he seeks to recover from the defendant for such services. The evidence tended to show that, when Shaw took the boy to the plaintiff's office, he requested the plaintiff to attend to the case, and assured him that the defendant would be responsible. The question is presented as to Shaw's authority to thus bind the defendant. He appears to have been an "inspector" whose general duties were to supervise the conduct of other employes in the car service, he acting as their superior. If no more than this had been shown, perhaps it could not have been inferred that he had authority from the defendant to employ a surgeon to treat an injured passenger; but it was shown that the defendant has instructed Shaw, in case of accidents, "to see that those injured were taken somewhere where medical aid could be given", and that he took this boy to the plaintiff pursuant to such instructions. This instruction may well be regarded as contemplating

the specified action on the part of Shaw, of his own volition and without any request by the persons injured, and so he appears to have acted in the case under consideration. Neither the boy, nor anyone in his behalf, appears to have made any request or to have exercised any choice or volition in the matter. It may be inferred from the evidence that Shaw, acting upon the defendant's general instruction as above stated, took the boy to this surgeon selected by himself, in order that the broken arm might be properly treated. From the evidence already referred to as to Shaw's authority in such cases, it might reasonably be considered, and so the Justice may be supposed to have viewed the case, that Shaw's instructions did not contemplate or mean merely that, he should remove injured persons to such a place that medical aid could be there bestowed, if a physician or surgeon should come there by chance, or in response to the request or call of any person; but rather that the meaning of his instructions was to place such persons under proper medical or surgical treatment—to see that they should receive such treatment. So construing the evidence, it went to show that Shaw's authority was such that, the defendant became chargeable upon his employment of the plaintiff in behalf of the defendant. Hence it is not necessary to consider the subject of ratification.

(Supreme Court of Minnesota. Hanscom vs. Minneapolis Street R. Co. 20 Lawyers' Reports Annotated 695.)

*Injury to Passenger—Negligence of Driver—Trench  
Underneath Track.*

The employes of defendant had made an excavation between the rails and outside of them, to a depth of six inches. The defendant's driver, against the warning of those at work upon the trench, drove on a trot into this trench, and the front wheels of the car, in which the plaintiff and other passengers were seated, dropped into the trench and injured the plaintiff by throwing him to the other side of the car, from the side upon which he was sitting at the time of the accident. There was no question but that the plaintiff was free from negligence. He was a passenger seated in the car reading and was injured without a moments notice of danger. The digging of a trench so deep as to weaken the track, so that it would not hold the car and the disregard of warning by the defendant's driver that he must stop his car, is such conclusive proof of the defendant's negligence that an assessment of damages was all that was left for the jury.

(Supreme Court of New York. Daub vs. Yonkers R. Co. 69 Hun. 138.)

*Collision with Wagon Crossing Track—Negligence of  
Street-car Driver.*

The plaintiff, at the time he was injured, was the driver of a beer wagon. His team were fairly heavy horses weighing about 1,300 pounds each. The wagon

and its contents weighed over two tons. The plaintiff drove across Third avenue, having previously looked up and down for cars and seen none. He crossed safely the south-bound track, and his horses crossed to the north-bound track and were upon the same when, upon looking southward, he saw a car coming up and distant about 60 or 80 feet. He signalled its driver, who apparently would not or did not see him, whipped up his horses, and had crossed north-bound track except the extreme rear part of his wagon, when his rear wheels were struck by the car. He was thrown out and severely injured.

The plaintiff was not bound to wait until the defendant's car passed him. If as a careful prudent driver he deemed it safe to cross the track in question, he had a right to do so. The car companies have not exclusive right to the public highways along which their tracks run; they are, through their drivers, required to exercise ordinary care and diligence in the management of their cars. The question whether or not plaintiff exercised his right to cross defendant's tracks, in a careful or careless manner, was a question for the jury to determine. They evidently believed that he was not careless, and the testimony is more than sufficient to justify that finding. Concerning defendant's negligence, that is also clearly established, for the testimony shows that the plaintiff's horses were actually upon the north track, when defendant's car was quite a long distance away. He, under the circumstances, had a right to go ahead, and it became defendant's duty to stop its car until plaintiff had passed over its said tracks. Its failure to stop its car was negligence, unless it was impossible to do so. The question whether or not defendant was negligent, was also submitted to the jury, who determined it affirmatively, and that conclusion is also justifiable by the evidence herein. City Court of (New York City. *Witzel vs. Third Avenue R. Co.*, 23 New York Supplement 317).

*Street Railway Track on Bridge—County Rebuilding Bridge after Destruction by Flood—Demanding Compensation for use by Street Railway.*

The corporate limits of the City of Rome extended to the further bank of the river, and the authorities of Floyd County built a bridge across the river, connecting a street of the city with its continuation beyond the river, and placed the bridge under the control and management of the municipal authorities, who took charge of it and engaged to keep it in repair, but stipulated that in case of its destruction or from any other cause they should not be bound to rebuild it. Under the power contained in its charter, and with the consent of the corporate authorities, both of the County of Floyd and City of Rome, a street railroad company constructed its tracks across the bridge, and ran its cars backwards and forwards over it until the bridge was washed away by flood. The County replaced the old bridge by a new structure upon the same site. The company set about laying its tracks over this new bridge, but the county authorities objected, unless the company would agree to pay for the privilege of using the bridge, and upon refusal to do so, filed a bill to

enjoin the use of it until the county should be compensated therefor.

*Held*, that the injunction was properly refused. The bridge forms a continuation of the street of the City across the river and is a part of such street.

Where any part of a public street or highway is washed out or otherwise destroyed by any means, and the damage is repaired by a new structure upon the portion thus destroyed, or rendered unfit for use; this does not give the County the right to exact additional compensation from a railroad company, which previously to the injury, used the street or highway with the assent of the municipality, where the railroad company proposes to make the same use of the street or highway after it has been repaired.

(Supreme Court of Georgia. County of Floyd vs. Rome Street Railroad Company. 77 Ga. 614.)

*Construction of Street Railroad—Limitation of Time—What Amounts to Occupancy of Street,*

An ordinance of the City of Houston granted to plaintiff the right to construct and operate a railway upon certain named streets. In the ordinance it was prescribed "so much of said railroad as extends \* \* shall be completed within one year from date, and the balance of said road shall be completed within two years). And so much of said right of way as may not be occupied by said Company within said time, shall be considered as abandoned". *Held*, that under this clause, upon failure to occupy, etc., within the specified time, the railway company forfeited its rights beyond that so occupied and no further; *i. e.*, the forfeiture did not extend to the completed work.

The extent to which the streets were *occupied* by the railway company, was a fact for the jury. It was improper for the Court to charge the jury that such occupancy existed "if the ties were laid and rails placed and spiked thereon".

The City, by its repealing ordinance, involved the right of the railway company to continue its work of construction in so much doubt, as to justify a discontinuance of the work until the effect of the ordinance could be judicially determined; and the time intervening between the passage of that ordinance and the final determination in favor of the right of the railway to continue its work should not be estimated against it.

(Supreme Court of Texas. Mayor etc., of City of Houston vs. Houston Belt & Magnolia Park Railway Company. 84 Tex. 581.)

*Passenger Expulsion from Car—Tender of Fare—Reasonable Amount.*

A passenger upon a street railroad is not bound to tender the exact fare, but must tender a reasonable sum and the carrier must accept such tender and furnish change to a reasonable amount. A tender of a five dollar gold piece by a street car passenger, who has no smaller change, is a tender of a reasonable sum; and the passenger who makes such tender cannot be ejected for refusal to pay his fare. But it does not follow that the passenger may tender any sum, however large: if he should tender

a hundred dollar bill, for example, it would be clear that the carrier would not be bound to furnish change.

(Supreme Court of California. *Barrett vs. Market Street Railway Company.* 81 Cal. 296.)

*Wagon Turning Out of Track—Damage by Car Approaching from Rear.*

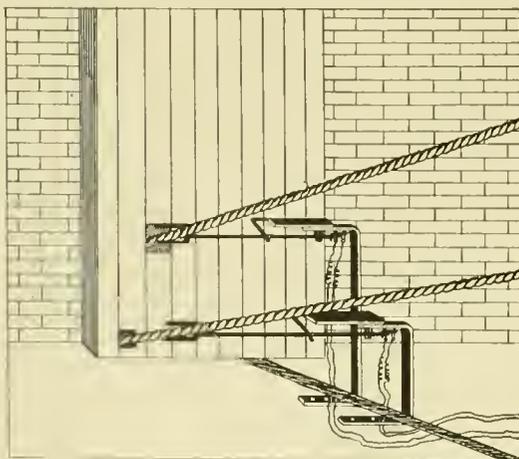

The plaintiff drove a beer wagon along the track of the defendant on Third Avenue until he reached 33rd street, when he swung his wagon to the East in order to get out of the track and then turned to the West. The wagon was nearly off the track, when an electric car struck the hind wheel and overturned it.

This case was properly submitted to the jury. It was the duty of plaintiff to turn off seasonably to avoid the car approaching from the rear, and while so doing the motorman was bound to exercise proper care to avoid a collision with the wagon. Whether the plaintiff was guilty of contributory negligence and whether the motorman was negligent, were questions of fact for the jury.

(City Court of Brooklyn. *Witte vs. Brooklyn City R. Co.* 23 N. Y. Sup. 1028.)

### A STRAND DETECTOR.

An automatic strand detector, the device of Mr. Nash, superintendent of cables on the West Chicago cable system, is here represented, as may be seen by the illustration. It consists simply of two forked arms through which the two incoming cables run. In event of a "strand"

THE STRAND DETECTOR.

the loose wire pulls the arm which closes a circuit and rings an electric bell, properly denoting which rope is stranded. The detector is situated just inside the power house, so that the splicer may have time to get at the strand before the cable runs out again. The bell gives warning continuously until made ready for operation again. Lumps of tar on the rope will not set off the alarm.

NEW BRUNSWICK, and in fact all that portion of Canada, suffered from a tremendous snow storm January 12 and 13. All business, including street car service was stopped.

### KEEP THE TROLLEY ON THE WIRE.

A motor car stood "lifeless" in the middle of the street,  
And all its twenty passengers had risen to their feet,  
One said a "fuse" had burned away, with elongated face,  
Another that a "plug" was blown out of its proper place,  
And all agreed they'd be delayed at least one tedious hour  
Before they could go forward and regain the absent "power."  
At last a modest little maid, whom none could but admire,  
Exclaimed: "I'll tell you what it is—the trolley's off the wire."

In household matters, love affairs, in monetary things,  
If happiness escapes you upon quick-departing wings,  
Don't worry, flurry, fuss and fret, but keep your temper down,  
Nor let your placid brow be marred by wrinkle or a frown;  
When friends desert, and enemies with hate would pierce you  
through,  
And everything perplexes, and you don't know what to do,  
Don't be discouraged or dismayed, nor from the world retire,  
But ask yourself this question: Is the trolley on the wire?

In any situation, though you be in sorrow clad,  
Don't be of doleful countenance and to your troubles add,  
Maintain a constant equipoise and peaceful frame of mind,  
And cast anxiety and care to the passing wind.  
In the hurly-burly of the rough-and-tumble world,  
Though at him shafts of malice were unscrupulously hurled,  
I never knew a man to fail, with high ambition's fire,  
Who kept, with strong and steady hand, the trolley on the wire.  
—MAHLON M. DELEVIS, in Omaha Bee.

### ANN ARBOR'S FIRE.

CARS went up in smoke early Thursday morning, January 25, when the car barn and rolling stock of the Ann Arbor Street Railway Company was destroyed by fire. The loss entailed was \$21,200, with insurance to the amount of \$11,000. The cause of the fire is not known. The current had been entirely shut off and the night watchman was cleaning the last car. Spontaneous

combustion is thought of as a probable cause and some hint at incendiarism. The watchman ran one car out of the barn. Five motors and a trailer were destroyed. This casualty stops street railway traffic until new cars can be procured.

### VEHICLES FOLLOWING STREET CARS.

An ordinance has been passed in New Orleans intended to prevent accidents, especially to pedestrians crossing a street immediately in the rear of a car. The text reads as follows:

BE IT ORDAINED, That from and after the passage of this ordinance, it shall be unlawful for any vehicle to follow in the tracks of any street railroad, any cars of said railroads, electric or otherwise, at a distance less than thirty feet.

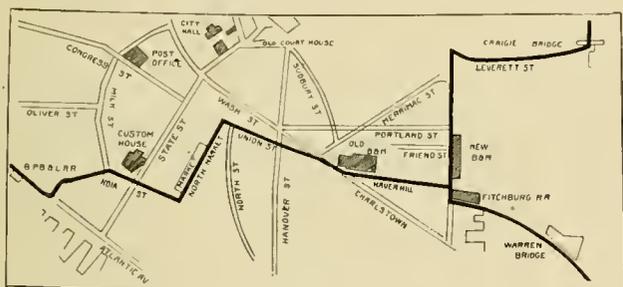

Be it further ordained, That any vehicle following any street car at a distance of thirty feet, shall be compelled to stop immediately at said distance whenever said street car ahead of said vehicle shall have stopped.

Be it further ordained, That any driver of any vehicle or vehicles who shall violate the foregoing provisions of this ordinance shall be guilty of a misdemeanor and subject to a fine of five dollars nor more than twenty-five dollars or imprisonment for five nor more than thirty days, at the discretion of the Recorder having jurisdiction of same.

## BOYNTON'S BICYCLE FOR BOSTON.

In order to give the 1,000,000 people within ten miles of the center of Boston rapid transit, E. Moody Boynton, of bicycle railway fame, wishes to supplant subway, electric and elevated railway schemes with his own particular brand of rapid transit.

To this end, James B. Bell, 178 Commonwealth avenue, Boston, Maj. Gen. O. O. Howard, New York, Robert D. Evans, president American Rubber Company, and others, have filed six important charters covering five routes and a circle railway, connecting all the Boston depots, Cambridge, Somerville, Lowell, Lynn, Salem, Beverly, Quincy, Brockton, Dedham, Attleboro and Providence. The terminal will be 800 feet long, and connect central points by means of covered ways, all at the second floors of buildings. The Boynton is a single rail affair, permitting of quadruple tracks in a small space. The structure will be elevated 16 feet, and the cars driven electrically. A description of this system was given about two years ago in the REVIEW.

PROPOSED ROUTE OF BICYCLE RAILWAY

From Craigie Bridge the line continues through Charles street and Columbian avenue to Roxbury.

From Revere Beach and Lynn the line continues up Purchase street to South Boston.

A branch line connects Purchase street and Columbus avenue via Eliot street.

From Fitchburg depot the line continues to Charlestown.

## STREET CAR FLIRTING.

If the New York Recorder is to be believed street car flirting is a dangerous thing.

A judge, riding in the cars recently, from a single glance at the countenance of a lady by his side, imagined he knew her, and ventured to remark that the day was pleasant, says the Boston Courier. She only answered: "Yes!"

"Why do you wear a veil?"

"Lest I attract attention."

"It is the province of gentlemen to admire," replied the gallant man of law.

"Not when they are married!"

"But I am not."

"Indeed!"

"Oh, no! I'm a bachelor!"

The lady quietly removed her veil, disclosing to the astonished magistrate the face of his mother-in-law. The judge has been a raving maniac ever since.

## AT YOUNGSTOWN.

With the opening of the new year several important changes were made at Youngstown, Ohio, and include the election of two gentlemen well known to the street railway fraternity.

A. A. ANDERSON,

the new general manager of the Youngstown Electric Railway Company, is a man of thorough railroad experience.

Mr. Anderson was born September 1, 1859, in Edina, Missouri, but immediately after the war removed to Jacksonville, Ill., with the family, consisting of his widowed mother and three children. After a brief residence in Jacksonville the Andersons again removed, this time to Indianapolis, where they have since resided. In 1878 he began in the street railway business under Hon.

Tom L. Johnson and survived every change of administration until 1893. He was made secretary and treasurer in 1886 and assistant to the general manager for five years. His new position finds him eminently well fitted for the task.

S. F. HAZELRIGG,

the new superintendent of the Youngstown road, is also an Indianapolis man. He was born at Greenburg, Ind., in 1862. At the age of 17 he began railroading and settled at Indianapolis, where he has resided until this year.

His street railway experience is a varied one, beginning as a driver and serving successively and successfully as division superintendent, foreman of shops and purchasing agent. Mr. Hazelrigg's entire education seems to point out the line of work in which he is now placed.

## ST. LOUIS PASSENGERS.

The quarterly street railway report for St. Louis street railways shows: The total number of trips made were 1,379,020, and 22,963,702 passengers were carried.

The total number of trips made in 1892 was 5,361,973, carrying 91,685,555 passengers. In 1893 5,993,178 1/2 trips were made, carrying 95,680,550 passengers.

ALLEGHENY, Pa., wins its lawsuit against the Millvale line, the Supreme Court deciding for the local authorities under the statute. The fight was to resist taxation of dividends.

THEY SAW STARS.

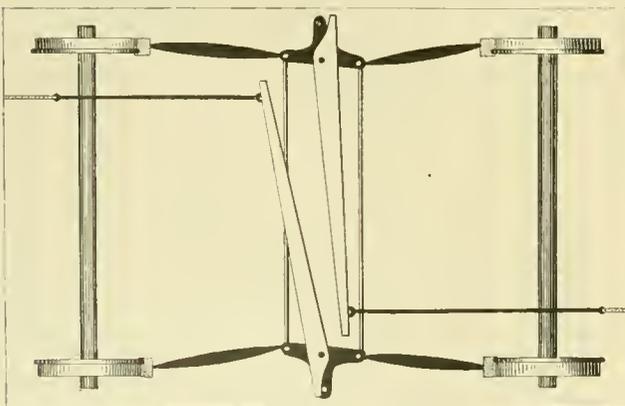

FULTON STREET near the bridge entrance, in Brooklyn, there is a great network of tracks, trolley wires, and elevated railway structure. An electric rambling down that way not long ago suddenly stopped, and began to shoot out a mass of sparks and molten metal, in the most approved "deadly trolley" style. The trolley had jumped the wire, and had become jammed against the iron of the elevated railway, bringing the trolley pole at about the middle against the wire. This simple re-arrangement made the elevated structure a return, and the line was short circuited at that point, with the result of heating the iron pole. The brave conductor did his best to release the pole, but could break the circuit for only a few minutes at a time. The pole thus became white hot, with the pyrotechnic results above noted. The motorman poured water on the car roof, which had been ignited by the falling sparks, thus saving the car from burning. Then he improvised a trolley by sticking an iron switch hook on the wire, until the car could be backed on to a side track. The jury-trolley also spurted forth a beautiful, new line of fireworks, which the motorman fore-fended by turning up his coat collar as high as possible.

The scene was a brilliant one, and called for a first rate exhibition of nerve and common sense on the part of the employes. The man at the helm, however, said the experience was more unusual than pleasant, and reminded him strongly of a place he had never visited, but had read about.

THE BARROW BRAKE.

This brake is the invention of T. J. Barrow, of Duluth, Minn. It has four independent shoes, any one of which

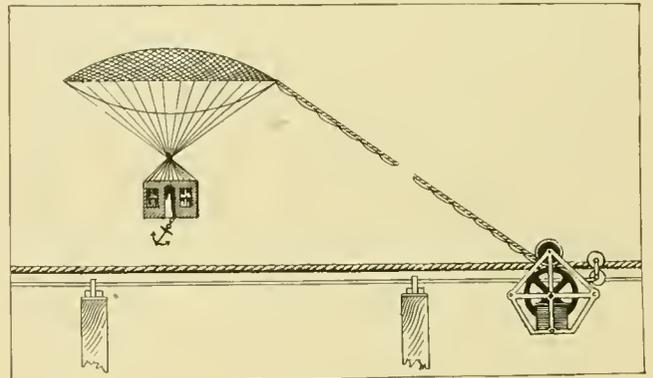

THE BARROW BRAKE.

can become worn or loose without interfering with the others. The drawing, which is a plan view with the brake on, explains its action. One point in its favor for use on modern motor cars is, that it takes very little room under the car, or rather takes none of the room

usually wanted for something else. It is needless to say that the leverage is great, and it is very powerful in its action. It is so simple that it can be turned out at any street railway blacksmith shop.

AN ENGLISH FREAK.

A patent has been recently taken out in England on an aerial railway. An electric motor suspended from an elevated cable derives its current from a neighboring con-

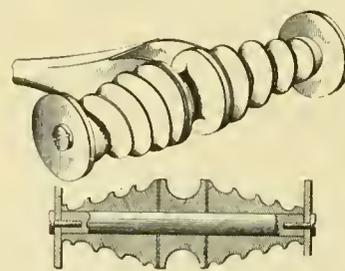

A SURE WINNER.

ductor, and hauls the elongated "arostat." The latter is hauled down at stations by the appendant anchor. We would recommend the combination for the \$50,000 Metropolitan Traction Company prize.

THE DUNCKER TROLLEY HEAD.

A very ingenious form of trolley head is the subject of a recent patent granted to W. F. Duncker, of Steelton, Pa. It does not necessitate any radical change from the

DUNCKER TROLLEY.

present construction of trolley wheels, and can easily be put on any pole. A spiral attachment is put on each side of the trolley fork. These are as free to turn as the trolley wheel. When the wheel leaves the wire these immediately return it.

The attachments are of metal, so that the current is never cut off. It is manifestly impossible for a trolley to leave the wire on a straight track with this in use. The principal objection to it is that it might catch on curve insulators, switches and pull-offs, on account of its length.

A DASTARDLY attempt to wreck an electric car was made by some unknown parties at Indianapolis lately. A stout wire was stretched across the track in the middle of a long block, just high enough to strike the motorman's stomach. A vestibuled car was the first to pass, saving some motorman's life, as the vestibule struck the wire first. The shock was severe enough to throw the car back.

## STREET RAILWAY LABOR IN OHIO AND MISSOURI.

The Ohio Bureau of Labor Statistics has issued its report for 1892, under the supervision of W. T. Lewis, commissioner. The work is very thorough. The facts and figures given from twenty-seven street railways in that state will be interesting for comparison. Reports are given from fourteen electric, eleven horse, one cable, and one electric and horse road. The capital invested per mile of electric road was \$25,827; cable, \$77,777; horse, \$16,644. The amount paid for wages was 41.9 per cent of the gross earnings. The amount paid for office help and management was 5 per cent and the insurance and taxes 3.7 per cent of the gross earnings.

The following tables have been selected because they give the reports of roads equipped entirely with electricity and may be compared with the numerous other similar roads throughout the country. Although the number of cars in daily operation is not given, the number of motormen will furnish enough information for an approximate guess.

The state of Missouri is to be congratulated on having so fair minded a labor commissioner, in the person of Henry Blackmore. In the introduction to the section of the report covering street railways, some statements are

made which show the real status of street railway investments, as opposed to the newspaper idea. He says:

"The amount of capital invested is \$31,367,359 (in Missouri). The gross earnings for the last fiscal year (ending November 5, 1893), amounted to \$6,049,374. This is as returned by the corporations, with one exception, which is an estimate. The percentage of the gross earnings to the capital invested is 19 per cent. The net earnings, after deducting the amount paid out for wages, salaries and improvements, are \$2,707,247, or 8.63 per cent of the capital invested. The amount paid out for wages and salaries aggregates \$2,687,896, or 8.56 per cent of the capital invested. The amount paid for wages, salaries and improvements amounts to \$3,342,127, or 10.65 per cent of the capital invested. The ratio of the wages, salaries and improvements is 55.24 per cent of the gross earnings. The wages and salaries amount to 44.43 per cent of the gross earnings. The wages are 41.20 per cent of the gross earnings. The improvements amount to 10 per cent of the gross earnings. \* \* \* A study of these statistics reveals the fact that these corporations in the aggregate, many of them doing an immense business, do not make a large profit on the investment. Deducting \$3,342,127, the aggregate of wages, salaries and cost of improvements, from \$6,049,374 gross earnings, leaves \$2,707,247 as the net earnings, which is 8.62 per cent on the capital invested. If there is a bonded debt in addition to the capital, on which interest must be paid, the per cent on the investment would be still further reduced. \* \* \* This class of property, in the smaller cities, and some of the lines in the larger cities, have returned no dividends to the investors, though the newspapers frequently advertise to the public that certain lines have wonderfully valuable franchises."

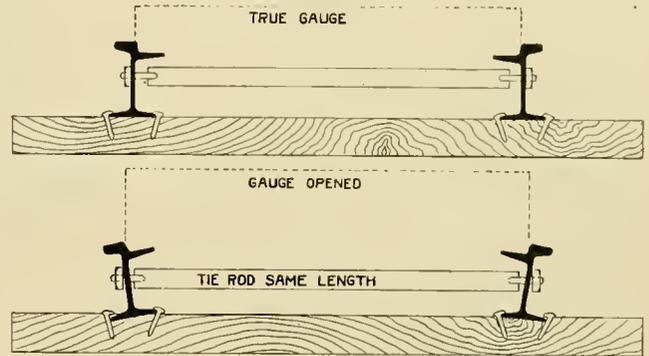

He also gives the companies due credit for the enterprise they have shown in keeping pace with improvements, and considers the condition of street railway employes good. A number of interviews with conductors and motormen are published, which show the men to be well satisfied, the main objection to the work being the suffering during cold weather.

THE Halle (Germany) Tramway, although its extension has only been nine months at work, pays  $7\frac{1}{4}$  per cent dividend. The Breslau Tramway has been working since June; the Essen Tramway has been running since the end of August; the Kieff Tramways are all to be changed into electrically-driven roads. Electric traction is being started also at Chemnitz, Dortmund, Lubeck and Christiania. All the above undertakings have been, or are being, carried out by the Allgemeine Elektrizitäts-Gesellschaft. The Leipzig Town Council have published a specification for an electric tramway in certain parts of the town, on the basis of a forty-year concession.

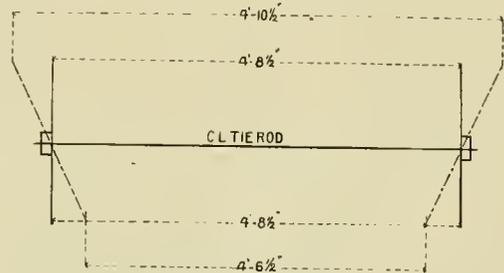

THE Dublin United Tramways Company has issued its annual report. The net earnings for 1893 were three per cent of the capital stock of \$2,751,000.

TIE RODS AND TIE PLATES.

A circular recently issued by William Wharton, Jr. & Co., shows plainly why tie rods are not articles to which much faith can be pinned, and why they have in times past betrayed the faith imposed in them. Figure 1

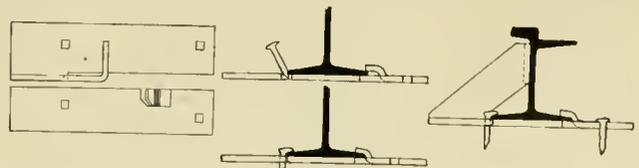

shows the track and tie rod new, and Figure 2 the same after use. Figure 3 shows the principle diagrammatically. The trouble is manifestly with the spikes and ties. Rails laid directly on the ties are sure to cut into the wood, as is proved on steam roads, but street railroads cannot give

the track and ties the constant attention possible on steam roads, hence, logically they should use something more permanent

Tie plates even if very thin, prevent loosening, provided they are of sufficient area. Figure 4 is of the Wharton tie plate. It has a clip to hold the inside flange,

because with a low girder having a wide tram, it is almost impossible to drive a spike at the proper angle. The driving of the spike forces the rail base under the clip. The rail brace (Figures 5 and 6) which is on the same principle, is of one piece, and is intended to do the work formerly entrusted to the tie rod.

CHICAGO residents of Indiana avenue, among them N. W. Powell, F. W. Farwell, F. E. Burley, G. A. Follansbee and B. W. Thomas, are agitating the subject of a conduit electric system on that thoroughfare. A. W. Wright, of the Siemens & Halske Co., wishes the Budapest system tried.

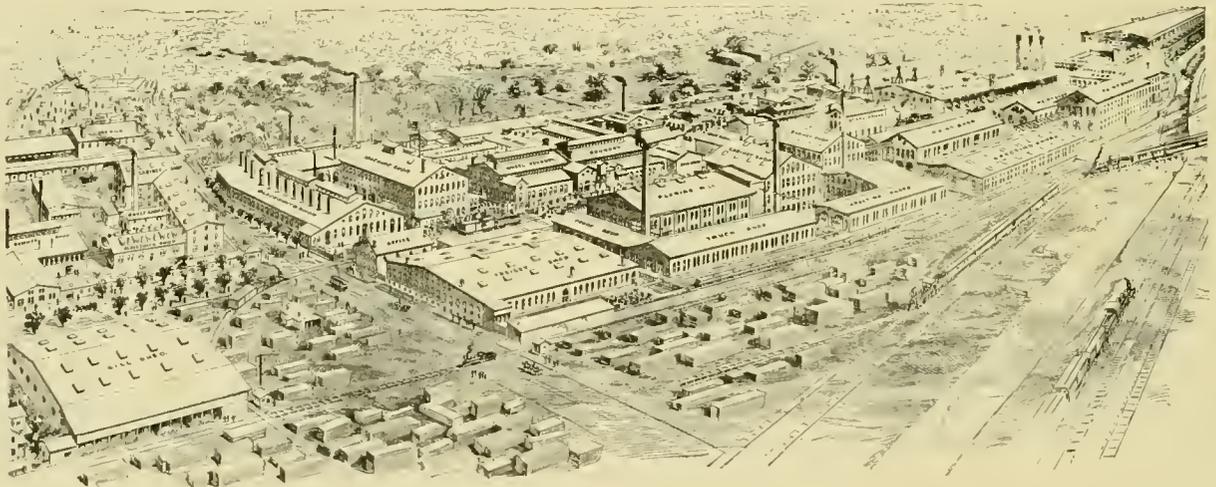

## THE BARNEY & SMITH MANUFACTURING COMPANY.

The engraving on this page of the REVIEW is not a bird's eye view of a town although a cursory glance might really make the mistake. It is however a village of industry where many hundreds of men spend the most of their waking hours, the plant of the Barney & Smith Manufacturing Company, of Dayton, Ohio.

This company has taken advantage of the late business depression to add materially to their facilities and to make out of hand a new department for the manufacture of street cars. The sill shed in the foreground is the latest improvement, covering 800 by 200 feet of ground space. It is fitted with an electric crane and is perhaps the largest storage shed in the country. The other shops the names of which may be seen on the roofs, in the engraving, are all arranged with the utmost care and provided

Smith, secretary and A. M. Kittredge, superintendent, with William Voss as his assistant. The smooth running of the great establishment reflects great credit upon the management.

THE 11th of January was celebrated by the Sandusky, Milan & Norwalk Electric Railway Company as Emancipation Day—emancipation from the receivership and the many annoyances of the late tightness in the money market. The officers and directors of the road and their wives were invited to the handsome residence of Treasurer A. W. Prout, at Sandusky, and feasted and rejoiced. The feature of the evening was a rhymed report of the treasurer, which contained both truth and poetry. The entire section of the country rejoices with the plucky and earnest builders and managers of the S., M. & N. Electric Railway as does the REVIEW and the fraternity.

WORKS OF THE BARNEY & SMITH COMPANY.

with all the facilities and tools for best and most expeditious work.

For many years the cars of Barney & Smith have been known to the steam roads and it is with pleasure that we announce their entrance to the broadening field of street railway business. The capacity of the works is now fifteen freight cars a day and forty passenger cars a month of the steam road pattern, besides special work in the line of private cars and coaches, the elegance of which have been unexcelled. The decorators and designers of the company are well known in artistic circles as cultivated and refined and the elegance of the steam car trimmings and paintings bears out the assertion.

It is with no hesitation therefore that the company goes into the street railway field, being assured that the well-known workmanship of Barney & Smith's factory and their indubitable honesty of material will bring to them a share in making of what promises to be the coming industry in car building lines, namely, street cars for rapid transit service.

The officers of the company are E. J. Barney, president; J. D. Platt, vice-president and treasurer; F. E.

## A QUESTION OF ETIQUETTE.

He was of the imperial-and-mustache order, and she was his own Tootsy-wootsy. Both were middle aged, but just as loving as could be.

They stood together on the up-bound track and signaled the car, which dutifully stopped.

"Step up, my dear," he said, grasping her tenderly by the waist.

"No, love, you step up first and I'll follow," she replied timidly, drawing away.

"Step up lively, please," called the conductor, impatiently clutching the bell strap.

"Are you going to step up, Kate?"

"Indeed I'm not, George,"

"Why not?"

"Because it's against the rules of etiquette for a lady to precede a gentleman up stairs."

As the car swept around the curve, they could be seen gesticulating wildly on the up-bound track, while the conductor whispered something about "No fools like old fools."

## VINCENNES VOLTS.

It would be below the dignity of the pretty and aristocratic little city of Vincennes, Indiana, to have anything but the very best street railway line. Vincennes now has 10,000 inhabitants, the majority requiring some method of locomotion.

In 1883 the first street railway company was formed by George and Frederick Graeter. The first line was, of course, on the mule principle. The rail was 30-pound flat iron, and the headway of the cars was not frequent enough to seriously disturb the solemnity of the occasion.

Now it is different.

In 1891, in the month of March, the Vincennes Citizens' Electric Street Railway Company acquired the rights, franchises and properties of the mule line and proposed the electrifying of the system.

The proposition won.

The new company was officered as follows: Allen Tindolph, president; A. A. Walker, vice-president; B. G. Hudnut, treasurer, and Ed. F. Tindolph, secretary and superintendent. During the summer of 1891 of the changes to be made were accomplished and the elegant electric system evolved out of the perseverance, tact and courage of the new managers.

The road now has in successful operation five miles of track, one third double, of standard gauge. The rail is mainly 40-pound T with 50-pound John-

son girder in the <sup>s</sup>down town district. The T-rail was rolled by the Belleville Steel Company. The roadway is unusually level, giving no grades of over 1 per cent. McGuire's trucks, four 19A and two 19B, are used, mounting four closed 20-foot car bodies and two 25-foot open bodies, made by the Ellis Car Company, on wheels made by the Terre Haute Car and Manufacturing Company.

## THE POWER STATION,

is 40 by 55 feet in dimension, and contains one 100-horse-power compound automatic, and one 75-horse-power Junior, Westinghouse, Church, Kerr & Co. engines. The boilers are made by Clift & Co. of Terre Haute, and are two 80's. Roney stokers are used, and Clift & Co.'s feed water heater. The electric equipment is Westinghouse, two generators of 100 and 80-horse-power and one single reduction 20-motor to each car.

There are twelve employes on the road as a minimum and twenty as a maximum. These are divided thus: 2 engineers, acting as foremen; 1 machinist and 1 helper, doing all repairs; the machinist also superintends track repairs; 6 motormen (8 in summer);

conductors, now dispensed with in winter. The road enjoys extensive patronage in the spring, summer and autumn months, and, to encourage riding, a special

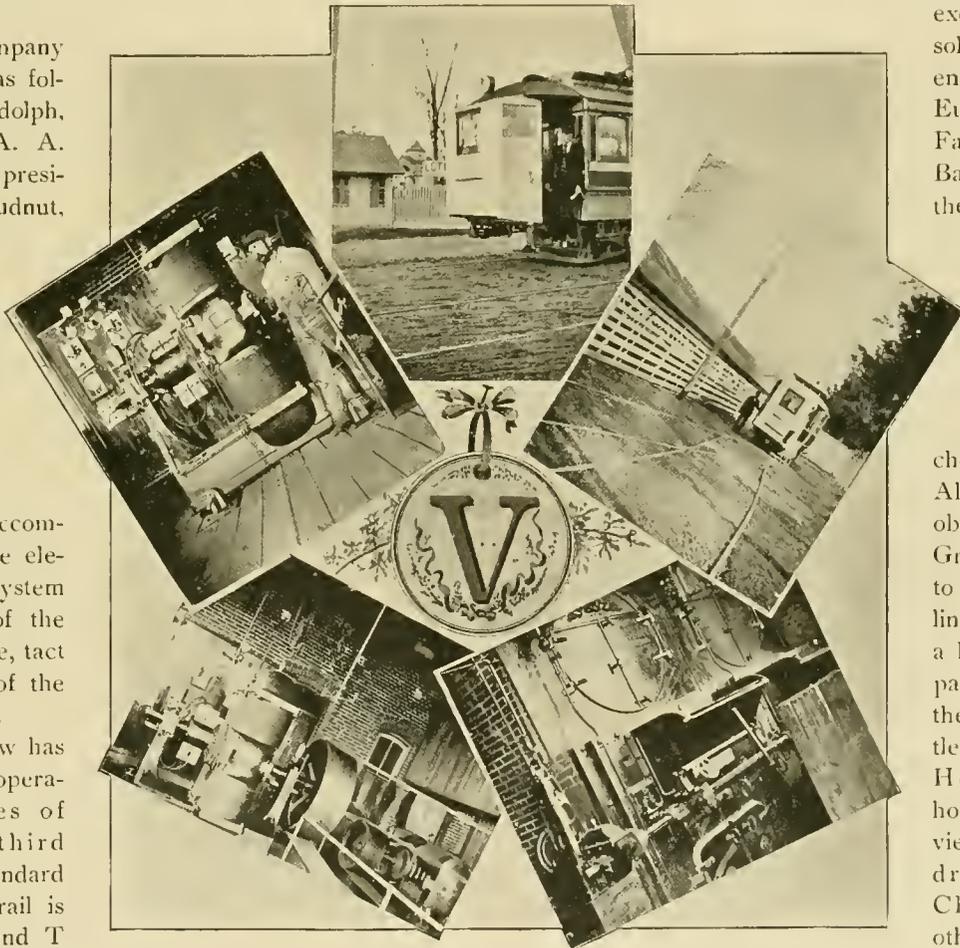

10-cent round trip excursion ticket is sold. This has proven very acceptable. Eureka Place, the Fair Grounds and the Base Ball Park are the chief points of amusement on the line. The company hold band concerts and open air mandolin concerts by an orchestra of 50 pieces. All "fete" days are observed at the Fair Grounds, thus adding to the traffic. The line is in the form of a horse-shoe and passes all the relics of the old French settlers, the William Henry Harrison homestead, St. Xavier's Catholic Cathedral, the Pastime Club rooms, and other places of historical interest.

The Tindolphs, father and son, are the moving spirits of the enterprise. Mr. Tindolph, senior, is an old settler, and an experienced transportation man, owning and operating Ohio and Wabash river steamboats. He has occupied governmental positions and is president of the Second National Bank.

Ed. F. Tindolph, secretary and general manager,

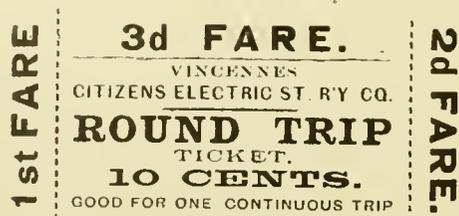

E. F. TINDOLPH.

VIEWS OF VINCENNES.

should have the credit of the elegant condition of the road, acting as his own superintendent and having every detail under his control. Although but a young man,

his twenty-three years of experience have been crowded full of business knowledge and of electric lore. We are glad to be able to reproduce herewith his portrait.

### EXPERIENCES OF A SUPERINTENDENT.

By C. P. Young, Superintendent Chattanooga Electric Railway.

#### PART III.

Another thing that is of great loss to electric railroads is the antagonistic spirit that exists everywhere against them by the public. Corporations are always treated with contempt, and it is hard to get justice even in the courts, as juries invariably go against corporations. Now somebody is to blame for this hatred. A street railroad is really a public benefactor. Not only does it increase in value land wherever it passes, but saves time for the citizens and gives employment to an immense number of unskilled laborers. Yet it is looked upon as a public enemy. In analyzing the present and the past I think there is a cause why corporations are branded as heartless. Many presidents and managers have tried unfair means to accomplish their ends. They have been too greedy. They have not treated labor fairly. They have tried too much bulldozing. They have fought the press, and, by not caring for the public rights, they have by their own acts made the public not care for them. Vanderbilt may have been right as a steam railroad man, but never as a street railroad man. War is too expensive, and accomplishes less than diplomacy.

In operating the cars on most roads a great waste exists. They are in the habit of running all day the same number of cars in the various divisions, notwithstanding that travel is heavy between 6 to 9 a. m. and 4 to 7 p. m., while from 9 to 4 there is generally light travel. I am a great believer in trippers and trailers, and every division should be treated according to its wants. If travel becomes heavy or light, lengthen or shorten schedule, but by all means have equal distance between, whether it be one or thirty minutes. Every trip a car makes means a certain outlay of money, but not always an income, and no car should make a trip in vain. Too fast schedule, and being too particular about time, costs money. The motorman is compelled to run too fast and (what I call) rawhide his car. By so doing, he consumes too much current, wears his motors out quickly, increases

liability to accidents, and, worst of all, cultivates a tendency to be reckless, eventually becoming a dare-devil, utterly unfit to have charge of human lives and valuable property.

We will now consider the motor and current question. There is no machine invented by man that is more exposed to the enemies of its existence than an electric street car motor. Dirt, dust, water, jars and jolts, constant starts and stops, are the surrounding conditions. Then the motor is generally handled by an ignorant man, and, perhaps (as is often the case), never was right when first started, and then all wonder why the car gives out and repair and supply bills are so heavy. A pound of energy is not the result of nothing, but of something, whether it be wheat and meat in a man's stomach, hay and corn in a horse or coal under a boiler. Suppose, for illustration, we take two roads with the same system of boilers, engines, dynamos, motors, track, hills, curves and crossings. One road is in the hands of an expert superintendent who understands his business, and who educates his men to know as much, if not more, than he knows himself. The other road is in incompetent hands. It is a known fact that 20 per cent of all cars are standing still either letting on or off passengers or waiting at end of line. This leaves 80 per cent in motion. Now, on the properly managed road, perhaps half of the cars in motion are rolling along without current and by momentum, while, on the other, on the badly managed road, the full number of cars in motion are using current. In the good station the consumption of coal, water, and strain of engines, belts and dynamos are about one half what they are in the station of bad management. Suppose now the expenses for coal, water, repairs and maintenance of the station for the good road is \$2,000 per month, the bad road will cost at least \$3,000,—a great difference. Nor is this all. On the bad road the motors, wheels and brakes will be very short lived, which means a great loss. Then on the good road feed, tap and ground connections are watched with a hawk's eye. The slightest defects are cured immediately, no matter where they appear.

We will now consider the various departments: Power-house, machine-shop, car-barns, day and night men, track and overhead work, and their crews, motormen and conductors—their management and discipline,—supply and accident department and officials.

The power-house is divided into four divisions: boilers, engines, dynamos and switchboards. A good many financiers think that any man that is strong and dirty, and that can handle a shovel, is all right for a fireman. This is a great mistake. Firing a boiler right and scientifically is an art that requires a high grade of intelligence. A fireman should be well informed on water, coal, combustion, expansion, contraction, evaporation, and the whole science of steam, and, above all, honest and faithful. A poor and ignorant fireman may take the best built and latest set of boiler, with the best steam fittings, and depreciate their value immensely and then use up tons of coal and vastly more water in a year than a good one, whose wages are twenty-five or fifty cents more per day

for the good fireman as against the bad one. Yet the good man, when the year is up, has his boilers in better shape, his steam-fittings, grate-bars and all other parts in good order and the coal and water bill largely in his favor. The engineers in charge of the plant should be good machinists and electricians, as well as good engineers; they should be able to repair any damage and know all about dynamos, switchboards, heaters and pumps, and also be thoroughly familiar with all the lines, cars—their weight, size and make. They should always be informed in regard to number of cars that are out, and if any extra cars are to be sent, and time for same. They should study economy in oil, water and all other material; be dutiful, conscientious and sober; neat personally, and take pride in keeping their engine-room clean and have a place for every tool and every tool in its place. And here let me add that a railway engine-room should never for one moment be left alone, but some one that understands everything should be there ready in case of trouble. You can never tell what may happen the next moment. A short circuit, a ground, or any one out of a thousand things may happen. The engineer really carries a greater responsibility than financiers realize. Electric railroading is a profession, the last one launched forth upon the sea of human activity, and the sooner investors and directors of electric railroads find this out, the better it will be for themselves and the traveling public, as well as employees.

## THE TEXAS STATE STREET RAILWAY ASSOCIATION.

On December 15, 1893, several representatives of Texas street railways met at Waco and concluded that the common weal demanded a union in which would lie the strength resulting from the interchange of ideas on various economic subjects. The temporary officers selected were: A. Zintgraff of the Denison Street & Belt Line Railway Company of Denison, president, and S. A. Hobson, of the Waco Electric Railway and Light Company, Waco, secretary, and a meeting called for January 24, 1894, at Austin, at which permanence could be considered.

The first annual meeting was therefore held at Austin on January 24, and with a representative attendance; the following officers were elected and committeemen appointed:

President, William H. Sinclair of the Galveston City Railway, Galveston;

Vice-president, J. K. Urie, of the Austin Rapid Transit Company, Austin;

Secretary and treasurer, S. A. Hobson of the Waco Electric Railway and Light Company, Waco. The directors are:

W. H. Weiss, San Antonio Street Railway Company;  
A. W. Childress, Queen City Railway Company of Dallas;

W. H. Sinclair, and J. K. Urie: committee on membership, Carl Drake of the Laredo Electric & Railway Company, Laredo, J. K. Urie, A. W. Childress and C. A. McKinney of the Houston City Railway Company, Houston.

The constitution was adopted and the next meeting set the third Wednesday in January, 1895.

The delegates were entertained with great hospitality by Mr. Urie of Austin and Mr. Drake of Laredo. A carriage ride to the great Austin dam and a pleasant excursion up the lake by steamer were the daylight festivities. In the evening a royal banquet was spread by Mr. Curtis of the Driskill Hotel and demolished by the guests.

Altogether the occasion was a most pleasant and profitable one and the Lone Star association will surely be a bright light to the firmament.

COL. WILLIAM H. SINCLAIR,

the president elect of the new association is almost too well known to require mention. Suffice it to say that there is not a street railway man in America that does not know the strong and kindly face of Col. Sinclair. At the age of 55 Col. Sinclair has a most successful and happy career to look back to. Born in Ohio, a brave soldier and officer in the federal ranks and an early post bellum settler in Galveston, Col. Sinclair has

been one of the most active and untiring agents in creating the new South. The Galveston road owes its excellence to his ability and the Texas association will find in him a stout ally and competent head.

SECRETARY S. A. HOBSON,

is a practical street railway man, having worked his way up from the ranks and at the age of 23 finds himself secretary and superintendent of the Waco Electric Railway and Light plant.

His first experience was as conductor on the Wyatt Park Street Railway of St. Joseph, Mo., afterwards working in the repair shops, and from there was appointed cashier. He early developed a talent for construction and was appointed to superintend the building of the Jule Street extension of the Wyatt Park Railway, this was in the summer of 1889. He was soon afterwards made superintendent of the road, at the age of 19; this place he filled until March 1891, when he resigned and came to Waco, Texas, and took charge of the construction of the railway and light plant of The Waco Electric Railway and Light Company, which now controls 6,000 incandescent lights, 200 arcs and ten miles of railway.

W. H. SINCLAIR.

S. A. HOBSON.

## POWER SELLING AND UNDERWRITERS' RULES.

ELECTRICAL department of the western insurance association has been undergoing a thorough overhauling during the past six months, and among other things the rule prohibiting the use of grounded 500-volt circuits inside of buildings has been brought out of its resting place and an attempt is being made to enforce it.

Hundreds of power users in the smaller towns have been made to feel the effect of this action, which practically forces them back to the use of the antiquated small steam engine (which by the way is no small fire risk), or necessitates leaving the "old line" insurance companies.

The following letter is self explanatory.

CHICAGO, Jan. 30, 1894.

WILLIAM H. MERRILL, JR.

Electrician Chicago Fire Underwriters' Association, City.

DEAR SIR:—

In view of the fact that the association which you represent has seen fit to refuse all risks on buildings containing motors run from street railway circuits, and as the danger of such circuits in buildings seems to us not to be such as to warrant this ruling, we would be pleased to give space in our columns to a discussion of the practice from both standpoints, and therefore request a statement of your position and the reasons therefor. We have always taken the position that such circuits when run according to proper rules are practically as safe as any class of electric light or power wiring, and that while special rules should be followed in their installation, they should be "inspected" instead of "prohibited." It is to our mutual interest to settle the question in the right way, whether it be according to our present ideas or yours. We would request that your presentation of the case include a statement of the fires caused by such circuits as far back as your records will permit, and that if possible a detailed enough account of any such fires be given, so that it can be judged whether they would have occurred had the wiring been done as carefully as that on arc light circuits and a proper system of inspection been maintained. Enclosed please find pages 355 and 356 of our June, 1893, issue which contains statements from the Omaha and Sioux City Street Railway Companies, W. R. Garton, of the Garton-Daniels Electric Company, C. F. Cook of the Westinghouse Company, Chas. Vint and C. K. Mac Fadden, Chicago, all of whom uphold our position. Also please find enclosed a clip from the London Electrical Review, reprinted in our September issue, in which the grounding of circuits is advocated from an entirely disinterested standpoint and their increased safety pointed out.

Very truly yours,

STREET RAILWAY REVIEW.

Mr. Merrill was glad of the opportunity to present the insurance mens' side of the case and furnished us the following reply:

EDITOR STREET RAILWAY REVIEW:—

I have read the articles "Grounded Circuits and Fire Insurance" and "Plain Argument in Favor of Grounding," published in the June and September issues of the STREET RAILWAY REVIEW. I have also read other articles and many

letters by railway men and electrical engineers regarding the practice of operating stationary motors by current supplied from trolley wires. Among all the interested authorities which I have seen quoted I cannot find one that advocates this system from an engineering standpoint or who pronounces it good engineering. In fact they all admit it weak. One insists that a lightning arrester should be attached to all circuits of this kind entering buildings, another that great precautions should be taken in insulating, supporting and fastening the conductors, another that the fusible cutout should be carefully looked to, another that a sign reading "danger" should be placed near each motor and the mounting and bases very carefully insulated, another that the ground connections should never be made on a gas or water pipe, another that "unusual precautions" should be taken in the installation, another that "proper" precautions should be taken, another that a circuit breaker and a first-class lightning arrester should be put in, in addition to switches, fuses, etc., another that only "the best" motors should be used on this class of circuits and the insulation of the fields and armatures should be carefully watched and kept at a high point, and so on ad infinitum. Each has his own "precaution," which if not explicitly followed will make the operation of the machinery "extremely dangerous" and no two of them suggest exactly the same "precaution." All of this while it does not solve the difficulty serves to show that the danger is there, if any proof of this kind is needed.

Admitting for the moment, that by concentrating the whole intelligence of the electrical engineering profession upon this problem, that it might be possible to operate a stationary motor on a 500-volt grounded circuit for an hour or two, without burning any property or killing anybody, and we find that the following precautions should be observed in the installation: (1) A reliable circuit breaker should be introduced where the tap is made and this instrument should be examined every week to make sure its reputation may not be affected. (2) A lightning arrester, which must also be "always reliable," (though exactly how no one has yet stated), must be attached to the line before it enters a building. (3) A fusible cutout employing either a five inch break between terminals, a bridge or a magnetic blow out, should be introduced on the circuit immediately it enters the building. The fusing of this protective device should be most carefully looked to after every accident, and no nails or pieces of barbed wire fence should be employed in place of fuse metal. (4) A knife switch giving a proper break should be introduced on the circuit either directly inside or directly outside the service entrance, by which the current may be entirely cut off and the wiring and apparatus disconnected. Both the switch and the cutout should be mounted on marble or slate bases. (5) The wire used must be of the "very best," must be supported wholly on glass insulators, kept at least eight inches from gas and water pipes and awning frames and structural iron work, and all other conductors and conducting materials. In fact, provided with a little house of its own, eight inches square throughout its whole run. (6) Ground connections must never be made inside buildings and preferably never on gas or water pipes. (7) The motor must be set up and insulated in "the most approved" style and must be of "the very best make," etc., etc.

And so on; "the very best" always means "the very cheapest" and "the most improved" is always "the easiest". Waiving all these however, how many motors operating from trolley roads have ever been installed in accordance with the above

rules? How many have observed half of them? Is it not impossible to carry them all out to the letter, (I am not sure but what I have omitted some very important ones even now), and would it not be cheaper to construct a metallic circuit or operate from a motor generator than to try? And would it not be better engineering? Would it not be safer? A 500-volt current is one of the hardest currents to handle. It combines the disadvantage of the series arc current in its high voltage with that of the low potential systems in its great heating effects. It should certainly be conducted through the safest channels engineering skill can devise. Is this done in the system under discussion? I think not. In actual practice, where we meet the man whom the STREET RAILWAY REVIEW told of, who ran his building circuit of bare wire because the trolley wires were uninsulated, and the man the Underwriters' fire reports tell of, who soldered his ground wire into the gas meter connection, we must plan our power systems so as to prevent the minor daily mistakes of construction men giving us serious trouble. If electricians wish to do nothing to check the steady growth of the electrical industry they should provide it with healthy nourishment. Planting such weeds as this system in its path will never make the cow give milk."

We could forgive the mixed metaphor at the end, about the cow and the weeds, if Mr. Merrill had only brought facts to prove that the system has actually proved to be such a mammoth weed as he represents. It is indeed strange that such circuits should be in daily use on hundreds of cars and around hundreds of car barns and offices without burning up every plant in the country within a week, if the claims made are correct. It will be noticed that our request for a list of fires caused by such circuits is not complied with. This shows that there is something seriously missing somewhere in the chain of practical facts necessary to prove the enormous fire risk on such circuits which warrants their prohibition. We expected that underwriters would go into the subject from an underwriters standpoint and bring up facts and figures to prove the danger of certain risks. That is certainly the most business like way to go at it. Instead, we find a lot of argument based principally on theory and on an obsolete precedent. In the early days it was difficult to keep the insulation up on metallic circuits, to say nothing of those which were grounded. The art of insulation progressed and knowledge of electricity increased until electricians did not regard grounded circuits with the former horror. It was demonstrated that grounding was good engineering on three wire systems. To the grounding of 500-volt circuits is but another step.

However, let us consider Mr. Merrill's statement, item by item. In the first place we do not know how Mr. Merrill defines "good engineering," but it seems to us that any safe system of power distribution which allows of the use of electric motors in places where expense would otherwise prohibit them, can be placed under that head. Engineering of any kind is as much a financial problem as anything else. The majority of stationary motors run from railway circuits are in small towns where separate power circuits are not able to pay expenses. This being the case it is certainly "good engineering" to run stationary motors from railway circuits if it is safe,

and this brings us back to the real question at issue. Mr. Merrill then goes on to cite the various precautions which are suggested by various electrical engineers and which should be taken in the installment of such circuits, "all of which \* \* \* goes to show that the danger is there." Does Mr. Merrill mean to say that there is not danger in every electric light and power circuit. Of course the "danger is there," but that fact does not preclude the possibility of safely operating such circuits. Referring to the suggestions made by the various electrical engineers he says, that all of these (suggestions) do not solve the difficulty. What on earth were they made for then? Were the men who made them talking just for the sake of making a noise or did they mean what they said. We were laboring under the impression that these men (the majority of whom know what they are talking about) made those suggestions because they believed that by having them carried out the circuits in question are made safe. If Mr. Merrill's reasoning is logical it is not safe for engineers in any department to specify safety precautions, because it would inform the insurance companies that there was danger and the risk could not be taken.

Then follows a set of rules which are very good in the main, but as they are evidently not given in good faith, they will perhaps bear modification. "How many motors operating from trolley roads have ever been installed in accordance with the above rules?" We would ask in return how many inside incandescent circuits outside of the large cities correspond to the specifications in the underwriters rules. If Mr. Merrill cares to make a tour of the smaller towns and condemn all risks having electric wires not installed according to underwriters rules, he will condemn about seventy-five per cent. If things are to be worked out on the basis of what actually is at present very well, but let the rules be enforced all along the line.

However, the only basis on which to argue the matter, is on the premise that the insurance rules are to be enforced. If rules can be enforced in regard to wiring of arc and incandescent circuits, they certainly can be in case of railway power circuits. We think that insurance companies are very foolish to accept any electrical installations without inspection. If this were done, a check would be put on the "daily mistakes of construction men." Supposing however, that there is no inspection, we think that the lineman will exercise more care, knowing that one side is grounded, than if he is depending partly on the insulation of the other side. A railway circuit installed with common sense precautions, is not comparatively as dangerous as at first appears. As an actual fact, arc circuits are generally grounded more or less heavily at various points, as anyone who has worked on arc circuits knows. This makes them practically worse than railway circuits. A well known engineer once said in private conversation that the most dangerous thing from an insurance standpoint in the whole field of electrical practice is the two wire incandescent system. Thousands of lamps, fixtures, drop cords, etc., are fed from one station. If (say the positive wire) becomes accidentally grounded,

at any point in the system, it reduces one half the insulation of the negative side of the entire system and a ground on the negative side, then of course means a prospect for a fire. The same is true to a greater degree of the non-grounded 500-volt circuit.

To sum up:—

1. The 500 volt grounded circuit, has been in use for several years in thousands of cars, hundreds of car barns and hundreds of buildings. The wiring has not been of the best, but the results do not show that such circuits are comparatively so dangerous as to warrant their prohibition.
2. Such circuits are the most simple. Increased complication always means increased danger.
3. If wiring rules are enforced they can be enforced as regards railway circuits. Such circuits are few and easily inspected.
4. The most able and practical electrical engineers admit the safety of such circuits, if properly installed. Prohibiting them is like prohibiting steam boilers, because uninspected boilers sometimes explode.
5. Prohibition of these circuits practically means the prohibition of electric power in many places where the rule applies.

convention again. The actions of the "old line" companies which are based on actual statistics are business like and unobjectionable. It is such arbitrary theory-based rulings as the one here discussed that will build up mutual insurance.

### W. F. ADAMS.

The newly elected president and general manager of the Chattanooga, Electric Railway, is a self made man and a splendid type of the young men that are making the South what it is commercially.

W. F. ADAMS.

Mr. Adams is now forty years of age, a Mississippian by birth and education, and a gentleman of great energy and resource. Beginning with absolutely nothing, he has build up for himself a wide reputation in manufacturing lines, and now enters the street railway fraternity, into which all are glad to welcome him. His first business experience was as a clerk, then as an

RUINS OF THE ATTEBORO, MASS., POWER PLANT.

There seems to be no great prospect that the underwriters will soon change their ruling. One of our most progressive managers hits the nail on the head when he says: "Before giving in, I shall co-operate with the owners of buildings using our power and try and find insurance companies outside of the association, who are willing to accept the risks. The so called "old line companies" are getting more arbitrary every year, and I am now looking into mutual insurance with a view to placing the insurance on our plant with such companies. I learn that many other roads are being forced to do the same thing, by their unjust and illiberal treatment."

At present the majority of policies of the "old line" companies are so worded that were they literally interpreted nothing could be got on them in ninety-nine cases out of a hundred. Mutual insurance is the only recourse and it is gratifying to know that it will be brought up at next

express agent, and finally at the age of 22 with a little money and lots of energy, he began manufacturing at Rienzi, Miss. Four years later, business tact and industry so built up his success, that he removed to Corinth, and established the W. T. Adams Machine Company, making boilers, engines and general machinery. This plant is now one of the best known in the South.

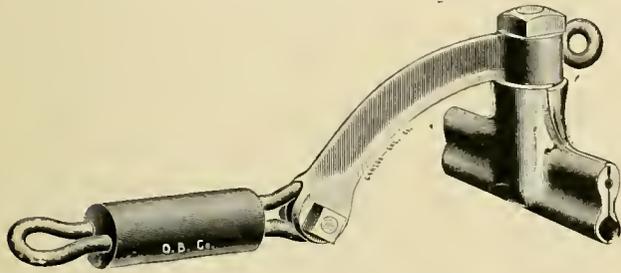

Mr. Adams is a practical man as well as a financier and the best that we can wish him is, that his success in the street railway field may approximate the success that has attended every previous effort. The Chattanooga electric railway, is to be congratulated upon its executive head, and the fraternity upon the accession of such a member.

OUR illustration above is of the ruins of the Attleboro, Mass., power house, from a photograph taken expressly for the STREET RAILWAY REVIEW.

THE OHIO BRASS COMPANY OF  
MANSFIELD, O.

The Ohio Brass Company, of Mansfield, O., is not a novice in the manufacture of street railway supplies. For several years its entire output has been handled by a supply house, but now the company has concluded to sell its own goods.

The company's plant is complete in every detail, including a machine shop and foundry, a completely furnished

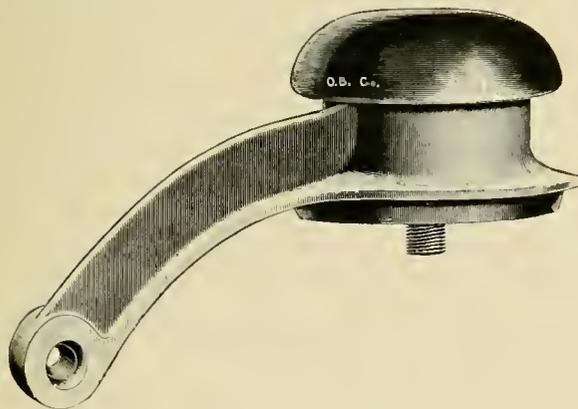

SINGLE CURVE PULL-OVER.

laboratory for testing both material and products and every modern method of making the best grade of goods in the most workmanlike manner. The testing instruments are from Queen & Company, and the Ohio Brass Company's goods are all rigidly tested by them. An illustrated catalogue of all the company's goods will be issued about February 20. It also stands prepared to make special work from designs.

As an advance sheet we show one or two devices from the forthcoming catalogue.

The single curve pull over fitted with type W trolley clamp is here illustrated. The yoke and adjustable cone are made in one malleable casting and insulated from

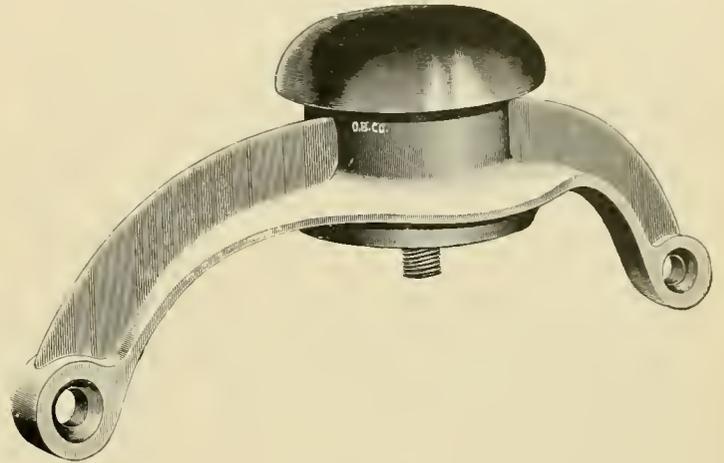

SINGLE CURVE HANGER—TYPE W.

span-wire by the small Mansfield strain insulator. This pull over was designed to meet the demand for a curve insulator of minimum weight for use on the smaller sized trolley wires. It is strong enough however to support No. 0, B & S trolley wire. The double curve pull over is similar in design and detail to the single curve pull over but has a double yoke and double insulation. The curve hanger bodies are made of the best malleable casting, giving strength and lightness. The insulating pieces are moulded from a special compound and the top and bottom pieces are dovetailed together and into the hanger

body to prevent surface leakage. The iron casting which is moulded into the insulating cap is larger than the inside diameter of the collar, thus insuring strength. All insulator caps and washers for type W hangers are interchangeable.

The Mansfield strain insulator is a superior device. The medium size has a breaking strain of 10,000 pounds and consists of two steel staples five inches long,  $\frac{3}{8}$  inches

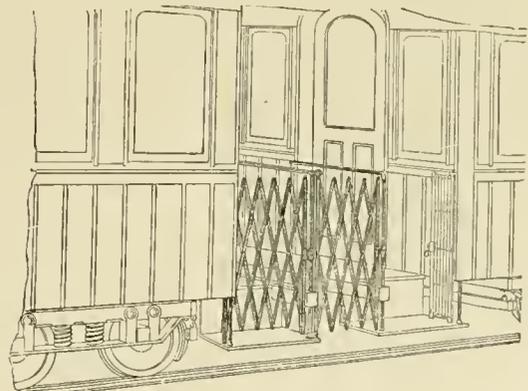

DOUBLE CURVE HANGER—TYPE W.

diameter, and moulded into the insulating compound. It is seven inches over all and weighs less than three-quarters of a pound. Its insulating properties are guaranteed under the severest strain.

The personnel of the company is: E. T. Cooke, president, F. B. Black, secretary and manager and C. K. King late of the Ansonia Electric Company as special salesman in the electrical department. The company has bright prospects for an excellent and increasing business.

THE PITT FOLDING GATE.

The folding gate has become almost a necessity on rapid transit lines and its importance in preventing accidents is such that its use is on the increase daily. William R. Pitt, of 202 Fifth avenue, New York, was one of the

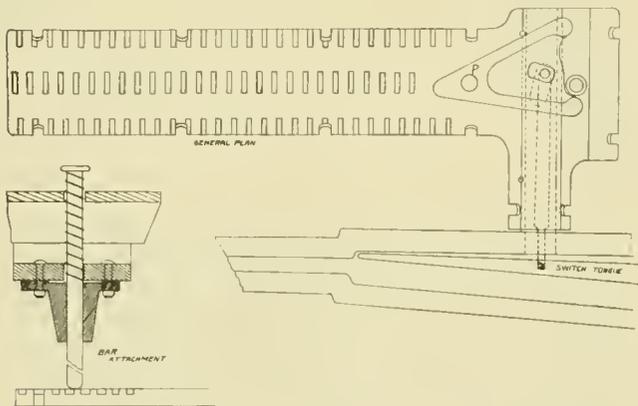

PITT FOLDING GATE.

pioneers in the folding gate business and to him are due many valuable improvements in this style of gate. The Pitt patent gate, made by the Composite Iron Works of New York, is made of a fine quality of channel steel and

great care is used in the details of construction. These facts have helped to make the Pitt gate one of the standards of quality. As a gate for use between trailers, where unusual stretch is required in going around curves, it has been in use for years in Philadelphia and Baltimore. It has stood the test of time and it will not be amiss if it is specified for new cars.

#### THE STANDARD SWITCH THROW.

The above named device has recently been installed at the corner of Ninety-second street and Commercial avenue, on the South Chicago City Railway, by the Milwaukee Switch Throw Company. It consists of a simple triangle of mitre steel, pivoted at one corner and thrown either way by a bar on the moving car. This triangle, which has an underneath connection with the switch point,

is mounted on a base plate, roughened to accommodate general traffic. The shifting rod on the car when pressed down strikes the track M, or N, as the case may be, and finally one or the other side of the triangle, thus throwing the switch. The only exposed moving part is the triangle. It can easily be kept in working order by the man who oils and salts the curves. The time saved by all the cars on a road in a day, amounts to considerable.

#### MIDWINTER FAIR TRAFFIC.

Saturday, January 27, 1894, will be long remembered by the enthusiastic thousands, who celebrated the opening of the MidWinter fair, at San Francisco. Unquestionably a grand success, beautiful to the eye and satisfying to the mind, the Fair opened with 72,248 spectators. The parades of the day, the opening exercises, and the features of the display have been told elsewhere. It is the purpose of the REVIEW to give honor to the magnificent service rendered by the intramural facilities of San Francisco.

To begin with, street traffic was not interrupted. Experienced men, stationed at points where the parades crossed the car lines, regulated the traffic, and allowed the cars to shoot by, at regular intervals, when the line was broken for that purpose. The spectators could thus see both parade and exercises.

It was a great day for the Consolidated Market Street Cable. Manager Stein says that his lines delivered 8,000

persons an hour at the Park, or 64,000 in all. The crowd began to leave at 5 p. m. and by 6:30 all had conveyance home.

On all lines, both direct and feeders, extra cars were placed, ranging from one-half to three times more than usual. Every car owned by the company was put in service. The Metropolitan Electric carried 20,000 passengers, and the other lines not direct, did a good business.

#### LOOK OUT FOR HIS KIND.

A smart accident insurance swindler, set up an office for the German Mutual Benefit Association, of Peoria, Ill., at Kansas City, Mo., some time ago, and insured a large number of street railway employes, at \$5 per membership and \$1 to \$2 a month thereafter. Last November, an injured conductor attempted to get his indemnity, but could not. This aroused suspicion, and an investigation of the agent's office and effects, showed nothing but leaves. He had absconded with all the fees and emoluments. The police of several towns are looking for him. His name was F. C. Baird.

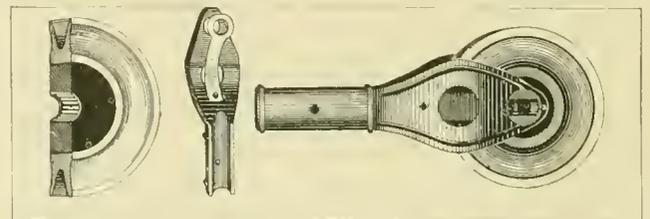

#### BIG FIRE AT CINCINNATI.

The splendidly equipped machine shops and the car barn of the Cincinnati Consolidated Street Railway Company, at Avondale, burned February 2, totally destroying the buildings and eighty cars, with all machinery. The loss is reckoned at \$175,000 as follows: on the cars, thirty motors, and fifty trailers, mostly open, \$125,000; on the building \$25,000, on the machinery \$25,000. The building was 250 feet long, one and a half stories high, with a basement. Bad insulation is the assigned cause, assisted by the oil soaked and highly inflammable construction.

The insurance was \$150,000.

#### THE BIDWELL TROLLEY HEAD.

A trolley harp and bearing which combines several valuable qualities has been successfully experimented with for some time past by C. S. Bidwell, electrician of the Ashtabula Rapid Transit Company. The wheel is

on roller bearings. The fork is in two parts. Side play is taken up by flat springs riveted to the harp. This with the roller bearing insures a long life for the wheel as far as journal wear is concerned. The harp is very easily taken apart, making a change of wheels easy. The rollers of the bearing can of course be used several times.

## AMERICAN STREET RAILWAY ASSOCIATION.

Executive Committee Meets at Atlanta, and Makes Arrangements for the Annual October Convention.

The executive committee of the American Street Railway Association met on January 24, at Atlanta, Ga., to make arrangements for the annual convention, which convenes in that city October 17, 18 and 19, 1894.

There were present, the president, Henry C. Payne, and William J. Stephenson, Lewis Perrine, Jr., Thomas H. McLean, W. Y. Soper, E. S. Goodrich, and the secretary, W. J. Richardson.

Letters stating their inability to be present, and regretting their absence, from D. F. Longstreet, James R. Chapman and Edward Whitaker, were read.

The question of employing a statistical secretary was discussed, but action deferred until after the convention.

The formation of a "Street Railway Institute," which was suggested at last convention, was also laid on the table, in consideration of the financial condition of the country.

The following selection of subjects for reports at next convention was made:

### REPORTS.

- "Can the T Rail be Satisfactorily Used on Paved Streets?"
- "Suburban Electric Railways."
- "Mail, Express and Freight Service on Street Railway Cars."
- "A Standard Form for Street Railway Accounts." By H. I. Bettis, Atlanta.
- "The Best Method of Treating Accidents and Complaints."
- "Street Car Wheels and Axles."
- "The T Rail Construction of the Terre Haute Street Railway Company." By M. F. Burke, Superintendent.
- "Street Railway Mutual Fire Insurance." By Lewis Perrine and the Secretary.

### DISCUSSIONS.

"Transfers and Commutation." To be opened by C. K. Durbin, general superintendent, Denver Tramway.

On the suggestion, by letter, of Superintendent McClary, of Birmingham, Ala., it was decided to hold an executive session on Thursday morning, October 18, and that members be urged to come prepared to furnish data and participate in discussion.

It was decided to request committees to limit their reports to twenty minutes each.

### HEADQUARTERS.

The Aragon Hotel was selected as headquarters hotel, and Machinery Hall, at the Exposition Grounds, was chosen as place for exhibits.

### ENTERTAINMENT AT CHATTANOOGA.

The street railway friends at Chattanooga, Tenn., presented a request that the visiting delegates to the October convention, and their ladies, visit Chattanooga on Friday,

October 19, and stated that arrangements had been made to keep the famous "Lookout Inn," on Lookout mountain, open until after the convention, to accommodate the Association. The committee voted to accept the invitation and date, and one of the most delightful side trips ever enjoyed by the Association will be the result.

## A SAN FRANCISCO ACCIDENT.

The worst street railway accident on the coast since the draw bridge disaster at Portland, Ore., occurred January 27th, on the San Francisco & San Mateo Street Railway line, on Chenery street, San Francisco. The line at that point is a combination of a heavy grade and curve. The motorman of the ill-fated car lost control of the brake and the car dashed down the hill, left the track and was stopped by a collision with a side pole, wrecking the vehicle and injuring 29 passengers, four of them fatally. The car was heavily loaded, carrying as nearly as is known certainly, 95 passengers, mainly visitors to the Midwinter Fair grounds, on their way to witness the fire works display at the exposition. The last passengers taken on were 25 employes of the line, who crowded the platforms

(From photograph of wrecked car.)

and the steps and bumpers. The grade on this hill is approximately 11 per cent and was the scene of a thrilling occurrence of a like nature at the time the road was first commissioned. This former accident however, did not seem to teach the management discretion, and the above mentioned load of nearly 100 persons on such a grade, amounts to little less than criminal carelessness. Knowing that the events at the Midwinter Fair would call forth increased traffic, more cars should have been run and extra precautions taken. That neither was done seems evident.

The motorman's statement to the manager is in part as follows: " \* \* \* \* \*

At Randall street I stopped to discharge a passenger, and then proceeded down the hill. When setting brakes, inside brake failed to work. I rang for conductor to set rear brakes, as the car was gaining speed rapidly. I threw the reverse lever over so car would generate current and choke down. Failing to generate soon enough I applied the current which checked the car, but my fuse blew out and car got away from me. Brakes were in good order up to time of accident."

The car is thus described by President Joost; length 32 feet, width including steps 9 feet. There is no enclosed space for the motorman and with his platform crowded he can not work to advantage. The company claims that all

its motormen are experienced and used to heavy grades, thus seeming to be willing to back the man's judgment. At the time of the former accident seven persons were injured and it is said that danger is augmented by the fact that children attending an adjacent school use the tracks as a toboggan slide, using boards on the rails, rendering them as smooth as glass. This second lesson in safety certainly should not need repetition.

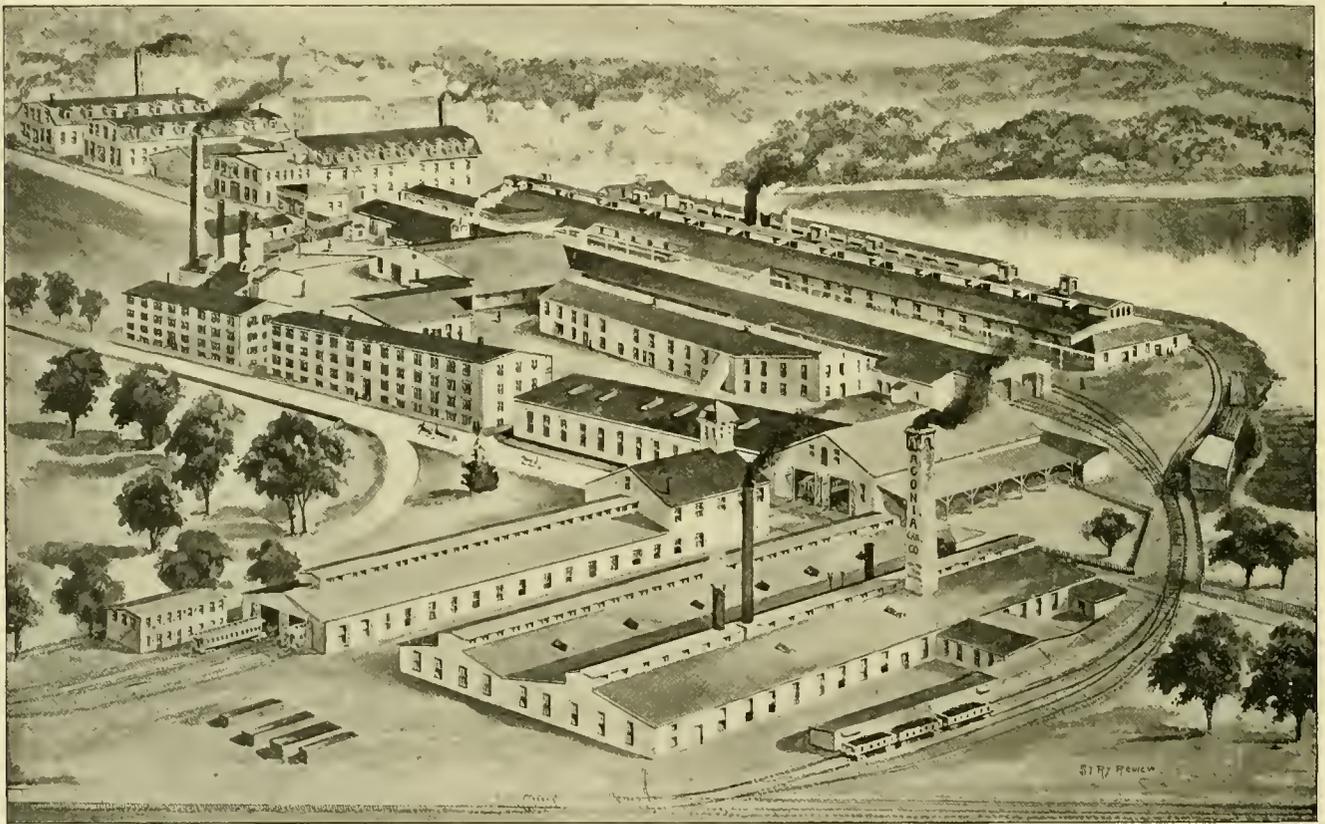

### THE LACONIA CAR COMPANY.

Announcement of the Entry of an Old Concern into a New Field.  
—Its Facilities and Prospects.

Laconia, in the State of New Hampshire, is not only famed in song and story, as the center of one of the most picturesque spots in American Switzerland, but as a more

arate quarters. Each department is interconnected by tracks, to facilitate the handling of work from one another. The areas of the department shops are as follows: mill 60 by 100 feet; paint shop, 50 by 270 feet; cabinet shop, 40 by 150 feet; blacksmith shop, 40 by 150 feet; gray iron and wheel shops, 40 by 200 feet. The capacity of the latter department is 100 street car wheels a day. In addition to these enumerated departments, the Laconia Company has a malleable iron mill, 150 by 200 feet in dimensions, one of the most complete in New England. This department makes castings for the West End Street Railway Company, the General Electric and other concerns.

The lumber yards and dry rooms of the Laconia Company, of course are large in proportion to the rest of the plant and their own special cargoes of

WORKS OF THE LACONIA CAR COMPANY, LACONIA, N. H.

than passing distinction, in the annals of New England's commercial prominence.

Its best known industry is without doubt the Laconia Car Company. The general view of which we take pleasure in presenting on this page.

For many years, in fact, ever since the beginning of extensive railroad building, the Laconia Car Company has been in the field of steam road work. It was founded in 1850, and with nearly fifty years growth and experience it is needless to state that the equipment of the factory is complete to the last detail.

As will be noticed by the reader, in even a casual glance at the accompanying engraving, the different departments of the work are provided with spacious, sep-

Oregon pine are brought direct to the works. Seven hundred men are employed at the works, all skilled in their various crafts, and cars of special designs may be built with assurance of the best material and workmanship.

The president of the company is Perley Putnam, a man whose executive ability has long been recognized; the secretary and treasurer is W. E. Putnam.

The street railway sales department is placed in the competent hands of F. E. Huntress, of 8 Oliver street, Boston, who will take pleasure in affording any one interested the most complete information as to price, style and time of delivery, the three main points of excellence requisite in car buying.

Electric motor for street cars. Benjamin G. Lamme, Pittsburg, Pa., assignor to the Westinghouse Electric & Manufacturing Company, same place.....	513,401
Span wire for overhead electric railways. Sidney H. Short, Cleveland, O., assignor to the Short Electric Railway Co., same place.....	513,426
Safety brake. Kitchell A. Maynard, Kansas City, Mo., assignor of one-half to William M. Randall and George M. Randall, same place.....	513,432
Supply system of electric railways. Henry S. Pruyn, Hoosick Falls, N. Y., assignor to James S. Gibbs, Chicago, Ill.....	513,440

ISSUED JANUARY 30, 1894.

Trolley wire finder. Edward Gale, Peoria, Ill.....	513,566
Starter and propeller for electric cars. Ernest Schmitz and James Mendenhall, Chicago, Ill.....	513,598
Gearing for electric locomotive. George W. Schwartz, Florence, Ala.....	513,599
Car brake. Herbert E. Collett, Chelsea, Mich., assignor of three-fourths to Herbert E. Collett, Jr., Lynn, Mass., and Charles W. Armstrong and James Howard Bing, Philadelphia, Pa.....	513,670
Car brake. Willard Curtis, Grand Rapids, Mich., assignor to William T. Powers and William H. Powers, same place.....	513,672
Wheel fender or guard for cars. George Blakistone, Baltimore, Md.....	513,701
Wheel fender for cars. George Blakistone, Baltimore, Md.....	513,702

Safety fender or trap. George Blakistone, Baltimore, Md.....	513,703
Electric connection for railway rails. Alfred Green, Rochester, N. Y., assignor one half to William Rosboro, same place.....	513,777
Car truck. John B. Smitham, Oil City, Pa.....	513,835
Trolley pole stand. Gustav Valley, Cleveland, O., assignor to the Steel Motor Company, same place.....	513,846
Trolley pole stand. Gustav Valley, Cleveland, O., assignor to the Steel Motor Company, same place.....	513,847
Switch operating device. Handley P. Cogswell, Brooklyn, N. Y.....	513,883
Street railway brush. Philip A. Coonradt and Arthur Coonradt, Rockford, Ill.....	513,888
Sectional electric railway. George W. Demmick, Lynn, Mass., assignor one-half to Henry Robinson, George Fuller, John S. Earl and Knott P. Martin, same place.....	513,894
Power transmitting mechanism for electric locomotives. Mark W. Dewey, Syracuse, N. Y., assignor to the Dewey Corporation, same place.....	513,895

ISSUED FEBRUARY 6, 1894.

Load governor for electric currents. Frank E. Pritchard, Oswego, N. Y.....	513,930
Conduit electric railway. Rufus C. Beardsley, La Fayette, Ind.....	514,056
Electric car truck. Charles F. Winkler, Kingston, N. Y.....	514,109
Closed conduit electric railway. Frank M. Ashley, Hawthorne, N. J.....	514,112
Electric railway. Frank M. Ashley, Hawthorne, N. J.....	514,113
Electric railway conduit. Frank M. Ashley, Hawthorne, N. J.....	514,114
Electric railway. Oscar A. Enholm, New York, N. Y., assignor to Edward C. Reiss and John J. Ashley, Brooklyn, N. Y., and Frank M. Ashley, Hawthorne, N. J.....	514,120
Safety guard for street cars. George T. Foster, Rochester, N. Y.....	514,121
Underground electric conductor. Henry A. Seymour, Washington, D. C., assignor to the Short Electric Railway Company, of Cleveland, O.....	514,133
Closed conduit for electric railways. Henry A. Seymour, Washington, D. C., assignor to the Short Electric Railway Company, Cleveland, O.....	514,134
Motor controlling device for electric locomotives. Sidney H. Short, Cleveland, O., assignor to the Short Electric Railway Company, same place.....	514,135
Safety car fender. George Latz, Baltimore, Md.....	514,234
Electric trolley wheel shield. Henry S. Pruyn, Hoosick Falls, N. Y.....	514,274
Series electric railway. Michel A. Cattori, Rome, Italy.....	514,303
Trolley wire shield. Louis Eschner, Philadelphia, Pa.....	514,353
Cable grip. John A. Tauberschmidt, Washington, D. C.....	514,389

### GEORGE E. PRATT.

One of the best known men in both the steam and street railway fields is George E. Pratt, who February 12, resigned the general sales agency of the Lamokin Car Manufacturing Company, to take a similar position with the Jackson & Sharp Company, of Delaware. Mr. Pratt has crowded into his existence of thirty-eight years a wide and varied experience in many departments of steam and street railway work. He began by serving an apprenticeship in the Taunton Locomotive Works, but later perfected himself to enter the navy as engineer. This course being precluded by the death of an influential friend, he became a clerk for G. E. Bryden, Superintendent of the M. P. & M., N. Y. & N. E. R. R., at Boston, in 1879. In 1882 he accepted a like position elsewhere. Next Mr. Pratt was

GEO. E. PRATT.

one of the chief movers in the organization of the New England Railroad Club, and was its first Secretary. Still continuing in railroad work he became successively private secretary to the master mechanic of the N. Y. W. S. & B. R. R. and to the owner of the Chautauqua Lake Railway. Next he went to Tennessee to make a report on the Chesapeake and Nashville Railway, for Cincinnati and New York capitalists, declining a position on this road to become traveling mechanical inspector for the Pullman Company. This position he left to become general sales agent for Lamokin cars. Besides these qualifications, Mr. Pratt is a practical mechanic, an expert stenographer and a hand-in-glove associate of the Master Car Builders Association members and American Street Railway Association men. His wide acquaintance in both fields wish him the success he deserves.

### THE AMES REGISTER.

With the purpose of supplying to the street railway manager a fare register that may have all the commendable features of a portable register, a bell punch and a stationary register, furnishing the conductor with a complete record of his day's work, no matter how many times he changes car, the Ames Register Company, 53 State Street, Boston, has placed on the market the register herewith illustrated and described, and which is a radical departure from the present methods. The simplicity of the machine is self evident. The scheme is that of a stationary register containing a portable register. This portable register fits all stationary parts and is inter-

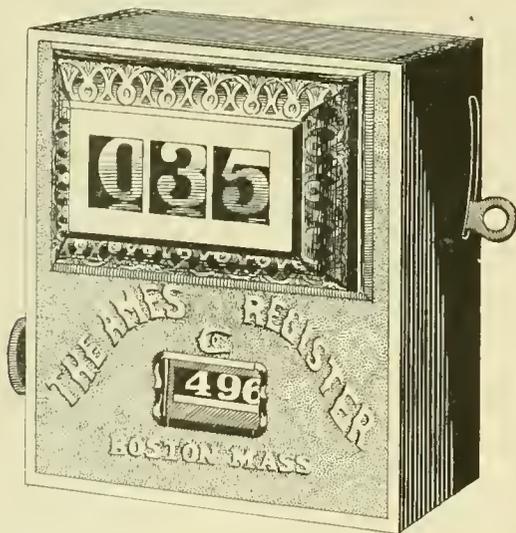

FIG. 1.

changeable. The stationary register can not be operated unless the portable register is in place, but the conductor may if desired by the company turn the stationary register back to zero at trip termini, without removing the portable register or altering its figures. The portable register numbers continuously to a million and starts at zero. Thus two distinct reports are given both unalterable. The engravings shown give a good idea of the plan; Figure 1, shows the register ready for operation; Figure

2, shows the portable register partly in place in the stationary; Figure 3, is the portable register. The method of manipulating the portable portion of this register is as follows: At the beginning of the conductor's day's work, he is furnished with the portable register, which he inserts into the stationary, or car register. Before oper-

FIG. 3.

ating the register he records upon his day-card the figures that appear on the portable register. At the close of his day's work, he turns in the portable register with his money and day-card. In computing the conductor's work, the official simply refers to the portable register to ascertain the number of fares taken during the day. By the use of this register it is unnecessary to assign an employe to the duty of recording the state of the register either before the register starts on its day's work or after

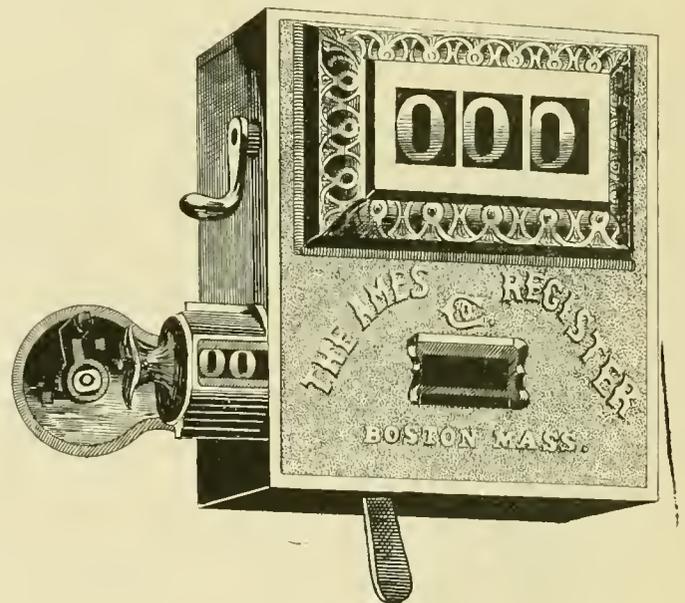

FIG. 2.

wards, the portable register doing this work. Every detail of the register is of the best workmanship and material, it is simple, durable and operated by one lever and the mechanism is accessible to the proper authority only. Louis Pfingst, the manager, will gladly furnish further details,

LANSING'S street railway during the month of January sold, at certain places, "Aid Society Tickets," one-fifth of the receipts of their sale going to the Aid Society of Lansing. Secretary Jay P. Lee is the immediate donor of the fund.

SIX sad and seedy stockholders went to the Keeley motor office, in Philadelphia, recently, and found no quorum, so they silently stole away.

## CAUGHT ON THE RUSH TRIP.

### American Street Railway Association.

HENRY C. PAYNE, PRESIDENT, Milwaukee, Wis.  
 WM. J. RICHARDSON, SECRETARY AND TREASURER, Brooklyn, N. Y.  
 W. J. STEPHENSON, FIRST VICE-PRESIDENT, Washington, D. C.  
 J. R. CHAPMAN, SECOND VICE-PRESIDENT, Grand Rapids, Mich.  
 LEWIS PERRINE, THIRD VICE-PRESIDENT, Trenton, N. J.  
 EXECUTIVE COMMITTEE: D. F. LONGSTREET, Denver, Col.; T. H. McLEAN, Indianapolis, Ind.; ED. WHITTAKER, W. Y. SOPER, Ottawa, Ont.; and E. S. GOOD, Rich, Hartford, Conn.  
 Place of next meeting, Atlanta, Georgia, third Wednesday in October, 1894.

### Massachusetts Street Railway Association.

President, J. H. CUNNINGHAM, Boston; First Vice-president, AMOS F. BREED, Lynn; Second Vice-president, FRANK S. STEVENS, Fall River; Third Vice-president, SAMUEL WINSLOW, Worcester; Secretary and Treasurer, A. E. BUTLER, Lawrence, Executive Committee, A. A. GLASIER, Boston; E. C. FOSTER, Lynn; CHAS. ODELL, Salem; P. F. SULLIVAN, Lowell; E. P. SHAW, Newburyport; PRENTISS CUMMINGS, Boston; R. S. GOFF, Fall River.  
 Regular meetings first Thursday of each month.

### Maine Street Railway Association.

President, WILLIAM R. WOOD, Portland.  
 Secretary and Treasurer, E. A. NEWMAN, Portland.  
 Next meeting will be held the first Wednesday in February, 1894.

### Ohio State Tramway Association.

President A. E. LANG, Toledo; Vice-president, W. J. KELLY, Columbus; Secretary and Treasurer, J. B. HANNA, Cleveland; Chairman Executive Committee, W. A. LYNCH, Canton, O.  
 Meets at Toledo on the fourth Wednesday in September, 1894.

### The Street Railway Association of the State of New Jersey.

President, JOHN H. BONN, Hoboken; Vice-president, THOS. C. BARR, Newark, Secretary and Treasurer, CHARLES Y. BAMFORD, Trenton; Executive Committee, OFFICERS and C. B. THURSTON, Jersey City; H. ROMAINE, Paterson; LEWIS PERRINE, JR., Trenton.

### The Street Railway Association of the State of New York.

D. B. HASBROUCK, PRESIDENT, New York City.  
 G. TRACY ROGERS, FIRST VICE-PRESIDENT, Binghamton.  
 JAS. H. MOFFATT, SECOND VICE-PRESIDENT, Syracuse.  
 WILLIAM J. RICHARDSON, SECRETARY AND TREASURER, Brooklyn.  
 The next meeting will be held at Syracuse, on the third Tuesday in September 1894.

### Pennsylvania Street Railway Association.

H. R. RHOADS, PRESIDENT, Williamsport.  
 B. L. JONES, FIRST VICE-PRESIDENT, Reading.  
 S. P. LIGHT, SECRETARY, Lebanon.  
 WM. H. LANIOUS, TREASURER, York.  
 Next meeting at Reading first Wednesday, in September, 1894.

### Texas Street Railway Association.

WM. H. SINCLAIR, PRESIDENT, Galveston.  
 S. A. HOBSON, SECRETARY AND TREASURER, Waco.  
 J. K. URIE, VICE-PRESIDENT, Austin.  
 Next meeting, third Wednesday in January, 1895.

### Arkansas.

LITTLE ROCK, ARK.—W. G. Brown, manager of the Arkansas Electric Supply Company, has received contract for a new plant at Searcy Ark., and will be in the market for a 750 light alternator with transformers and incandescent street light fixtures, also a 75-horse-power high speed engine.

### California.

POMONA, CAL.—C. W. Foote, the Cleveland capitalist, who is backing the street railway scheme, has taken up residence here.

ONTARIO, CAL.—The Ontario & San Antonio Heights Railway Company would like full information of any gas motor adapted to street railway purposes

OAKLAND, CAL.—The Consolidated Street Railway Company elects F. M. Smith, president; J. W. Coleman, vice-president, and A. K. Grim, secretary and superintendent.

OAKLAND, CAL.—Oakland Railroad Company files its incorporation at \$2,500,000. Directors: Charles F. Crocker, H. E. Huntington, S. F. Gage, C. E. Greer, F. S. Douty.

OAKLAND, CAL.—Borax King F. M. Smith is still bent on completing his proposed lines. A citizens' committee is conferring with Mr. Smith. The last project is to build eight miles of new line.

SAN FRANCISCO, CAL.—Geo. G. Buckland asks extensive franchises for electric railway lines, including many miles of street. He asks but 30 days to begin work, and six months to spend \$500,000, and three years to complete all work.

SANTA ANA, CAL.—The annual meeting of the Santa Ana, Orange & Tustin Street Railway elects the following officers: M. J. Bundy, president; N. Palmer, vice-president; Miss Mamie Ross-Lewin, secretary; Commercial Bank, treasurer.

OAKLAND, CAL.—Receiver Ira Bishop, of the Piedmont Consolidated, says that the receipts for November were \$6,417, and disbursements, \$10,947, or a net loss of \$4,530. December loss about \$3,000.

OAKLAND, CAL.—The receiver of the Piedmont Cable Company has been granted his application to mortgage the road, to raise \$15,000 to pay operating expenses until a purchaser may be found. It is also rumored that a change to electricity is contemplated.

SAN FRANCISCO, CAL.—The Underground Sealed Conduit Railway Company has incorporated, with \$500,000 capital and \$250 subscribed to sell letters patent for street car appliances. Directors, L. C. Pressley, L. G. Crossley, E. O. Rollins, L. L. Lindsay and C. S. Wheaton.

SACRAMENTO, CAL.—The Sacramento Power & Electric Light Company, Albert Gallatin, president, and Joshua Barker, secretary, has negotiated a loan of \$1,500,000, mortgaging all property and franchises to the California Safe Deposit & Trust Company for thirty years to secure the loan.

### Canada

WINDSOR, CANADA.—The Windsor Electric Railway will extend east, and are now after franchise.

TORONTO, CAN.—The Toronto Street Railway Company asks bids on its 6,000-horse-power station, about to be built.

LONDON, CANADA.—The London Street Railway Company elect H. A. Everett, president; E. W. Moore, vice-president, and S. R. Break, secretary-treasurer and general manager. The annual report shows gross earnings of \$52,244, and operating expenses of \$40,686, leaving revenue of \$11,557, an increase of \$4,175 over 1892.

HAMILTON, ONT.—The Hamilton Beach & Electric Railway Company is seeking incorporation. The capital stock of the company will be \$48,000, divided into 480 shares of \$100 each. The following are the incorporators: Messrs. John Calder, J. N. Waddell, A. E. Carpenter, Robert Campell, of this city; W. Kearns, M. L. A., Richard Baxter and W. Allen, Burlington.

### Chicago.

CHICAGO.—Lake street L will build electric plant at 1137 West Lake street, to cost \$7,000.

CHICAGO.—A subscriber wishes to know the address of the American Construction Company, and whether it has a Chicago office. Does any one know?

CHICAGO.—All persons having claims against the Railway Equipment Company are notified to present such, properly attested, to Geo. O. Fairbanks, receiver, at 305 Ashland block, Chicago, within three months.

CHICAGO.—South Side Extension Railroad Company, organized by Marcellus Hopkins, W. R. Champlin, Edwin L. Lobdell, W. W. Gurley, of Chicago, and David R. Lewis, of Evanston, proposes to build a loop for the Alley L. Capital \$1,000,000.

CHICAGO.—The Pollasky Elevated Railway for the North Side is incorporated by, L. O. Goddard, W. W. Tracy, Springfield; Fred C. Gardner, Gen. W. Sooy-Smith, James T. Hull and Andrew McNally, of Chicago, Green, Willits & Robbins, Home Insurance Building, are their solicitors.

CHICAGO.—Mysenburg & Wright are championing the advantages of the Siemens-Halske underground conduit system for Indiana avenue. The Love Electric Traction Company is also trying to persuade the use of their conduit, but the failure of the present Love line on Fullerton avenue militates against it.

CHICAGO.—The report that J. B. Wallace, of Ansonia, Conn., is about to form a new company for the electrical and railway supply business has been confirmed by Mr. Wallace. The incorporation papers have been issued. The old Ansonia Supply Company will be the basis of operations. Mr. Wallace is in Chicago.

CHICAGO.—The West Chicago Street Railroad Company now owns the Cicero & Proviso Electric Railway. Secretary Ballard, of the Cicero & Proviso, will not deny the truth of the statement, and advised the reporter to see E. A. Cummings, who engineered the deal. Mr. Parsons evaded a denial. There is no doubt but that the report is true, but no particulars are yet given out.

### Colorado.

PUEBLO, COL.—The Pueblo Street Railway Company asks right to extend to Bessemer, and loop. Will be granted.

DENVER, COL.—A. U. Buell, president, Capt. E. P. Miller, general manager, and directors of the Denver, Longmont & Noland Stone & Railway Company, have negotiations pending for the equipment of their road. Work to begin with spring.

### Connecticut.

NORWALK, CONN.—Norwalk Horse Railroad will change to electric traction.

HARTFORD, CONN.—The East Hartford & Glastonbury Horse Railroad, elects, president, E. S. Goodrich, Hartford; secretary, Geo. D. Curtis, Hartford.

BRIDGEPORT, CONN.—The street railway strike has been settled by a compromise. The two heaviest stockholders says that the contemplated change to electricity will come soon and cost \$500,000.

HARTFORD, CONN.—A large scheme, based on the several charters for street railways branching north from Hartford, is being unfolded. It contemplates the syndicating of all the city, suburban and interurban lines. William H. Goodrich is a prime mover in the affair. The General Construction Company, of Boston, has the contract for building lines from West Hartford to Farmington.

### District of Columbia.

WASHINGTON, D. C.—General Manager W. Kesley Schoepf, of the Eckington & Soldiers' Home Railway Company, asks for two permits, additional track laying.

GEORGETOWN, D. C.—The Georgetown & Tennallytown Electric Railway has made M. W. Offutt, president; H. Bradley Davidson, vice-president; John E. Beall, secretary and treasurer.

### Florida.

JACKSONVILLE, FLA.—It is understood that the Jacksonville Street Railway is to put in heavier rail and extend its system in Fairfield.

OPELIKA, FLA.—Auburn, Ala., and Opelika will be connected with a street railway. Capt. John L. Cowan, of Opelika, is the promoter, and \$30,000 of 6 per cent bonds have been sold. The line will be seven miles long.

### Georgia.

ROME, GA.—The court has declared the Rome Electric Railway solvent, and dismissed the application for receivership.

ATLANTA, GA.—Judge Pardee refuses the receivership asked by bondholders of the Atlanta Consolidated. President Hurt says that the matter of interest will be arranged soon, and that all will be satisfied with the arrangement.

### Illinois.

OAK PARK, ILL.—Oak Park Town Board grants Cicero & Proviso Electric Railway right to lay extension in town. Must be built within a year.

FREEMONT, ILL.—C. E. Loss & Co., of Chicago, will build the electric railway system in Freemont, changing the horse car line. Residents take \$25,000 stock. The plant will cost \$100,000.

MOLINE, ILL.—The People's Power Company has purchased the gas and electric plants of Moline and Rock Island, owned by the Brush Electric Company, for \$200,000. The Rock Island plant will be moved to Moline, to take advantage of the water-power.

EAST ST. LOUIS, ILL.—Organized, the Mark Equipment Company, at East St. Louis; railway equipments and supplies; capital stock, \$10,000; incorporators, F. S. Taggart, Henry L. Bauer, and Frank E. Nulsen. The company is the reorganization of the Mark Railway Equipment Company, of Cleveland, which failed six months ago.

### Indiana.

INDIANAPOLIS, IND.—The contract for the new power house on West Washington street has been let to Jungclaus & Schumacher. It will be 320 by 330 feet and cost \$125,000.

NEW ALBANY, IND.—The directors of the Highland Electric Railway Company, of New Albany, have elected J. F. Gehhart, president, and Col. W. W. Tuley, secretary and treasurer.

FT. WAYNE, IND.—The Lakeside Street Railway is bonded for \$100,000, to secure payment of bonds issued to the Knickerbocker Trust Company, of New York. R. T. McDonald is owner.

RICHMOND, IND.—Union Trust Company, of St. Louis, asks judgment on bonds of the Street Railway Company for \$212,000, and that Superintendent A. D. Titsworth be appointed receiver. The company is owned by Col. J. F. Miller and Russell B. Harrison. The line will continue operation. Hard times and decreased business the cause alleged.

### Iowa.

BURLINGTON, IA.—George O. Ray expects to break ground for his new street railway line early in the spring.

FAIRFIELD, IA.—The old Park & Belt Motor Line is to be rehabilitated and extended. The plan is not yet fully formed.

STOUC CITY, IA.—The bondholders of the Sioux City Street Railway Company, holding \$525,000 in bonds, have organized to buy in the road at the receiver's sale.

CLINTON, IOWA.—Superintendent Highlands, of the State Electric Company, is making arrangements for equipment of the North Second street electric light plant as a railway power station.

INDEPENDENCE, IOWA.—The company now controlling the Street Railway Company is officered as follows: R. Campbell, president; M. A. Campbell, secretary; A. D. Gurnsey, superintendent.

COUNCIL BLUFFS, IA.—A. K. Stone resigns superintendency of the Motor Company. J. T. Stewart is re-elected president; Chas. T. Stewart, secretary; J. H. Millard, treasurer. Mr. Stewart declined presidency and Guy C. Barton, of Omaha, was elected to fill place.

### Kansas.

LAWRENCE, KAN.—The Westinghouse Electric & Manufacturing Company is figuring on the electric equipment of the street railway line. J. D. Bowersock is authority for the statement that the line will pay, and that eastern capital is behind the scheme.

ATCHISON, KAN.—Atchison Telephone & Electric Light Company is organized by B. P. Waggoner, David Kelso and Ellsworth Ingalls, of Atchison, W. G. De Celle, St. Paul, and O. H. Simonds, Duluth, to put in a telephone, light and street railway system. Capital \$100,000.

## Kentucky.

LOUISVILLE, KY.—M. E. Eaken, of Louisville, wishes to buy five miles of about 30-pound second-hand steel T rail with splices for logging road, to be delivered at Cairo or Memphis, Tenn.

LOUISVILLE, KY.—The New Albany (Ind.) Street Railway Company, the Belt & Terminal Railway, and the New Albany & Portland Ferry, it is said, will go into receiver's hands, on application of Bennett H. Young, representing holders of first mortgage bonds.

## Maine.

ROCKLAND, ME.—The Rockland, Thomaston & Camden Street Railway Company elects, Hon. George E. Macomber, of Augusta, president; Hon. A. D. Bud, of Rockland, treasurer, and Hon. H. M. Heath, of Augusta, clerk.

## Maryland.

BALTIMORE, MD.—A bill is before the legislature to incorporate the Baltimore & Ann Arundel Electric Railway Company, at \$50,000 capital.

BEL AIR, MD.—The Deer Creek Electric Railway Company elects: F. W. Baker, president, and Noble L. Mitchell, secretary and treasurer, for the ensuing year.

HAGERSTOWN, MD.—The city council grants a franchise to O. H. Ormsby, of Pittsburg, and S. Ritter Ickes, of Altoona, Pa., for an electric railway. Thirty days given for acceptance.

BALTIMORE, MD.—P. A. B. Widener, of Philadelphia, is here in the interests of the Baltimore & Washington interurban.

A scheme is on foot and charter prepared for the consolidation of all the city railways, at a capital stock of \$12,000,000. All roads to be represented by directors in the new company.

BALTIMORE, MD.—To trolley the Chesapeake & Ohio canal, a company is organized by Chas. K. Lord, third vice-president of the B. & O.; Lloyd Lowndes, H. Crawford Black, Alexander Shaw and Clarence Lane.

Baltimore Traction Company lets contract for two lines, to J. G. White & Co., of New York.

## Massachusetts.

PALMER, MASS.—The Palmer & Monson Electric Company forms a new company, to build a street railway in Warren, West Warren, and West Brimfield. The new company is to be called the Central Massachusetts Electric Company.

LYNN, MASS.—Professor Elihu Thomson, of the General Electric, is reported to be about to withdraw from the company. His friends say that an attempt will now be made by Mr. Thomson and his associates to secure the big West Lynn plant for the new company, and there make new appliances and old ones not owned by the General.

SPRINGFIELD, MASS.—The Wyman-Lea Electric Railway Company is about to organize, to build a trunk line from Holyoke to this place. Miss Aldworth, a wealthy spinster of Holyoke, and Judge Wyman, of Boston, are interested.

The Central Massachusetts Electric Railway Company, which has been formed at Palmer, it is understood, proposes to connect all the towns on the Boston & Albany, by building a line between Springfield and Worcester.

BOSTON, MASS.—In the U. S. Circuit Court interested parties of the Interstate Railway, of Rhode Island, ask for a receiver for the Attleboro North Attleboro & Wrentham Street Railway Company, January 20, Cornelius Sweetland was made receiver for both roads. Now a separate receiver is asked for the the A., N. A. & W.

The Wyman-Lea Electric Railway scheme elects officers as follows: Henry S. Dickinson, of Springfield, as president; A. L. Green, of Holyoke, clerk; and C. Fayette Smith, of Holyoke, treasurer. The directors are Judge W. B. C. Pearsons, of Holyoke, ex-mayor George S. Taylor, of Chicopee, George Nye and H. S. Dickinson, of this city, Isaac C. Wyman, of Salem, Horatio Gore, of Boston, and B. W. Woodward, of Cambridge.

## Michigan.

BATTLE CREEK, MICH.—Bond holders of the street railway expect to have road sold by April 1. They will then rebuild at expense of \$50,000.

ST. JOSEPH, MICH.—C. P. Wright, of the St. Joseph & Lake Shore Electric Railway, says that the company means business, and that the Erie Steel Works has the contract for construction.

ST. JOSEPH, MICH.—St. Joseph & Lake Shore Electric Railway Company is organized at \$75,000, to build an electric railway in St. Joseph, Mich. The officers are C. P. Wright, president; J. S. Wolfe, vice-president; A. I. Thatcher, treasurer, all of Chicago, and S. C. Rosenberg, secretary, St. Joseph.

DETROIT, MICH.—Judge Taft has decided against the street railway company's claim that the city was stopped from proceeding against the company on account of having recognized the validity of an amended franchise giving it life until 1909. This is a victory for the city and involves all the railway company's franchises. The company is given three months to remove its tracks or get a new franchise. Case will be reviewed by the court of appeals.

## Minnesota.

MINNEAPOLIS, MINN.—Thomas Lowry has returned to Minneapolis, after a long eastern trip.

MINNEAPOLIS, MINN.—M. B. Ridgeway, of this city, is promoting an electric line from here to Lake Superior, with power houses every fifteen miles. To be used for freight.

MANKATO, MINN.—Henry W. Brown, city recorder, Mankato, will receive bids until March 1, for the lighting of the city electrically for a period of ten years, on the basis of 100 maximum and 50 minimum arc lights and 100 maximum and 50 minimum incandescent lights.

## Mississippi.

LAURELL, MISS.—Eastman, Gardner & Co., are in the market for a second hand lathe, of about four feet swing, and from six to ten feet between centers.

## Missouri.

HANNIBAL, MO.—The Stillwell Meat Company is preparing to put in a 300-light incandescent plant.

ST. LOUIS, MO.—The Bridge & Beach Manufacturing Company will erect new shop and buy 200-horse-power engine.

KANSAS CITY, MO.—The West Side Electric Railway elects W. N. Colar, Jr., president, and C. F. Hutchings, secretary.

KANSAS CITY, MO.—George Law petitions county court for right to construct an electric railway from Westport to Kansas City. Work to begin in six months.

KANSAS CITY, MO.—The Merriam Park, Rosedale & Kansas City Electric Railway, organized by C. W. Brown of Kansas City, and B. F. Hollenbeck of Shawnee, at \$50,000.

CARTHAGE, MO.—E. S. Rowse, of the St. Louis Trust Company, St. Louis, which owns the Carthage Horse Road, is investigating affairs of the line, with an eye to an electric change.

ST. LOUIS, MO.—Directors of the St. Louis & East St. Louis Electric Railway Company, are: C. C. Carroll, John N. B. Bollinger, D. R. Powell, V. W. Fisher and John J. Taussig.

CLAYTON, MO.—Organized: The Clayton & Creve Cœur Railroad, to build from Clayton, to intersect the Missouri Pacific, by Henry Chomeau, Phil Deuser, W. B. Glensfelder, H. M. Smith and Jacob Studd.

ST. LOUIS, MO.—The Clayton & Forest Park Electric Railway elects: president, Thomas K. Skinker; vice-president, John S. Bowland; secretary and treasurer, B. F. Thomas. Mr. Thomas stated that the company is in excellent financial condition, and that the road, which is now completed to Clayton, so far as the tracks are concerned, would be in operation by May 1.

ST. LOUIS, MO.—The following roads elect officers, as follows:

St. Louis & Suburban Railway Company—President, Charles H. Turner; vice-president, Samuel M. Kennard; secretary and treasurer, R. Lehman; directors, Clark H. Sampson, James Green, C. C. Maffitt, James Jackson and Ellis Wainwright.

Jefferson Avenue Street Railway—President, George A. Madill, to succeed P. C. Maffitt; directors, Edwards Whitaker, Robert McCulloch and P. C. Maffitt.

### Nebraska.

BEATRICE, NEB.—D. W. Morrow, Omaha, is elected president of the Rapid Transit Company; vice-president, Nathan Blakely; secretary and treasurer, L. E. Walker.

NEBRASKA CITY, NEB.—The Nebraska City Street Railway elects: President, H. H. Bartling; vice president, John J. Teten; treasurer, F. W. Rodenbrock; secretary, John C. Watson.

OMAHA, NEB.—W. S. Dimmick, of the Postal Telegraph Company, has taken the superintendency of the Omaha & Council Bluffs Street Railway & Bridge Company. He will move to Council Bluffs.

OMAHA, NEB.—The East Omaha Street Railway Company elects officers: Arthur S. Potter, president; Dudley Smith, vice-president; H. W. Yates, treasurer; Alfred B. De Long, V. O. Strickler, general attorney.

### New Hampshire.

DOVER, N. H.—William F. Brewster has been appointed receiver for the Consolidated Light & Power Company, and has taken possession.

### New Jersey.

BRIDGETON, N. J.—Business men petition the city council for franchise for the Bridgeton, Cedarville & Port Norris Electric Railway.

CAMDEN, N. J.—The extension of the Camden, Gloucester & Woodbury Electric Railway to Paulsboro will be pushed and in operation next spring. Bridges to be built.

MOUNT HOLLY, N. J.—The Burlington County Electric Railway Company is organized at \$125,000 by Jacob F. Burrows, James L. Grieb and William M. Esler, of Philadelphia; Robert B. Esler, Jr., of Ardmore, and S. H. Morison, of Camden, N. J., to build freight and passenger line between Mount Holly and Burlington.

MT. HOLLY, N. J.—The Burlington County Electric Company has been organized, with a capital of \$125,000, and will operate an electric road between Mount Holly and Burlington. The incorporators are: Jacob F. Burrows, James L. Grieb, and William M. Esler, of Philadelphia; S. H. Morison, of Camden; and Robert B. Esler, Jr., of Ardmore, Pa.

TRENTON, N. J.—The Bristol & Trenton Passenger Railway has secured right for twenty-six miles of road to Morrisville. Several big bridges will be built. The officers of the road are as follows: President Col. Edward Morrell; vice-president and general manager, Henry V. Massey; secretary and treasurer, William V. Massey. These officers with Frank G. Edwards, of Bristol, and William G. Thompson, form the board of directors.

NEWARK, N. J.—The New Jersey Consolidated Traction Company has elected these officers: President, E. F. C. Young, of Jersey City; vice-president, Jeremiah O'Rourke, of Newark; general manager, David Young, of Newark; secretary, Thomas J. George, of Newark; treasurer, R. F. Bower, of Philadelphia; auditor, W. J. Ramsay, of Newark; chairman of the committee on construction, B. M. Shanley; superintendent of the Newark system, D. W. Sharpe; superintendent of the Jersey City system, Thomas Sayre; purchasing agent, Charles H. Thorne; roadmasters, A. W. Pratt, of Newark, and James W. Leahy, of Jersey City. The company intends to extend its trolley system across New Jersey.

### New Mexico.

ALBUQUERQUE, N. M.—Jesse M. Wheelock, for O. E. Cromwell, takes possession of the street railway, and appoints A. A. Trimble superintendent.

### New York.

NEW YORK CITY.—Edward E. Higgins is settled at 26 Cortlandt street, as "expert in street railway values and economics."

ALBION, N. Y.—The plan for an electric road from Batavia, Albion, and Oak Orchard is promoted by F. A. Sickles, of Buffalo.

BROOKLYN, N. Y.—The Brooklyn City Railway elects old board of directors, except A. J. Lyman, who is succeeded by S. L. Husted.

NEW YORK CITY.—Austin Corbin, of the Brooklyn L, reports favoring extension of the Long Island Railroad Company and of the L.

WILLIAMSVILLE, N. Y.—Directors of the Buffalo & Williamsville Electric Railway decide to order two open cars, to be delivered April 1.

WAVERLY, N. Y.—The Waverly, Sayre & Athens Electric Railway Company has bought a power house site. The road will operate May 1.

ELMIRA, N. Y.—The West Side Railway Company will increase its stock from \$100,000 to \$300,000. Money will be used for extensions and improvements.

BUFFALO, N. Y.—Manager H. H. Littell says that the street railway will acquire more power either from the Niagara Company or by building a new power plant of its own. East Side power house to be built next spring.

NEW YORK CITY.—Charles A. Johnson, formerly of Johnson, Kelley & Miller, will confine his attention to street railway securities, and have offices at 80 Broadway. He is largely interested in street railways in New Jersey, and a fully competent judge.

POUGHKEEPSIE, N. Y.—Joseph Morsehauser, of this city, is appointed receiver for B. Van Steenburg, the promotor of the Highlands & New Palatz Electric Railway, which has a bonded debt of \$145,000 and issue of stock of \$40,000 but which was never built.

NEW YORK CITY.—William Caldwell, Chas. A. Stadler, John C. De Le Vergne, William Shaw, John C. McNamara, Anthony N. Brady, Robert C. Pruyn, Edward A. Maher, and Thos. N. Oleott, are elected directors of the Union Electric Railway Company.

NEW YORK CITY.—W. A. H. Bogardus, late secretary of the Brooklyn City Railway Company, has been made general manager of the same, and Cyrus P. Smith will become secretary. Superintendent Cameron will oversee the Central and South Divisions and William Morrison will have the eastern lines.

WAVERLY, N. Y.—Waverly, Sayre & Athens Railway Company elects A. N. Broadhead, president; Dr. F. M. Stevens, vice-president; A. C. Wade, secretary and treasurer. The board of directors consists of: J. L. Hamilton and J. Tinsabaugh, of Sayre; S. D. Broadhead, of Jamestown, and William Christy, of Cleveland, Ohio. E. S. Chapman, is chief of construction.

NEW YORK CITY.—President D. F. Lewis, of the Brooklyn City, details the consolidation of the Broadway and associated lines of the Brooklyn City and the Long Island Traction Companies. The new system will be called the Brooklyn, Queens County & Suburban Railway and is capitalized at \$10,000,000. One hundred and six miles of rack are to be operated.

NEW YORK CITY.—A sweeping change of the directorate of the Dry Dock, East Broadway & Battery elects the following new men: George H. Prentiss, A. S. Rosenbium, Simon Danzig, Solomon Mehrbach, John H. Waydell, E. W. Sumner, Edward C. Hillier, Marshall S. Driggs, and M. Feuchtwanger. They will take the places of Messrs. William White, John H. Scribner, John E. Hoffmire, Charles A. Hotchkiss, Wm. Richardson, Joseph Jacobs, S. Sidney Smith, and Peter J. Thorne.

SYRACUSE, N. Y.—The organization of a big syndicate of the principal headlight manufacturers of the country has been formed here. It included makers of steam road and street railway headlights, and is capitalized at \$1,500,000, and comprehends St. Louis, Chicago, Dayton, O., Rochester, Syracuse, and Utica firms. No officers have yet been chosen, but a board of directors has been named, including Irwin A. Williams, Utica; Pomeroy L. Salmon, Syracuse; Frank S. Upton, Rochester; Ward W. Willits, Chicago; John Kirby, Jr., Dayton, O., and Alexander Handlan, St. Louis.

NEW YORK CITY.—Henry R. Worthington makes a motion for the appointment of a receiver, before Judge Barrett, for the Thomson-Houston Electric Company, of New York. Mr. Worthington is judgment creditor for \$1,576. There is also a judgment against the company for \$75,279, in favor of the Durant Land Improvement Company, for rent. Geo. W. Mastin, president of the company, recites that the company's property is worth \$300,000, and that the liabilities are \$738,000. Decision reserved. Mr. Sunny says that the company is a local affair, and does not affect the General Electric.

## North Carolina.

NEW BERNE, N. C.—R. P. Williams, of the New Berne Electric Railway, has returned from the north, announcing that storage batteries will be used.

## Ohio.

CINCINNATI, O.—The Cincinnati Street Railway Company will adopt an air brake.

LIMA, O.—A. E. Townsend, of Pittsburg, has been here to arrange Wayne avenue extension of the electric railway.

WARREN, O.—The Trumbull road re-elects old officers and will decide February 20 on extensions and improvements.

WARREN, O.—E. J. Ohl and W. W. Rosensteel are appointed receivers for the Niles & Mineral Ridge Electric Railway.

CLEVELAND, O.—The Cleveland & Berea Street Railway Company is to be equipped with the trolley instead of storage batteries.

OVERLIN, O.—Daniel Freeze and G. M. Parker are leaders in a scheme for an electric railway between here and North Amherst.

WARREN, O.—Mineral Ridge & Niles Electric Railway has been appraised at \$56,430 and will continue operations under receivers.

CLEVELAND, O.—President H. E. Andrews has decided to greatly improve his entire system and to buy new rolling stock and supplies.

COLUMBUS, O.—The Indianola Fourth Street Railway Company is incorporated at \$10,000 by C. E. Miles, Robt. Thomson, M. E. Schaeffer et al.

CLEVELAND, O.—The Cleveland City Railway Company has made application for a franchise in the town of Glenville, for a term of twenty-one years.

CINCINNATI, O.—The Mt. Adams & Eden Park Street Railway Company re-elects John Kilgour, president, and Jas. A. Collins, secretary and treasurer.

POMEROY, O.—The scheme to electrify the belt railway and connect several towns is well on foot. It will cost \$300,000. The line is to be operated by June 1.

WARREN, O.—W. T. Williams, president of the Mineral Ridge & Niles Electric Railway, obtains judgment against the street railway for \$3,530, which will precipitate receivership.

CLEVELAND, O.—The Willson avenue barns of the Cleveland Electric Company burned, January 13, destroying eighteen motor and twelve trail cars. Loss is \$60,000. Incendiary origin is alleged.

TOLEDO, O.—J. K. Tillotson has obtained \$100,000 backing to begin construction and equipment of the Maumee electric road, and construction will begin as soon as \$20,000 is raised by subscription.

TIFIN, O.—Tiffin Electric Street Railway elects officers, as follows: President, M. Frost; vice-president, Wm. H. Dore; secretary, N. W. Miller; treasurer, R. D. Sneath; general manager, Frank Bloom.

CLEVELAND, O.—The Buckeye Electric Company has gained the suit dissolving the injunction against manufacturing the Buckeye incandescent electric light. This gives it liberty to proceed with manufacture.

NORWALK, O.—President De Witt, of the Sandusky, Milan & Norwalk Electric Railway, and Manager Wood, of the same road, will be assisted by local capital in a new electric railway through the north part of the county.

YOUNGSTOWN, O.—The Youngstown Park Falls Electric Railway Company and the Youngstown Electric Railway have consolidated. Extension to Lanterman's Falls in the spring, and to Canfield will be made during the year.

CINCINNATI, O.—The Avondale car sheds and machine shops burn loss \$175,000. Thirty motor cars and forty-eight trailers destroyed. Defective wiring the probable cause. Insurance \$150,000. The Consolidated Street Railway Company is the loser.

TIFIN, O.—All the Tiffin & Fostoria, the Tiffin Street Railway Company lines, the Tiffin Electric stock, have been transferred to the Tiffin Interurban Consolidated. Eastern capital has perfected the consolidation, and the connecting links will be built by May 1.

JACKSON, O.—City council has favorably acted on the Wellston & Belt Line proposition. The road is to connect McArthur Junction and Jackson, will build about forty miles, and use both steam and electricity. The directors are Harvey Wells, David Clatts, H. C. Wills et al.

COLUMBUS, O.—The Columbus Street Railway Company elects Emerson McMillin, president; E. K. Stewart, first vice-president; R. E. Sheldon, second vice-president; P. V. Burlington, secretary and auditor. The general superintendent and minor officers will remain unchanged.

DEFIANCE, O.—Geo. W. Bechel is appointed receiver for the Defiance Light & Power Company, on application of the Machine Works and the Standard Oil Company, large creditors. The enterprise includes gas, electric light and railway plants. Liabilities, \$30,000; plant worth, \$100,000.

CLEVELAND, O.—Cleveland City Railway Company (Little Consolidated) elects officers: President, M. A. Hanna; vice-president, F. De H. Robinson; secretary and treasurer, J. B. Hanna; general superintendent, George Mulhern. Report says, \$850,000 was expended between June 1 and January 1 for improvements.

CLEVELAND, O.—Horace E. Andrews succeeds Henry A. Everett as president of the Cleveland Electric Railway Company, being nominated by Mr. Everett. Mr. Everett is made vice-president; James Parmalee, president, and R. A. Harman, secretary; L. E. Beilstein, assistant secretary; Henry Beilstein, assistant secretary; Henry J. Davies, adjuster and secretary of the board of directors; Tom L. Johnson, chairman of the board of directors; Charles W. Wason, electrical engineer and purchasing agent; John J. Stanley, general superintendent.

## Oregon.

ALBANY, OREGON—The Albany Street Railway power-house and car barn, totally destroyed by fire.

## Pennsylvania.

COLUMBIA, PA.—President Given opens the Columbia & Donegal Street Railway.

MIDDLETOWN, PA.—The Middletown Electric Railway has had its franchise annulled by the city council.

MCKEESPORT, PA.—The Versailles Traction Company elects W. C. Soles, president, and A. B. Campbell, secretary and treasurer.

FRANKLIN, PA.—The Franklin Electric Railway Company elects A. H. McKelvey, president, and resolves to begin work in the spring.

PHILADELPHIA, PA.—J. A. Hanna has opened an Eastern office for the McGuire Manufacturing Company at 1050 Drexel building, Philadelphia.

JOHNSTOWN, PA.—President Moxham says that the Johnson Company will put \$3,000,000 into a new plant for manufacturing their recently patented products.

PITTSBURG, PA.—Braddock Electric Railway will extend to Edgewood, A. L. Sailor is president and C. F. Ellis superintendent. The franchise is obtained in Braddock township.

PITTSBURG, PA.—J. C. Whittle, Beaver Falls, president of the Homestead Street Railway of this place, says that work will begin April: All capital is now ready and right-of-way secured.

WEST CHESTER, PA.—S. M. Patterson, president of the Pennsylvania Traction Company, officially announces that work will begin next spring on the new electric line from Harrisburg to Philadelphia.

PHILADELPHIA, PA.—People's Passenger Railway, the People's Traction and its leased lines, and the Philadelphia Traction have had their numerous requests for extensions referred to a special committee.

PHILADELPHIA, PA.—The People's Traction Company's order for 270 cars, is divided between Pullman, St. Louis Car Company and the Lamokin Car Company. The track equipment was divided between Brill and Peckham.

SLATINGTON, PA.—The Slatington Street Railway Company is organized. Capital, \$30,000. President, R. W. Mosteller, Slatington; directors, Henry Buttner, John W. Balliet, H. W. Hanker, Slatington; Morris Hoats, Allentown.

PHILADELPHIA, PA.—The Hestonville, Mantua & Fairmount Passenger Railway directory decides to put in electricity, and will issue \$500,000 in stock and \$750,000 in bonds. The stockholders will consider the matter March 12.

LANCASTER, PA.—A mortgage for \$2,000,000 has been filed against the Pennsylvania Traction Company, to secure 1,500 bonds, of \$1,000 each, and 1,000 bonds of \$500 each. The Provident Life & Trust Company, of Philadelphia, is named as trustee.

PHILADELPHIA, PA.—Joseph T. Skerritt, general manager of the Brigantine Traction Company, 144 South Fourth street, Philadelphia wants an alternating generator, new or second hand (later in good condition), for 750 or 1,000 lights. Send best figures and send them quick

READING, PA.—Application will be made to Governor Pattison, on February 8th, for a charter for the Metropolitan Electric Company, of this city. The incorporators are R. N. Carson, R. Nelson Buckley, and David C. Golden, of Philadelphia; John A. Rigg and Richmond L. Jones, of this city, and its object is to furnish power to the Reading Traction Company.

KITTANNING, PA.—The electric railway here to Ford City (five miles) is again being agitated. A New York company has secured the charter granted two years ago to A. C. Bailey and J. D. Bailey, of Ford City, Tyson Hellman and Fred Wick, of Kittanning, and others. C. A. Siegfried, of New York City, represents the capital, and says the road will operate next summer.

READING, PA.—Those interested in the Reading & Southwestern Electric have decided to proceed with construction and will apply for a charter for the first division, to be called the Mohrsville & Adamstown Electric Railway. The officers and directors are: President, Ludwig T. Custer; vice-president, Ex-Senator E. Billingsfelt, Adamstown; secretary and treasurer, George W. Keim, Reading; A. C. Snader, Ex-Senator Billingsfelt, S. Miller, Elmer E. Billingsfelt, H. C. Mohn, R. Hyman, Adamstown; Isaac Spatz, Mohrsville; Dr. J. B. Sterley, W. Van Reed, H. C. Geissler, V. S. Seltzer, Reading, and James W. Shepp.

### Tennessee.

KNOXVILLE, TENN.—The Middlebrook Electric Railway is about ready to operate. Prof. J. K. Payne is the engineer.

CHAFFANOOGA, TENN.—Mr. Gustafson, of Corinth, Miss., has been made superintendent of the Electric Railway Company, under President Adams.

CLARKSVILLE, TENN.—Clarksville Street Car Company elects officers; W. M. Daniel, president; F. P. Gracey, vice-president, and J. B. Polk, secretary. The car line is being extended to Porter's Bluff on Red river,

NASHVILLE, TENN.—The United Electric Railway Company now in receiver's hands, is to be reorganized by Gen. W. H. Jackson. The plan calls for \$140,000 improvements and repairs, and the taking up of \$1,500,000 old bonds in new bonds or cash, and to pay for other bonds in stock.

### Texas.

WEST (MCLEAN CO.), TEX.—West Power & Light Company organized at \$25,000 by W. W. Glasgow, W. W. Morgan, et al., all of Houston.

AUSTIN, TEX.—The Texas Street Railway Association held its first meeting January 24, and elected the following officers: W. H. Sinclair, Galveston, president; J. K. Urie, Austin, vice-president; S. A. Hobson, Waco, secretary-treasurer; and A. W. Childress, of Dallas, and W. H. Weis, of San Antonio, directors.

### Utah.

SALT LAKE CITY, UTAH.—The Salt Lake Rapid Transit Company elects: President, J. S. Cameron; secretary, Geo. S. Gannett; superintendent, A. M. Hinckley.

SALT LAKE CITY, UTAH.—The Cedar City Terminal Railway, of Cedar City, Iron county, is incorporated for \$20,000, by W. W. Cluff, Coalville, Elias Morris, and J. E. Langford, Salt Lake City, et al., to build ten miles of railway, to cost \$200,000.

### Virginia.

PORT NORFOLK, VA.—The Portsmouth & Port Norfolk Railway will change to electricity and add two miles of new track. Bonds are now to be marketed to make the improvements.

CHARLOTTEVILLE, VA.—The city grants the Piedmont Construction Company franchise on some of the principal streets for electric railway. They must begin construction in ninety days.

### West Virginia.

PARKERSBURG, W. VA.—The city attorney has been instructed "to prepare a franchise acceptable to the Park City Railroad."

### Wisconsin.

RHINELANDER, WIS.—Rhinelanders wants a street car line, and claims to be able to support it.

RACINE, WIS.—Amended articles of the incorporation of the Belle City Street Railway have been filed, increasing the capital stock to \$200,000 and allowing the selling of light and power from the trolley circuit.

MILWAUKEE, WIS.—A second mortgage for \$1,300,000 on the property of the Milwaukee Street Railway Company, has been filed in favor of the Central Trust Company, of New York, which holds the \$10,000,000 first mortgage.

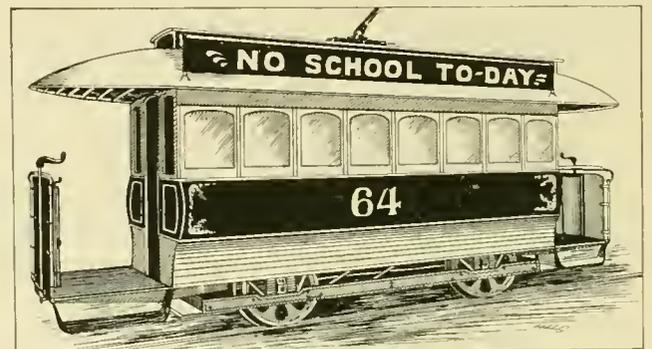

The transfer of the Becker lines has been made to the Consolidated, and, formally, B. K. Miller, Jr., is made president; W. L. Mason, vice-president, and Geo. O. Wheatcroft, secretary and treasurer.

### Wyoming.

CHEYENNE, WYO.—It is the intention of the Street Railway Company to put in an electric equipment. The present track has been bought by Denver parties for mine railways, and will be moved.

## AS AN EDUCATIONAL ADJUNCT.

The progressive and accommodating street railway company, of Bath, Me., renders the accommodation to the school children of the city, suggested by the illustration. On stormy days the lower grades of the city schools hold

no session and the youngsters' parents are apprised of the fact by a placard attached to the street cars, bearing the legend, "NO SCHOOL TO-DAY;" or "ONE SESSION ONLY", as the case may be. Treasurer Twitchell, of the company, says the method is effective and a great accommodation to the children.

**A QUEER STRIKE.**

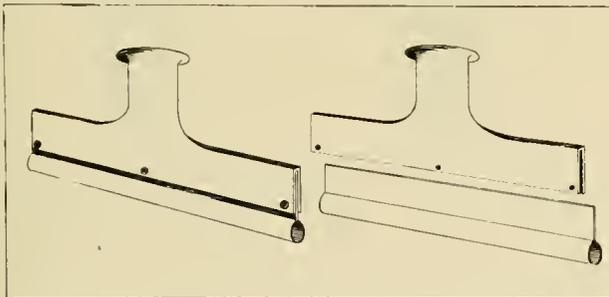

OF the queerest strikes on record occurred at Emporia, Kan., February 2, paralyzing the street railway system of Emporia. The strikers came to terms in two hours. The walking delegate in the case surreptitiously entered the mule stables of the company and loosened all the mules. "When the doors were opened the mules began to sing," and with caudal appendages erect made a break for liberty, braying like mad. It took several hours to capture their asinine majesties, when work was resumed.

**CHEAP POWER AT LITTLE ROCK.**

The power plant of the Little Rock Consolidated, which was designed in 1891, by B. J. Arnold, consulting engineer, 565 Rookery, Chicago, has just passed its second year of operation. The general manager, H. G. Fleming, says that the cost of power for 1893, including labor, was 1.05 cents per car mile, of which cost 0.7 cents was for fuel. Deducting the extra cost for the power produced and used for other purposes than the street railway, leaves the net cost of power 1.03 cents per car mile. As the number of the cars is but seventeen the figures are nothing less than remarkable. In 1892 the power cost was 1.39 cents per car mile and in 1894 Mr. Fleming has hopes of even a further reduction.

**THE SMITH TROLLEY HANGER.**

A very simple trolley clamp or hanger has been invented by C. H. Smith, superintendent of the Lebanon and Annville Street Railway. The wire is held in a sleeve made of a simple sheet of brass bent around the wire. The edges of this brass sleeve are inserted in a slit in the brass hanger casting and held by rivets put through holes in the casting. The brass sheet is formed

to a size a little smaller than the trolley wire before application so that there is a tight fit. The device has the advantage that the wire can never come entirely loose and fall to the ground, although it would seem that in time the wire might work slightly loose in the sheath. Some of these have been in use for three months on the Lebanon and Annville and Mr. Smith reports them to be in a satisfactory condition.

**MRS. LONGFIELD LOST.**

A damage suit against the Madison, Wis., City Railway Company, for \$5,000, brought by Mrs. Margaret Longfield, has resulted for the defendant. The trial occupied two days and it was proven that the woman became frightened on account of the car being turned back on a grade to avoid a collision. In her fright she jumped off the car carelessly, sustaining a few bruises, for which damage she sued. The judge charged the jury to find for the defendant. This was Manager Geo. H. Shaw's first damage suit and he is naturally very pleased at its outcome.

**GEORGE A. YUILLE.**

The newly elected secretary and treasurer of the West Chicago Street Railroad Company comes to his office well prepared for the many and difficult duties and complexities hidden under the simple title of secretary and treasurer.

G. A. YUILLE.

Secretary George A. Yuille was born of a well-known Southern family, thirty-two years ago, at Mobile, Ala., where he received his education and the preliminaries of his business training. Thirteen years ago, however, he came to Chicago as secretary of the Packing and Provision Company, in which position he remained six years. The next four years were spent as secretary and treasurer of the gas companies united in the trust, and two years more found him president of the Economic Natural Gas Company. It is with this fullness of experience in corporation affairs that Mr. Yuille takes the chair so eminently well filled by R. W. Crawford for the past seven years, and in which he will no doubt be as successful.

**STREET CAR REFORM.**

Reuben, Reuben, I've been thinking  
What a difference there'll be  
When the Council gets its thumb-screw  
On the street car company.

Cynthia, Cynthia, 'tis intended  
By the scheme that has been planned  
If one sits, he pays a nickel,  
But a cent, if he must stand.

Reuben, Reuben, more politeness  
This will teach you men I'm sure;  
He who gives seat to no lady  
Pays four cents to be a boor.

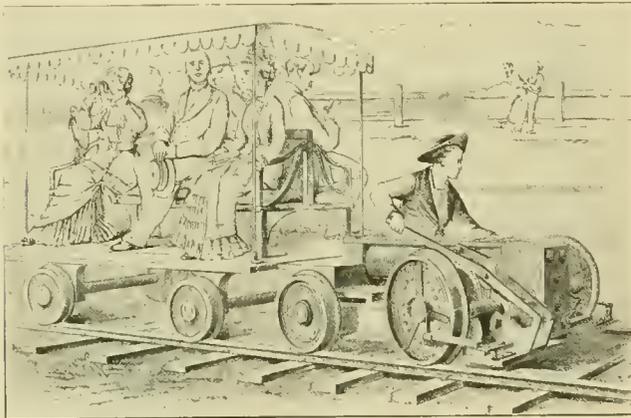

Cynthia, Cynthia, I am certain  
You like all the women are  
And you'll wait to get a bargain  
Riding on a crowded car.

Every one with one cent ready,  
Will wait long and grumble loud:  
"That last car was nearly empty!  
I am waiting for a crowd!"

A VISION FULFILLED.

The issue of the Scientific American for June 5, 1880, contained the illustration here represented, of "Edison's New Electrical Railway," built at Menlo Park. The description says:

"The motor is precisely like one of Mr. Edison's electrical generators and the power is supplied by his stationary engine, the power being converted into electrical

(From Scientific American, June 5, 1880.)

energy. \* \* \* The current thus created is conveyed to the track by two copper wires, one to each rail. \* \* \* The engine runs at the rate of twenty-five miles an hour. \* \* \* It is not entirely visionary to expect that our street railways and elevated railways may not at some very distant date be successfully operated by electricity."

This was but fourteen years ago, and how "visionary" the prophesy of the American was, we all know.

MR. RICHARDSON'S WILL.

The New York Sun says: "The will of the late William Richardson, of Brooklyn, who was long president of the Atlantic Avenue Railroad, has been admitted to probate. It bears date May 26th, 1887, and ex-Secretary Tracy is one of the witnesses. The entire real and personal estate, valued at \$165,980, is left to the widow, Mary Richardson during her life, and at her death, it is to be divided into five parts, two of which are to go to Louisa Richardson, the daughter, in case she remains unmarried, and the remaining three to the three sons of the testator Wm. J. Richardson, John E. Richardson, and Charles A. Richardson, in equal parts.

Should Miss Richardson marry before her mother's death, each of the four children is to receive an equal share. It was generally supposed that Mr. Richardson's estate amounted to \$1,000,000, at least."

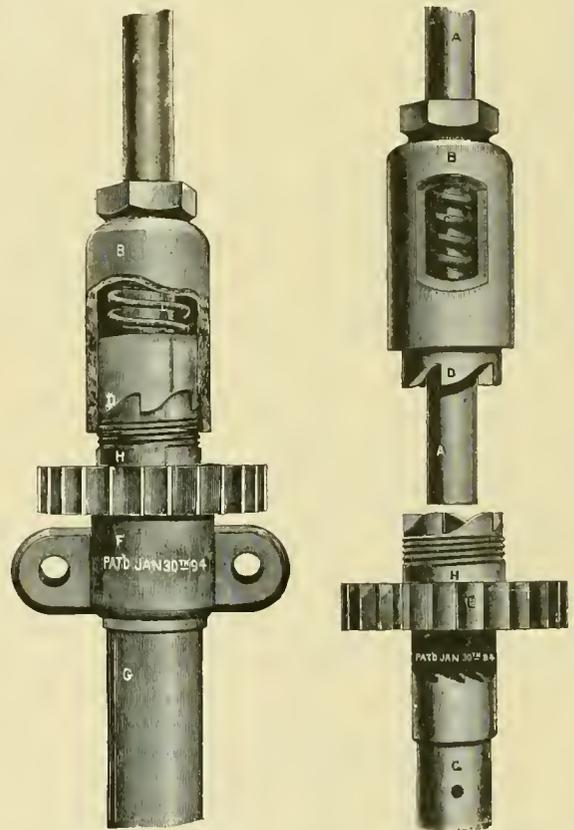

A CALIFORNIA woman has been denied a suit for \$20,000, for damages to her health and business by reason of a street railway accident, for three good reasons: first, she was not injured; second, she had no business, and third, she lied about the whole affair.

LOS ANGELES DOGS WALK.

In Los Angeles there has been an order issued to conductors of the cable division of the Consolidated Company not to allow dogs on the cable cars unless 50 cents fare is paid for each of the canines. Dogs have never been allowed on the electric cars. The many people who have been annoyed by dogs on the cars, from the wooly window washer, beribboned poodle and panoplied pug to the big yellow cur, will be glad of the move to keep the dogs at home, where they belong.

A SAFETY CLUTCH BRAKE.

The Safety Clutch Brake Company, of 725 Sansom street, Philadelphia, makes the coupled clutch brake, of new design shown herewith. The brake is designed to be placed on the front timber of the car platform. The device is easily understood from the accompanying engravings. The scheme of action is as follows:

A—Brake shaft extending down through H; B—Casing enclosing C the spring which forces D, the upper clutch in position to form coupling; H—Lower clutch which forms the hub of sprocket wheel E; F—Box or bearing that is bolted to front timber of platform, securing E in rigid position; G—Brake chain shaft, lower end of which is supplied with suitable brace to prevent springing or bending.

The advantages claimed are; the extra direct thrusts of the five bearings give more power; it is stronger, with less parts and no screws; no welding to the staff. The total area of thrust bearings is 1/2 inches. It is strongly endorsed by the Philadelphia Traction, and Peoples' Railway Companies of Philadelphia.

The officers are, L. Bachheimer, president; C. E. Baird, vice-president and general manager; and E. M. Fields, secretary and treasurer.

THE CLEVELAND CONSTRUCTION COMPANY has moved its offices from Cleveland to No. 244 South Howard street, Akron, Ohio.

THE NILES TOOL WORKS, of Hamilton, are sending out a fine souvenir in the form of a cigar case, of one of which we are in receipt.

THE silver amber sheet mica of the Palermo Mica Company, 27 Peck Slip, New York City, is meeting with ready acceptance by the trade.

THE Delaware County & Philadelphia Electric Railway has ordered twenty-four cars of the Lamokin Car Company, to be mounted on McGuire trucks.

WM. HAZLETON, III., has taken the eastern agency of the Fulton Foundry Company, Cleveland, and has fine offices in the Havemeyer Building, New York.

IT is reported that E. P. Allis & Co., of Milwaukee, are about to enter the field of electrical manufacture, making dynamos to couple direct to the Allis engine.

THE Texas agency of the Ideal engines made by A. L. Ide & Son, of Springfield, Ill., has been surrendered by Fred A. Beall, of Fort Worth, to Hunter & Booso, of Dallas.

THE CHICAGO ELECTRIC TRUCK COMPANY, Chicago, came into corporate being January 29, at Springfield. It is capitalized at \$25,000, by C. W. Lyman, John Fraser and George H. Graham.

A VERY handsome steel engraving embellishes the large calendar sent out by the Pittsburg Steel Hollow Ware Company, and which will be mailed on request to street railway companies.

THE Belle City Railway Company, of Racine, Wis., has installed a McIntosh & Seymour engine of 225-horse-power. The company now has 750-horse-power and will furnish private lighting.

THE ELECTRIC TRACTION COMPANY of Philadelphia order 10 cars of Jackson & Sharp and 40 from Pullman. The General Electric got 40 motors and the Curtis Electric an order for 10 motors. Trucks are all McGuire.

THE Delaware County & Philadelphia Electric Railway has bought cushion car wheels for equipment of twenty-four cars, and the Electric Traction are also ordering several sets with a view to further purchase later.

THE SCHULTZ BELTING COMPANY, of St. Louis, has just received an order from England for 2,800 feet of belting and an order from Russia for 15,000. The belt trade is reported awakening and prospects for spring trade good.

A HANDSOMELY framed photograph of one of the Lewis & Fowler Manufacturing Company's fine cars has been placed on the wall of the REVIEW editorial room. It is the remembrance of George W. Myers, the secretary of the company.

HUGH McMILLAN, of Detroit, has entered upon the street railway specialty field. He will deal in rail bonds, overhead line equipment and similar goods. Mr. McMILLAN is well known and has the best wishes of the fraternity in his new venture.

CAR BODIES, on short notice, can be supplied by the Ellis Car Company as follows: 5 nine-bench open bodies with closed ends; 10 ten-bench of the same description; 5 sixteen-foot box bodies; 5 nineteen-foot box bodies, and 1 twenty-five-foot box.

A. GROETZINGER & SONS, 271 River avenue, Allegheny City, Pa., besides placing a goodly number of Dermaglutine pinions and gears, place on the editorial desk a neat paper weight and match scratcher, containing on the face a neat card for Dermaglutine.

PRESIDENT BALLARD, of the Lewis & Fowler Manufacturing Company, says his company is fast feeling the effect of improvement in business, their factory being well supplied with orders in every department, and also notice a marked improvement in collections.

HOWARD E. HITCHCOCK, formerly of Springfield, Mass. has accepted the city salesmanship of the Raymond gas engine for Chicago. F. M. Hicks & Co., of Chicago, make the engines, and are about to market a series of from three to twenty-five-horse power for street railway work.

THE order of 250 new cars by the People's Traction Company, Philadelphia, was divided as follows: St. Louis Car Company, 210 cars; Lamokin Car Company, 40 cars; Peckham, 125 trucks; Brill, 125 trucks. The Sperry Electric captured half the motors, balance going to General Electric.

CURRIER, MAYO & Co., is the new firm name of the successors to the well known concern of J. A. Grant & Co., Boston agents of the McIntosh-Seymour engine. C. H. Currier was the "co." of the old firm and Mr. Grant now becomes the "co." in the new, and while he will still give considerable time to the business, will leave the active management to the younger members, who thus succeed a large and well conducted business, in which they cannot fail to maintain the splendid record so long made by J. A. Grant & Co.

GENERAL SUPERINTENDENT ELLIOTT, of the Birmingham Traction Company, has adopted a novel scheme. The Birmingham Traction uses the Bemis double truck exclusively. Mr. Elliott is now turning them over and putting on rubber springs, which arrangement, he claims, makes them run much better.

THE CONSOLIDATED CAR-HEATING COMPANY, of Albany, N. Y., at a meeting held January 9, declared its regular semi-annual dividend of three per cent, payable February 15, 1894; transfer books to close from February 1 to February 16. The affairs of the company were reported in a prosperous condition.

CONDUCTOR.—“Last call—Shell out or I'll put you off”

WHEN the Stanwood Manufacturing Co. does anything it is well done. This remark applies to the new catalogue “C”, just issued, which shows all styles of steel steps and running boards, together with measurements and diagrams. Five styles and one hundred sizes are in use on 468 roads. This implies merit.

THE annual meeting of the New Process Rawhide Company, of Syracuse, N. Y., resulted in the following offices and directors being chosen: President, T. W. Meachen; vice-president, Hon. W. B. Kirk; secretary-treasurer, A. C. Vosburgh; directors: Emil Laass, Jacob Amos, C. H. Duell and C. L. Stone.

THE SAFETY CLUTCH BRAKE COMPANY has been organized with offices at 4337 Lancaster avenue, Philadelphia, for the manufacture of a coupled clutch brake for street railway cars; C. E. Baird is secretary. Although the device has only recently been patented, it has been endorsed by several managers and street car builders.

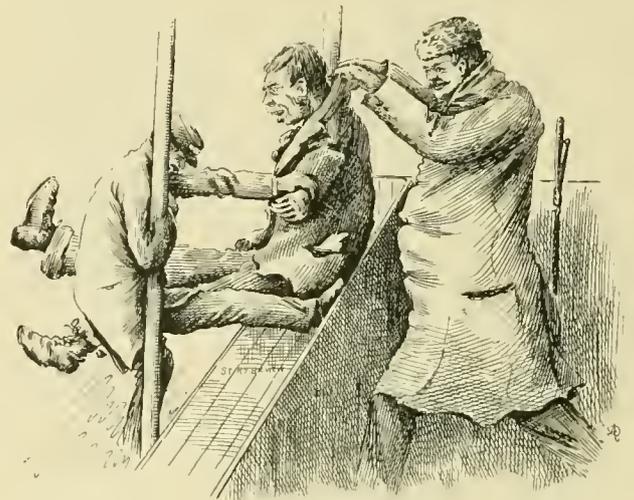

THE GOUBERT MANUFACTURING COMPANY, of 32 Cortlandt street, New York, reports a good business in its improved feed water heaters, the sales for 1893 being over 100,000 horse power. It is also the sole manufacturer of the popular Stratton steam separator, the sales of which, during '93, were nearly double those of former years.

J. W. PARKER & Co., Philadelphia, agents for the Ball Engine Company, have taken the New York agency, as previously mentioned, and placed F. Schmerber and J. S. Du Vall in charge. Mr. Schmerber was for some time chief engineer of the Pierce & Miller Engineering Company, and Mr. Du Vall is well known to the trade in his connection with Mr. Chinnock.

CHAS. A. SCHIEREN & Co., have sent out a very neat little catalog, devoted exclusively to its perforated “electric” belting. These belts have had a phenomenal record and the rapidity with which they have come into general use is wonderful. The catalog has engravings of a number of the largest perforated “electric” belts now in use, and contains valuable reference matter.

SAMUEL LEWIS, 12 Lorimer Street, Brooklyn, reports a good trade in the well known Lewis diamond car mat, having recently equipped the last 50 cars built by Lewis Fowler for the Brooklyn City railway. Ever since 1869 the Lewis diamond mat has been known to the trade and besides a large general trade Mr. Lewis has equipped nearly every car in New York and Brooklyn.

SARGENT & LUNDY, engineers and millwrights, have removed from the fourteenth floor of the Monadnock to room 13 on the ground floor. Martin J. Insull has been added to the firm, and every department of power equipment will now be included within the range of the firm. They are western agents for the Crocker-Wheeler Electric Company, and have secured J. M. Atkinson as sales agent.

“Youz put me offen the car?”—!!!

THE METROPOLITAN ELECTRIC COMPANY has been made general western agent for the Standard Paint Company. The merits of the P. & B. goods are too well known to REVIEW readers to say anything more in their praise. The Metropolitan Company will keep a full supply of the goods on hand. Besides this the Chicago office is reopened in charge of William Weierbach, 871 Rookery.

THE JOHN T. NOYE MANUFACTURING COMPANY, is no longer represented in the west by Fairbanks, Morse & Co. All western business will be handled by the main office at Buffalo, until some further arrangements can be made for a local agency. All correspondence should be addressed accordingly.

GENERAL MANAGER ROGERS, of the Sperry Electric Railway Company, of Cleveland, is pushing the interests of his company prominently to the front, and that the claims for good quality in their motor are being recognized is evidenced in the recent order from the People's Traction Company of Philadelphia. Their order is for 125 of the Sperry motors, and was secured in the face of particularly active competition.

"Howly father! Oi niver see a little feller with sich a grip in me loife!"

THE STAR ELECTRIC LAMP COMPANY, Chicago, manufacturers of the Sunbeam lamp, has changed its name to The Sunbeam Lamp Manufacturing Company. The intent of this company is to furnish lamps superior in quality. Recently some discoveries have been made, as the result of the extensive experiments carried on, which, it is claimed, will greatly improve the quality and add to the value of the Sunbeam lamp.

THE W. S. HILL ELECTRIC Co. at 133 Oliver street, Boston, has kept its shops full of orders throughout the dull times. Their line of switchboards, switches, and rheostats is very well known by all street railway men. They will soon put on the market a new lightning arrester which has many superior points. The switchboards of the new power houses of the Philadelphia Traction Company will be furnished by them. This is one of the largest contracts of this kind ever made.

CHARLES A. LIEB, for the past four years mechanical engineer for the Edison General Electric Company, and well known in the street railway field on account of his numerous inventions in that line, has associated himself with the White Manufacturing Company at 556 West 34th street, New York City. Mr. Lieb's large acquaintance in the trade will add much to this already very popular firm, which is well known as one of the oldest wheel and supply manufacturing concerns in the country. General Manager Edward White apprised us of the fact that even a more complete line of his specialties will soon be put on the market.

AMONG late important items of news is one that tells of the incorporation of the Graham Equipment Company in Rhode Island, with a capital stock of \$100,000, paid up. The officers are, J. H. Graham, president; G. S. A. Gardiner, vice-president and treasurer; E. G. Rodgers, secretary, with offices at No. 258 Washington street, Boston, and No. 232 Carter street, Philadelphia, Pa. Works have been established in Boston and Philadelphia, and a fine lot of orders already on the books. A recent call for Graham trucks is for one concern that is equipping four roads.

THE utility and safety of iron structures is becoming more widely known as better construction of some kind becomes necessary. The Berlin Iron Bridge Company, of East Berlin, Conn., is putting the roof on a building for the United States Government, at Fort Wadsworth, N. Y. The building is 41 feet by 231 feet, the roof being made entirely of iron—iron trusses covered with corrugated iron. The new works of the Stanley Electric Manufacturing Company, at Pittsfield, Mass., will be entirely of iron, designed and built by the Berlin Iron Bridge Company.

A HANDSOME gold embossed cover and eighty pages of valuable matter comes to the REVIEW office as the catalogue of the Bass Foundry & Machine Company, of Fort Wayne, Ind. It gives, with illustrations and full data, the particulars of the engines, boilers, pumps, parts, repairs and furnace specialties made by the Bass Company. No steam user or prospective buyer can afford to be without it. Measurements for boilers, engines and furnaces, and standard price lists for belting, asbestos and the like are also given. It will be sent on application to any one interested.

THE GENETT AIR BRAKE, the only air brake on the market adapted to street railway work, are full of orders, and their works in Chicago is a very busy place. While an excellent working brake from the first, it has been constantly improved as suggested from more extended use. They now offer an improved "Duplex System of Air Brakes" suited to both electric and cable cars and which requires only eight inches of axle space. This brake serves all the requirements of a wheel brake and its use cannot fail to largely reduce grade accidents, which have been so numerous and disastrous of late.

THE GENERAL ELECTRIC COMPANY has secured a large number of recent contracts in the street railway field. The recent Philadelphia contracts of the People's Traction Company gave 125 equipments of G. E. 800 motors to the General Electric with type K controllers. The remaining 125 went to the Sperry Company, of Cleveland. Other contracts embrace: 20 car equipments for the Union Railroad Company, of New York; 25 for the Steinway Railroad of Long Island; 1 700-horsepower generator for the same and 8 M. P. 300 K. W. generator for Cincinnati, O.; 10 car equipments for St. Louis Street Railway Company, St. Louis, Mo.

## RAILWAY EQUIPMENT LIABILITIES.

The statement of Receiver Geo. O. Fairbanks, of the Railway Equipment Company, is on file at the Cook county clerk's office, and reads as follows:

ASSETS.	
Estate, real and personal	\$ 5,141.41
Accounts deemed good	3,568.97
Accounts deemed doubtful	15,317.71
Accounts deemed desperate	15,480.15
Total	\$39,508.24
LIABILITIES.	
Accounts owing	\$22,973.01

## REPORT OF THE CANAL TROLLEY COMMISSION.

The New York state report of the canal trolley experiments gives two tables which average as follows:

The slight difference in the horse-power in the doubling of the speed will attract attention and is not easily explained.

AVERAGE SPEED.	AMPERES.	VOLTS.	E. H. P.
2.65 miles.	63.08	294	24.87
4.24 "	63.55	313	26.21

## IT TELESCOPED A BARN.

When car 24 of the Steinway Electric Railway, of Long Island, New York, started out on its trip it had no idea of going into the barn so soon it did. But it was not the car barn. The barn belonged to Tom Kavanaugh. A steep grade on Lockwood street compounded with a curve was the cause of the car's vagary and leaving the track at a high speed, the recreant vehicle went smash into the side of the wooden affair, carving its way through the structure and stopping in the baled hay pile. The fifteen passengers were uninjured and the car needed but a few repairs to take its place on the line next day. The motorman's escape was miraculous.

## MAKING THE STOCKHOLDERS USEFUL.

Two workingmen were discussing serious subjects. Quoth the younger: "I say, Bill, what's them 'ere joint stock companies?" "Well, I'll explain it to yer. You and Jim and half a dozen more of our mates puts up a penny each and buys two ounces of bacca and a clay. Then I calls myself the managing director, and I sits down and smokes that pipe and bacca. D'ye see?" "Yes, but where do we come in?" "Oh, you're the shareholders; you looks on and spits."—Natal Witness.

## A TIP.

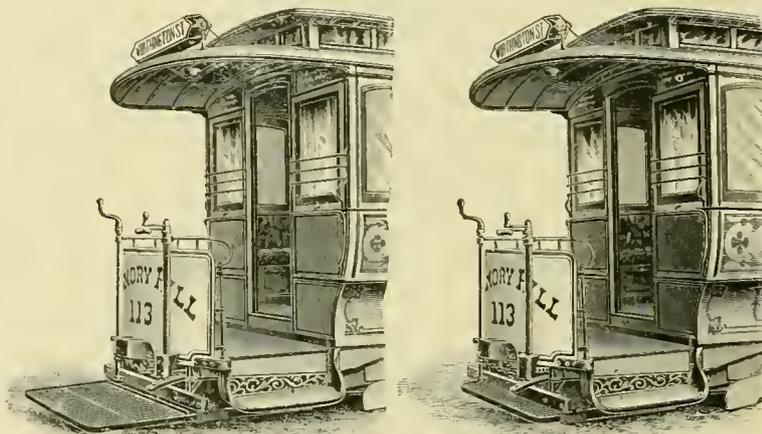

Oh! they are wise  
Who advertise  
In Winter, Spring  
And Fall;  
But wiser yet  
Are they, you bet,  
Who never let up  
At all.

—Cincinnati Tribune.

## A FEAT OF THE PFINGST FENDER.

The illustration shown herewith is of the Pfingst fender, made by Lonis Pfingst, 53 State street, Boston, and adopted by and in use on the Brooklyn City, of Brooklyn, the Lynn & Boston, and the Springfield, Mass., Street Railways, with a number doing duty on the West End Street Railway of Boston. This fender was also recommended by the fender commission of Boston, and the railroad commission of Massachusetts.

A recent incident and the averting of an accident to two children, cause much favorable comment on the Pfingst device. Two children, one aged five, and the other three, were struck by a Tremont street, Boston, car, No. 20. The children were directly in front of the car, which was running at speed. To the surprise and joy of all bystanders and passengers, when the car was stopped the two youngsters were found curled up on the Pfingst fender, yelling like Indians, because they had lost two

FENDER PULLED OUT READY FOR USE.

FENDER PUSHED BACK OUT OF USE.

cents! No other damage was caused and the pair walked home.

The fender is a light strong platform, suspended from the truck and made of steel and malleable iron. The fender is held nearly level, about three inches above the track. It projects about three feet in front of the car when in use, and can be pushed clear under the car when necessary. The fender will not engage with the track or slight immovable obstruction, even when weighted, and it may be easily replaced if necessary, when bent after use.

Mr. Pfingst, also makes for the street railway use an adjustable spiral spring, an improved ratchet brake handle, a duplex hammer foot gong and an eight sided sign for direction of cars.

The inventor and manufacturer is a rising man in the street railway field. He was born in New York City, attending the public schools there until the age of fifteen, when he entered the employment of the John Stephenson Company, as an apprentice, at the same time attending Cooper Institute, where he was graduated from the mechanical department. When 22 he left the Stephenson works and joined the forces of the J. M. Jones Car Company, then at Schenectady, where he remained a year.

The next two years were spent in New York City in the business of pattern making, moulding and machine work. Next at Yonkers, N. Y., and finally as superintendent of the street car department of the Pullman works, gave him the finishing touches for thorough education in street car affairs. It is not remarkable then that his next place was as master mechanic of the Third Avenue Railway of New York City, under General Manager Robertson, where he remained two years, resigning to become master mechanic of the Boston lines, at that time consolidated. There he remained five years. During this latter connection Mr. Pflingst was well-known as the inventor of many valuable specialties in the line of snow-plows and smaller devices.

LOUIS PFLINGST.

Resigning in the fall of 1892, he opened a general supply business, and surely none is better able to judge of the necessities of street railway work than one of Mr. Pflingst's wide and thorough experience. Probably no one ever had better opportunity to study the supply business from the buyer's side. Mr. Pflingst's latest honor is his election to the general management of the Ames Register Company, which has abundant capital and the best of prospects.

TEST OF WEBSTER SEPARATOR.

The Warren Webster Company, of 2 Canal street, Chicago, are congratulating themselves over the results of the tests made by George H. Barrus, C. E., of Boston, on their steam and oil separators, at the World's Fair; so much so, in fact, that the report is being published by them in full, in a neat circular. The separators, one for live steam and one for oil, were attached to a duplex steam pump. Between the steam separator and the boiler was inserted a drip chamber. When the drain valve of this drip chamber was closed, the condensed water, of course, overflowed, and some or all of it ought to be caught by the separator.

The results of this test was as follows, which show that the separator intercepted practically all the moisture introduced.

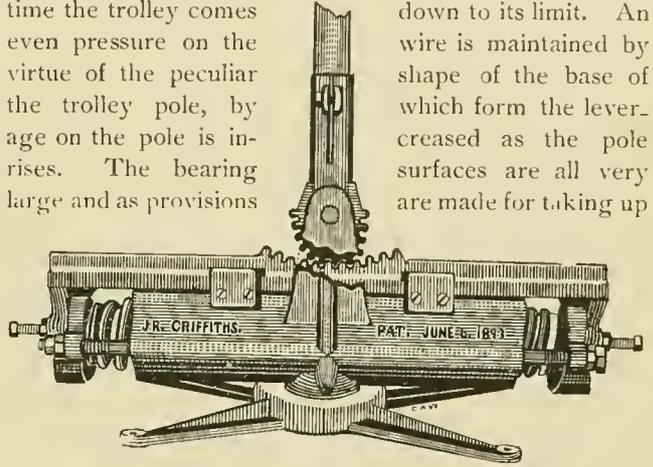

1. Weight of water drawn from the separator per hour when drain pipe of drip chamber was closed.....	26.1 lbs
2. Weight of water drawn from the drip chamber per hour when the chamber was drained .....	21. lbs
3. Weight of water drawn from separator per hour when drip chamber was drained.....	4.5 lbs
4. Total weight of water drawn from drip chamber and separator when both were drained.....	25.5 lbs
5. Weight of steam passing through separator per hour.....	120. lbs
6. Percentage of moisture in the steam intercepted by the separator.....	17.5 %

With the pump using steam at the rate of 120 pounds per hour, fifteen ounces of "Capitol" cylinder oil were used in two hours, of which 86.7 per cent was recovered by the oil separator placed in the exhaust.

THE "CHICAGO" TROLLEY BASE.

This trolley base is the invention of J. R. Griffiths, 129 East Erie street, Chicago, who has just placed it on the market. It is made up of very few parts and all those are interchangeable. There are no chains to break every time the trolley comes even pressure on the virtue of the peculiar the trolley pole, by age on the pole is in-rises. The bearing large and as provisions

down to its limit. An wire is maintained by shape of the base of which form the lever. creased as the pole surfaces are all very are made for taking up

THE CHICAGO TROLLEY.

all wear, the base ought to last a long time without any repairs.

The feature of equal pressure for all heights of wire is one sought after by many but attained by few, and Mr. Griffiths is to be congratulated on his success. It is highly commended by the management of the Whiting & East Chicago Electric Railway, on which road it has been extensively tried.

OBITUARY.

William Henry Allen, treasurer of the Union Street Railway, of New Bedford, Mass., died January 15, at his residence in that city, at the age of 41. Mr. Allen was closely identified with steamboat and railway enterprises all his life, and for many years was treasurer of the New Bedford & Fairhaven Street Railway. His amiable disposition gained for him many friends. He left a wife and four children.

THE Douglas-Lanxey electric line, in the Isle of Man, is in successful operation and now Lowcock, Hill & Company, of Manchester, are about to inst all a road from Douglas Head to Little Ness, on the same little isle.

AS WE go to press, a fearful blizzard is sweeping the central states. In Chicago it is the worst storm with one exception in twelve years. Cable lines are running, but some horse lines are abandoned, and on others, four horses to a car find great difficulty in pulling through.

THE Annual dinner of the street railway presidents, of Philadelphia, met January 31st, at dinner to discuss affairs together. There were present the secretaries, members of the board of directors and other officers of the roads and a number of distinguished gentlemen of other callings.

## PATENT OFFICE GOSSIP.

Conduit patents this month 8. Fenders 7.

H. R. KEITHLEY, obtains a patent (512,711) on a device already well and favorably known to our readers as the "Chicago" rail bond. It is one of the very few devices making a perfect moisture proof rail contact. See illustration.

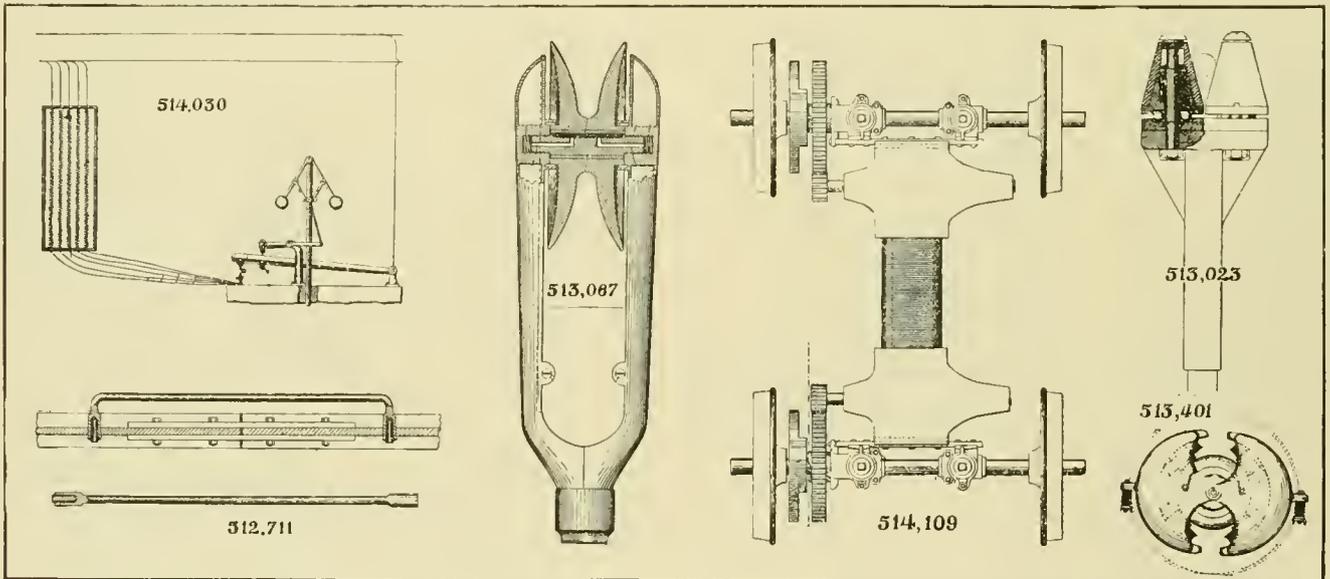

A NOVEL principle of trolley construction is that described in 513,023. The current collector or trolley wheel consists of two conical rollers mounted on roller bearings. The wire runs between these. See illustration.

THE trolley oiling device 513,067 consists of a hollow fork suited to holding oil and apertures for conveying the oil to the axle, as shown in the illustration.

A VERY peculiar motor construction for railway motors is the invention of Mr. Lamme, of Pittsburg, (513,401)

## THE CHICAGO OFFICE OF THE GENERAL ELECTRIC.

After many rumors of change of the Chicago offices of the General Electric, it has finally been given out that the building at 173 Adams street is to be deserted, and the force consolidated and centralized at the more convenient headquarters, the Monadnock block, corner Jackson and Dearborn streets. Some six thousand square feet of floor space has been taken at the south end of this hive of electrical industry, and the actual removal of the household is already under way. This is in direct line with the policy of consolidation and retrenchment now carried on by the General Electric, which began by the removal of the main office force, in New York, to the factory at Schenectady. The Chicago office will be considerably reduced by the transference of the principal part of it to Schenectady, and the abolition of some of the service.

and is the property of the Westinghouse Company. The two halves of the field magnets are independently sleeved upon the axle and flexibly suspended from the truck or car body. It has always been considered a necessity of motor design to have the fields occupy a perfectly rigid and fixed position. If this invention is ever put on the market it will be a radical change from existing forms. See illustration.

F. E. PRITCHARD, of Oswego, has secured a patent on one of his well-known regulators, for use in water power plants. It is simply a governor which as the speed rises cuts in more resistance, throwing more load on the dynamo. See illustration (514,030).

NUMBER 514,109 is another Winkler single magnetic circuit motor truck design. See illustration.

NUMBER 514,109 is another Winkler single magnetic circuit motor truck design. See illustration,

## INTERURBAN AT SHEBOYGAN, WIS.

F. I. Sæmann, secretary and treasurer of the Sheboygan City Railway, of Sheboygan, and H. E. Thomas, of the Dairyman's Bank of Sheboygan Falls, have purchased the charter rights of the Sheboygan and Sheboygan Falls Transit Company, and have secured exclusive franchise, for ninety-nine years, over the toll road, between this city (population 23,000) and the village of Sheboygan Falls (population 1,500) five miles distant. The kind of material used in construction of tracks and motive power is left optional with the company. The track will be laid on one side, away from the roadbed, with T rail.

Considerable bonus is being pledged, besides passengers, mail, express and freight will be carried. The fare one way will be fifteen cents, round trip tickets twenty-five cents, which gives passengers a transfer over the lines in the city.

The Sheboygan City Railway, is considering the advisability and cost of changing from animal to electric power.

THE CRAWFORD FENDER.

Two devices which are rapidly becoming known to the street railway field, are the wheel guard fender and the pick up fender, invented by R. A. Crawford, and made for the market by the manufacturing company of the same name. We illustrate both herewith. The wheel guard fender board is placed in front of the wheels, as shown in the illustration, under the cars, usually without a top screen. Where the wheels come out to the car body front a steel lattice screen is used. In contact with a movable obstacle, the fender board rubs the ground and pushes the body forward. Meeting an immovable object the fender board turns under, then upwards, passes over the object and resumes its normal position. These movements are occasioned by the use of maximum, minimum and medium power springs and the strength of the material used.

The pick-up fender is also automatic and independent of the motorman. It has a backward down-yielding movement to the road bed, which lessens the impact of anyone falling into the fender and also prevents passing

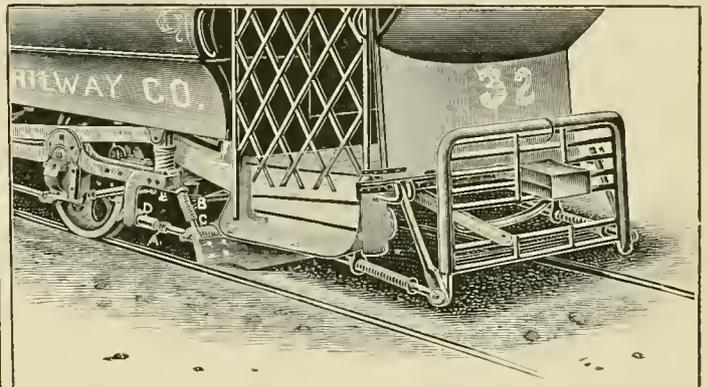

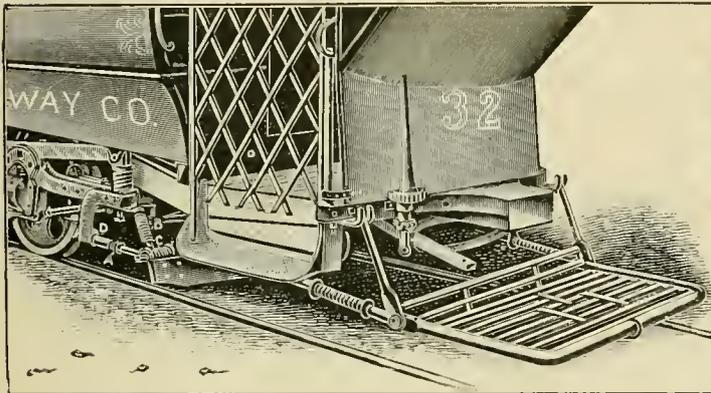

R. A. CRAWFORD.

A NEW SUPPLY COMPANY.

We take pleasure in informing the trade that the Wallace Electric Company has been organized for the purpose of conducting a business in electrical goods as manufacturers and manufacturers' agents, at 104 Michigan avenue, Chicago.

Their line embraces alternating current generators, motors, meters, transformers, etc. Wires and cables for all electrical purposes. Incandescent and arc lamps, measuring and indicating instruments, switches, etc.; also a full line of electrical street railway appliances and supplies, and a few carefully selected specialties.

The officers and management of the company are well known to the trade. The general manager, J. B. Wallace, has been actively identified with electrical industries from the earliest experimental stages of electric lighting in this country. William S. Hine, president, has had a large experience in this business through his connection with the United States Electric Lighting Company, and the Westinghouse Electric and Manufacturing Company, as general district agent.

CRAWFORD FENDER IN AND OUT OF ACTION.

thereunder. It folds up over the draw bar and bumper so as not to interfere with the sliding action of the draw bar, when coupled to another car in going around curves and both ends of the car may be equipped and yet take up no more space in the barn than if not equipped. Its action is quiet and effective and as the material used in construction is the best of steel and iron, it may be depended upon in every emergency.

R. A. Crawford, the inventor, is a practical man of thorough theoretical training. Although a young man, his experience has been wide and varied, and his business education complete. In 1891 he began the investigations and experiments that have been so successfully concluded as above narrated.

ISAAC T. VAN DUZER died in St. Paul, January 4, at the age of 77. In 1841 he built the first street railway in New York City, and shortly afterwards built the Hudson River Railroad, from Poughkeepsie to the city.

Max A. Berg, secretary of the company, is well known as the former manager of the street railway department of the Ansonia Electric Company, and M. M. Wood, whose special devices are well known for street railway construction, will be electrical engineer in this department.

The company is not electrical supply dealer, but manufacturer and manufacturers' agent.

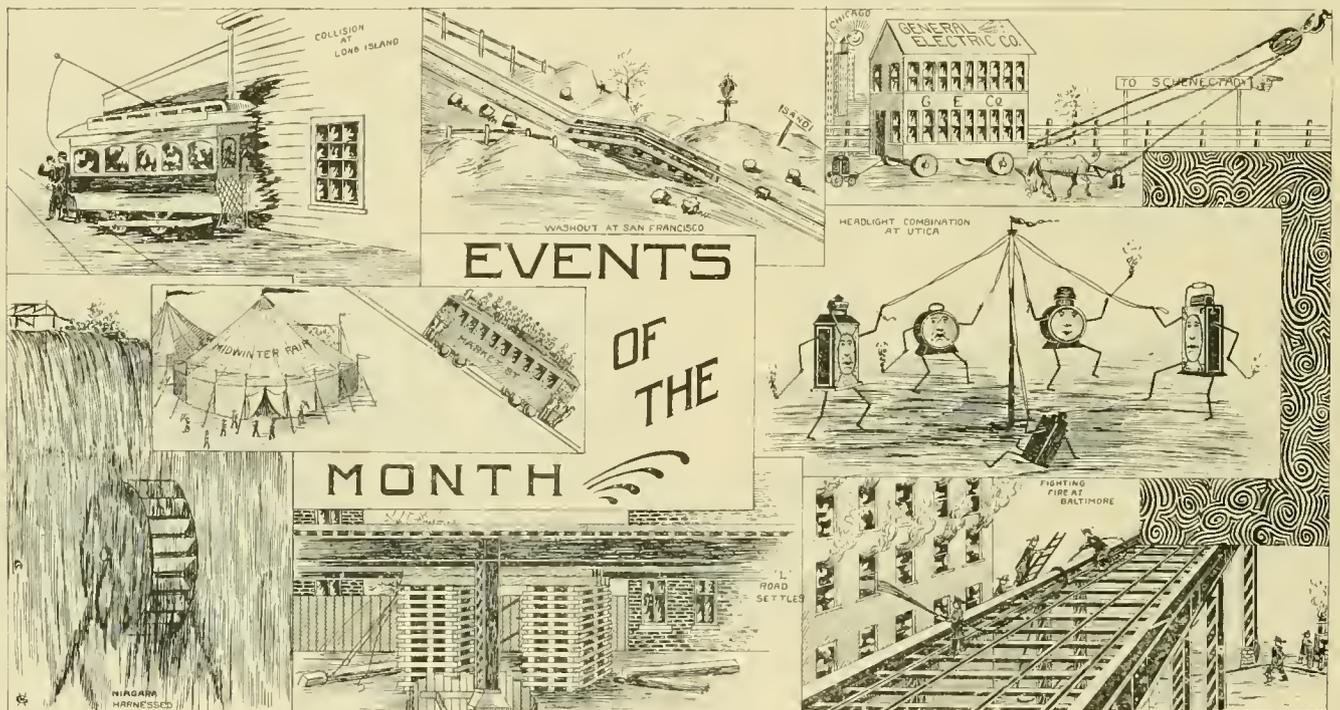

Catalogues, price lists, etc., are in press and will be mailed on application.

They are thoroughly equipped to promptly and satisfactorily handle your business and solicit orders.

If he said it he ought to be retired. A Grand Rapids' paper recording the visit of an electrical engineer from another town, reports him thus: "I find that the Grand Rapids system is one of the best, if not the best, in the country. The method of running the electric current through the motors in use here, is one of the most inexpensive and at the same time most servicable."

## THE MONTH ILLUSTRATED.

The last thirty days have been pretty well crowded with street railway incidents. Fires, fatalities and faction have fatigued managers and men. For instance: In Long Island, an electric car ran away down grade and telescoped a barn. It hurt the car some and spoiled the barn, but did not injure the 15 passengers. Then, too, rain storms in San Francisco washed a good many tons of sand on to the railroad tracks, washing away and filling up cable conduits. The General Electric Company took its penates and its bed, and walked to Schenectady, where it now keeps house. Niagara's water power was harnessed some time ago, but during the month the faucet was turned and the wheels go round now. Our own Chicago Alley L sagged a couple of feet for a section,

because some careless workmen dug under it. No one was hurt, but several passengers of the two train loads on the structure at that time, fainted.

At Utica, the headlight manufacturers of the country came to a council of war and decided that the union there, was light, and so a combination was formed as related elsewhere in this issue.

The Lake Roland L, in Baltimore, found itself a great convenience for the fire laddies, when an adjacent building took to smoking. Last, but not least, the Midwinter Fair opened and the artist feelingly draws a stuffed car.

GEORGE BARNETT, president of the board of public works of St. Louis, favors the underground placing of wires in subways, somewhat similar to those used at the World's Fair, except that they would be set in cement and made permanent in character. His estimate of the cost is \$50,000 per mile.

## ATLANTA'S NEW ROAD.

The popular resort of Lithia Springs is about to be connected with Atlanta, Ga., by an electric line, to be called the Lithia Springs Electric Railway. Henry Camp, of Covington, is president; Thomas Camp, secretary and treasurer and B. F. Curtis, general manager. J. W. Hobson, of St. Joseph, Mo., was main promoter and will remain in Atlanta until the line is built and running. The cost will be \$300,000, and extensions proposed, when this is done, as much more.

The trips to Lithia Springs will be made uniformly in one hour, but it can easily be made in forty or forty-five minutes. It is believed that thousands will this summer enjoy the breeze, the fresh air, and lovely scenery that the new electric railway will offer to its patrons.

## NEW PUBLICATIONS.

ENGINEERING EDUCATION, STREET RAILWAY REVIEW, Chicago. Price, \$2.50. The proceedings of the Engineering Education section of the World's Engineering Congress, last summer, have been printed in book form. As the number for sale is limited, those desiring copies will do well to send in their orders early. The papers it contains will be a reliable adjunct to an engineering library.

DYNAMO AND MOTOR BUILDING FOR AMATEURS. By Lieutenant C. D. Parkhurst. W. J. Johnston Company, Limited, 41 Park Row, New York. Price, \$1. A clear, concise set of instructions with working drawings for four types of machines. Technical points are taken up in connection with the larger machines which are of value to the professional as well as the amateur.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,  
269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4. MARCH 15, 1894 NO. 3.

ONLY forty days until the festive summer cars will begin to make their debut, but each one deserves a thorough overhauling in the meantime.

A RULING by the Supreme Court of this state, recited in our legal department, emphasizes the extreme importance of thoroughly instructing drivers as to special care in operating a car past a point where an infant may be near the track. The courts almost invariably place the entire responsibility for discretionary care on the servant of the company, as was ruled in the case mentioned.

OUR illustrated description this month of the commencement of construction of the electric railway in Madras, India, marks the beginning of a new history of transportation in the far East. Although the event occurred within the past sixty days, the REVIEW, with customary enterprise, secured photographs of the inaugural ceremonies which will be found interesting glimpses of Oriental life.

THE snort of the iron horse, among the hills and valleys which surround Jerusalem, is no less indicative of the invasion of accidental ideas in the Orient than is the electric railway which is about to be constructed in Cairo, Egypt. There may be nothing new under the Egyptian sun, but we cannot but express the firm belief

that could the followers of the Ptolemies free themselves for a day, of their mummy wraps, with the transformation from ox-cart to electricity they would in all honesty have to own that the new conveyance was ahead of even the gold plated chariots of the good old days. An inclined plane up the pyramids and a pair of arc lights to give sight to the Sphynx at night should now be slated as possibilities of the no distant future.

THE storage battery system at Birmingham, England, about which so much has been said, and for which so many claims have been made, has finally been decided to be unsuccessful, so much so that the directors of the Bristol Tramway Company, who investigated the system, have recommended to the shareholders that the accumulator method as practiced at Birmingham after a thorough test under the best possible conditions, has been found excessive in cost and uncertain, and they therefore recommend the overhead trolley for the city of Bristol.

THE management of the San Francisco & San Mateo electric railway, on which the terrible fatality occurred last month, owing to a motorman losing control of his car on a steep grade, now announces, with great flourish of trumpets in the daily papers of that city, that hereafter all motormen will be examined as to fitness and ability before being put in charge of a car. The almost criminal lack of common sense which could permit men to drive even a horse car without proper examination, is a remarkable confession for a street railway company, and had better have been left unpublished. Under the past conditions of management the wonder is that only two fatal runaways had occurred.

ONE of the advantages (!) of municipal ownership of street railways is illustrated in the very tempestuous controversy which has been going on for several weeks past in our neighboring city of Glasgow, Scotland. When the road was built by a private corporation it was decided to run cars on Sunday. At first only a sufficient number were put out to transport the attendants on church service to and from their homes. While this was undoubtedly very wicked, still a great many piously inclined people availed themselves of the opportunity to attend the sanctuary who otherwise through bodily infirmity and lack of means could not otherwise have walked or hired a carriage. Gradually other worshippers came to use the same gospel chariots to attend meetings, where sun and sky, open air and flowers and green grass constituted the ritual and litany, of which they were deprived during six long days and nights of toil and drudgery. But the attendance on Nature's choir grew to such alarming proportions it finally came to be considered sinful by a very consequential portion of the good citizens, and now, that the city government has it in its power to permit or refuse the Sunday car service, there has been a most determined fight to stop the wheels. How strong this sentiment is evidenced that, on the final ballot, one-third the town council voted to discontinue the service.

ALTHOUGH long distance transmission for railway work has as yet been entirely on paper, there is prospect that the near future will see the installation of several plants of this nature, aside from the railway stations, which will eventually be run from the great Niagara plant if it proves as economical a source of power as expected. As the matter is being agitated, the statement elsewhere, outlining the opinion and policy of the Cie de l'Industrie Electrique, Geneva, will be of interest, as presenting one side of the case. This company, of which R. Thury is the electrician, has made several installations of the type described. The company's position, will, of course, be questioned by many, but it shows the practicability of direct current transmission in many places not usually thought to be suited to it.

THAT even the editors of leading English journals have much yet to learn on the operation of street, or, as they delight to term them, tram cars, is fully evidenced in an editorial in "Industries and Iron." The editorial ignorance is thus forcibly displayed:

"An American journal actually takes up seriously the question of the value of track brakes, or brakes which operate by pressure on the rail. How any sane engineer could ever get the length of writing on such a subject as the substitution of brakes acting on the rail for brakes acting on the wheel is inconceivable, but that the subject should be dealt with seriously, and the reasons, which are apparent to any thinking mind, carefully worked out and detailed, is even more strange. Apart from the wrong theory, the bare suggestion of a "track brake" brings to one's mind endless practical objections. This proposal is on a par with that which, by the way, is now being carried out in Boston, namely, the electric welding of the joints of some miles of tram line."

Track brakes are usually used as auxiliaries to the ordinary wheel brakes, and very successfully. In San Francisco alone there are several hundred cars so equipped, and in other cities where the grades are few and light, the track brake is equally serviceable. Our English brother may not be so far amiss when he places the track brake "on a par" with electric rail welding, for the latter seems to be the coming solution of the joint problem.

FIRE insurance matters are certainly in a very unsettled and unsatisfactory condition. The underwriters, finding that their losses are on the increase, have gone about in a blundering way to decrease them, without getting at the root of the matter, by looking well into the condition of the risks they insure. Instead, they make the innocent suffer with the guilty, and adopt sweeping rules which are only partly enforced, or are enforced in such a way as to be of no great practical value to themselves or anyone else. For example, a trolley circuit motor, carefully installed, may be run in a building next door to a lot of lights wired up in a criminal fashion. The building with the motor will be rejected, and the one with the electric lights accepted, with possibly a slight raise in rates. Very likely the accepted building burns down, and the underwriters raise the rate all along the line.

The plan nominally adopted by the underwriters, and described in another column of adopting a standard of construction and charging for deficiencies, would be an excellent one if carried out. At any rate, if mutual insurance is to be inaugurated, as now seems very possible, the rocks struck by the old line companies must be avoided, and the results of their experience made use of. The rules and rates will bear close inspection by both policy holders and prospective mutual insurance promoters.

It is strange that those who oppose the trolley seem utterly to forget that it is usually simply a matter of choice between the trolley and some worse system. The remarks of Mr. Preece, commented on in another column, are a good example of this. The trolley is like many another engineering device; not without its drawbacks, but at the same time the only thing available to reach a desired end in many places. Trolley opponents seem to have a vague idea that some other system of mechanical traction is practicable for places where the trolley is usually proposed. Briefly, the present status of street railway propulsion is as follows: The mechanical difficulties of cable traction limit it to lines with few curves, and its cost always makes a heavy traffic necessary for profitable operation. The only electric conduit systems which have shown any prospect of being a success in ordinary streets, cost nearly as much as the cable to build, and while the cost of operating on light loads is not proportionately as great as with the cable, the field for the electric conduit road is but little larger than that of the cable road. If storage batteries are ever successful, it will be only on level lines, with light traffic. This leaves the trolley as the only practicable system in the largest part of the street railway field. This outlook may not be bright for those who have been expecting a substitute for the trolley, but it is simply looking matters squarely in the face.

OUR illustrated description last month, the only one ever published, of the aerial railway at Knoxville, Tenn., had only reached our readers when the news of the accident on that line was telegraphed to all parts of the country. While it is extremely doubtful if that form of transportation will ever find any considerable adoption, there are a few places where it is the most feasible means of conveyance. With the record of the fatality at Knoxville, it is extremely unlikely many similar lines will be built in the near future, and yet the disaster is unfortunate in an engineering sense, as many ropeways are doing magnificent service in mountain districts and operating under natural conditions far more dangerous than the one mentioned. The blame for failure would seem to rest with the constructing engineer and operators of the line. A system of counterbalancing weights could easily and should have been provided, which would have made impossible the accident which occurred, and a grip brake of sufficient length and strength to clutch the main cables would also have insured safety.

## MADRAS ELECTRIC RAILWAY BEGUN.

The Orient to be Quickened with Advanced Electrical Ideas from the Occident.

The presidency of Madras is a system of dependent and allied native monarchies under British dominion. Its area is 139,000 square miles, and its population numbers 35,000,000 souls. Madras, the capital city, although a coast town, has no harbor, being reached from the roads, seven miles out to sea. Its population in 1891 was 450,000. It was founded in 1639 by the British and since has had a number of changes of ownership, resulting again in British possession. The town is divided into Black Town and English Town, the former being great-

supervision of Thomas Parker, M. I. C. E., M. I. E. E., F. R. S. E., director of works of the Electric Construction Company, of Wolverhampton, England.

It will be a conduit system, and is carefully worked out in every detail to allow a dry conduit and perfect contact. The line will run in the center of the road and will be double tracked from a point on Esplanade road, opposite the Christian college, to the central power station at Egmore. The right hand rail is of the ordinary girder type, weighing 56 pounds to the yard. The rail will rest

THE ESPLANADE, MADRAS, INDIA.

est in population and area and the latter the most powerful.

Up to date the system of transportation has been a series of primitive cabs, sedan chairs and bob-tail horse cars. But even the lazy Indian is getting tired of those methods and demanding something better.

The Anglo-Saxon is to meet the demand, and when an Englishman does anything for the Provincial he does it well. So with the street electric railway in Madras.

The Madras Electric Tramways Company, which is to furnish the miscellaneous population of the city with convenient modern and rapid intramural transportation is, naturally, an English corporation. The road is planned by and the materials manufactured under the personal

on a longitudinal bed of concrete and on cross sleepers every five feet.

The left-hand rail coming from the power house, is a slot rail bolted to cast iron yokes buried two feet below the road level and resting on nine inches of concrete. The yokes are placed five feet apart. The yokes are cased with cast-iron casing, and over the top is a cast iron covering with interstices for the laying of paving. The conduit thus formed is drained adequately by connection with existing sewers and through special pumps and drains where extra precaution is necessary. The road is standard gauge and tied at intervals. The rails will be laid six inches above the present road level at certain points and the road afterwards graded up. This

will be of untold advantage to the city, as it will then be necessary to grade and repair these streets at present almost if not entirely uncared for. Another advantage expected is that the now miscellaneous collection of ox-carts, sedan-chairs and mules, termed by courtesy, street traffic, will be compelled to "keep to the left," obeying the "rule of the road." At present the careless Indians mix indiscriminately down-going and up-going traffic.

On January 10 the first earth was turned to begin the construction. At an early hour the engineering corps was busily engaged in preparing for the ceremony in a space previously fenced off, and a warning sign was put up to keep as many as possible of the curious natives from thronging the party.

Engineer Robins stands at her left with the shovel, and Assistant Engineer Torrance at his back. H. V. Faulconer stands by the transit and his assistant, Engineer Beveridge, just behind him. To the right, Commissioner Simpson is next the contractors' sign, with Assistant Secretary Salisbury to the rear. Managing Director Chalk stands at Mrs. Chalk's left hand.

The engraving on page 131 shows the same place after work had begun. The native laborers and the higher cast natives make an unique scene.

The engraving of the power house in course of construction shows the delightfully simple method of getting the brick to the bricklayers. The costumes of the laborers are as simple as their methods.

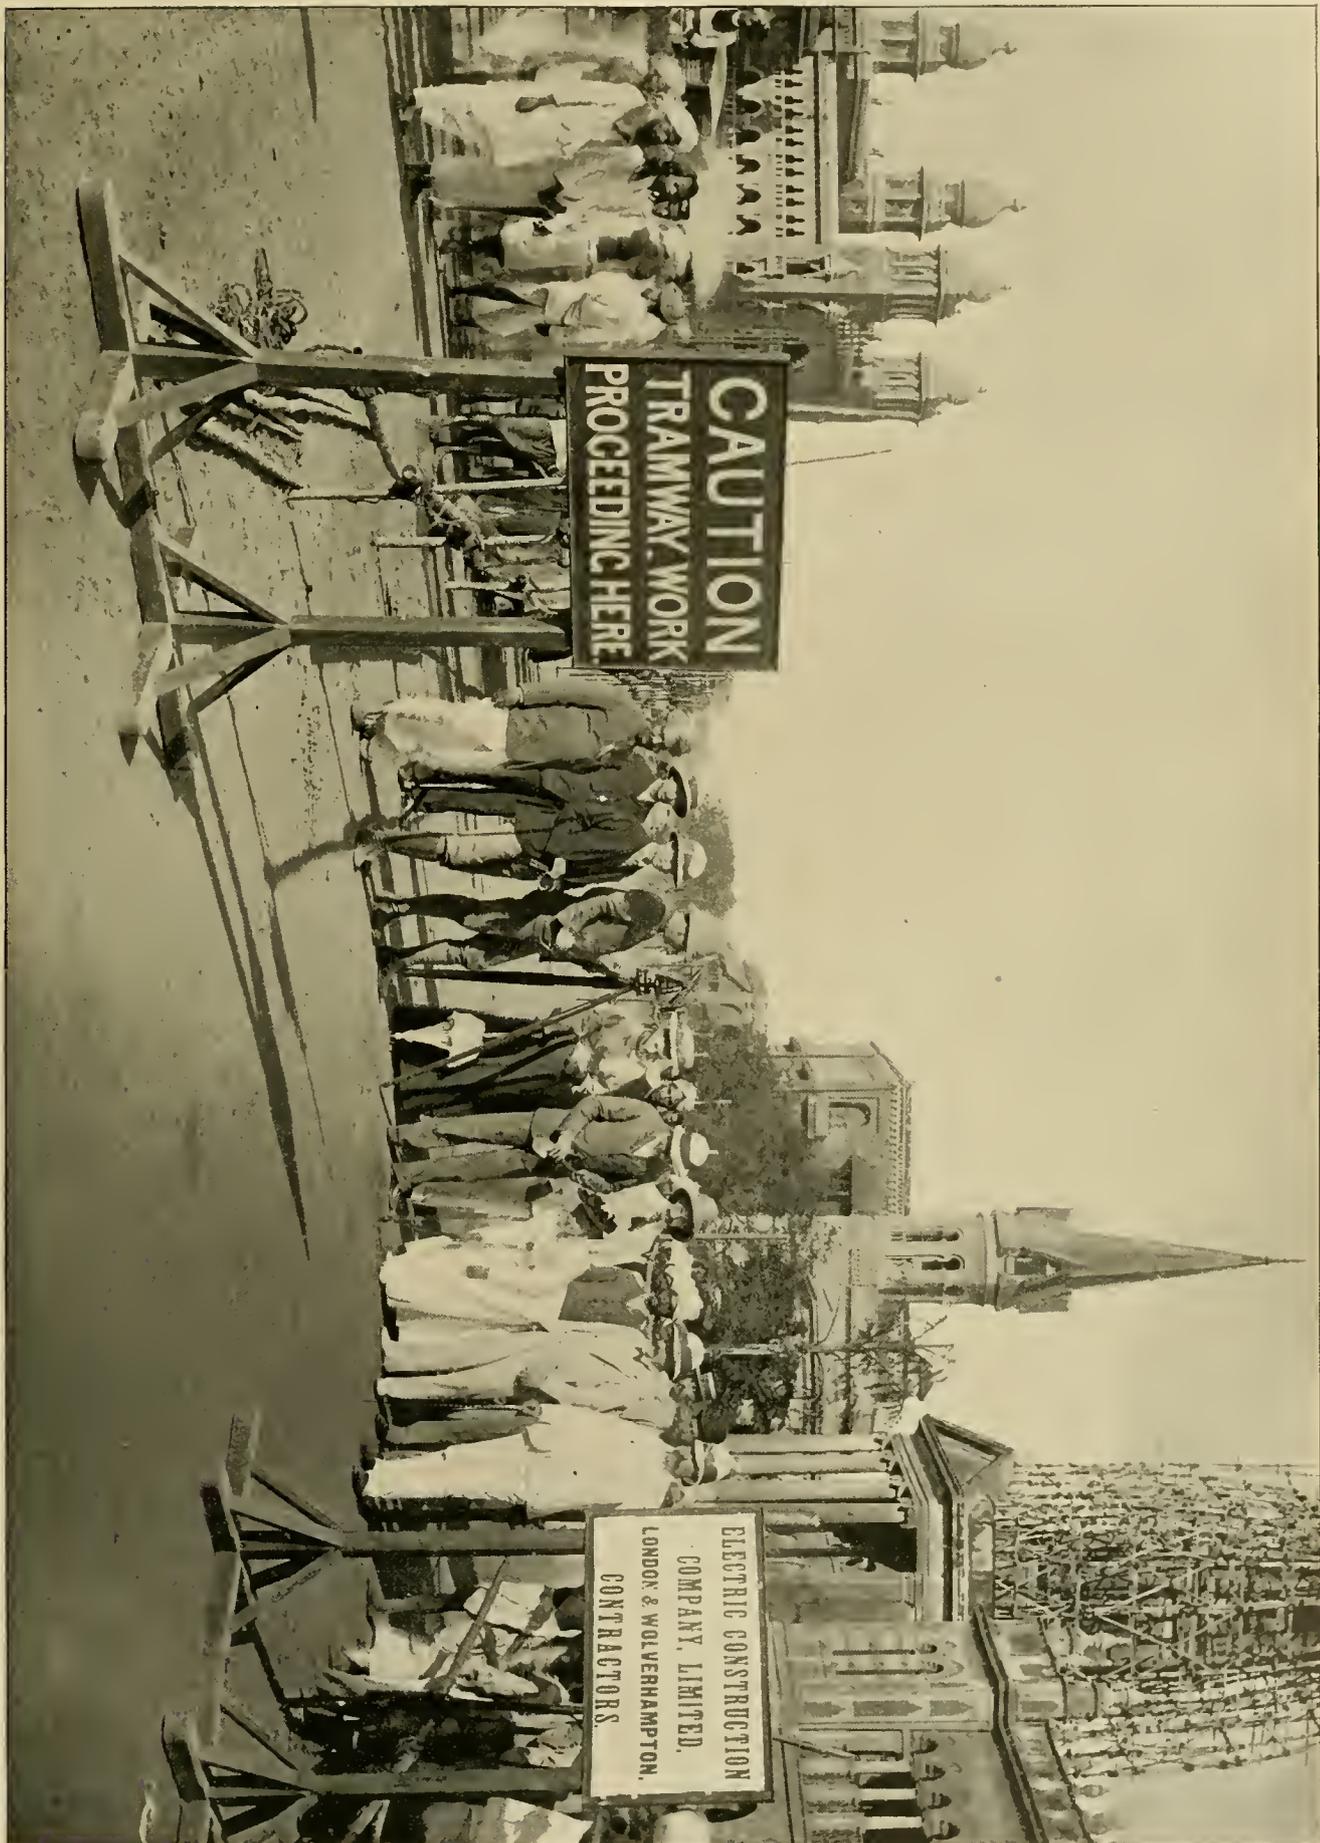

MADRAS ELECTRIC TRAMWAY—WORK COMMENCED ON CENTRAL POWER STATION.

At 8 o'clock, J. J. Robins, chief electrical engineer, representing the construction company, requested Mrs. Chalk, wife of managing director S. A. Chalk, to turn the first "sod," in the presence of Mrs. Faulconer, wife of the operating company's chief engineer and manager; Mr. Chalk; H. V. Faulconer, chief engineer; Engineer J. J. Robins and their assistants; S. D. Simpson, deputy commissioner of police, and others. In the excellent view of the proceedings shown, the natives in their Indian garments, the High Court buildings on the left, and the Free Church on the right, may represent church, state, and the native population, while modern scientific achievement is shown by the little Anglo-Saxon group in the center. The lady with the pick is Mrs. Chalk,

As in the southern states in this country the bricks are carried on the head, and the latest in dress reform is demonstrated in a manner at once simple and economical. Both sexes are employed in the work.

This beginning of electric railway construction on the Indian peninsula promises much for future enterprise, and who knows but that our Aryan brethren may yet be spurred from their Oriental slumber by the 500-volt current?

THE suit between Mr. Mason and Mr. Shaffer concerning the ownership of \$25,000 bonus for the sale of the Indianapolis street railway is on trial before Judge Baker of Indianapolis.

HIGH COURT BUILDINGS.

FREE CHURCH BUILDINGS.

MADRAS ELECTRIC TRAMWAY COMPANY, INDIA—BREAKING THE ROAD, ESPLANADE—JANUARY 10, 1894.

### HALF FARES.

Interesting Facts from all parts of the Country, Boiled Down for Busy Readers.

THE Lake Roland Elevated Road of Baltimore has paid its last quarter's park taxes, amounting to \$3,115.08. This indicates gross receipts of \$35,056.44 for the quarter.

A PASSENGER, on the rear platform of a city railway cable train, in this city, was held up by three men and relieved of \$500 in cash and \$25,000 in valuable papers.

THE Tacoma street railway employes will give a day's wages each to the cause of the Inter-State Fair, to be held at Tacoma.

THE Richmond City & Seven Pines Railway is sold to the Richmond City Electric Railway for \$50,000. The line traverses the battlefield of Seven Pines.

THE injured of the East Liverpool, O., trestle accident, on Thanksgiving day, ask damages. One wants \$10,000 for loss of his wife, and another \$5,000 for general injuries. Public sentiment is with the railway.

SIXTY senior students in the Lawrence, Kansas, High School, wrote essays on "What a Newspaper Should Be." The essay that carried off the prize read: "A newspaper should be read and paid for."

AN employe of the Selma, Ala., recently cut a wire in a careless manner and received the full force of the current. He fell 18 feet to the ground from the pole, seemingly dead. He was resuscitated, finally, but has no memory of anything previous to his fall.

THE Janesville, Wis., Street Railway Company, made \$1,550, net, last year, and Manager Proudfoot is proud all over. The report shows receipts, \$12,601, total expenses, \$11,050. The old board of directors was reelected.

THE new Mt. Adams & Eden Park power house planned by Engineer Bert Baldwin of the company, will be 50 by 70 feet, one story, constructed of iron, brick and stone. It will contain two 800-horse-power engines and four 400-horse-power generators.

The electric railway scheme in Dublin, Ireland, is to run a line from the city to the Hill of Howth. The Dublin Tramways Company asks the concession. When this line is completed feeders will be built. S. G. Frazer, C. E., is the engineer.

THE president of the Rochester, N. Y., Street Railway Company, John N. Beckley, has issued a "special caution" order to motormen, for the spring months, to look carefully after children playing on the streets and going to and from school.

THE British Trade Journal says: "Now is the time to begin railway and tramway enterprises. Prices are at lowest ebb."

DANIEL DWYER, of San Francisco, intervenes in the suit of the California Title Insurance & Trust Company foreclosing a million dollar mortgage. This opens the way for a number of other suits and the foreclosure will not go by default as was expected.

THE item relative to Toledo, O., street railway tracks, in the February issue of the REVIEW, was incorrect. David Robinson, of the Robinson Street Railway Company, corrects it as follows: Toledo Consolidated, 60 miles, Robinson lines (the Toledo Electric) 30 miles, all of which are electrically equipped.

THE newly equipped line on Eighth street, Cincinnati, celebrated its opening on February 28, by giving all its Price Hill patrons a free ride. President John Kilgour was master of ceremonies and a distinguished party took the trip. Among those present were D. W. Pugh of the Stephenson Car Company, of New York; E. H. Davis, of the Barney & Smith Company, of Dayton, and George Bullock, director of the Cincinnati Street Railway. The new cars, of which there are five, were made by the Barney & Smith Company.

SEVERAL unusually active and vociferous kickers, in New York City, have been writing "pro bono publico" letters to the papers, complaining of the wet and disagreeable conductors who must needs go through the cars collecting fares. "A Conductor" gives the following suggestion for a remedy:

"Let the conductor stand, or if he prefers it, sit in a nice easy chair on the tail end. Let each passenger have the exact fare ready (no pennies) when he or she steps on a car, hand it to the poor, tired conductor, resting or sleeping in his chair, ring up one fare themselves (no more) on the indicator, and when they wish to alight, step to the front of the car, draw the driver's attention by tapping on the glass of the front door that they are ready to get off; go to the rear end, each one to hand the conductor a bad cigar from men, a lock of hair or a false tooth from women, as a souvenir; step off and go home perfectly satisfied that everything is as it should be and the conductor is doing his full duty."

THE first summer car in this latitude made its appearance at Decatur, Ill., March 2. The local paper said it was a reminder of straw hats and summer underwear.

It isn't every town that has the electric railway controversy as badly as Hartford, Conn. A rival town, already blessed with the trolley, says: "Hartford has trolley for breakfast, trolley for dinner, trolley for supper and trolley for lunches, but nary a trolley for business."

PROFESSOR W. A. VALLO, of Philadelphia, has invented a compressed air street car motor. Each car is to be self contained and the exhaust air will be used to blow away the snow in winter and cool the car in summer, as well as brake the train. Signor Vallo is a music teacher and we fear it has gone to his head.

A GRAPHIC METHOD OF SUPERINTENDENCY.

The Scheme of a Bright Manager to Encourage Competition Among Employees.—How it is Done.—The Results Attained.

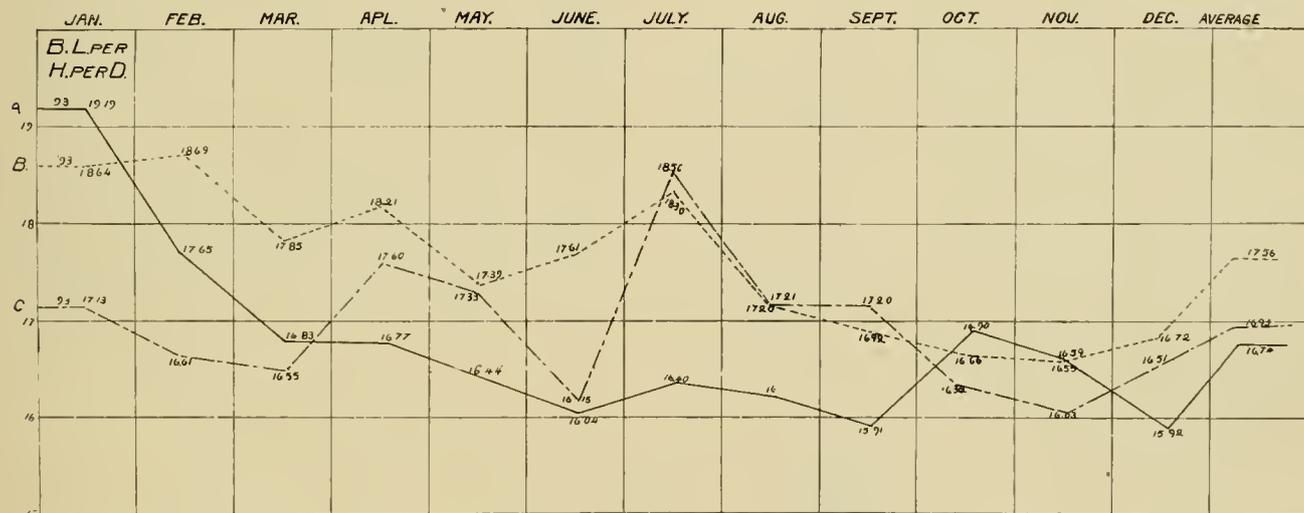

The superintendent of one of the largest and best equipped street railway systems in the world has been using for years a graphic method of showing the daily expenses in certain departments. For the first time is now made public the results of his experience and an explanation of his plan.

"I find," said the manager, to the REVIEW representative, "that the surest road to success is the confidence and cooperation of the departments under me. To gain the support of the foremen and barn bosses and interest them in the economy of street railway work, means the lessening of expenses everywhere. What competition is to the life of trade a generous rivalry is to the success of the management of men. Hence my plan. Graphics have been used for many years to show plainly and

barn may be seen at a glance, but each year's record for each barn may be ascertained as easily.

For instance, in the excerpt of the chart given, barn "A" for 1893 shows barn labor per horse per day in January as  $19\frac{19}{100}$  cents, decreasing in February to  $17\frac{65}{100}$  cents, and reaching its minimum in September at  $15\frac{91}{100}$  cents. In 1894 another line will start out from the proper ordinate and follow or digress from 1893's record. Barn foreman "C" had a January record of  $17\frac{13}{100}$  cents with a July maximum of  $18\frac{50}{100}$  cents and a June minimum of  $16\frac{04}{100}$  cents. The boss at barn "B" held the straightest line with  $18\frac{64}{100}$  cents in January neither remarkably making it greater or less. His average was  $17\frac{56}{100}$  cents.

"The men," said the superintendent, "spend hours studying this pictured record, discussing this and that point of economy, planning to lessen the expense in this or that direction, and fully determined to bring out a better record next month. The consequence is that sick horses are carefully nursed back to health; old horses are disposed of to the best advantage possible; no oil or harness is misused or wasted; six men are not put on a

promptly the fluctuations of the grain market, the thermometer and what not. Why not for street railway economics?"

For each department the superintendent drafts a chart to cover the twelve months of the year, with space for the averages and the scale or data. The two excerpts from the charts given in this article represent graphically barn labor per horse per day in Number 1, and the total cost per horse per day in Number 2.

In Number 1, the chart is divided into the necessary sections to represent the possible minimum and possible maximum cost per horse per day for barn labor in cents, running from 15 to 20, each section being further subdivided for 10 mils. The barns are properly denoted and a scheme of colored and varied lines correspond with each barn. As each month, the report of the cost per horse per day as ascertained, the line is properly extended to represent the rise or fall in the cost of barn labor per horse per day. Each year's record is properly labeled so that not only the difference in the expenses of each

sweeper when five can possibly fight the storm, and better judgment is exercised in every detail of management."

The positions for the following year are scaled impartially on the record. The man who can save the company money, knows by his record whether he will have a more lucrative position next year, and the careless, improvident or incompetent man reads his future in the stars more successfully than any clairvoyant can tell him.

For the general weal, chart number 2 shows T. C. per H. per D. (total cost per horse per day). It is divided similarly to the first mentioned, but giving a different scale, and showing the year's instead of the barn's record. Thus, in 1893, the January total cost per horse per day was  $48\frac{265}{1000}$  cents, with a maximum in April of  $67\frac{013}{1000}$  cents and a minimum in September of  $48\frac{115}{1000}$  cents, averaging  $55\frac{990}{1000}$  cents. In 1892, starting at  $54\frac{403}{1000}$  cents, the cost ranged from  $63\frac{519}{1000}$  in September, to  $47\frac{004}{1000}$  in December, averaging  $57\frac{936}{1000}$  cents for the year.

The machine shop departments are also thus tabulated

and described. The pay roll is pictured upon another chart, and other traction than horse is shown forth.

The superintendent benefits from all the tables, and each department by its previous record, its neighbor's record, and itself.

The labor of a draughtsman a few hours each month suffices to put the records in trim for inspection, and corrections are closely watched for and carefully inspected by the men. In making the chart the several barns, lines, or divisions of departments are indicated by different colors, which we have not been able to reproduce, and instead have used black and dotted lines for the same purpose.

### THE CAR RECORD.

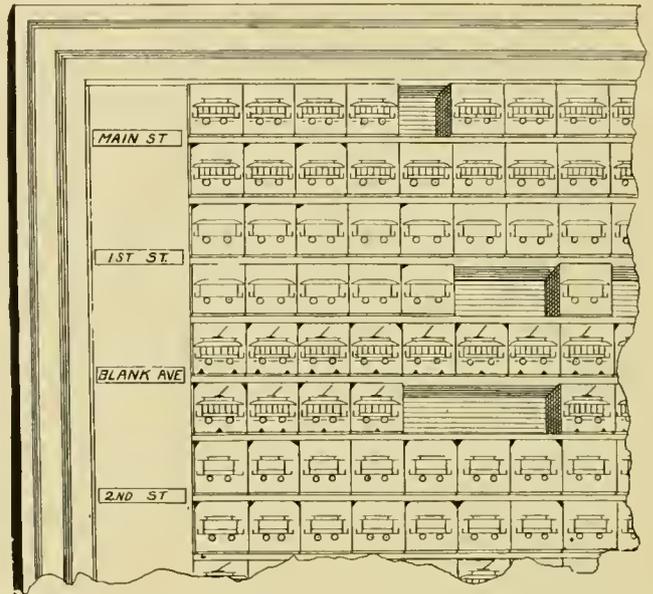

Besides these details, the superintendent can by reference to another expense-saving device, determine the exact state of his car equipment. The scheme is similar to the steam road method, but will bear description and study. It is this: A frame of suitable size is divided into compartments representing each separate line of the system. Each compartment is subdivided longitudinally into sections with strips or slats like small shelves. These shelves hold small blocks, about half an inch square, which stand for the individual cars. On each of these blocks is pasted the skeleton representation of a car, as shown in figure 3. And there is your car remaining only to be further described by certain arbitrary signs as may suit the superintendent's fancy.

The skeleton car plans are printed on variously bright colored paper, corresponding with its own established

No cut corners, a 21 foot car.

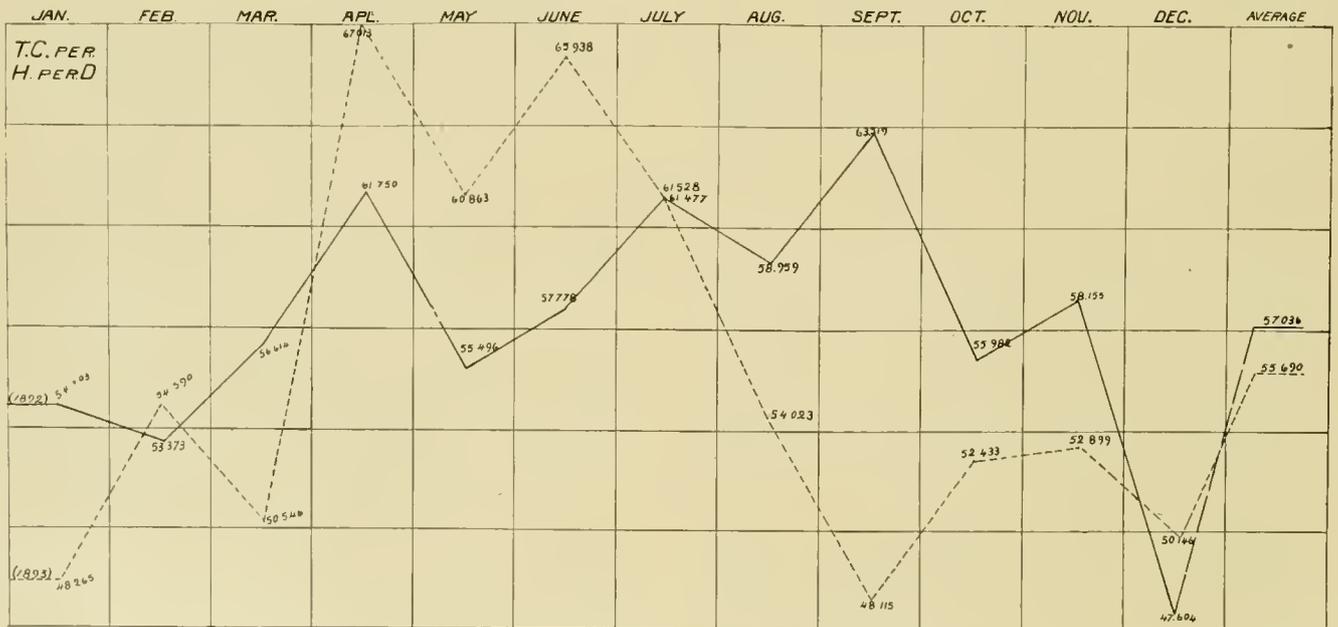

A single motor equipment shows one incision in the bottom of the block. Two motors, two incisions.

Proper drawings upon the face of the card also completely describes every car in service—its number, line,

equipment and place, whether in the shops, on the proper line, lent, sold, borrowed or destroyed.

The case is divided laterally into sections of ten blocks each for convenience in counting up the hundreds of cars in use. The services of a man a few hours a month is

color of the line to which the car belongs. For instance: First street cars (blue line) are on blue paper, the Main street line rejoices in its brilliant red, and the Blank avenue shows plainly in yellow.

Some of the signs used by the superintendent are:

One cut corner 16 foot car.

Two cut corners, a 14 foot car.

sufficient to keep this simple system in operation. It dispenses with the services of bookkeeper and is much more convenient.

MIXING MORTAR by means of power supplied from the trolley circuit is said to be a feature of Great Falls (Mont.), building.

THE BEGINNING OF TRAMWAYS IN LONDON.

THE BEGINNING of the large and powerful, if not progressive London General Omnibus Company, was in the brain of an Italian, Count Orsi, then, in 1855, residing at Paris. Following out the idea the Count attempted to raise the capital from wealthy Londoners and French bankers. Failing in this, he went back to Paris, incorporated his company, fixed the capital at \$4,000,000 in \$20 shares and proceeded to sell to small investors. The Parisian and London press began with unanimity to deprecate the scheme and prophesy the failure of the small investors.

But the money was subscribed.

Coming back to London with \$4,000,000, the Count was no more to be deemed a visionary. The leaders took up his cause. Five Englishmen and three Frenchmen were made directors, and one day in 1856 five hundred and twenty-five busses were put to work in the Metropolis. Two thousand five hundred are now in operation, and the Count Orsi, still hale and hearty at the age of eighty-three, watches his venture with interest.

A peculiar ceremony of transfer at the time that the English directory entered into management may bear repetition. The French directory were ranged on one side of the room and the English on the other, a la Rugby, but seated and eight feet apart. A chair was placed in the middle to represent the undertaking. There the Count solemnly transferred the chair to the English side, typifying the transfer.

DUBLIN'S DOINGS.

The twenty-sixth semi-annual meeting of the Dublin, Ireland, United Tramways Company, was held January 16. The report was highly satisfactory to the stockholders as a five per cent dividend was declared, free of income tax, besides a comfortable sum added to the sinking fund. The system is worked by horses of which there are 1,203. The number of cars was 156. The car mileage for the half year was 1,208,035; track operated, 33 miles; parcels delivered, 169,250; accident compensation, \$105 for the half year.

The accounts for the half year give the following showing: running expenses (provender, repairs, wages, etc.), \$178,645; traffic receipts, \$329,990; total working expenses, \$225,485; total income, \$349,110; balance to net revenue, \$88,770.

The parcel delivery at all times of the day and not at stated intervals, cost \$5,945 and paid \$8,015; mail brought in \$155, expense nothing extra. Both these subsidiary methods of increasing income have been described in the REVIEW. Nearly \$50,000 was spent in repairs of road bed and reconstruction. R. S. Tresilian is assistant secretary, whom we thank for report and congratulate upon the brilliant record of this Irish road.

AN ALDERMANIC MEASURE.

The bright secretary and treasurer of the Houston, Tex., City Railway Company, C. A. McKinney, sends us the following copy of a resolution adopted by the San Antonio, Tex., city council, relative to the 38-girder rail in use on certain streets of that city. The resolution is printed as follows:

Whereas, cars of the San Antonio Street Railway Company have frequently left the track on South Alamo street between East Commerce and Goliad streets, running with terrible speed and force onto sidewalks and even into fences, walls, etc., to the great danger of all traffic on said street as well as the passengers on board the cars; and,

Whereas, Said track is laid with flat rails which were once suitable and in use during the days when cars were moved by mule power but which are now too light and in other points inadequate for the heavy electric cars now being used; and,

Whereas, For the reasons above stated said portion of track on South Alamo street is a most dangerous nuisance; now, therefore, be it

Resolved, That the mayor notify President Weiss, of the San Antonio Street Railway Company, to immediately substitute T rails for said flat rails within thirty days from this date, with notice that if the change is not made in the time specified the city will condemn said portion of track and by ordinance abrogate the company's franchise to said portion of South Alamo street. Also that cars be limited to one mile an hour on said track until the T rail is substituted, and that the city attorney be instructed to draw up an ordinance to regulate the speed of cars on said track until the T rail is substituted.

This action will be noted with interest by those who wish to substitute T rail or wish to lay T rail for new lines.

DEATH OF HIRAM R. RHOADS.

Hiram R. Rhoads, president of the Pennsylvania Street Railway Association and of the Williamsport, Pennsylvania, Street Railway Company, died February 17 at his home in Williamsport, at the age of 49, of heart failure.

Mr. Rhoads was born in Philadelphia, in 1845, and began his railroad career at the age of 18 as a telegraph operator with the Pennsylvania Railroad Company, rising to division chieftainship. Going into telephone service at the beginning, he opened the second exchange in Pennsylvania and in 1880 organized a telephone supply company of which he was president.

In 1890 he purchased the Williamsport Street Railway Property and later became interested in the Lycoming electric light and the Norris-town Street Railway Companies. His election to the presidency of the state association was a deserved honor to his integrity and ability as an organizer and his executive skill. The entire fraternity mourns his loss.

OF the 1,720 electrical patents issued in 1893, says the World, 213 were in the traction field, of which 84 were systems and conduits, and 25 electric locomotive devices. Electric welding claims 18 plans, while trolley specialties head the list with 104 individual inventions.

THE LATE H. R. RHOADS.

## LONG DISTANCE TRANSMISSION BY CONTINUOUS CURRENTS.

By F. Boissonnas of the Cie de l'Industrie Electrique, Geneva.

The extraordinary fancy shown lately by most electrical people in favor of multiphase working for long distance transmission, and in general for all kinds of work, is not justified by the practical results achieved, and we will endeavor to show why we do not believe in the successful future of multiphase currents transmission or distribution. It must be well borne in mind that we do not reject absolutely multiphase current, and in some cases we may even find advantages in their adoption, but we want to declare against the opinion that they are the universal panacea for long distance transmission and distribution.

It is only since the Frankfort exhibition, less than three years ago, that multiphase currents have made a practical entrance into the electrical world. They were previously well known to electricians, principally from the experiments of Ferraris, Tesla and Thomson, but their coming on the stage of large experimentation announced as a practical achievement, was engineered with such skill that the effect produced was enormous, when the practical results were at least questionable. What were the advantages claimed for multiphase currents? They were numerous; at least two of those stood in front well ahead of the others. First of all, the ease with which all alternate currents are transformed from low into high tension or from high into low tension, and next, the simplicity of construction of motors, and their starting even when loaded. If we consider the first advantage, which is a real one, we see it is yet limited by practical considerations. Let us suppose we have to transmit a very large power at a very great distance. If we want to do it economically, we have to use an enormous voltage, to reduce the cost of mains. Now, how do we get that enormous voltage? Nothing is more easy, as it seems. We have the transformer at hand, and we will transform at 50,000 or 100,000 volts. That is certainly very nice when speaking of it, but when we come to design transformers to stand this enormous tension, we have to face difficulties such that we are obliged to come to lower tensions. It is splendid to design transformers for 100,000 volts, but it is still more splendid to see these transformers at work. We mean transformers for industrial purposes, carrying a certain number of amperes, and not experimental transformers for some hundredths of amperes.

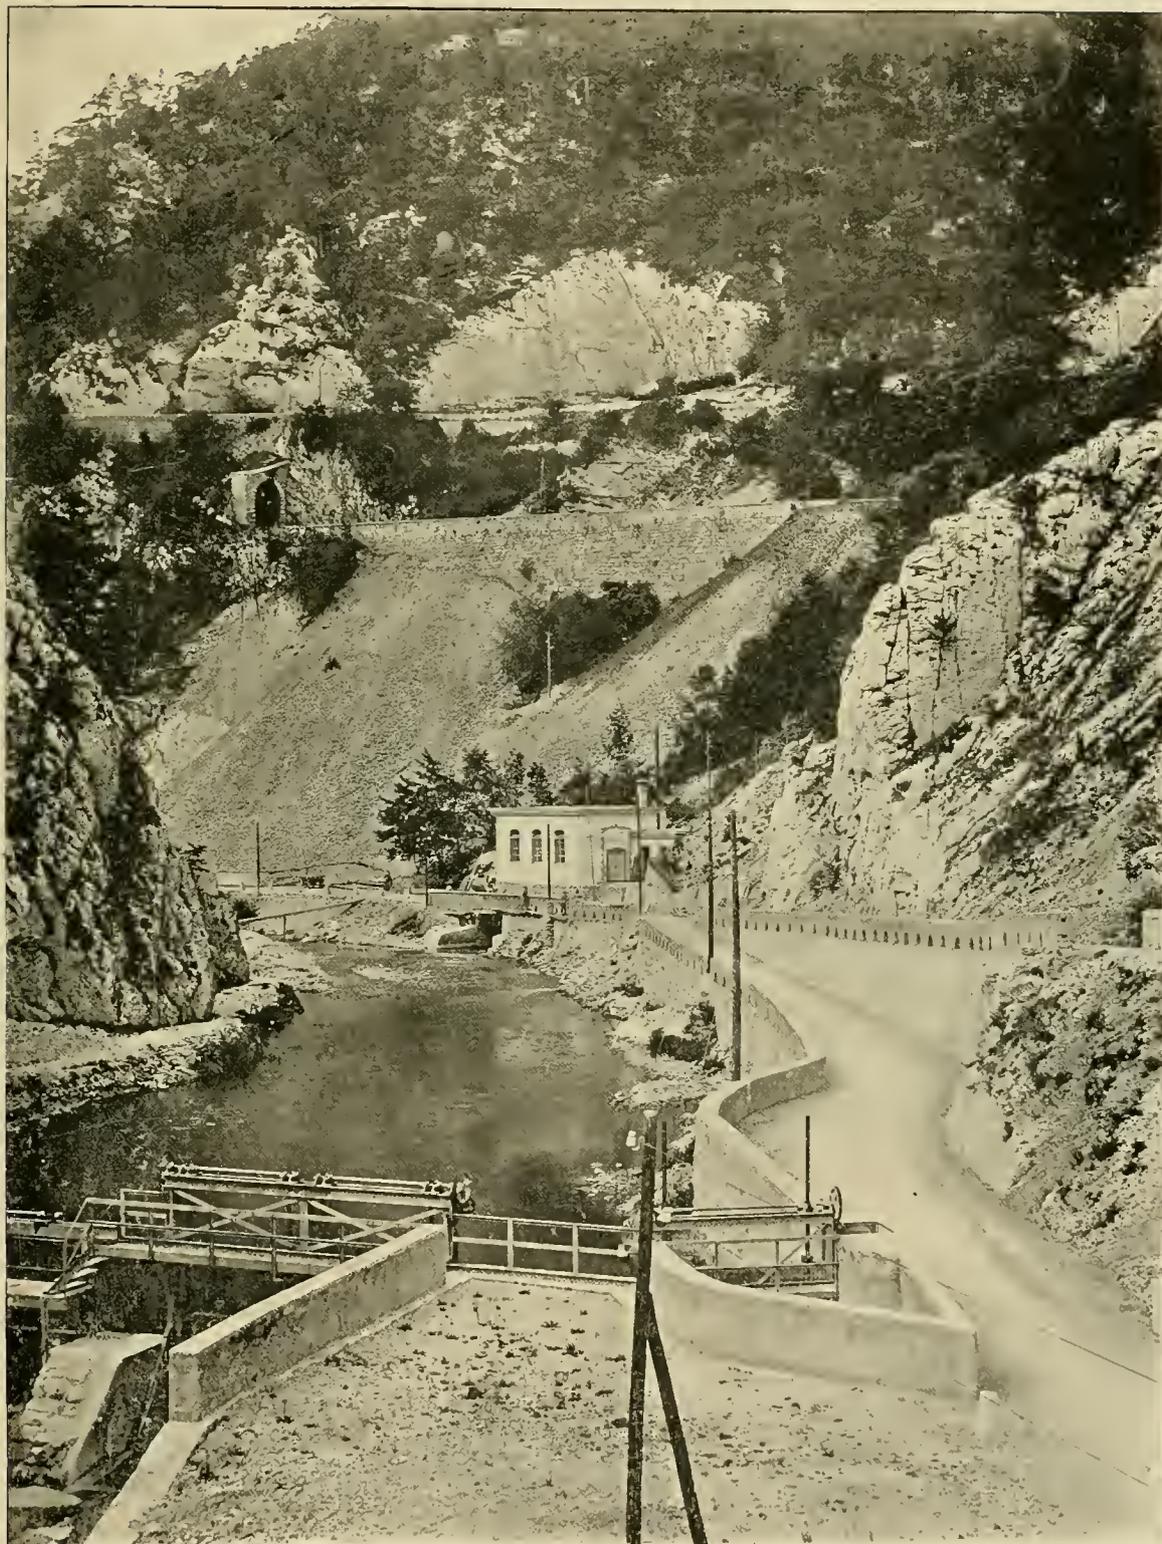

We think we are right in asserting that no commercial transformer has been constructed for working steadily at pressures over 20,000 volts, and there are not more than two installations utilizing this voltage. They have been in working order only since a few months, not a period sufficiently long to form a definite opinion on their qualities. But we contend that, in the cases where they have been adopted, continuous currents would have filled their place with equal, if not better results. The multiphase

current motor has over its continuous current rival the advantage of dispensing with commutator and brushes. That is a great point in mining work where you have to take sparking into consideration, but we must remark that in modern continuous current motors, the running can be considered as sparkless even under varying loads, and that by the use of carbon brushes, the tear and wear on the commutator may be neglected. We are well aware of the advantages of easy transformation and of suppression of sparking, but in most cases these advantages are overrated and cannot compete with the inconvenience derived from the system itself. We all know that in practice, either with tri- or biphased currents, if one conductor is used as common return for several circuits, that which is the most economical and less complicated arrangement, the circuits utilizing this common return come more or less in interference one with the other, with the result that if the currents passing in these circuits are different in intensity they induce variations in the voltage, variations which may reach as much as 30 per cent in practice. Thus is lost the quality of multiphase currents to supply light and power with the same mains.

In multiphase current working we have an important question, as to the best frequency. Is it better to work at low or high frequency? The question is twofold. If we consider the cost and efficiency of transformers, high frequency is to be preferred, and it seems also better for connecting alternators in parallel, if we consider practical results. But on the other hand, low frequency is better for motors, as it enables getting very low speeds without multiplying the number of poles. You are obliged to sacrifice either the transformers or the motors, as taking the average does not give good results. By using multiphase currents, you prohibit the use of concentric cables, on account of their capacity effects. You cannot always adjust your load so that the capacity just balances the lag in the current, (that is to say, the self-induction) and the connection or disconnection of parts of cables by the starting or the stopping of a motor, induces pressure effects, enormous as to the rise of voltage they originate; this voltage being possibly many times the working voltage, with the result that no insulation will be capable to withstand the enormous strain put upon it. Many devices have been brought out, it is true, for attenuating these pressure effects, but they are more or less complicated, rather more than less, and people do not want complications which they may dispense with. If pressure effects are originated in concentric cables carrying multiphase currents, induction effects are set up in parallel cables carrying these currents, which means loss of power and trouble in the distribution.

Another complication people do not want is in the number of conductors. In multiphase working, the bet-

LONG DISTANCE TRANSMISSION BY CONTINUOUS CURRENTS.

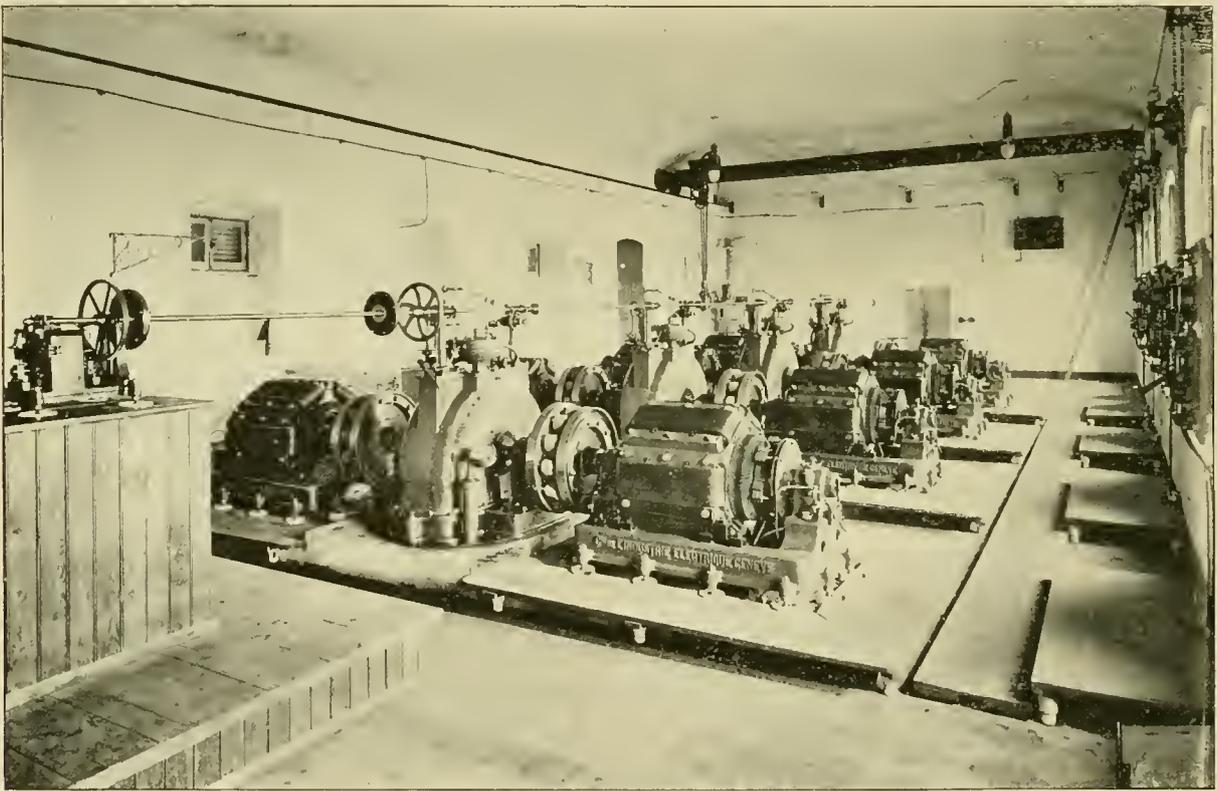

PACCINOTTI WATER POWER STATION NEAR GENOA, ITALY.

ter results are achieved with four conductors; but who will want four wires if he knows he can do as well with two, or still better with one? Another very important question is that of efficiency. Users have to pay for the whole current entering their premises, and if they have a transformer, they have to pay for the current wasted in the transformer. Moreover, in long distance transmission by multiphase currents, we have to take into account the losses in the generator, a step up transformer, the line, a step down transformer, and the motor, supposing each motor to be supplied by its own transformer. If we may dispense with transformers, we have a clear profit, not only on the working, but even on the prime cost, since owing to the increased efficiency, when leaving out trans-

series, and an able professor has gone so far in this way as to say that this coupling was impossible, since to connect a new machine, the load increasing, it was necessary to break the circuit. He did not, evidently, think that by short circuiting permanently the machines when at rest, there was no necessity of breaking the circuit to connect a new unit.

High tension closed coil continuous current machines have not come into general use on account of the difficulties encountered by makers with the commutators. We claim to have arrived at such results in that way as to be able to guarantee absolutely the good working of 3,000 volt dynamos, even if working day and night continuously for months.

INTERIOR PACINOTTI WATER POWER STATION.

formers, the plant to be erected for transmitting a given amount of energy may be considerably less, and consequently cheaper. With very high tensions, each transformer is a weak point, facilitating a break down. The system we propose and advocate below, is not considered by ourselves as an universal panacea, but as an excellent specific in many cases, principally for long distance transmissions and distributions.

What is the greatest grievance against continuous currents? People pretend its use to be incompatible with high tensions. That is wrong altogether. If we have batteries, and if we want a high tension, we connect in series as many cells as are necessary to get this tension. Why not to do the same thing with dynamos? There is a very strong prejudice felt against coupling dynamos in

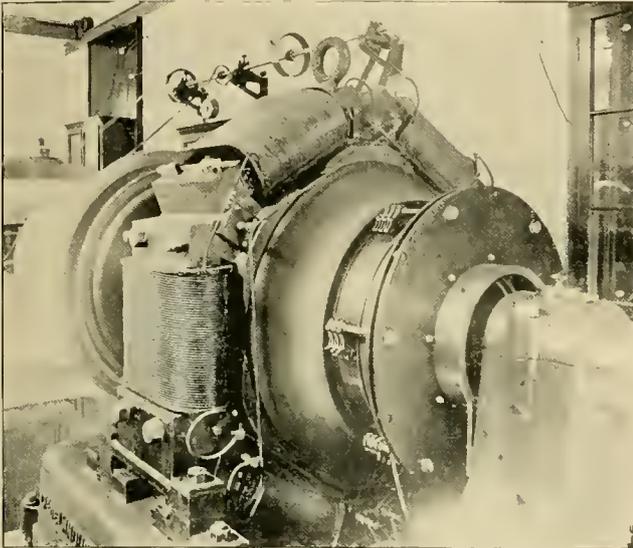

With 3,000 volt units it is not difficult even with a limited number of units to reach very high voltages. With six units only we arrive at 18,000 volts, and nothing prohibits going much higher. This arrangement is possible only for a certain power to be transmitted, as you cannot make 3,000 volt machines for a few horse-power only. The system may seem complicated at first sight, on account of the number of units necessary, but, if we consider the results achieved both as to efficiency and simplicity of working, we see that this complication is more apparent than real. For efficiency an example will show it better.

Suppose we have to deliver current to a motor and must be able to get 1,000 horse-power out of the shaft of the motor, and this current is to be transmitted from a

generating station utilizing water-power. Let us see if it is more advantageous to use multiphase or continuous currents for this transmission.

Starting with the first-named, the efficiency of the motors of large power, either continuous or multiphased, may be taken as 92 per cent, the efficiency of transformers 95 per cent, that of the line in both cases 90 per cent, and that of the generators also 92 per cent. So the horse-power required from the turbines will be in the case of multiphase currents  $1,000 \div (0.92 \times 0.95 \times 0.90 \times 0.95 \times 0.92) = 1,454$  horse-power.

With continuous currents and a transmission in series,

1300-VOLT GENERATOR, PACCINATTI STATION.

allowing us to reach the same voltage as with multiphase currents, the efficiency is the same for motor, line and generator, but we dispense with transformers, so that in this case, the energy required from the prime mover comes to

$$1000 \div (0.92 \times 0.90 \times 0.92) = 1,312 \text{ horse-power.}$$

So we realize a saving of 140 horse-power and the working is much simpler.

#### SOME PRACTICAL EXAMPLES.

After a perusal of the above, it will be interesting to investigate the manner in which this company has demonstrated their theory as to direct current transmission.

On the side of the mountain, opposite Genoa, is an available waterfall of nearly 1,200 feet. This is utilized by three stations, one above the other, the object being to obviate using such enormous pressure with the turbines. Evidently Pelton wheels are not common in that region. The power transmitted from these stations is about 1,000 horse-power. The highest is known as the Galvani station, the intermediate the Volta, and the lowest the Paccinotti. Our engravings are of the Paccinotti, which is a fair example, and will be described briefly. These are four 140-horse-power turbines, each connected by insulated couplings with two series wound dynamos, giving a constant current of 45 amperes. The maximum voltage of each machine is about 1,000. The dynamos

are all run in series, so that the station voltage at full load is 8,000. The turbine speed is regulated by the current, by means of a differentially wound motor, which opens and closes the turbine valves. However, the peculiarity of the series dynamo nearly makes such regulating apparatus unnecessary, as, no matter what the load, these dynamos require a constant torque, and this is just what the turbine tends to keep. The dynamos and surrounding platforms are very carefully insulated, as will be noticed.

The power is transmitted about twenty-five miles, and utilized by motors of from 3 to 60-horse-power. The system is best adapted to the use of large motors, and hence to the replacing of engines in street railway plants, which is about the only way in which power transmitted from a long distance can be utilized by street railways in the present state of the art. Since completing the Genoa stations, the Cie de l'Industrie Electrique has put in another plant for transmitting power to a station eighteen miles distant. In this, two 3,000-volt generators are connected electrically in series, making the line voltage 6,000 to 6,500. The two motors, which are used to run a paper mill are also connected in series.

#### THE ONE THING NEEDFUL.

The public-spirited citizen sat down with a grunt in the street car and glanced about for an audience.

"These stuffy cars are regular disease breeders," he said to a short, fat, bland and meek party by his side, in a voice that could be heard in the car that was following.

"So?" queried the meek man.

"Yes; and it is an infamous outrage that the poor laboring man has to pay five cents for a ride when four of those cents go into the monopolist's pocket."

"Don't say?"

"Yes; and you can't beat them with a rival company, for they'll buy up the courts, they'll buy up the courts."

"Is it possible?"

"Yes, and—"

"Hold on," said the meek man, as the conductor came in to see what the noise was about. "Haven't you forgotten one more thing that ought to be done?"

"What's that?" asked the loud man, with a don't-interrupt-me-inflection.

"Don't you think," said the meek man, very slowly, "that they ought to provide inside platforms for public speakers?"

#### NEW PAVEMENT AT MUNICH.

A pavement has been tried in Munich for about two years, which consists of blocks made from serpentine rock ground up, treated in a solution, and pressed into shape by hydraulic power. The blocks are 10.8 by 4.4 by 6 inches and 7 by 4.4 by 6 inches. The manufacture is carried on by a German firm. The blocks are peculiar, in that while very tough they are not brittle, and powerful blows make an impression on the stone but do not break or splinter it.

### AN ELECTRIC FREIGHT LINE.

An interesting experiment is said to about to be made on the Delaware River and Lancaster Railroad in Chester County, Pennsylvania, looking toward the equipment of this erstwhile steam line with electricity. The road is eleven miles long and has been built four years but abandoned after two trials, one as an independent line and one as a leased part of the Wilmington and Northern.

Col. Du Pont of Philadelphia, president of the original Company, is now planning to resume independent operation, using electricity instead of steam power and hauling freight exclusively. A fall on the French Creek is thought to be sufficient for water power.

Valuable quarries will furnish the traffic and freight.

### THE STREET CAR SPITTER.

At present, Minneapolis has given over every other interesting topic to discuss the abomination of tobacco chewing and spitting on the street cars. The medical faculty has been invoked to give long columns of physiological and bacteriological reasons why the spitter must go. Ladies by dozens besiege the general manager and the mayor, asking for relief. The city council will probably have a proposition submitted to abate the evil. Ad interim the car cleaner waiteth and trembleth, between hope and fear, and the spitter eke wondereth if the succulent "plug" will be relegated to the front platform and the aristocratic fine cut shall be banished from its morning ride.

### GETTYSBURG BATTLE-FIELD ROAD RECEIVER.

The Maryland Steel Company and the Brill Car Company, file bill in equity, asking that a receiver be appointed for the Gettysburg battle field railway and that the management be restrained from selling the property. The bill charges mismanagement on the part of the management and that \$11,000 are owed the complainants. Judge McClean allowed preliminary injunction.

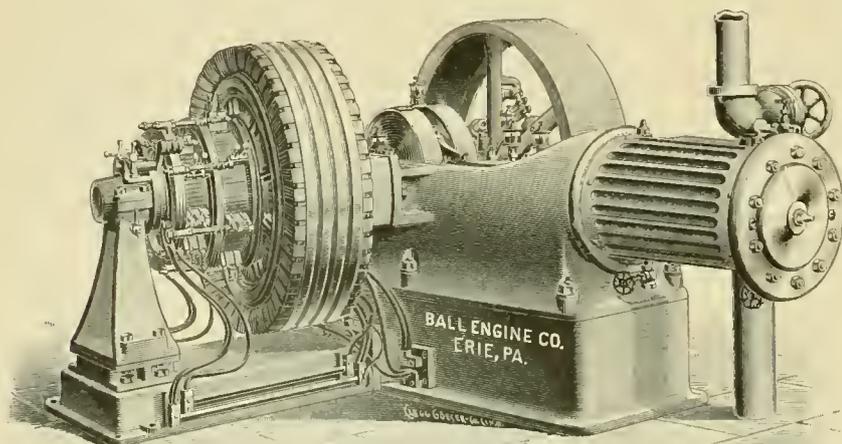

### THE SEVEN STAGES OF A STREET RAILWAY.

- I. At first the incorporators  
Striving and pushing for a chartered right  
To enforce the doctrine 'right means might.'
- II. Then the wealthy syndicate,  
With their glowing bits of fact and fancy,  
Sounding like tales of necromancy.
- III. And then the bankers  
Seeking to sell the bonds, solid as rock,  
Keeping themselves the freely-watered stock,  
This for the lambs—investment good as gold—  
A brand new lamp, better than those of old.
- IV. Then the car trusts,  
Mortgages on wheels  
Foreclosed so readily without appeals.
- V. And then the receivers,  
No coupons now to pay,  
All debts deferred until some other day,  
A voting trust protecting all the stock  
That grewsome bears are sure to try to knock.
- VI. The sixth stage shifts  
Into the reorganization plan,  
Where all the wreckers join in one great band  
Where innocent experience dearly bought  
Is daily learned by some—by others taught.
- VII. The last scene of all in this eventful mystery,  
Two streaks of rust—a mortgage and—a history.

*Mount Holly Herald.*

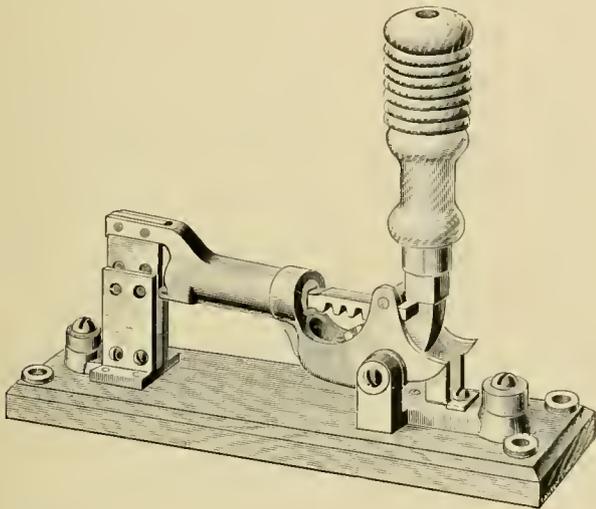

### THE BALL DIRECT CONNECTED ENGINE.

Engine builders have of late been rapidly adapting their engines to direct connection with various types of dynamos, and the direct connected form is coming extensively into use, especially where space is valuable. The Ball Engine Company, of Erie, Pa., have made a number of installations in connection with various types of dynamos. Among recent ones, are two 200-horse-power cross-compounds, directly connected to Siemens & Halske dynamos, for the Lumber Exchange Building, Minneapolis, Minn., one 125-horse-power simple engine, connected to a Waddell-Entz dynamo, in the store of Willoughby, Hill & Co., Chicago, one 80-horse-power engine in connection with a Waddell-Entz dynamo, in the building of Cumner Craig & Co., Boston, Mass. The accompanying engraving is of the 80-horse-power engine and Waddell-Entz dynamo. The armature is keyed to the engine crank shaft. This shaft is supported at the end by an outboard bearing, resting on an extended sub-base. The distinctive features of this well-known engine are beauty of design, simplicity and compactness, solidity of frame, large bearings and excellence of materials and workmanship. The massiveness of the Ball engine makes it well adapted to varying loads. The regulation is within one per cent. Every detail of construction receives the most careful inspection and every engine is thoroughly tested before shipment is made.

**PNEUMATIC QUICK BREAK SWITCH.**

The Ohio Brass Company, of Mansfield, Ohio, manufacture a quick break switch which introduces a pneumatic blow out. The engraving shows the switch closed. The handle has a toothed segment near its base. This segment meshes in a rack operating the plunger rod in the cylinder. When the handle is drawn down the plunger is drawn out of the cylinder and a spring in the cylinder is compressed. When the handle has been drawn down to a certain point the small projecting pieces strike the body of the switch and the contact lips are separated. As soon as this is done the compressed spring in the cylinder draws the arm up to make a quick

wide break, while the movement of the plunger forces a jet of air against the arc. The switch is of polished brass on a slate base, and is made single, double and triple pole from 100 amperes upward. It is a very ingenious and at the same time simple device and certainly has a place on the switchboard.

**MELBOURNE'S MUTUAL BENEFIT ASSOCIATION.**

A strongly organized and splendidly conducted Mutual Benefit Society has been doing its good and beneficent work among the employes of the Melbourne Tramways Company, since 1888.

Its benefits are classed thus:

- I. Relief of members in case of sickness or accident.
- II. Defraying funeral expenses of members or members' wives.
- III. Providing medical attendance for members, their wives, and children under sixteen years of age.

The membership is composed of employes in any capacity, of the Melbourne Tramways & Omnibus Company, Limited, not a contractor for the company or an employe of a contractor, of good moral character, between the ages of 16 and 45, not a member of any trade union wholly or in part composed of employes of the company, and who passes the physical examination and pays the dues.

Entrance fees are charged. From the ages of 16 to 35, sixty-two cents; from 35 to 45, \$3.75. Each member pays a weekly subscription of twenty-five cents in advance, provided that any gifts received from the company or any other source shall be applied to lighten this tax, until it shall be reduced to twelve cents per week.

Honorary members may pay annual subscription of \$25.00. The funds are distributed between the two general purposes, namely: The sick and funeral fund and the medical and management fund.

The society is governed by a managing committee, representative of the classes of labor employed, as follows:

- 1 gripman and 1 conductor from each line of cable.
- 1 driver from each horse car or omnibus line, provided the maximum number of cars or busses be not less than five.
- 2 men inside car barns.
- 2 men inside engine house.
- 2 men inside stables and buss barns.
- 2 from miscellaneous employes, clerks, etc.

The committee must have at least twenty and not more than thirty-one members.

The benefits are on a sliding scale. Every member who shall have been in good standing six months and incapacitated by sickness or accident, may draw \$5.00 a week not longer than six months. Members of nine months' standing may draw the same amount for six months, half the amount for three months more, and \$1.25 a week for three months longer. A six-months member's next of kin receives \$50 and a nine-months member's \$100 in case of member's death.

In case of death of a member's wife, or widowed mother supported by such member, the member receives \$25 if of six months' standing, and \$50 if of nine months' standing. Every member shall be entitled to receive free medical attendance for himself, his wife, his children under sixteen, and for a widowed mother or her children under sixteen, if supported by the member.

These benefits are protected from misuse by certain regulations relative to drunkenness, immorality, bravado and fraud.

A series of blanks is in vogue, of which we reproduce three.

DOCTOR'S CERTIFICATE ON FUNDS.

I certify that..... is afflicted with or suffering from..... and is not able to follow his usual employment of..... Society Doctor.

DOCTOR'S CERTIFICATE OFF FUNDS.

I certify that..... is sufficiently recovered to be able resume his usual work as..... and is not entitled to further sick allowance. Medical Officer.

MEDICAL CLAIM FOR FUNERAL ALLOWANCE.

I certify that....., aged..... years, late of....., died on the..... day of....., 18.., and I consider his (or her) death to have been caused by..... (or the verdict was.....) Dated..... day of....., 18.. Medical Officer.

The society is under supervision of the provincial government, and has been of the greatest and most praiseworthy service to the employes and their families.

## T RAIL IN SAN FRANCISCO.

The Southern Pacific Railroad at its street crossings in San Francisco uses a small T rail as a flange, in the manner shown in the accompanying illustration. The paving is then laid against the flat bottom of the set-in rail. It has the advantage of not requiring any form of rail not commonly in use on the road. We are indebted to W. A. Underhill, of San Francisco, for these interesting particulars.

## PREECE ON AMERICAN ELECTRIC RAILWAYS.

The eminent English electrician, W. H. Preece, ex-president of the Institution of Electrical Engineers, has been favoring that body with some notes taken on his trip to the United States last summer. He concluded his paper with a few remarks on electric railways, some of which will be news to Americans.

Thus, for example, it is generally known that broken insulators are more common with bracket than with span wire construction, but a very different impression of the status of center pole construction is given by Mr. Preece, who says: "Attempts have been made to improve the appearance of the road, by using handsome central iron poles, with solid brackets on each side, to carry the two trolley wires, but the want of elasticity has introduced fresh evils. The trolley frequently comes off and great sparking is evident." It is also indeed "astonishing that the American community submit" to the trolley, when it is the only practical solution of the rapid transit problem in 99 out of 100 cases. The Chicago North Shore Electric Railway is briefly described, and in general favorably criticised. He says, however:—"The feeders are carried on wooden poles, which are very unsightly. These feeders could have been more economically and more efficiently put under ground." If Mr. Preece had not been able to figure out simple problems in arithmetic better than that in times past he would never have attained his present standing. What a foolish thing it was for the North Shore company to sink so much money running feeders on neat pole lines over the prairie and down the back alleys of suburban villages, when those feeders could have been more economically and efficiently put underground. We are afraid, however, that the interest on six or seven miles of underground wiring would make a big hole in the receipts of a suburban road. Mr. Preece has learned that the average mileage of a car in full service is 250 miles a day, and its mean speed fifteen miles an hour. This will make those superintendents who thought their cars were making a good record at 150 miles a day and a maximum speed of fifteen miles an hour, rub their eyes and wonder if they have been asleep and have been left behind in the march of progress.

## COST PER CAR MILE AT LITTLE ROCK.

Last month mention was made of the good record of the Little Rock (Ark.) street railway system.

Through the kindness of Consulting Engineer B. J. Arnold we are enabled to give this month, in its entirety, Manager H. G. Flemings' excellent record.

As to fuel, coal is used at \$1.25 a ton. Lima oil can be delivered on side track at  $3\frac{5}{100}$  cents a gallon, thus being unable to compete with coal.

The gross earnings of the system for the year ending December 31, 1893, were \$101,460.03, the operating expenses were, not including insurance and taxes, \$62,828; net earnings, not including insurance and taxes, \$38,636; per cent of expenses to earnings,  $61\frac{9}{10}$ ; insurance, \$1,600; taxes, \$3,503.

The car mileage was 714,228; total expenses per car mile,  $8\frac{8}{100}$  cents, not including insurance and taxes; insurance and taxes per car mile, .7 cents. Passengers carried (numbered) 1,969,582; expense per passenger, not including insurance and taxes  $3\frac{1}{100}$  cents; line expenses, per car mile, .2 cents; track expenses, per car mile, .6 cents; expense per car mile for car cleaning, repair of cars and motors, 2.1 cents; expense per car mile for power, 1.5 cents; expense per car mile for fuel, .7 cents. The other expenses per car mile were 4.4, and the earnings per car mile, 14.2 cents; passengers carried per car mile, 2.76.

During the year not a passenger was killed and only 19 injured, or a proportion of 1 in 103,662 passengers carried. The damage claims amounted to \$275. In the statistics given are included only revenue passengers, complimentary tickets and employes riding would swell the total traffic to over 2,000,000 and reduce the per passenger percentage in proportion.

For an 18-car road in the hands of a receiver, and with 30,000 population to draw from, this record is an unusual one.

## THE MATHER ELECTRIC COMPANY.

The Mather Electric Company announces its return to manufacture and its reorganization. The official list is as follows: President, Maro S. Chapman; vice-president, T. C. Perkins; secretary and treasurer, John L. Bunce. All the officers are well known to the electrical fraternity, and are, besides, experienced in the manufacturing business.

The technical arrangements are in the hands of Theodore Gonet, with E. Powell as assistant. The company begins operation with a well equipped factory, at Manchester, Conn.

There is a good working capital, and the business will be extended as necessity requires. It is intended to manufacture a variety of electrical specialties, including large dynamos for electric light and street railway power stations.

DURING the severe snow storm of February 12, the Milwaukee Street Railway Company kept its 130 miles of track open throughout the day.

PERFORMANCE OF MODERN MOTOR EQUIPMENTS.

Electric railway motors and their attendant appliances have been in a state of constant change ever since the beginning. While the motors have been greatly improved in the way of durability the requirements have also been increased. The maximum speed now common is from 10 to 25 miles an hour, in place of 8 to 12, as formerly. It is also safe to say that quicker starts are made than a few years ago. For these reasons a scientific comparison of present equipments with previous ones is almost impossible, and perhaps even were it possible it would be useless, as no one would think of going back to the double reduction motor with its attendant repair bills even if a much higher efficiency could be shown for it.

very clearly the current consumption of modern motors pulling trailers, and the results were very gratifying, both as regards average and starting current. Almost nothing has lately been published on the power consumption of the latest types of motors when running alone. The accompanying curves have been selected as giving a good idea of the performance of modern motors under various conditions.

Figure 1, is a curve plotted from readings taken on a Sperry motor in regular service on West Twenty-second street, Chicago, by superintendent W. F. Brennan, of the Chicago General Street Railway Company, and a REVIEW representative. In this and in all the following

FIG. 1.

Nevertheless it is interesting to know how modern equipments really act under modern requirements, and to see what changes series-parallel control and increase of speed and weight of cars have brought about in the power consumed by a car. For any given weight of car and type of motor the initial starting current required with series-parallel control is one-half that necessary with the old style rheostat and the motors always in parallel. To partly counteract this are the heavy modern car bodies. The initial starting current must also necessarily be higher with single reduction than with double reduction motors, other conditions being equal. Increase of speed of course calls for more current and helps increase the average current required from the power station thereby, also helping to counteract the effect of series-parallel control.

The motor current curves from the Chicago City Railway, published in our November, 1893 issue, showed

curves, the time taken in waiting at railroad crossings has been left out of the account, hence the averages will be a little higher than they actually are in practice. In Figure 1, the length of trip was 9,900 feet; time, 11 minutes, 20 seconds; maximum speed of motor, on level, 12 miles per hour; average speed of trip, 10 miles per hour; average current, 24.4 amperes; track slightly greasy; line straight, and without grades; weight of car, 6 tons. Figure 2, is the return trip of Figure 1. The average current was 23.8 amperes, and the average speed, 10.1 miles an hour. The points marked S, are the starts from a dead stand-still. The readings were taken every 10 seconds. The motor is Sperry's latest type bevel geared, and flexibly suspended between the axles. The starting current is, of course, high, but still less than with many old types. The control is entirely by rheostat.

Figures 3, 4 and 5 are from the note book of G. W. Knox, electrician of the Chicago City Railway. Right

here it may not be amiss to mention the sound policy of superintendent Bowen, in keeping such close records and having such extensive tests made of everything on his electric lines. Furthermore, his willingness to give the street railway fraternity the benefit of them can not be too highly commended, and we are sure is appreciated by all.

S 10 means that the car was started from a standstill and the controller put on the tenth or highest point without pausing at the intermediate ones. It is gratifying to note the fact that it is almost impossible for a motorman to seriously abuse his car by too sudden starts. Even with a very rapid handling of the controller the current rarely exceeds 60 amperes, and with a slow start, such as is

FIG. 11.

Figure 3 is from a Westinghouse single motor equipment in regular service on Forty-seventh street. Distance, 3 miles; time, 23 minutes, 30 seconds; number of passengers, 85; weight of car, 13,680 pounds; average speed, 7.8 miles an hour; maximum speed 15 miles an hour; average current, 20.5 amperes; 15 second readings.

common on many roads, the initial starting current is even less than that required at full speed. In other words, to make a very quick start now requires no more current than was formerly required for very slow ones.

In Figure 4 the distance was 18,480 feet; time 17 minutes, 30 seconds; average speed 12 miles an hour; weight

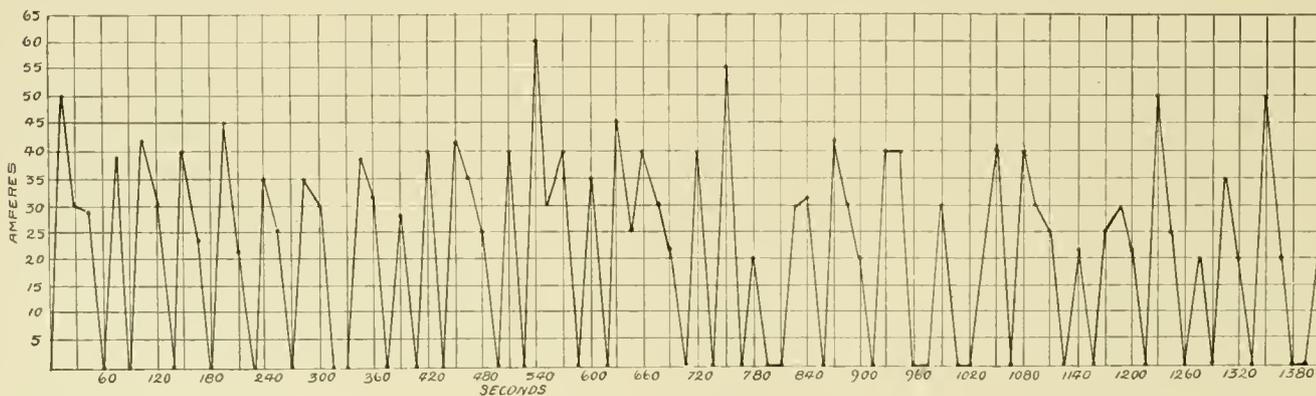

FIG. 111.

We come now to a study of series-parallel control. Figures 4 and 5 are from a Westinghouse double motor car without trailer, on Thirty-fifth street. S indicates a start from a dead stop. G is a 6 per cent grade, 1,200 feet long. M indicates maximum speed. The figures show the point which the controller handle was on. Thus

of car, 15,980 pounds; passengers, 26; average current, 29.3 amperes; track a little slippery.

Figure 5 is the return trip of Figure 4. The time was 18 minutes, 45 seconds; average speed, 10 miles an hour; average current, 18 amperes.

The following are some figures obtained by Mr. Knox

from double motors running on the various points of the Westinghouse controller. The average of readings is as follows. Four to fifteen readings were taken on each point.

	AMPERES
First point,	11.0
Second "	12.0
Third " (motors in series resistance all out)	16.7
Fourth "	19.5
Fifth "	23.1
Sixth "	24.2
Seventh "	22.1
Eighth "	29.7
Ninth "	31.6
Tenth "	34.2
First " (6 per cent grade)	20.5
Third " " "	19.0

point 10 miles per hour; second 10; third 8.5; fourth 12.2; fifth 10; sixth 12; seventh 12; eighth 17.1; ninth 17.1; tenth 15. The voltage never varies more than 10 per cent and the track was apparently all in the same condition, so that the variations both of speed and current are very hard to understand. A motor running at full speed along a level track will show variations of current amounting to five or more amperes, for which there is no apparent reason. There are however on ordinary streets usually almost imperceptible differences in the condition of the track and it is very probable that these are the cause of many strange variations, which are noticed not only on individual car tests but in the power station from day to day.

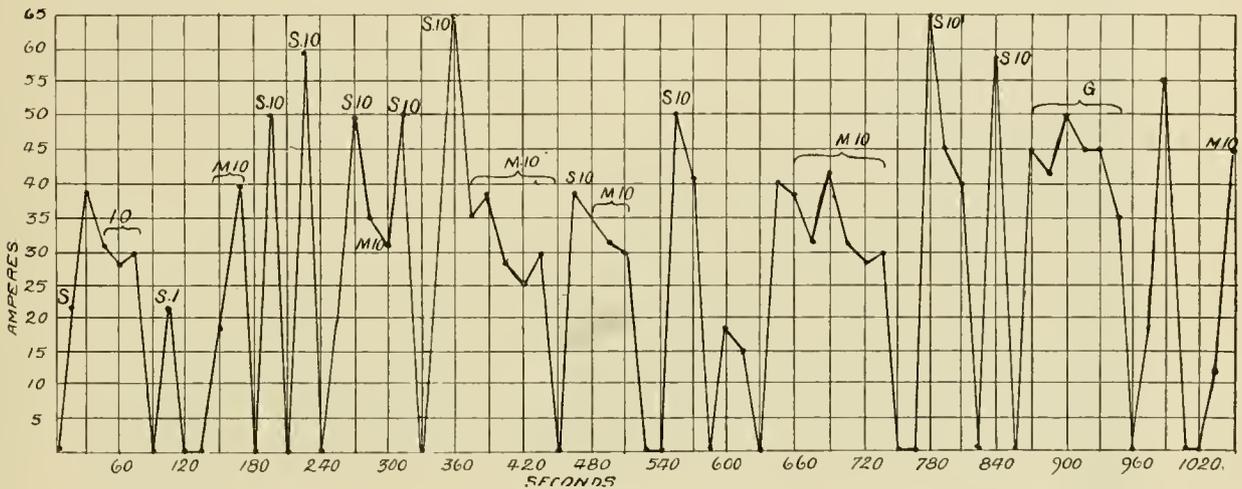

FIG. IV.

The low readings on the seventh point are partly accounted for by a very slight favoring grade. Other conditions were apparently identical and while the test did not pretend to be hair splitting it was carefully made and represents every day conditions. Of course in prac-

### A BRILLIANT SCHEME.

The Electrical Engineer commends to inventors the designing of an electric car speed indicator, which would enable the motorman to tell the speed of his car at a

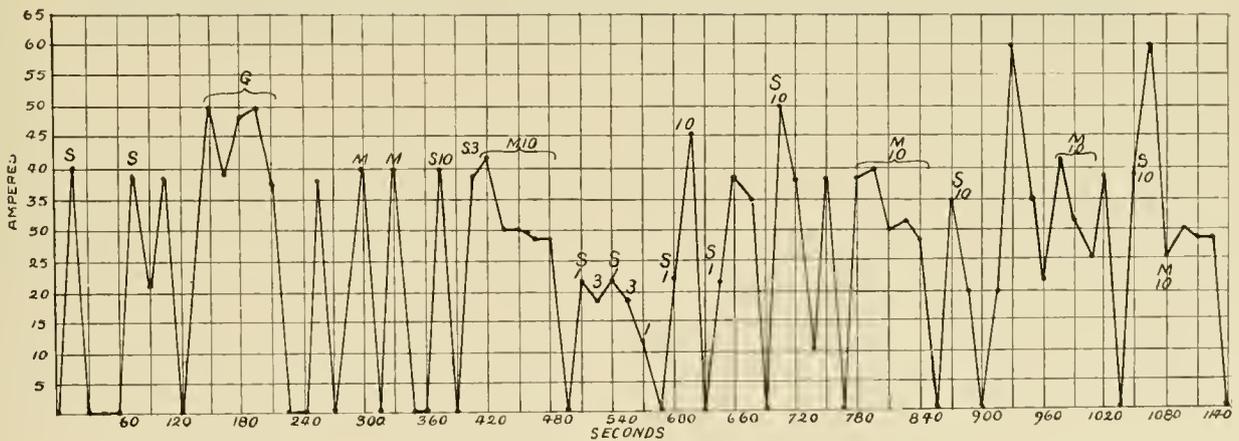

FIG. V.

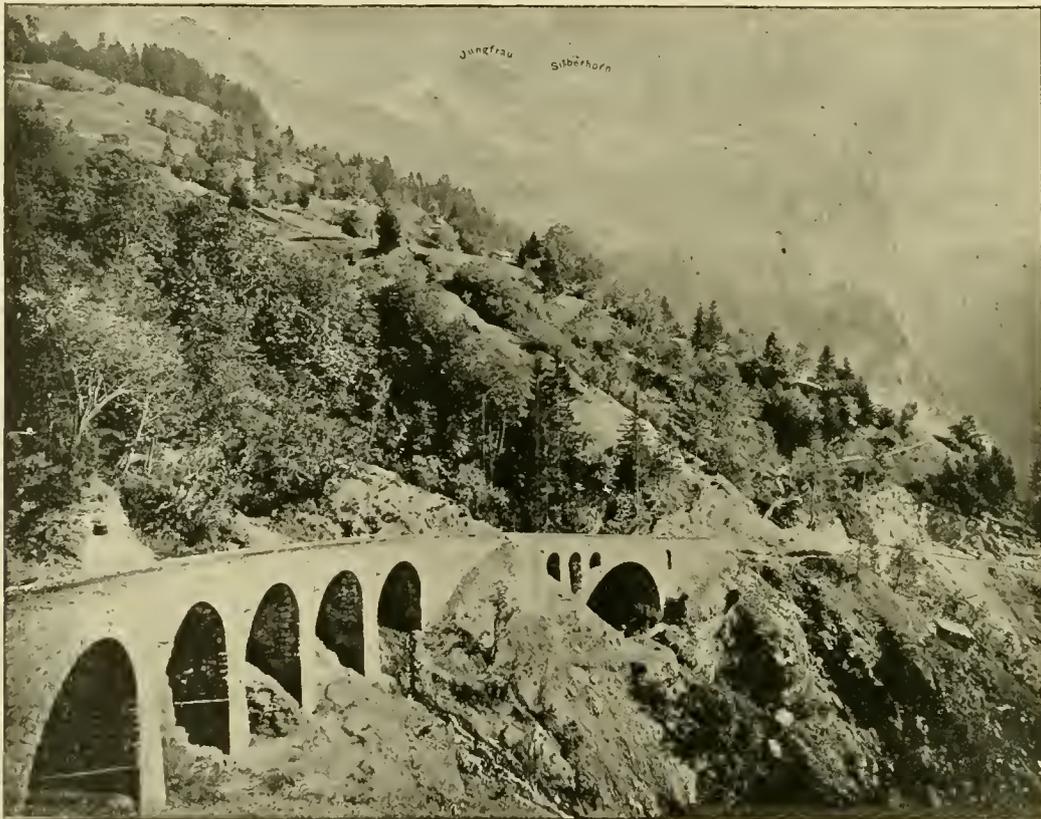

tice the controllers are never stopped long on any but the third and tenth points. There are also variations which come in to influence results, and which are most difficult to account for. This is shown by the record of the speeds during the above readings, which were as follows: First

glance, and so tell whether he is violating the city ordinance as to speed. "That it has become a necessary adjunct for electric cars is obvious," says the Engineer. We always had the impression that a motorman who could not tell how fast he was running within two or

three miles per hour ought to be taught better or fired. Fine distinctions are not necessary, and as a competent man can determine very closely his car speed, what is the use of putting such a plaything as a speed indicator on a car. If the schedule time is too fast, danger of accidents will be increased. The maximum speed has very little to do with it. It is the temptation to sacrifice safety for time and take risks that would not otherwise be taken that kills both motors and people. Speed indicators either of the "visual" or "audible" type would only complicate difficulties..

If, however, some "indicator" becomes necessary, we suggest the most effective would be a governor geared

feet can be carried. This makes the construction of false works very difficult. One of the most serious difficulties is in regard to surveying the steep and irregular mountain side. It was found impossible to project the line from data obtained from the preliminary survey, because it gave such an inaccurate idea of the contour of the land and curves could not be located with sufficient accuracy. Another peculiar difficulty met at first, was with the curves which were planned as if they were to be laid on level ground. Consequently the inner rails would fall short. As the design of the track required that all joints should be exactly opposite one another this interfered considerably with the work. Metal ties bolted to the

RACK RAILWAY UP THE WENGERN ALP.

to the car axle, which would automatically operate a stuffed club and thump the driver in the back of his neck when the speed limit was overreached.

#### RACK ROAD UP THE WENGERN ALP.

The last of the Swiss mountains to be ascended by a rack railroad is the Wengern Alp, on which the road was opened to traffic last summer. Being the newest road, of course advantage was taken of the experience gained on all the previous Swiss roads of the kind, and the railway in question represents the most improved practice. T. Delmar, in the *Railroad Gazette*, from which our engraving is taken, gives an account of some of the difficulties encountered in the building of this mountain line. The cost of transporting material up the mountain is something enormous. Then, too, no timber longer than 20

rails were used throughout. It is thought by many that this will be the last road of this kind to use steam. Coal per mile operated, costs from \$1.40 to \$3.40. Electricity generated by water power as on the Stanserhorn cable road described last month, is to be the coming power for mountain roads.

EIGHT men were asphyxiated in the basement of the cable plant at Kansas City, recently. A strand of the cable wrapped around and broke a gas main. The men were sent to repair the pipe, with the above result. Superintendent C. P. Kline was one of the victims.

By the bursting of a steam pipe in the power house of the Philadelphia Traction Company five men were injured.

## INSURANCE RATES AND POWER HOUSE CONSTRUCTION.

In spite of the peculiar and unreasonable policy of insurance companies as shown by some of their rulings, the average station manager and constructor has much to learn from them as regards the proper construction and maintenance of buildings. If mutual insurance is to be made a success by street railway companies it must be taken up in a thorough manner. All the good points of the "old line" management must be strictly adhered to and the hap-hazard and unbusiness like points rejected. The great weakness of the old line management is in making rules and not enforcing them. It is this policy which works injustice to the insured and loss to the companies themselves. If competent inspectors were hired who would look over every risk, such odious rulings as were discussed last month, in regard to trolley circuit power renting, would not be necessary, or rather thought necessary.

"But," they cry, "we are too poor to maintain inspectors to enforce our rules." Very well then, charge higher rates if necessary and maintain inspectors. They would in the end save money, both for the insurers and the insured. They would not be a very great expense if hired by the underwriter's associations, and if their work was carried on according to a proper system. Local agents are entirely unfit for this work from more standpoints than one. A system of expert inspection would greatly improve the condition of insured property and so ultimately decrease fire losses.

The rules recently adopted by the Underwriters International Electric Association and in force in the majority of states east of the Mississippi river, furnished much food for reflection by owners of street railway plants. These rules specify a certain standard of requirements for power houses, car barns, and repair shops. For these standard types of construction a base rate is charged. For each item which does not conform to the specifications a certain amount is added to this rate. Thus in building a plant it is possible to know just what the insurance rate will be.

The standard power station is described as one built of brick or stone; one story, without basement; roof and roof supports of metal; floor of brick, cement, stone or earth; cornice, brick, stone or metal; eaves 15 feet or more from the ground; no combustible finish or finish leaving concealed spaces; division walls brick or stone with standard fire doors. The stack must be brick, or if of iron, must be outside and on a brick foundation; wire tower of same material as the station proper; stairs and elevators in a tower, outside building, or with self closing hatches; heating by steam, hot water or hot air with the piping on iron hangers and free from woodwork; lighted by gas or electricity installed according to rules; occupied only for the legitimate uses of the station itself and unexposed within fifty feet unless protected by a fire wall. The electrical arrangements are to conform to the rules of the Underwriters International Electric Association with

which most of our readers are familiar. The switchboard must be incombustible or of skeleton wood. A competent man must be kept constantly in the dynamo room during running hours. A watch clock making an hourly record must also be kept and the dials kept on file for inspection. Waste must be kept in metal cans which are emptied every day. Floors must be kept clean and the station must not be a storehouse for oils of any kind. Tops of boilers are to be clean from soot and dust. Three pails for every 1,000 square feet of floor area are to be kept filled—half of them with dry sand, the other half with water. For every 5,000 square feet of floor space, 100 feet of folded hose must be kept attached to a standpipe capable of supplying 1,000 gallons for every 5,000 feet of floor area at a pressure of 25 pounds. There must be two double hydrants connected with a 6-inch main within 250 feet of the building and a fire department within 1,000 feet of the building; also a telegraph fire alarm within 100 feet.

For a building answering to these specifications, the rate is 50 cents, and to this is added a definite amount for each particular which does not come up to the standard. Thus 10, 20, 40, and 80 cents are added for two, three, four and five story buildings. Veneered or frame walls add 25 cents; shingle roof 20; tin, gravel or slate roof 10; wood floor 20; wood finish 15; metal stack through shingle roof properly ventilated 25; metal stack improperly ventilated and through anything but metal roof 100; wire tower if not as in requirements, at least 25; concealed wiring 25; wires under floor unless in an approved conduit 25; switchboards, rheostats, and feeder equalizers unless standard 50 cents each; oils stored in station 100; ashes in combustible receptacles 100; tops of boilers if not kept clean, 25. For the balance of the items not conforming to the standard, additional rates of from 5 to 15 cents are charged.

For car barns the general specifications and charges for deficiencies are very similar to those for power houses. Pits if used must have brick, cement or earth floors, and be lined with the same material. They must not be extended under the floors or connect with one another. Steps must be of brick, stone or iron. Even for this kind of pit, however, the charge is 15 cents extra. If the building adjoins other buildings the division wall must be of brick or stone at least 12 inches thick, and free from all openings. Track doors must swing outward and clear all trolley span and pull off wires and each other. All tracks must run clear to street without transfer table. Tracks must terminate in stop blocks, allowing 4 feet between end of cars and building. No frogs or crossings permitted inside of buildings; stoves not to be used for heating cars; repairing, painting, varnishing and finishing not allowed in the building; trolley wire must not be put in a trough, and the hangers must be put near enough together to prevent the wire touching the ground in case of breakage. A cut-out switch located outside the building must, when opened, cut out all the wire inside of and within 100 feet of the building. The electric lights must be controlled by a switch independent of the main feeder

switch. No portable lights are allowed except in pits, and these must be connected by two flexible rubber covered wires in a length of woven hose, and controlled by a switch outside of the pit. Rails must be double bonded with No. 4 soft copper wire. Cars must not be left with the trolley on. The presence of a competent foreman or watchman is required at all times in the building. Lighting and lubricating oils may be kept in a fire-proof building near the barn, and one day's supply may be kept in the barn. The oil room may be the lamp room. Two bushels of clean, dry sand must be kept in the oil room.

The base rate for a standard car barn is 75 cents. The charges for deficiencies are similar to those on power houses. Car stoves add 10 cents; portable lamps not according to rules 25; feeders running through building for other than light and power in the building 25. If transfer table is used, the rate on cars (which is 25 cents in excess of the building rate) is increased 15 cents.

The schedule on repair shops is almost identical with that on car barns. The base rate, however, is \$1.25.

The above rules and rates are full of suggestion to present and prospective owners of plants.

#### A "HITCHING-ON" ORDINANCE.

The articles in the REVIEW advocating the passage of a protective ordinance in every city, which should make it a fineable offense for children to hitch on cars, has already been followed out in several places. Among others, is Madison, Wis., and George H. Shaw, superintendent of the electric lines, sends us the following copy of the new order:

AN ORDINANCE for the prevention of accidents to children.

The common council for the city of Madison do ordain as follows:

SECTION 1. Any boy or girl of the age of four years and upwards, who shall wantonly, mischievously step or sit upon the steps of any railway car for the purpose of surreptitiously riding thereon, or shall in any manner cling to the steps or railing at either end of any street railway car, or to the sides thereof, while the same is in motion or under way in its track, for like wanton, mischievous or sporting purposes or intentions, shall be subject to and pay a fine of not exceeding ten (10) dollars as the court may in its discretion determine.

SECTION 2. Parents or guardians of any child who shall knowingly permit such child to play upon any street railway car, shall upon conviction be subject to and pay a fine not exceeding ten (10) dollars as the court may in its discretion determine.

It will be noticed the responsibility is placed directly on the parents and guardians, who are thus encouraged to execute the slipper act where it will do the most good on the obstreperous small boy.

THE new eastern office directory is increased by one more. The Fulton Truck and Foundry Company of Cleveland has established its eastern branch at 26 Cortlandt street, New York City, in the Havemeyer building. William Hazelton III is in charge as general eastern agent. Mr. Hazelton is too well known to the trade to require special attention further than that he is fully acquainted with the merits of the new steel truck, the Imperial, and will take pleasure in explaining it to anyone who is interested.

#### A ST. LOUIS VETERAN.

The oldest street railway employe in St. Louis, is a blythe young man of 64, with a record of forty years a car driver. His name is James T. Manley, and, like the veteran of Boston, a sketch of whom was given in December, Ireland was his native heath.

In 1846 Manley came to America. He was then seventeen, and was engaged as an errand boy by a New Yorker, afterwards going to Philadelphia. Several vicissitudes landed him in St. Louis in 1850, where he was hired by a transportation company to cross "the plains" with an overland train. Surviving Indians and other incidents he returned to St. Louis but went west again in the governmental service at Fort Laramie,

JAS. T. MANLEY.

where he remained two years.

In 1854, the Honorable Erastus Wells, lately deceased, employed Manley in his 'bus service, as driver. He then made 14 trips one day and 16 the next. This he continued until Mr. Wells established the first street car line in St. Louis, when he entered the new service, driving the first car which made 20 to 25 trips a day, going east to Fourth Street and West to Fourteenth.

In 1861 horse-car driving was deserted for the more exciting field of usefulness in the late war. Manley enlisted in Company C, First Missouri infantry, under General Stirling Price and served to the end of the war.

After the war he reentered the car service under Mr. Wells. The next few years were uninterrupted except by a visit to Ireland to bid his mother farewell.

In 1869 Mr. Manley was promoted to a clerkship in the office of the Market and Olive Street Railway Company and in 1871 was married. Four years later having lost his two eldest children and becoming discouraged he resigned to go into business for himself, as shopkeeper. This, however, proved an unfortunate venture and after three years he returned to the front platform, working on different lines.

In 1883 he entered the employ of President John H. Maxon, then of the Lindell line. Mr. Manley drove on two lines of this system making 10 trips one day and 14 the next.

When, four years ago, the Lindell company began to run its electric equipment, Manley went into the new service. With one change, a six months service with the St. Louis Suburban, Mr. Manley has been a conductor on a Lindell train ever since, running two trips in the morning, beginning at 6, and six trips in the evening, beginning at 6 o'clock.

"I wish I could make collections as easy as that," said the merchant to the conductor.

"Mine may seem good but they're only fare." replied the conductor.

ANOTHER CHANNEL PIN.

We illustrate a new patented device used in bonding rails for electric roads, and designed to take the place of the old style channel pins, which have been so long in use.

This device is called the Acme bond cap. As shown, it is a common cylinder closed at the bottom like a cartridge, with a slot running part way through the wall and the entire length of the cap. The cap is driven through a hole in the rail, made in all cases  $\frac{1}{32}$  of an inch smaller than the largest diameter of the cap. When the bond wire is inserted and the cap driven into the rail, the weakest point of the cap, which is where the slot is cut, collapses, and the two sides are forced together, forming a burr on the inside, which engages with the copper wire and holds it firmly in position.

It is claimed that this cap is thoroughly waterproof and makes absolute contact on all sides of the bond wire, is easy to insert, and holds the wire with a vise-like grip. It is being placed upon the market by Goodhue & Lincoln, 1564 Monadnock block, Chicago.

A TALL STORY.

Jermiah Jenkins is the alliterative appellation appended to a driver of a Greenburg, New York City horse car. He has since been rebaptised Lengthy Jenkins, probably on account of his "talth." His breadth is not nearly in proportion. Horse car driving was a serious thing with Mr. Jenkins, as the confined position, shown in our excellent engraving, was rapidly warping his willowy figure into the shape of a letter S.

But Mr. Jenkins is a man of ideas, one of them is illustrated. It is a hole idea in one picture. The head that contained the idea is projected through the hole, allowing Mr. Jenkins to assume a graceful darsartean position and attend to business at the same time.

He also has the advantage of a free hand movement, as pictured, and many a future alderman of Greenburg owes his career to Mr. Jenkins "extensible kid catching movement," for which he is blessed by all the mothers on the street. Long live Mr. Jenkins.

THE MULE WAS SICK.

A little town down in Indiana has a street railway line. That is, the driver, conductor, president and superintendent all one person, so alleged. The officers of the road announced sometime since that better service would be given the denizens of Podunkville and notice was posted to the effect that Monday was the date for the new service. But alas for the vanity of human expectations, a catastrophe happened that delayed the change and a big paste-board sign at the "corner" announced the bit of heart rendering news. "No new service to-day, the Mule is sick."

SAN FRANCISCO'S BIG MORTGAGE.

At a meeting of the stockholders of the Consolidated Market Street Cable Railway Company of San Francisco, February 6, an issue of \$17,500,000 in bonds was voted, to be issued in the form of a blanket mortgage.

The outstanding bonds of the Consolidated amount to \$7,000,000 and enough of the new issue will be reserved to take them up. The remainder will be used for extension, reconstruction, and further consolidation. The bonds will run forty-nine years at 5 per cent. The old bonds were 6 per cent. The new corporation stands ready to put from one-half to one million dollars into electrical equipment immediately

A LARGE BRIDGE.

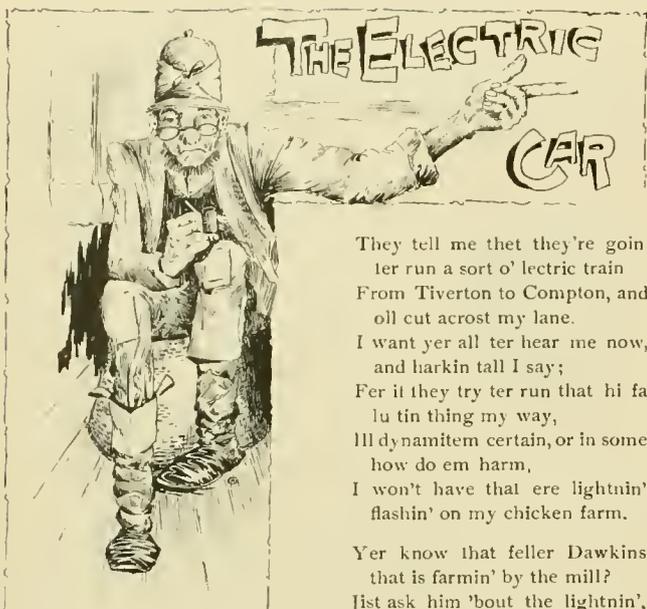

The King Bridge Company, of Cleveland, is preparing plans for an iron drawbridge for the New York Central Railroad Company, which, when completed, will be the largest iron drawbridge in the country. The bridge is to span the Harlem River in New York City, and will cost \$3,000,000. The contract calls for the completion of the bridge by next December. It will be 400 feet from end to end and will swing on a central pivot, and when turned will leave a clearance of one hundred feet on either side for passing vessels. The lowest point will be twenty-four feet above the water.

A NEW ENGINE BUILDER.

A local syndicate has bid in the Sioux City Engine Works, of Sioux City, Iowa, assuming the \$150,000 indebtedness and paying \$20,000 equity. They have consolidated with the Pech Manufacturing company and incorporated the Sioux City Engine and Iron Works, with a capital paid up of \$240,000, to operate the two plants together. W. P. Manley, A. F. Call, and T. A. Black, bankers; W. M. Thompson, of Elgin, Ill.; R. H. Brown, of Storm Lake, and R. A. Finkbine, of Des Moines, are the incorporators.

The new concern has a good field to work in and will no doubt find success.

THE Buffalo Street Railway Company shows the tremendous increase of traffic for 1893 over 1892 of 10,000,000, with an increased car mileage of 2,000,000. The increase in the past four years has been 200 per cent.

They tell me thet they're goin  
 ter run a sort o' lectric train  
 From Tiverton to Compton, and  
 oll cut acrost my lane.  
 I want yer all ter hear me now,  
 and harkin tall I say;  
 Fer it they try ter run that hi fa  
 lu tin thing my way,  
 Ill dynamitem certain, or in some  
 how do em harm,  
 I won't have that ere lightnin'  
 flashin' on my chicken farm.

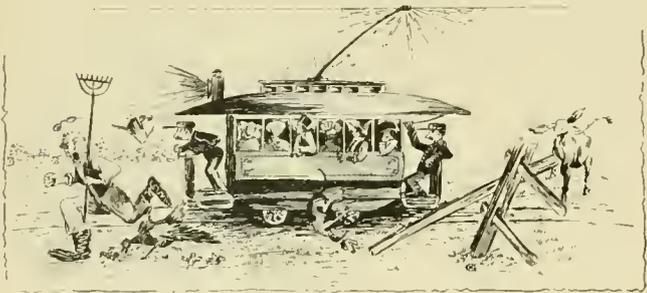

Yer know that feller Dawkins  
 that is farmin' by the mill?  
 Jist ask him 'bout the lightnin',  
 fer it struck his brother Bill.

An' knocked the life right out him—laid him deader than a nail.  
 An' then ter think o' buyin' it fer runnin' on a rail,  
 I kaant see what's got in 'em, cause fer me ther aint no charm,  
 I won't have that 'ere lightnin' flashin' on my chicken farm.

I know it's scientific, an' some people think it smart  
 Ter have the thing ter pull 'em, 'stead o' ridin' on a cart;  
 They say "we mus' be stirrin"—an'—"the scheme oll make a hit,"  
 "We farmers is too old"—an'—"the young mus' manage it."  
 I'm waitin' fer the'r hittin', an' I'll raise a big alarm!  
 Ef enny of 'em try ter run acrost my chicken farm.

Why, the people oll be stricken, all the hosses run away,  
 The milk all gittin' sour, lightnin' makes it spile that way,  
 The hands instead o' plowin' oll be ridin' on the thing,  
 An' any amount o' trouble yer the pesky thing oll bring;  
 I tell you what I'm kickin' an' oll raise my mighty arm,  
 If enny of 'em try ter run acrost my chicken farm.

*Henry Lippincott in Chicago Herald.*

### HOW TO CURE ELECTROLYSIS.

A REVIEW reader wishes to know how to prevent the electrolysis of gas and water pipes by the return current. A year ago this would have been a difficult question to answer, but with the inventions made and the knowledge gained from a study of the subject by intelligent electrical engineers on many roads, since that time, it can now safely be said that this trouble can be almost entirely cured. The first and most important point is to reduce the resistance of the return by bonding heavily with some good copper bond, giving moisture proof contact. Several bonds of this kind are now on the market, which were not available a year ago. Cross bond at frequent

intervals and double bond if the traffic is heavy. Number 0000 wire is none too large for this work. The main objection in the past to depending on the rails and bonding alone, was that the old style bonds nearly always gave defective contact. Their weakness was aggravated by a too light track construction, which gave so much motion at the joints that many bonds broke or became loose, leaving the track circuit open. The channel pin never gave a good contact and the moisture-proof qualities of a cold riveted joint are very uncertain at best. With up-to-date bonds and track work it has been demonstrated that there is little difficulty in maintaining the integrity of the rails and bonding. Wires of sufficient capacity to carry the entire current should be run around all switches, curves and special work, as the bonding can not be depended on at these points. Care should be taken to have a good heavy connection between the power house and the other parts of the system. If the tracks do not run past the power house, a line of old rails heavily bonded and buried will make a good track feeder. If the system is large, track feeders of some sort should be run to several points, so that the return cannot be broken by tearing up track at any one point. A return installed in the above manner will have so low a resistance as to reduce electrolysis to practically nothing. Frequent firm connections to water pipes will reduce the electrolysis on them, although until recently the opposite was thought to be the case. This plan will not take the place of the improvements in the return as before described, but such water pipe connections are a useful aid in reducing the action on the pipes and in a measure giving temporary relief when the return is in bad condition. The connections should be made frequently and at points where there is the most electrolysis. The connections at the pipes must be well made. This plan has been tried with success at Milwaukee, and is described in Mr. Rau's paper in the December 1893 REVIEW. The efficiency of heavy bonding as against other methods has been pointed out by numerous writers in our columns during the past year and with present improvements in bonds can be considered as beyond any doubt.

THE street car spitter is to be abolished in Chicago, also. The Municipal Order League, composed of women, is co-operating with the superintendents of the various lines. Miss Ada C. Sweet, the lawyer, says: "Our great effort is to educate the public up to the point of refusing to tolerate such a nuisance. The great mass of men and boys are not brought up to habits of cleanliness, and it is to these we appeal. We are trying to get the Health Department interested."

Snow blockades and fights between street railway companies and residents along the lines have been incidents of February's great storm. It was impossible to move all the snow at once, and the public, unreasonable as usual, wished the companies to perform miracles in the matter of snow banishment.

## PERSONAL EXAMINATION OF INJURIES IN DAMAGE SUITS.

Father Knickerbocker, and presumably all his daughters, are at present greatly exercised over a certain young lady of that city and the "discovery" of a state law, enacted last year, which gives the defendant in a suit for damages arising from personal injuries, the right to demand a physical examination of the plaintiff.

In October of 1892, a collision occurred on the Ninth avenue elevated, in which the petition cites, a Miss Lyon was thrown violently against a seat, upon the floor, and as a result was rendered unconscious for several hours, and received thirty thousand dollars worth of injuries to her spine, as estimated by her lawyers, and in the attempted collection of which sum all this rumpus has occurred.

The daily papers immediately championed her cause vigorously and made a special assignment of big words, for properly writing it up in a manner at once gallant and sensational. The law was "monstrous," "barbarous," "a gross outrage" and "unconstitutional;" while the young woman is "not quite twenty, and an orphan, with a face remarkably beautiful and expressive, with large black eyes, which now bear a mournful expression, and great waves of dark brown hair that reach below her knees."

It is certainly comforting to know that the young lady does not wear false teeth and a wig, though we cannot forbear the suspicion that had the plaintiff been some cross eyed old maid, with red hair, the susceptible reporter would not have felt called on to denounce the law in all the harsh terms used.

The plaintiff's lawyers are temporarily raised on a pinnacle of public conversation, where they stand with upraised hands and vehemently denounce the law and the corporation which dares insist that the damsel with the mournful expression of optics, bare her pretty shoulders before a commission consisting of two physicians and one other gentleman, all appointed by the court. To just what degree modesty is violated beyond what is considered good form at any notable evening function we are not advised, but venture the opinion it can't be much. The furore which has occasioned several thousand female epistles to the several editors, seems to take its vigor, not so much from the mere scantiness of attire prescribed in the bond, as from the fact that it is ordered by the court, and that a failure to comply therewith means a sad, sudden and certain pair of wings to the thirty thousand damages so earnestly prayed for by the party of the first part.

We do not wonder at the position taken by the general public in this case, and on first consideration is only what should be expected of a sympathetic and generous sentiment. It even is no more than is due from society viewed from the standpoint from which the general public looks. It sees only the wealthy corporation with ability to pay and the suffering claimant seeking justice which can never be fully met by a mere payment of dollars, however many. The company, respon-

sible for the injury; the petitioner a sufferer for life; therefore a big verdict is the least that can be done to ameliorate her unfortunate condition.

What the public does not see and seems to have no means of knowing, is, that the world is full of persons whose sense of honor is located far beyond the vanishing point, and who, revolting and unlikely as it may seem, do not hesitate to trade on natural or accidental deformities of the human body, and in many, many cases on alleged physical pains and ills that have not and never had any existence whatever in their precious frames. Others do not hesitate at self inflicted injuries made with the sole interest and purpose of seeking damages from railroad corporations and alleging the injuries as the result of careless or criminal operation of roads. None but those, who like the writer, have had ample opportunity to study the records of the claim agents' department of a great street railway corporation, can have any appreciable conception of the amount, extent and ingenuity of this kind of wickedness. Two years ago the REVIEW made a thorough expose of numerous blackmail suits, in which severe physical injury was alleged, but which had either no existence in fact, or existing, had been caused months or years before and in other cities. To briefly illustrate, one case was that of a man who had lost a leg and claimed \$10,000. from the cable road. It was discovered that no less than two steam railroads had already settled for that missing member, and much doubt exists that it was in the first instance lost in a railroad wreck and not in a lumber camp. Another was a young woman having every appearance of being a perfect lady, who incredible as it may seem, bathed parts of her body and her bed with blood purchased at the stock yards in this city, and was found in great apparent agony and undoubted surplus of gore, by the company's surgeon, for whom she sent. It required fine detective work in both cases to discover the fraud. Within a year past a young man in this city threw himself in front of a cable train, and although the safety device prevented him from receiving the expected injury, it could not a few days later keep him from a partial amputation with a jack knife, of one finger, for which he claimed accident insurance, alleging the injury to have resulted from a Fourth of July revolver.

Commenting on the Lyon case, the Register of Sandusky, Ohio, cites two instances, one of a man and one of a woman, both of whom sued and received \$5,000 damages against that city for alleged personal injuries received from falling on a defective sidewalk. In both cases an almost immediate miracle seems to have been worked by the receipt of the money, for the lameness entirely disappeared in a few days thereafter and has neglected to return. Had personal examinations been made in those two cases, the Register is convinced the verdict could never have been rendered as recorded.

Even where personal examination is allowed, as it is in many places, the defence still labors under great disadvantages. It is only within the last month that a most startling disclosure was made in San Francisco. In

November of 1891, a certain street in that city was being raised four feet to grade. During the progress of the work, a horse car line was operating on this street. On one trip a car containing four or five passengers, met a big truck team loaded with the trimmings of hides and other savory glue stock on its way to the glue works. The car and wagon met at a point in the road where it was impossible for both to pass. After a wordy war between the two drivers, it was decided to push the car back, which was being done, when the car horse, catching a extra flavor of the aforesaid glue stuff and seized with a sudden realization of what the future had in store for him, was taken with temporary panic and jumped the track, dragging the car from the rails, but not overturning it. Among the passengers was one Mrs. Mary Jane Doolin. Now Mary was rudely displaced from her seat when the car went into the mud. This occurred on November 17, 1891, and on February 8, 1892, suit was began by Mary Jane and her husband, against the Omnibus Cable Company, for the modest sum of \$20,000.

The plaintiff called medical and other witnesses who made out for her a strong case. From the testimony on this side of the controversy it was made to appear that Mrs. Doolin has received a concussion of the spine and other injuries, which rendered her almost a physical wreck. On the other hand, it was contended by the railroad that Mrs. Doolin had not been injured at all, and there was an effort by counsel to establish that the woman's injuries were simulated.

A medical examination was insisted on, which was made in the presence of five doctors, including the company's surgeons. It was then conceded that Mary Jane was affected with an ovarian tumor, which the defense stoutly maintained was not induced by the accident, and which of course her doctors insisted could have been occasioned in no other way. Mary came into court in an invalid chair, with blankets and smelling salts, and all the paraphernalia consistent with a confirmed invalid, although it was remarked that Mary constituted on the whole, a decidedly husky and healthy exhibit. However, this idea was quickly disipated when she went through a series of contortions which her doctor scheduled as convulsions, and was carried out of court in a storm of tears and hysterical screams. As usual this did the business; but not yet satisfied the company took an appeal and hung on to that \$20,000.

Ten days later, Mary Jane's family was increased by the arrival of a fine little daughter, and through some strange coincidence the tumor seems to have taken offense and left for parts unknown, and has not been seen since. Mary, however, continued to push her suit as vigorously as ever and worked the tumor racket right along, until within the past month the company accidentally learned of the above and will ask to have the case set aside. It was a good one on the doctors and a close call for the company.

But we will not weary our readers with a recital of facts and cases of a similar nature, which would require many pages. The manager of every steam and street

railway of any size can recall them by the score. In view of the fact that even with the privilege of personal examination by the defendant's medical staff, it is not always possible to prove the real state of affairs, how highly important becomes the right to make such examinations by properly appointed and suitable commissioners.

In the case specially in point, that of Miss Lyon, we do not assume to question the truthfulness of her statement and the existence of all the injuries she sets forth. To all appearances she is justly entitled to damages, and if so, we trust the law will allow her proper compensation from the railroad company; but the court, Judge Pryor, has placed himself in a surprising position by tempering his order for the examination with an official statement that the law was a bad one, an outrage of personal rights, and that he only granted the petition because he was powerless to refuse it.

As long as it is necessary to resort to courts of law for the enforcement of the golden rule, just so long will unscrupulous and designing persons scheme and contrive at means to defraud and rob railroad corporations; and just so long will the innocent suffer with the bad, and have to prove their case to the extent of personal examination if justice is to be done. The individual who really has an injury, is in no way outraged to be required to submit to a personal examination by commissioned doctors, at his or her home; and a really honest person instead of hesitating should rather insist on such examination, as the quickest, surest and most effective manner of establishing the truth, rather than being dragged for days before the public in a court of law. Our own, and by no means limited experience in such matters, assures us that where actual claim exists, companies are only too glad and willing to settle out of court for any sum within reason; for where real injury exists they are absolutely sure to get an adverse verdict and have a big lawyer's bill in addition. The fact that of the amounts sued for in the courts of Chicago for personal injuries are finally settled in or out of court for not to exceed 5 per cent of the amount claimed, shows most clearly the enormous amount of chaff that in the eyes of the public passes as wheat.

A case which will not bear close inspection is ninety-nine times out of one hundred an unrighteous one.

Commenting on the New York case, the Philadelphia Record is authority for the following statement:

The New York judge who recently ordered a physical examination in the case of a young woman who had brought suit against the Manhattan Elevated Railroad Company for injuries to her spine, was acting in compliance with a law passed at the last session of the New York Legislature, which, it now appears, is in conflict with a decision of the Supreme Court of the United States. In the case of the Union Pacific Railway Company against Clara Bottsford (an appeal from the Circuit Court of Indiana), in which the woman had sued for alleged injuries to her spine, caused by the fall of a sleeping car berth, and the court had refused to order a physical examination, the Supreme Court in an opinion by Justice Gray, sustained the lower court, and said it appeared to the court that it was an invasion of the sanctity of the person to a degree that the law did not recognize, and that it was inconsistent with common law. Two of the justices dissented, it is true; but the decision, nevertheless, appears to be the supreme law of the land. And there is, therefore, a possibility that it may be invoked before the pending litigation in New York shall have reached its conclusion.

## EXPOSURE OF A PROFESSIONAL WITNESS.

The Siamese twin of blackmail suits, some of which are referred to in the preceding article, is the professional witness, and as many good people are as uninformed on the existence of such creatures as on the attempts to rob through legal authority, we recite below, a case uncovered by the Tribune of this city and recounted in its columns.

The case which called out the discovery of the "witness," arises from an incident on a State street cable car in this city, on which a passenger tendered as fare, first a silver dollar then a \$5 and at last, \$10 bill, all of which were refused by the conductor, who pronounced them counterfeit and finally ejected the passenger, who claims to have presented the money in question at a bank, where it was pronounced good. Be this as it may, he entered suit against the City Railway, claiming \$10,000 damages, and his attorneys advertised in the daily papers as follows.

PARTIES ON STATE ST. CAR FEB. 22  
who saw dispute over counterfeit money please  
call room 9, 89 Madison-st.

This ad. called out the following reply:

CHICAGO, Feb. 27th, 1894—In answer to above clipping will say that if you have use for a professional witness, who is thoroughly competent and reliable, small fee only required, I can be of great service to you. It will probably be to your advantage to address me at once in confidence. Trusting you will act favorably, I remain

Very respectfully,

C. G. ARNOLD,  
245 Washington Boulevard.

The measure of success which attended the newspaper investigation of the alleged witness is best told in the reporter's own words. He called at the street number mentioned, and found a very inoffensive appearing young man, who with his wife, occupied one small back room in a flat, and who informed the reporter he was the C. G. Arnold in question.

"You answered an 'ad' at Room 9, No. 89 Madison street, in regard to counterfeit money case?"

"Yes."

"I am from Crocker & Crocker, the law firm which inserted the 'ad.' We may be able to use you."

"Well, I am sure you will find me a good witness. I have been in a number of cases and I always did my work well."

"Of course you were not on a State street car Feb. 22 and therefore know nothing about the case?"

"O, no."

"Well, I'll give you an outline and then I want you to tell me whether you can testify and what your terms will be."

Then the reporter told the story of Mr. Harmeyer's experience and inquired, "What do you think?"

"O, I can testify to that. But I will want to be posted better before the case comes on; and I'll do it reasonable, too."

"How reasonable?"

"How much do you think it worth?" asked Arnold, cautiously.

He was assured that his visitor had no authority to offer any sum at all, but to get his (Arnold's) terms. After some hesitancy Arnold inquired, "Would \$25 be too much?"

"I think we could pay that much all right. And now I'll tell you: We have a great many cases in which we need additional testimony. If you do this job well you will strike a good thing, if we can depend on you. I suppose we could be sure of having you swear to anything we wanted you to, as you make it a business?"

"O, yes, I'll swear to any thing you want if you post me thoroughly on what you want, and you will always find me a reliable witness. I testified in a case before Justice Everett about two months ago. A divorce was granted on my testimony before Judge Horton a year and a half or two years ago. Next month I have another divorce case out at Kewanee."

"But are you not too well known in the courts? How many cases have you appeared in?"

"About half a dozen. You need not be afraid of that."

"Now we may need another witness in this case, in order to make sure work. Can you get us another man?"

He could, and was rather eager to be employed by Croker & Croker, and repeatedly assured the reporter that he would be found to be a "good witness."

## "AMBER'S" SERMON ON KICKERS.

That woman philosopher that hides her vigorous personality under the pseudonym of "Amber," and writes for the Chicago Herald, in a recent column delivered the following sermon, headed

## A STREET CAR EXPERIENCE.

"I rode in a street car the other night, while the rain was pouring like hot shot at Chickamauga thirty years ago. The car was crowded, the conductor had his hands full, and everybody was growling. If the car halted a moment there was a chorus, 'Nice accommodations for the public!' 'This is a fine way to run a cable!' 'Why don't they lay off for good?'"

"And I thought to myself, how many of these Smart Alecks could or would do anything better if they had the chance? I suppose if the Lord had known what he was about he would have put the round pegs in the square holes and vice versa, but if there has been a big error at the start it is too late to fix things up now. These growlers and fault finders ought to have been put in charge of the world's comfort long ago, there's no doubt about that, but how are you going to help things along now by bemoaning the fact that they were not? No doubt there would never have been a blunder made if things had only been managed right by the ruler of all things. Cables would have run like feathers through oil, conductors would have been large souled Sidneys and courteous Bayards, The rain itself would have been gently checked before it fell, and life for every one of us would have been just "one grand, sweet song," had the Smart Alecks had a chance. It is too bad humanity should have been such a sufferer all on account of a little error in the primal deal."

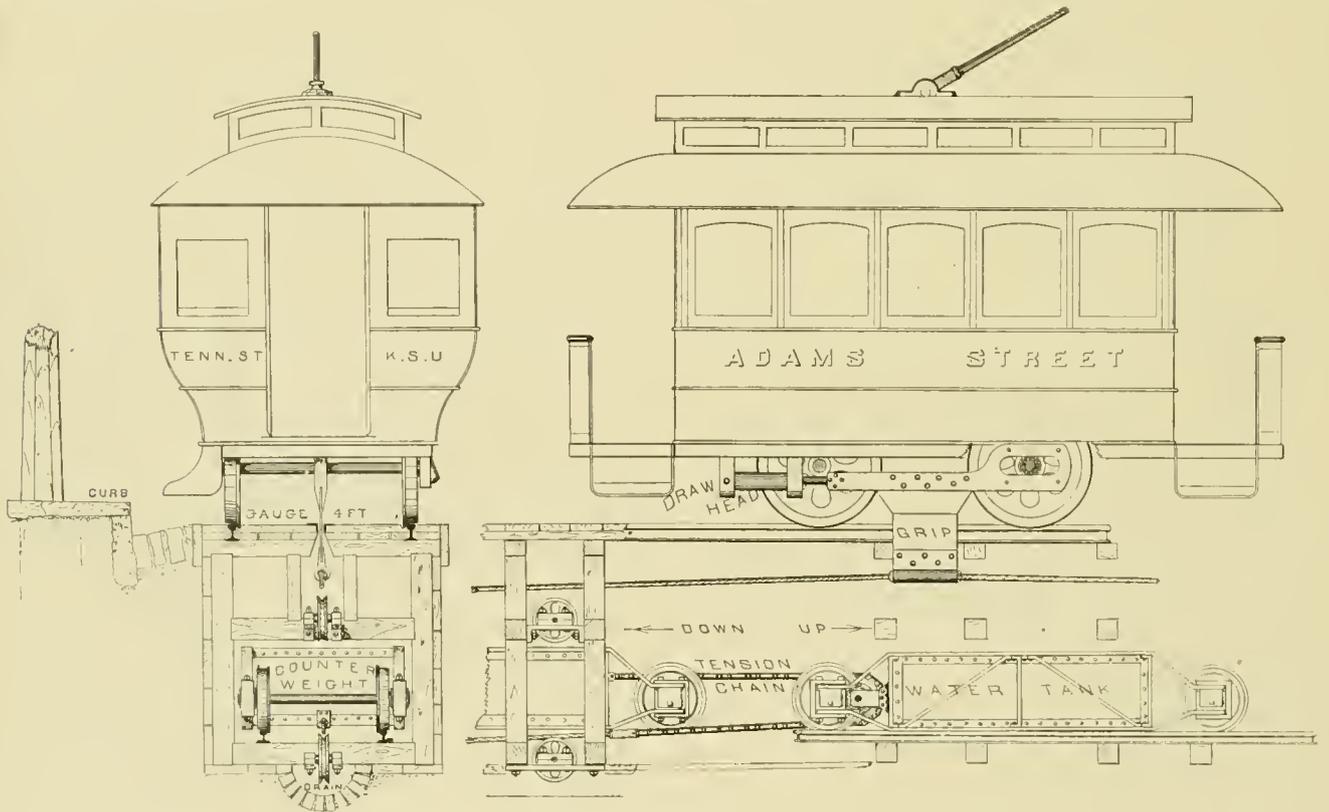

The rapid transit editor evidently never saw that "copy."

A STORAGE BATTERY COMPANY TO BE ENJOINED.

The Brush Electric Company and the Consolidated Electric Storage Company as co-complainants, have sued the Electric Storage Battery Company and W. W. Gibbs president (manufacturers of the chloride accumulator), for infringement, in the United States Circuit Court for the district of New Jersey. The suit is brought on the Brush Storage Battery patents, recently sustained by the United States Circuit Court of Appeals, more especially patent No. 337,299. The motion for preliminary injunction will be heard before Judge Green, at Trenton, on February 20.

PROPOSED GRADE CLIMBER, AT LAWRENCE, KAN.

The Athens of the Sunflower State is Lawrence. To this town, therefore, Kansans look for all the most advanced ideas of whatever description they may be—ethical or electrical. The magnificent state university on which the state has recently expended \$150,000 in new buildings, is at the edge of the town, with the entrance to the grounds on Adams street. Adams street is at present a path 1,500 feet long, with a rise of 115 feet, and up this incline the seekers after knowledge must perspire, in order to acquire the learning supposed to inhabit the elegant buildings. With an eye single to the alleviation

ELEVATION AND CROSS SECTION OF SYSTEM PROPOSED FOR LAWRENCE, KAN.

COST OF TRACTION IN FRANCE.

Electricite, the French journal, gives the following figures for the cost of street railway traction in France. The figures are per kilometre equal to 3,280.7 feet, and, in francs, one franc—twenty cents.

	FRANCS.
Horse traction on the tramways of the General Omnibus Company in Paris.....	0.612
Horse traction at Frankfort-on-the-Main .....	0.590
Horse traction on the Southern tramways, Paris.....	0.542
Horse traction on the Northern tramways, Paris.....	0.516
Traction by furnaceless locomotives on the Rueil and Port Marly line.....	0.450
Horse traction on the Rouen tramways .....	0.407
Mekarski compressed air traction at Nantes .....	0.343
Electric traction at Frankfort-on-the-Main.....	0.309

IOWA LEGISLATORS have a bill on hand to make street railways pay the employes each day.

of this trouble, civil engineer Holland Wheeler proposes an inclined railway up the Adams street hill.

The engraving shows the idea as a conduit fitted with track, upon which runs a truck carrying a counterbalancing weight of water. The water is supplied at the top of the hill by means of a stopcock from the city water main, operated from the bottom of the hill by the conductor of the car. As soon as the tank is full the counterbalance begins and the cars ascends. When the tank reaches the bottom of the hill the water is automatically discharged and the balance truck runs up empty. The hill line is a separate installation and the grip on the rope is to be permanently fastened. The rope will be driven by a stationary motor, which will be operated from the trolley as ordinarily and controlled by the motorman on the car.

It is expected that the state will furnish the power from

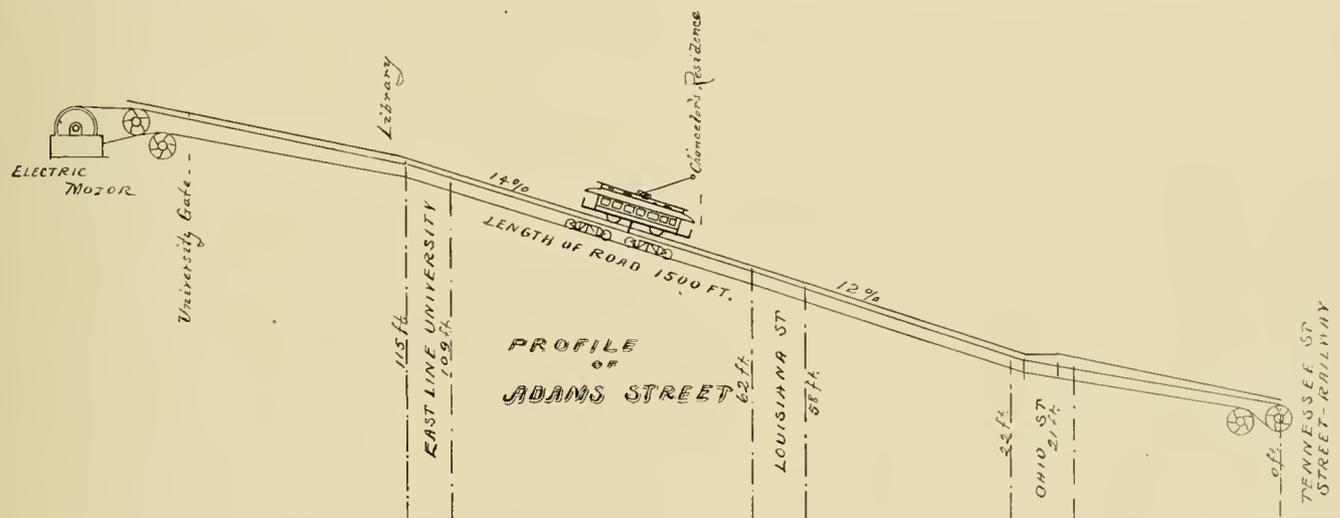

its own fine and ample electric plant at the university. There will not be traffic enough to warrant the building of the plant as a commercial enterprise, but it is hoped that the state may be induced to make appropriation for this much-needed improvement and give the students not only the institution but also the means of getting to it.

The proposition has not yet been acted upon, but is feasible and urgently necessary, as there is no direct carriage road up this brief but difficult hill, which the seeker after knowledge must climb. We hope to see Mr. Wheeler successful in carrying out his plans. A somewhat similar road was recently described in this magazine as operating on the Canadian side at Niagara Falls. In this case, however, two cars were used to counterbalance and the extra counterbalance to equalize the load was a tank of water carried beneath the car floor. The line at Niagara has worked successfully.

got accumulator traction, which does not seem to pay, and Blackpool has a conduit system laid in the ground, which suffers, or used to suffer, from periodical inundation. The two electric railways in England—those in Liverpool and the City of London—are giving unbounded satisfaction; so much so, that the former has been taken over from the contractors long before the expiration of the guarantee, and is already undergoing extension."

The fact that the trolley has gained its entrance into New York is the only mistake of the Gazette, but the spirit of the paragraph is right for progress. No rapid transit item has ever produced the comment of the English press to such an extent as the Metropolitan offer, and we hope that English genius may add its quota to the sum of experience to be gained by the competition.

THE Chicago General Street Railway is putting in a small steam plant to charge the storage battery on its lines.

## A LIGHT FROM LONDON.

That the most conservative press in the world should champion the trolley may be a surprise to many of our American howlers. Here is an extract from the Pall Mall Gazette, London:

"The Metropolitan Tramways Company, of New York, having made the generous offer of a £10,000 prize to any one who will produce by March, a working system of traction possessing all the advantages and none of the disadvantages of the overhead wire or 'trolley' system, it remains to be seen what the scientific world can produce. It is rather forcing the growth, this artificial stimulus, for the 'trolley' is a very remarkable development from the system of a few years ago and civilization can well afford to pause at it. We may come to balloons in time, but meanwhile the 'trolley' which has been stifled in New York by the blind and utterly unreasoning opposition of the press, is doing a work in all the other great cities of America which we over here may well envy. The overhead wires are no great disfigurement, as any one must admit who has seen the admirably equipped line in South Staffordshire; and the smooth, swift running of the cars is beyond comparison. Coventry alone of English towns has had the courage to give over its streets to this new system, if one except a single country road at Leeds. Glasgow fought shy of it when the question came up; whilst Birmingham has

## PENNSYLVANIA TRACTION COMPANY.

One of the biggest networks of electric railway tracks in the great state of Pennsylvania is owned by the Pennsylvania Traction Company, of which ex-Senator John J. Patterson is president and John Hertzler secretary, with offices at Lancaster, Pa.

The company now operates fifty miles of electric line and will build seventy-five miles more in the spring and summer of '94. It leases the Lancaster & Philadelphia Electric Railway, the Lancaster City Street Railway Company, the Lancaster & Columbia Railway Company, the Columbia and Ironville Street Passenger Railway, and the Columbia & Donegal Railway Company.

The superintendent is W. J. Armstrong and the purchasing agent John S. Graybill.

ENGINEERS are at work preparing for the construction of elevators to carry passengers to and from the Brooklyn elevated railroad stations. They are to be operated and lighted by electricity. The new plan will be put in operation first on the Broadway line.

SOME Chicago North shore cars are being equipped with the Chicago air brake.

## A GRAPHICAL METHOD OF LOCATING FEEDING POINTS FOR ELECTRIC RAILWAYS.

BY WILLIAM C. BURTON.

In electric railway work we cannot have as exact a knowledge of the actual current which will be required, as we have with lighting systems, and since also the variations of current are much greater and more frequent, there can be no exact and accurate way of determining feed wire, but the following method has been found useful as an aid to the judgment of the designer. The only assumption necessary when using it, is the average current required per car at different points on the road, and this can be estimated with reasonable accuracy.

First, find the average distance of each car on the line from the power house, when running with the given headway and speed. This is easiest done by locating the cars in their mean positions on a map of the road, and then measuring their distance from the power house. Then, assuming the current required per car and the allowable drop in pressure in the feeder, calculate the number of circular mils of copper required for each car, to allow the given drop, at its determined distance from the power house. If it be assumed that the resistance of the return circuit through rails, earth, and track feeders, is equal to that of the feed wire, (this is found to be approximately true) then the formula

$$\text{Circular mils} = \frac{20 C. D.}{V.}$$

gives the required circular mils, when C=current, D=distance in feet from power house to car, V=allowable drop in volts.

A curve must now be plotted, the abscissa of any point of which represents the distance from the power house, and the ordinate represents the total circular mils of copper required by all cars beyond the given point (add circular mils for each car).

Now, assume on the curve the location of the last feeding point, at such a distance from the end of the line as will give the right drop in pressure in the trolley wire. Through this point draw a horizontal line. At a distance representing 211,000 circular mils (if Number 0000 wire is to be used) above this line, draw another parallel to it. The point at which this second line intersects the curve will give the second feeding point, since its abscissa represents the distance from the power house at which additional copper equal to a Number 0000 wire becomes necessary, to carry the cars with the given drop. Above the second line draw another at the same distance and locate the next feeding point, etc.

If there is a distance vertically between the last line and the highest point on the curve, less than represents a Number 0000 wire, of course the last feeder will have to be of a smaller size. If the distance between any two feeding points is greater than will give the assumed drop

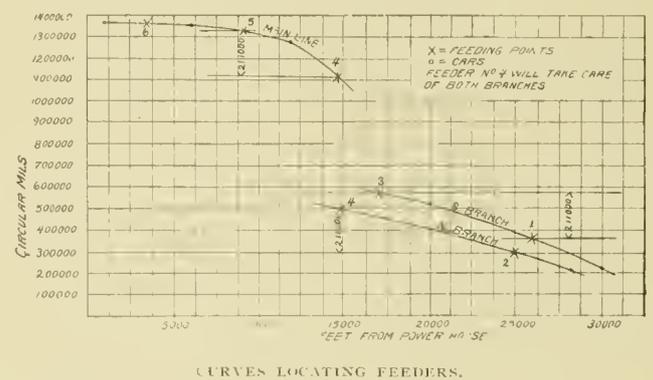

in the trolley when the maximum number of cars is located between the points, then split feeders or two or more smaller feeders must be used. Frequently, however, by slightly changing their location, feeding points may be placed at or near the intersections with branch lines (for which feeders must be separately calculated) so as to furnish current partly to each line, thus utilizing a single large wire in place of two or more small ones. By so doing a 100-car road has been fed entirely through 0000 wires without the variations of pressure becoming greater than was allowable.

If it is desirable to take into account grades or other causes requiring extra large current on certain parts of the road, this may be done by allowing greater current per car at these points.

Example:

Car Number.	Distance from Power House.	Circular mils required per car, from formula.	Total circular mils required at given distances.	Current per car = 30 amps. Allowable drop = 80 volts.
1	30,000	224,000	224,000	} South Branch.
2	20,000	150,000	524,000	
3	20,000	150,000		
9	28,000	210,000	210,000	} North Branch
10	17,000	128,000	466,000	
11	17,000	128,000		
4	12,000	90,000	1,270,000	} Main line to junction.
5	12,000	90,000		
6	6,000	45,000	1,360,000	
7	6,000	45,000		
8	1,000	8,000	1,368,000	

As shown by the curve, five 0000 feeders are required and a No. 3 wire must be used for a short feeder to take care of the cars near the power house. No two of these feeding points are far enough apart to require split feeders or mains, as the road is double track and the two trolley wires will carry the cars between the points with small drop.

Although this method may seem rather long, the operations are very simple, and it takes a comparatively short time to locate the feeders for a large road.

## STREET RAILWAY LAW.

EDITED BY MR. FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Care required to Prevent Injury to Child.*

Where those in charge of a street railway car know that a child of tender years is in danger of injury, and they may, by the exercise of ordinary care, avoid injuring such child, and fail to exercise such care, the question of the negligence of those having the care of such child will be immaterial, and the railway company will be liable to the child.

At the time of the accident the plaintiff was an infant not quite seventeen months old. He was struck and knocked down by one of appellant's horse cars. The child was so young as to be incapable of exercising care, and cannot be charged with negligence.

The question in this case is whether the driver of the car could have avoided the injury to the plaintiff, after the latter had been discovered to be in a place of danger. Even though the plaintiff had come into such position through the negligence of those having him in charge, the defendant's servant, who had control of the car, was bound to use reasonable care in avoiding an injury to the plaintiff, if he saw, or, by the exercise of ordinary prudence, might have seen plaintiff's peril.

Where the person in danger of being injured is an adult, the defendant will only be liable for wilful injury or gross negligence, on the ground that the adult will be presumed to have the capacity of making some effort to remove himself out of the way of the threatened peril. But in the case of a child of tender years, the defendant will be liable for the want of ordinary care.

In the present case, the driver of the car admits that he saw the plaintiff upon the crossing before the accident occurred. One witness testifies that the child was on the track. Other testimony is to the effect that he was a short distance south of the track. The horses attached to the car were not walking, but going along in an ordinary trot. The driver says that when he first saw the child, it was facing south, with its back to the approaching car, and that, when he, standing on the front platform, was almost abreast of the child, it turned and ran into the car. The little babe was evidently startled by the noise of the car behind it and, turning, ran child-like into the danger instead of going away from it. Under all the circumstances, it was for the jury to say whether he did or did not use ordinary care and prudence in trying to avert the injury after he discovered the danger. There was evidence enough to justify the court in submitting the question to the jury.

The parents of the plaintiff were persons in humble circumstances. They had a small grocery, and lived in the same house where the store was kept. They tended the store themselves, and the father was engaged part of the time as a teamster. The baby was strapped in the baby-carriage and taken out for an airing by a brother fifteen years old. This brother had been in the habit of taking care of the child in this way, and, on the afternoon in question, had wheeled the carriage to the corner where

the accident occurred. While he was looking at some house-movers or at the children playing near by, the baby slipped from the carriage and crept and toddled into the place of danger.

If it be admitted that the older brother was negligent in suffering the child to get upon the street, such negligence on his part would not relieve the defendant from liability, if its servant could have avoided the injury after he discovered the danger.

(Supreme Court of Illinois. Chicago West Division Railway Company vs. Ryan. 131 Ills. 474.)

[NOTE.—Gavin vs. City of Chicago, 97 Ill. 66, was a case of personal injury to a four-year old child by being caught in a swing bridge. The Court said in the opinion: "The bridge, in the condition it was then in, was reasonably safe for all persons using the slightest care for their own safety. No duty rests on the City to make such bridges safe for children to play around or upon, nor is it expected that parents will allow their children to occupy such dangerous places as playgrounds, and if they wander from their homes without the knowledge of their parents, and sustain injury at such places, it must be attributed to mere accident that no care which they are obliged to observe, on the part of municipal authorities, could prevent." City of Chicago vs. Starr, 42 Ill. 175, was an action for injuries to a child from the falling of a counter standing on the sidewalk. It was held that the City was guilty of slight negligence, but that the negligence of the parents in allowing the child to be at large on the streets was such as to preclude any recovery. In City of Chicago vs. Hesing, 83 Ill. 204, it was held to be gross negligence on the part of the City to leave a ditch filled with water, about five feet deep, in a public and frequented street, bordering on a sidewalk, without any guards to prevent children from falling into the same, and if a child is drowned by falling into the same, the City will be liable. In such case a failure on the part of the parents to keep a constant watch over the child will not be imputed as negligence.—Ed.]

*Street Railway Tracks—Unreasonable Burden on Street—Injunction—Rights of Abutting Property Owners.*

Municipal corporations, when empowered by the legislature to do so, may devote a reasonable portion of the street to the use of a street railway without making compensation to the abutting owners, since such is a proper use of the street.

The legislature cannot devote the entire width of the street to railroad purposes unless compensation is first made to the abutting owner for the taking of his easements, though there be no constitutional restriction on the legislature.

Where a street is already incumbered with two street railway tracks, with a line of poles between, and in addition, with many electric light, telegraph and telephone poles on both sides of the street, an injunction will issue in favor of abutting owners against the construction of a third track and additional poles, though authorized by the City Council, since such a track is a special injury to the property rights of the abutters; it appearing that the tracks already in the street afford ample facilities to run all cars necessary for public convenience.

(Supreme Court of Utah. Dooley Block vs. Salt Lake Rapid Transit R. Co. 33 Pacific Reporter 229.)

*Collision with Wagon on Track—Injury to Passenger on Car.*

Where a motorman on a street car sees that a man driving a wagon along the track neither looks back nor pays any attention to the ringing of the bell, by increasing his speed or attempting to leave the track, it is his duty to bring his car under control, and the company is liable for injuries to a passenger if he continues until it is impossible for him to stop.

In a action by a passenger against a street railway company for personal injuries, received by a car running into a wagon on the track, the fact that the negligence of the driver of the wagon contributed to the injury, is no defence.

(Supreme Court of Washington. *Sears vs. Consolidated S. R. Co.*, 33 Pac. 389.)

*Elevated Railroad—Falling Sparks—Injury to Person in Street—Proximate Cause.*

By an unlawful act of a railroad company, fire was thrown upon a horse passing under the structure, so as to make him unmanageable, and by the same act the driver was so injured that, smarting from his injuries, he did not exercise judgment and skill in guiding the horse, and the plaintiff walking along the street was run over by the horse and wagon. *Held*, that the railroad company was liable to the plaintiff; that the damage was not so remote as to preclude recovery, since the chain of causation was not broken; that the mistake of judgment on the part of the driver, being caused by the defendant's unlawful act, could not be set up as an intervening cause.

(New York Court of Appeals. *Lowery vs. Manhattan R. Co.*, 99 N. Y. 158.)

*Removing Snow from Tracks—Making Street Dangerous—Injury by Upsetting of Sleigh.*

Where, in a suit against a street railway company, for personal injuries caused by the upsetting of a cutter while crossing defendant's track, the evidence showed that the snow which had fallen during the winter had been thrown up beside the track and trampled or beaten down so as to leave a depression at the track at a street crossing, of from six to ten inches or more, with a short slope downward; and that plaintiff's husband, who was driving, finding it necessary to cross the track at that point, turned the horse so as to cross as nearly as he could at right angles, but the sleigh, on making the descent, tipped over to the left and threw plaintiff out and injured her, these facts show negligence on the part of the company.

(Supreme Court of Michigan. *Laughlin vs. Street Railway Company of Grand Rapids*, 62 Mich. 220.)

*Car Running Backwards on Incline—Injury to Plaintiff's Team.*

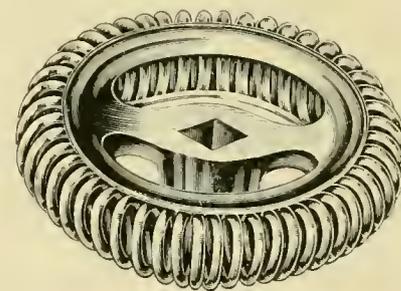

The horses attached to a street car were unable to pull it from a ferry boat up the steep and slippery incline, and stopped part way up, and the car was held by the brake. An extra horse was usually in readiness to help pull cars up the drop, but, on this occasion, there was none, and the driver, after endeavoring to procure other horses, unfastened the brake and started his horses, which were

unable to pull up the car, and it began to run back. The driver applied the brake but could not stop the car, and it came upon the plaintiff's horses which were behind, attached to a wagon driven by plaintiff. The plaintiff had started from the boat as soon as the car was out of the way, his horses then being about ten feet back, and at the time the car began to run back, they were about twenty feet behind. The plaintiff backed as far as he could, but another team being behind him, he was unable to get out of the way, and the car came upon his horses and injured them. *Held*, that the case was properly submitted to the jury; there was evidence of due care on the part of the plaintiff; there was also strong evidence of the negligence of the defendant, both in omitting to have an additional horse to aid in pulling the car over the slope, as was usual under the circumstances, and also in the action of the driver in lifting his brake so as to permit the car to slide backwards. It was this negligence which was the proximate cause of the accident.

Massachusetts Supreme Judicial Court, *Cook v Metropolitan R. Co.* 98 Mass. 361.

**A COOL STEAM VALVE HAND-WHEEL.**

The familiar handle of the stove griddle lifter has been embodied in a steam valve hand wheel, made by W. F.

Greene, of Troy, N. Y. The circumference of this wheel is a continuous coil of steel wire. Having such a large radiating surface, it does not get hot as do solid metal ones, while being cheaper and

very much more durable than the wooden handles. The corrugated surface affords a good firm grip on the wheel.

**LONG DISTANCE TRANSMISSION OF STEAM.**

It is generally thought that of all methods, power transmission by steam is the most wasteful, but E. B. Cox cited an instance at the last annual meeting of the American Society of Mechanical Engineers, where at a coal mine, steam was carried 4,500 feet over a hill. The pipe was surrounded with mineral wool and laid in a trough made of two boards nailed together at right angles. On top of this another similar trough was laid, They were carried on stakes driven X-wise into the ground. At the pumping station, where it was used, a receiver made out of old boiler iron acted as a separator. Although a very cold climate, the arrangement has been in use since 1877 without any repairs. Mr. Cox says that the secret of success in steam transmission is in the receiver.

THE LEFFLER RAILWAY SYSTEM.

While most inventors have been at work trying to perfect a conduit system with which the ordinary railway motor can be used, P. W. Leffler, of 637 Monadnock block, Chicago, has attacked the problem in an entirely different way. His plan is to lay between the rails a series of magnets. These magnets attract magnets on the car. The arrangement of car and track magnets can be seen from the drawings. The conduit magnets are 6 inches high, 8 inches wide and  $1\frac{3}{4}$  inches thick. They are mounted on an iron base plate and capped with a suitable iron lid to protect them from street traffic. They are cut into circuit in sections about nine feet long. The switch to do this is operated by the car. The magnet cores are nine inches between centers. The car magnets are excited by a storage battery through the medium of

the other two deliver it to the commutator proper, which has two rings each divided into four segments. There are three pairs of brushes, the relative positions of which are seen in Fig. 3. A plan view of commutator brushes

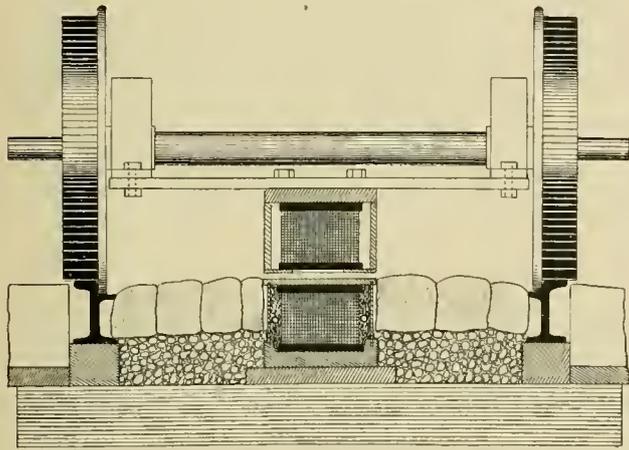

FIG. 1.—SECTION THROUGH CAR AND CONDUIT.

a commutator which changes their polarity as the car moves along, the action being almost identical with that in a synchronous alternating current motor in which the conduit magnets would constitute the fields and the car magnets the armature. The energy expended in the fields is higher and that in the armature lower than would be the case in an ordinary motor of the type mentioned. The car magnets are intended to run  $\frac{3}{4}$  inch above the conduit. The commutator, which is used to alternate

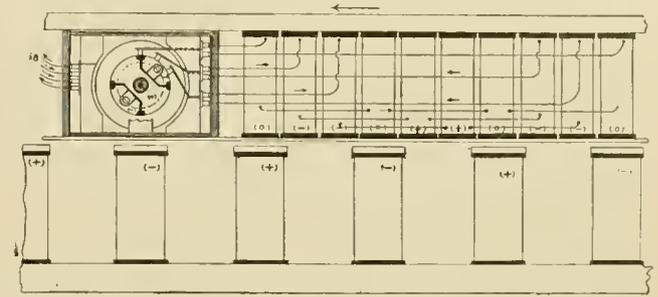

FIG. III.—CONNECTIONS OF MAGNETS WITH COMMUTATOR,

and field magnet connections is shown in Fig. 5. When a pair of brushes passes from one pair of segments to the next, the current through the pair is reversed, and of course the magnets connected to them change polarity. Each pair of brushes is connected to every third magnet. Figure 3 represents a position in which one set of magnets is directly over the track magnets. The bushes connected to this set are accordingly on the insulating strip between segments and are out of circuit. The two other pairs of brushes are on the same pair of segments and their polarities are the same. A little study of the diagrams will make it plain how the polarity of magnets is changed so as to create a nearly constant horizontal effort on the car. As said before, the action is that of

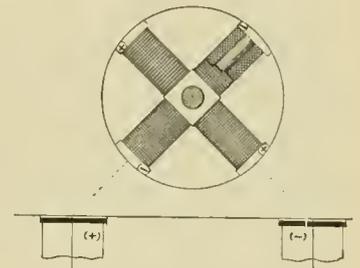

FIG. IV.—POLES OF COMMUTATOR.

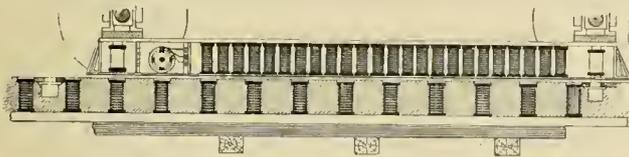

FIG. II.—SIDE VIEW OF MAGNET SYSTEM.

the current in the car magnets, is made to revolve in synchronism with the motion of the car over the track magnets, by constructing it with four constantly excited poles as in Fig. 4. These poles are attracted to the opposite poles in the conduit and so the commutator is given a positive and synchronous motion. The current from the storage battery is led into the commutator through contact rings as in Fig. 5. Two of these rings take the current which excites the fields of the commutator and

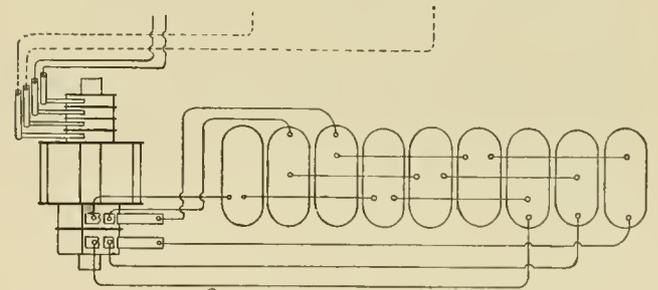

FIG. V.—PLAN VIEW OF CAR MAGNETS.

an alternating current dynamo running as a motor. The braking power of the reversed motor is of course very powerful as it is independent of traction. The inventor's estimate of the cost of the conduit for one mile of single track is \$16,000. The repair of car magnets is, of course, much less than on a motor with revolving armature, and the mechanical losses on an ordinary motor are done away with. In fact, the combination of car and track magnets is nothing more or less than an alternating motor with strong fields, a wide air gap and very weak armature and slow inductor velocity.

## ELECTRICITY IN ANACONDA, MONTANA.

Electricity Unlimited, from Inexhaustible Water Power Flumed from the Mountains—Thousands of Tons of Icicles in Winter Present a Fantastic and Beautiful Picture.

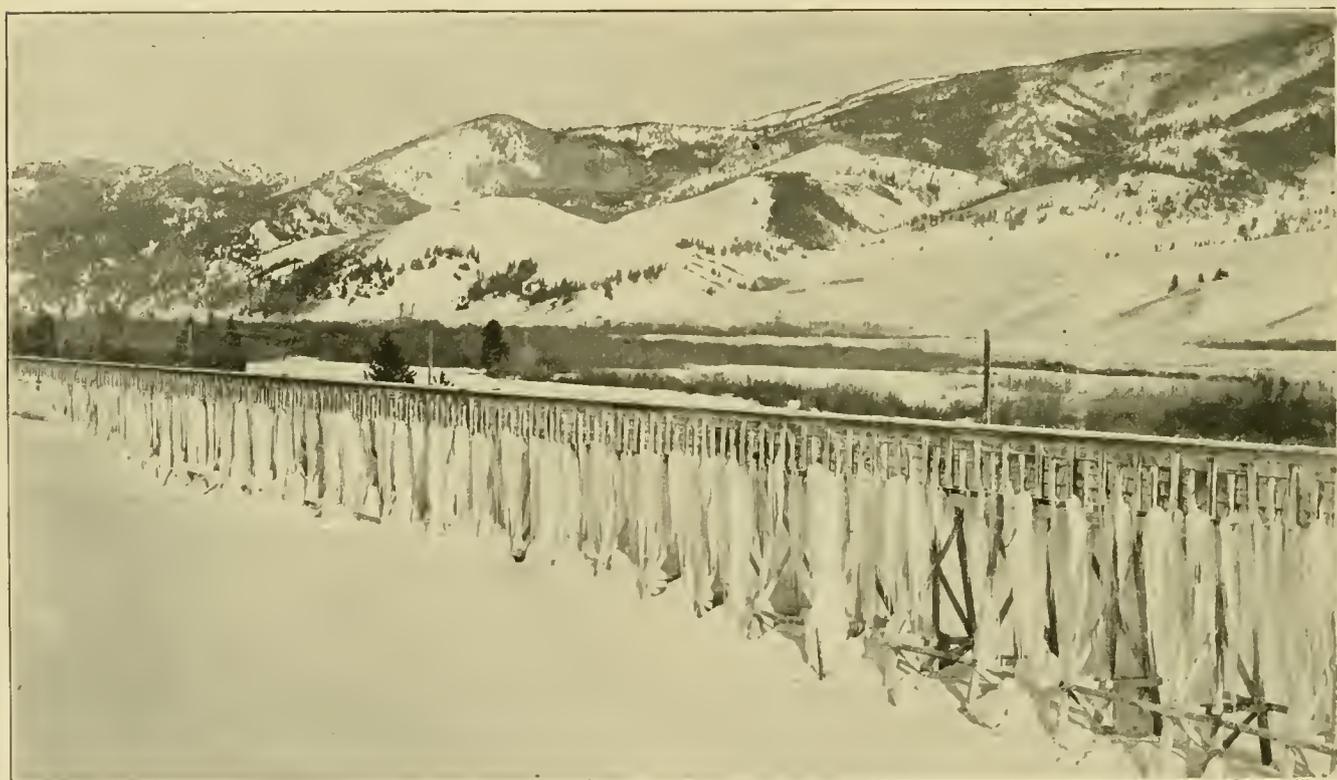

The plants of the Electric Railway, Light & Power Company, of Anaconda, Montana, possess special interest for all who are compelled to generate power in localities where fuel is costly and water power can be obtained.

This company constitutes the electrical department of the Anaconda Mining Company, the greatest producer of copper in the world, whose immense smelting, concentrating and refining works are at Anaconda, a thriving city of 6,000 people, situated in the heart of the Rocky Mountains.

The company has two plants, both operated by water

house, and conducted thence by means of a wooden flume, which winds around the hills, and at the station is at an elevation of 142 feet above it. The flume is built of red fir, three inches in thickness, and its dimensions are five feet by five feet, with a fall of eight feet to the mile, which gives the water a velocity of 420 feet per minute, and carries a sufficient supply to develop 900 horse-power.

The flume crosses a number of ravines supported on trestles, one of which is shown. The ice at this point is the accumulation of the entire winter. The leakage amounts to little or nothing, not 1 per cent; and no ice whatever forms inside the flume even in the coldest weather, when the thermometer stands at from ten to thirty degrees below zero, sometimes for days at a time; but at several points leakage and water which splashes

"The water rushing madly down the flume, builds gigantic icicles."

power, the largest and most important of which is located a couple of miles up the valley from the town, and furnishes the incandescent lights of the city and the arc lights of the "Upper" works of the Anaconda Company. In addition to this, there is generated 650 electrical horse-power, which is transmitted three and a half miles down the valley to the electrolytic refinery, and there utilized in the refining of the copper as it comes from the converters. Here also is provided the power for operating the street railway of the city, which has five and one-half miles of track, including a line to the "Lower" works, some two miles below the city. This plant is operated solely by water power, and runs every hour in the year.

The source of supply is a mountain stream, from which the water is taken at a point three miles above the power

over the sides as it rushes madly down the flume, builds up gigantic icicles, which in the course of a few weeks depend in great stalactites, and later, reaching to the ground, stand like mighty pillars of purest ice, formed from the crystal waters of the mountain springs.

The lower end of the flume is connected with the power house by a steel pipe 4 feet in diameter and 650 feet long, which is divided on its entrance to the building into smaller pipes, each leading to one of the water wheels. The water after passing through the wheels is conveyed in a flume a half mile across the valley, and there emptied into the flume of the Lower Smelting Works and is again used to operate the second electric plant, located at the "Lower" works, four miles below.

The surplus water not required by this second plant is

THE CITY OF ANACONDA, MONTANA.

used in the different processes of concentrating and smelting the ore.

At the first and larger plant the water wheels consist of three Leffel horizontal shaft, double discharge, turbine wheels of 300-horse-power each, which are shown in the accompanying engraving.

There are also three Pelton wheels of 125 horse-power each, which are kept as reserve. The power house is a substantial structure of stone and brick, 60x130 feet.

The water wheels are in the basement and are belted of a 6-inch line shaft on the floor above, which in turn transmits its power by link belts to the dynamos.

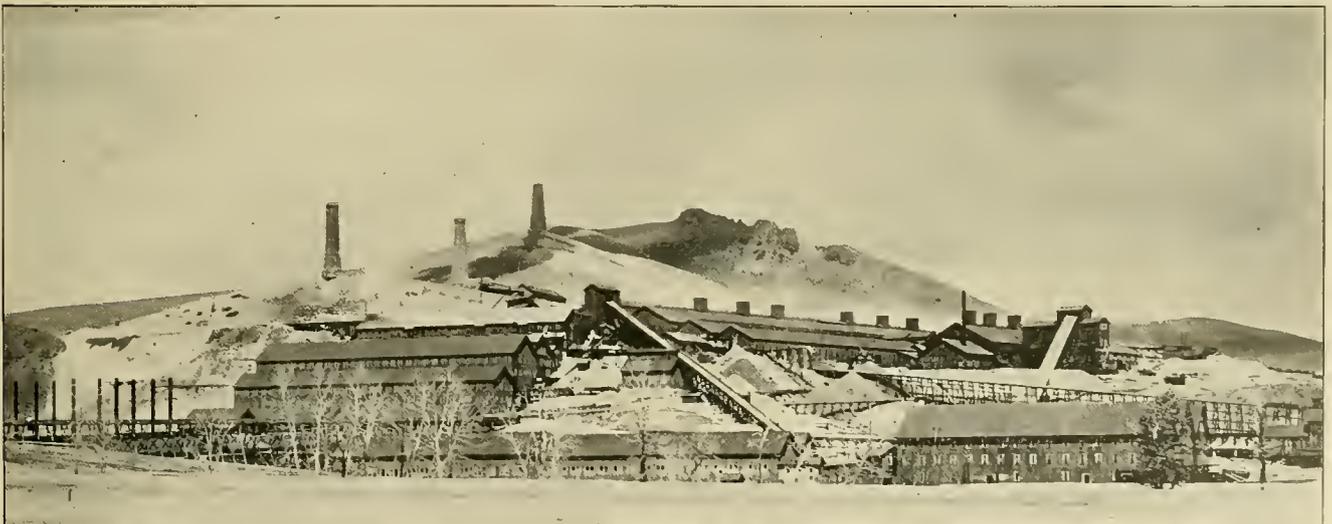

The arc and incandescent machines are at one end, and also the Thomson-Houston railway generators operating the street railway. The refinery power is supplied by eight Edison 100 K. W. 500-volt generators, divided into

two systems of four machines. Each system has its four dynamos connected in series and runs at 2,000 volts pressure. The line consists of two positive and two negative wires of No. 0 copper for each system.

At the refinery, four 500-volt motors in series, receive the current of each system and transmit the power to low pressure Edison generators, which connect directly with electrolytic tanks.

The expense of operating this power plant is exceedingly low, two men only being required on each of the 12-hour shifts.

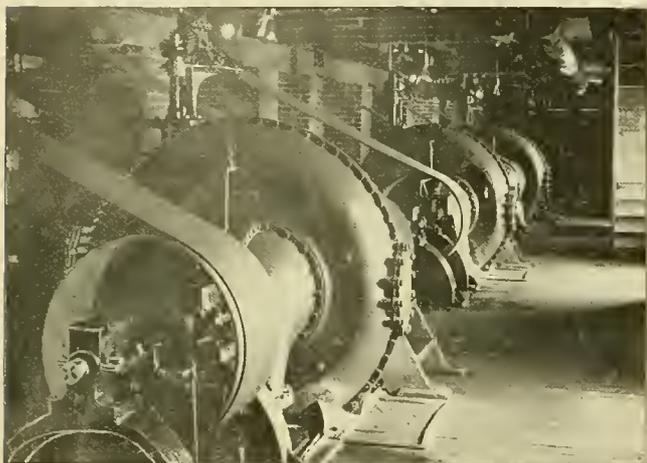

The price of coal is \$6.50 at Anaconda. This station has been in operation since 1891, and in six years from the time it was started will have repaid its entire cost in the saving it will have effected over the expense of operating a steam plant of the same size for that length of time.

LOWER SMELTING AND CONCENTRATING WORKS, ANACONDA.

The second plant of the company furnishes light only and is not run during the day time.

The water wheel here is a vertical shaft turbine of 325-horse-power, working under 15 pounds pressure, and drives the Westinghouse incandescent and the arc machines lighting the Lower and Upper works and the arc light machine of the city.

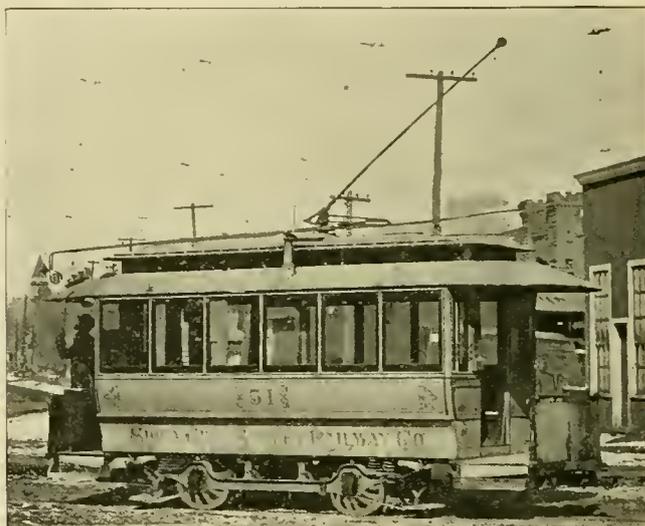

THE TURBINES.

The electric railway is one of the successful enterprises of this enterprising city, which bids fair in the near future to become the capital of the state. Notwithstanding the frequently severe weather incident to mountainous regions, the road is always kept in operation. During the summer a large created travel is induced to a beautiful park on the mountain side, at terminus of one of the lines, where the company frequently provides band music

THE GAYNOR TROLLEY BASE.

The accompanying engraving represents a trolley device, the invention of L. R. Gaynor, of Sioux City, Iowa. Its object is to put the trolley pole under the control of the motorman while he is on the front platform, and is for roads where there are no conductors. To the

GAYNOR TROLLEY BASE.

trolley base is attached a horizontal frame. It is attached above the swivel so that it turns as does the pole. The trolley rope is run over pulleys at each end of the frame so that is in reach of the motorman and he can pull down and adjust the trolley. To enable him to see the state of affairs, a mirror is provided at the end of the frame as shown.

INTERIOR VIEWS OF GENERATING STATION.

for the public. The energetic and very successful superintendent of the railway and lighting companies is Charles R. Holmes, formerly of Chicago, and one of the youngest street railway managers in the country. The road shows a constantly increasing revenue, while expenses are kept at a point not easily attained in many eastern cities, where labor and supplies cost much less than in Montana.

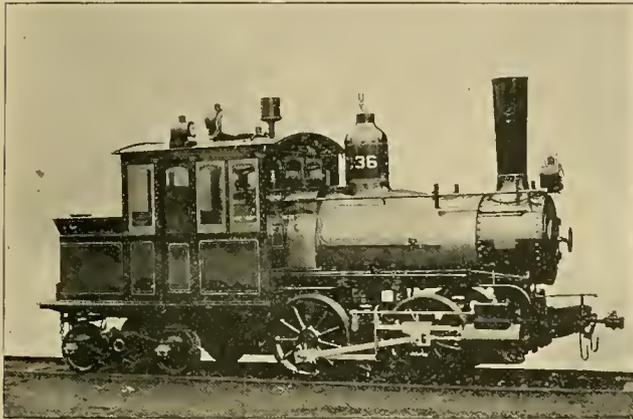

WHILE] the general press howls at street car horse cruelty, the Philadelphia Times gives a few sharp pointers to the omnibus companies, that allow their over burdened horses to strain and fall upon icy asphalt, for want of sharp caulks or rubber pads, both of which are cheap. The cruelty of buss and dray companies although not so much remarked is far more worthy of censure.

**NEW LOCOMOTIVE FOR NEW YORK ELEVATED.**

A Short History of "L" Improvement.—The New Engine.

In an article on the new locomotives for the Manhattan Elevated in New York, the Engineering News brings out some valuable historical points connected with the beginnings of elevated roads.

The first elevated line was in 1868, on Greenwich street, from the Bowery to Cortlandt street, and was operated by endless chains. This was extended to Thirtieth

NEW L ENGINE FOR NEW YORK

street in 1870, but the chains proving a failure, were abandoned and small four-wheeled dummies substituted. These dummies carried saddle tanks on the boilers, the cylinders driving a crank axle between the main axles with connecting rods on the drive wheels. The ordinary train consisted of two cars of 11,000 pounds each, seating forty-eight passengers. The length of the trip was four miles and it was made in twenty minutes, including some seven stops. Late in 1871 the New York Elevated Railroad Company was organized, extending and improving the system. In 1877 a re-organization was effected and some large four-wheeled engines substituted, together with some of the Forney type. The Metropolitan was organized in 1876, operating double-end dummies of four drivers, and using leading and trailing pony trucks. The later ones were of the same type but with larger capacity of boiler and shorter cabs,

The Metropolitan now owns 311 engines of the Forney type and 1,090 passenger cars. Master Mechanic Peeples gives a table of dimensions showing the history of the development. The first engines weighed 12,000 on drivers, cylinders, 6 by 12; the double-enders weighed 35,310 on drivers, cylinders, 10 by 20 (time 1879); the Forneys of May, 1886, weighed 32,500, with cylinders 12 by 16 inches; the Forneys of 1894 weigh 33,000, with 12 by 16 cylinders.

Although two-cylinder and four-cylinder compounds have been introduced on Brooklyn and Chicago roads, the New York lines still adhere to the simple engine exclusively.

The latest engine is that built by Pittsburg Locomotive & Car Works of Pittsburg, Pa. These are designed to

haul five cars of 29,000 each, on a grade of 2.5 per cent at a maximum speed of 25 miles an hour. The builders' dimensions are as follows:

**RUNNING GEAR:** Diameter drive wheels, 3 feet 6 inches; truck wheels, 2 feet 2 inches.

**WHEEL BASE:** Driving, 5 feet; truck, 4 feet 8 inches; total, 16 feet 1 inch.

**WEIGHT IN WORKING ORDER:** On drivers, 33,000 pounds; on truck wheels, 14,000, engine, total, 47,000; full coal capacity, 16,00 pounds; water capacity of tank, 4,267; allowed for water in boiler, 4,000 pounds.

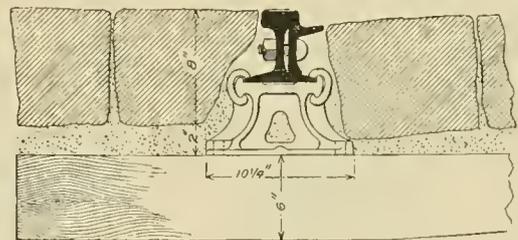

**CYLINDERS:** 12 by 16 inches; distance, center to center, 6 feet 4 inches; center to valve face, 10 $\frac{3}{8}$  inches; diameter piston rod, 2 $\frac{1}{8}$  inches; connecting rod, between centers, 5 feet.

**BOILER:** Type, extended wagon top; working steam pressure, 140 pounds; diameter of barrel, 3 feet 5 $\frac{1}{8}$  inches; heating surface of 183 tubes, 491 square feet (exterior).

The valve gear is link type, and Eames' vacuum brakes are used.

**STEAM ROAD PAVING TO T-RAIL.**

A substantial piece of paving to T rail in a paved street has been laid by the New York Central in the city of Syracuse, N. Y. A tram rail of special form is bolted to the T forming a tread for vehicles, and the stone blocks are brought up flush on either side of the iron, which is carried on cast-iron chairs 5 inches deep, and

which, in turn, rest on the sleepers. The T is an 80-pound and the tram a 30-pound. This construction, exclusive of paving, cost \$13,498 per mile when laid, and could be duplicated to-day for about 7 per cent less. Our illustration is from the Railroad Gazette.

**THE NEW EXCUSE.**

In the ante-Trolley days  
 When some mysterious blaze  
 Destroyed the goodly "Clothing House"  
 Of the Moses-Aaron Co.,  
 With considerable fustian,  
 Spontaneous combustion  
 Would get the credit of the deed—  
 The others would Scott-free go.  
 But now, to be specific,  
 The cause of fires prolific,  
 When the companies insuring  
 Can't see that cause, you know,  
 They blame it on the current  
 Of the trolley — if it weren't,  
 Perhaps some one might hie him  
 To the penal, lost, Limbo.

EACH conductor and motorman of the Jamestown, N. Y., Street Railway Company has received as a gift, from some unknown friend, a neat pocket bible.

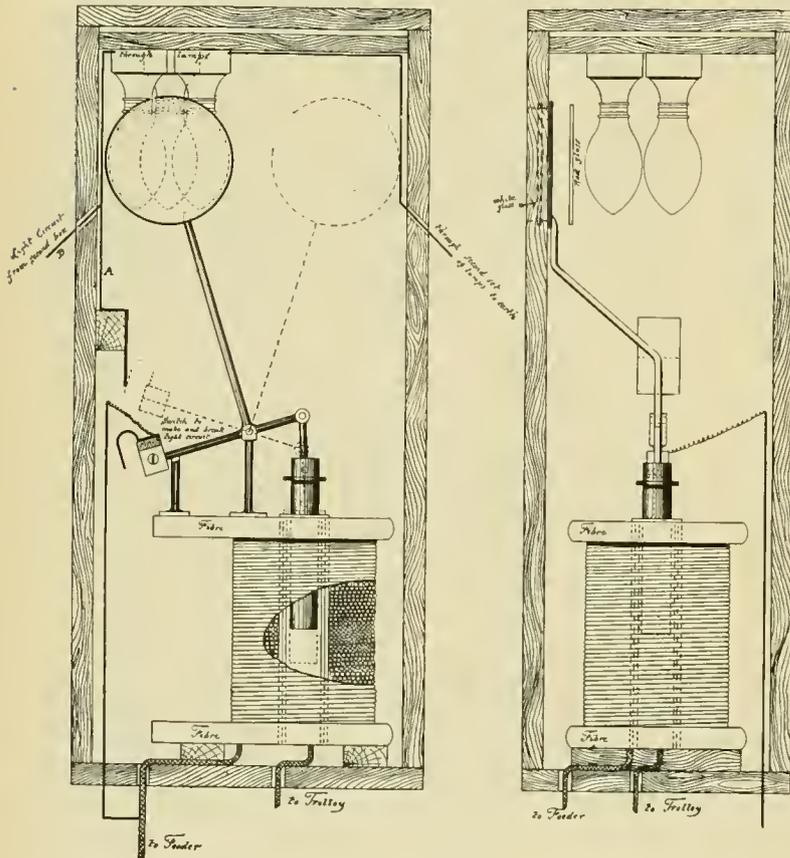

BLOCK SIGNALS AT BUFFALO.

The Buffalo Railway is obliged at present to operate a small portion of one of its double track routes as a single track. The single track portion occupies two sides of a block, so that cars would be frequently meeting on the single track were it not for the block signal which has been installed. Two trolley wires are used for the single track, as shown in the general plan in Figure 1. This single track portion is separated by circuit breakers from the rest of the line. The signal boxes are connected in between the feeder and the trolley wire. When a car enters the block, the current which supplies

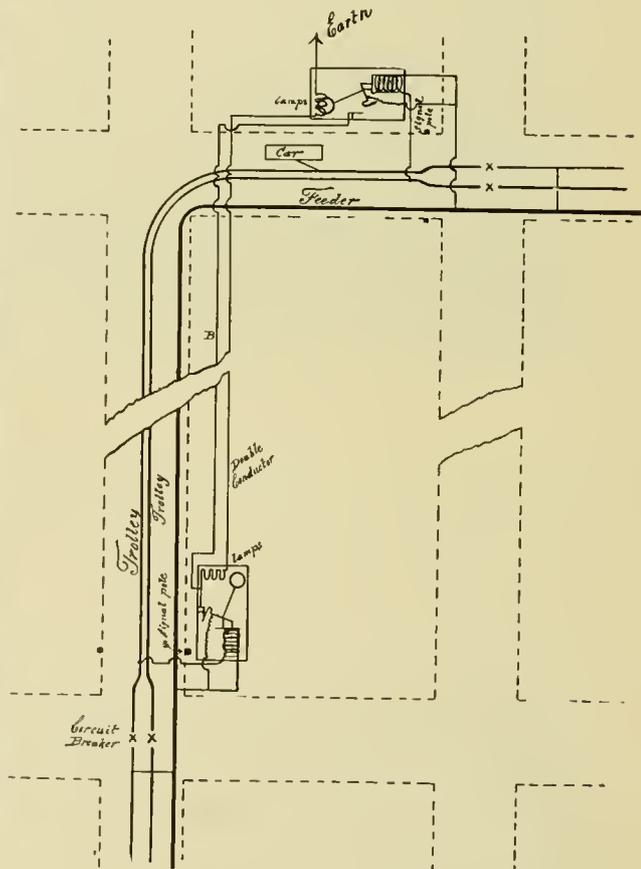

system was devised in the company's office, at the suggestion of H. H. Littell, general manager.

SUNDAY SERVICE IN SCOTLAND.

The heading refers not to divine service, for faithful attendance upon which the sturdy Scotchman is noted, but to the more secular and week-a-day occupation of operating street cars on the Lord's day. Public agitation in the City of Glasgow has been quite active on the combined question of Sunday concerts in the City Halls and go-to-meeting trams. The concerts fared but poorly, and it has finally been left to the curator to designate the

SIGNAL BOX.

PLAN OF CIRCUITS.

the car must flow from the feeder through the signal box at the other end, thus giving cars going in the opposite direction warning that a car is on the block. The detail of the signal box is shown in Figure 2. The main trolley current flows around a solenoid of low resistance. The plunger of this solenoid operates the disc or shutter which discloses the lights at night, and by its color gives the day signals. The simplest way is to have these signal lights permanently in circuit. The most economical way is to have them cut in automatically, as shown here. This method has only one lamp circuit for the two signals. It would be simpler, of course, to have each bank of signal lamps independent, as then no wires other than the trolley and feed wires would be needed between the boxes, for the lamp circuit could be grounded at each box. The shutter is held to safety by a counterweight. The

good from the bad and to put his seal of approval on such as may be deemed within the limits of sacred service.

In this free country, free even to the extreme of error not infrequently, the occasion for an editorial of which the following is a part, from one of the leading Glasgow dailies, seems a good way back toward the days of the Mayflower:

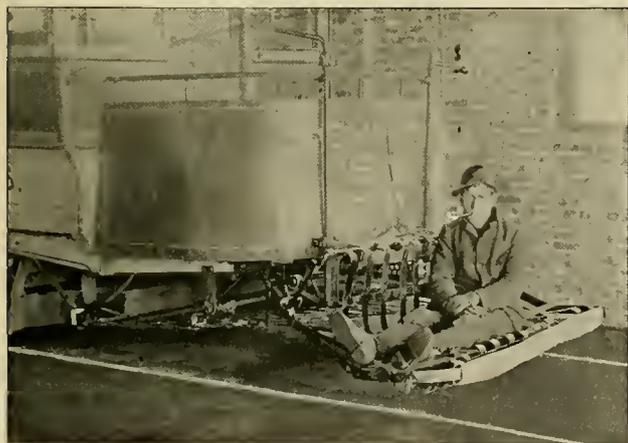

"While practically putting a ban upon the better sort of Sunday concerts, the majority have decided to give a modified tramway service on the Sabbath. But, after all, the Council could not have done less than this. Every practical consideration supports the continuance of some such Sunday vehicular convenience as now exists—indeed, the present service might be improved upon; and there are no moral considerations against it. Indeed, we may go further, and say that the ethical question, so far as it is involved in the matter, is all in favour of the policy of humanity. The doctrine that travel, change

of air, the meeting of friends are irreligious on Sunday is certainly inhuman, and, as the inhuman cannot possibly be divine, is assuredly not a providential ordinance. The working masses of this crowded city suffer enough, surely, from the too arbitrary recognition of this absurd and cruel decree in being, practically cribbed and cabined within the confines of Glasgow from Saturday night till Monday morning. To forbid, further, all movement within this too restricted area would probably serve as the last straw of convention laid upon the back of that long-suffering camel—the public. For, of course, coercion in such a matter would, in practice, have proved quite impossible. The Corporation car would no sooner have been taken off the streets than the omnibus of private enterprise would have made its advent, horrifying the over-zealous Sabbatarians by such noise and rattle as were never caused by the harmless, necessary tramway. The marvel is that 16 intelligent Town Councillors of Glasgow voted for a proposal so nonsensical.”

The Sunday car question is specially raised on a memorial bearing the names of some 120,000 Sunday-school teachers and scholars, and the Young Men's Christian Association. Some of the arguments are amusing to Americans. For instance, one speaker set forth that Sunday operation was introduced when the lines belong to a corporation for the benefit of stockholders, and now the road was owned by the city few but the wealthy cared to use the cars Sunday. Then he adds a little later—"The traffic on the Lord's Day has grown to such an extent that the streets literally swarm with cars," which would indicate there are few poor people in Glasgow. Another backed (?) his argument for cessation of cars on the ground that as fast as they gave facilities the traffic increased," while another more sensibly remonstrated with the statement "To attempt to stop all Sunday traffic would be like trying to sweep back the Atlantic with Mrs. Partington's broom." It was finally decided by a vote of 32 to 16 to continue the Sunday car service and the storm is quelled, at least for a time.

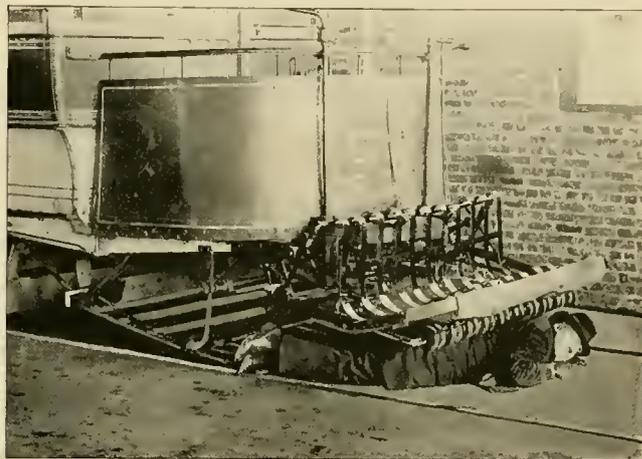

THE DARRACH FENDER.

S. A. Darrach, of Newark, N. J., has invented a fender which he is not afraid to try on himself and which has

proved its efficiency by picking up Mr. Darrach in numerous trials. Although he is an elderly gentleman, as will be seen from the engraving, in which he is shown

under the fender, he sustained no injury in the dozen or more times he was picked up. The fender is a light frame of steel pipe, supporting the cushion of flat steel springs, which take the place of the wire netting usually employed. If a person is lying on the track the fender passes over him and a scoop under the car body in front of the wheels is automatically lowered to receive the body. But very little weight rests on the person passing

MR. DARRACH DEMONSTRATING HIS FENDER.

under the fender. The prime object of the fender however is to rescue people who are on their feet at the time the car strikes them. For this purpose the flat steel springs are well suited, arranged as they are, to protect the person from striking the dashboard or sills. The trial at Newark recently was very satisfactory. We understand that Mr. Darrach is at work on a fender which does not extend beyond the car dash.

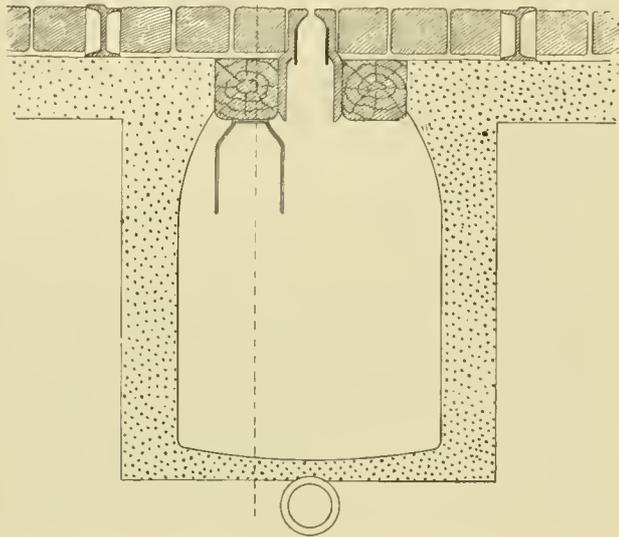

MEAKER REGISTERS FOR CHICAGO CITY RAILWAY.

The Meaker Manufacturing Company, of Chicago, whose portable fare registers have been exclusively in use the past ten years on all the lines of the Chicago City Railway, has just closed a new contract with that road. The fact that the former contract was to expire was known to all the register companies and the result was a decidedly lively fight to secure the new contract, and in this connection the report became general that the road was about to discontinue portables and adopt stationary registers. Hence the new contract for continued use of the Meaker portable register, which was closed March 1, is not only highly complimentary to the excellence of the Meaker machines, but may also be properly termed a very large compliment, inasmuch as the City Railway uses 1,600 of these registers.

A COWARDLY attempt was made, February 24, to burn the repair shops of the Brooklyn, N. Y., Elevated Railway Company. It was the second such attempt, and cost the company \$3,000. Discharged employes are suspected of the deed.

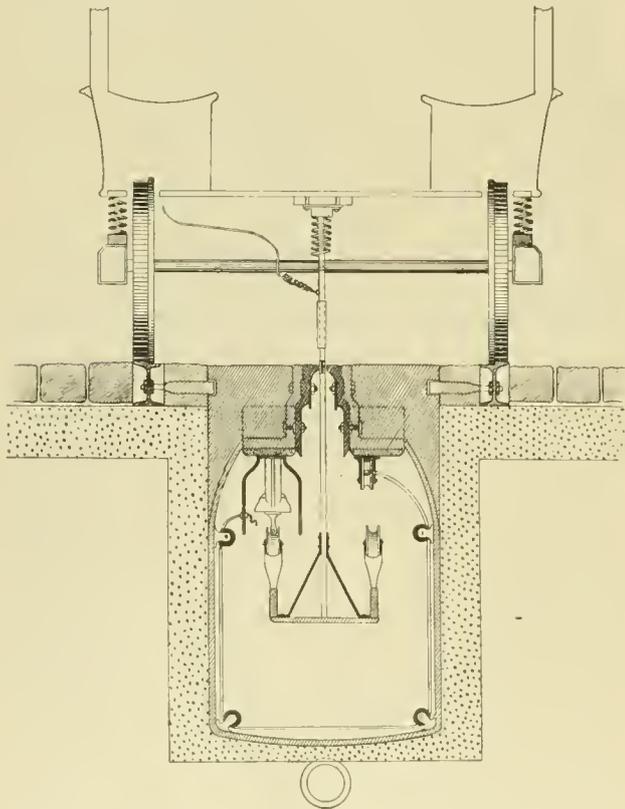

**CROSBY & REITMEYER CONDUIT.**

This conduit is similar to a cable conduit in construction, except as regards shape and depth. It is five feet deep from the top of the slot rails and three feet wide. The sections given here show the details. Although a

CROSS SECTION AT YOKE.

single trolley system, the double trolley arm is used to facilitate operating on Ys and turnouts. The trolley wire is protected along its entire length with a hood of sheet iron lined with vulcabeston. The trolley hangers are

CROSS SECTION SHOWING TROLLEY CONTACT

supported from timbers extending along the slot rail inside the conduit. The inventors have given a great deal of attention to the trolley arm. Side motion of car is allowed

for by a socket in the iron plate where the arm is attached to the car. The spring holding up the device has play of only about three inches, so that no harm comes to the trolley if it does come off, and the difficulties of switches and turnouts are reduced to a minimum.

**PLEASURE RESORTS AND CREATED TRAVEL.**

PART IV.

It is often a matter of surprise to the uninitiated that the roads in the smaller towns carry such a comparatively enormous number of people to their pleasure resorts. We have shown that this traffic can be induced in nearly every town large enough to support a street railway, and that the results are something surprising, even to the managers themselves. There is a difference between cities in this respect, but it can generally be noticed that where there is a great deal of pleasure riding it is directly the result of an effort on the part of the street railway management. A road noted for the number of its pleasure riders is the Citizens Street Railway, of

KALAMAZOO, MICH.

Kalamazoo is conceded to be one of the most beautiful cities in the United States. The road consists of eleven

miles of track, equipped with 48-pound T-rail, laid on oak ties, 2-foot centers. The roadbed was put in in the most substantial manner. All of the turn-outs, switches, crossings and special work was made by the Page Iron Works, of Chicago. Through the business portion of the city iron center pole construction is used. The remainder of the line is of side pole, span wire construction. The overhead line has been built in a most modern and substantial manner. The company is operating thirteen double motor cars, 16-foot bodies, built by the St. Louis Car Company, and during the summer months operate in addition to these motor cars, twelve trail cars, making twenty-five cars in all. The motors are all General Electric single reduction, on St. Louis trucks. The road is operated by four 80-horse-power General Electric rail-

way generators, which are driven by a 450-horse-power Lane & Bodley corliss engine. The railway company owns and controls a beautiful piece of property, situated 2½ miles from the center of the city, which is known as Lake View Park. This property consists of about ninety-three acres of land and water, the lake being about one-quarter mile wide and one-quarter mile long. The grounds are provided with dancing pavilions, band stands, restaurants, check house, and a large boat house, and upon the lake are twenty-five 14-foot row boats, two electric launches, and one steam launch. During the summer months, attractions, such as balloon ascensions, tight rope walking, swimming matches, fire works, band and orchestra concerts are given, and are attended by large crowds. On Sundays a religious service is held in the afternoon, and with music in the evening, and it taxes the rolling stock of the railway to carry the people back and forth. The lines of road radiate from the center of the city, all crossing a given point, and at which point the transfer station is established and transfers given to passengers from one line to another. This company was the first to introduce the "aluminium ticket." They are sold at the rate of six for a quarter for adult tickets and ten for a quarter for children's

the largest producer of celery and has a large number of very fine public, state, county and city buildings. The engraving which shows the people getting in line to board the cars, was taken on a circus day last summer, on which day 12,000 people were carried, or more than one-half the attendance at the circus.

STANDING IN LINE.

## UTICA PARK, ON THE UTICA & MOHAWK.

The popularity of President James T. Mann's resort can best be judged by a few words, quotation from the *Globe* of Utica.

"In this lovely Mohawk valley few more delightful spots can be found than that one which in so brief a time has become such a favorite—Utica Park. Nature and man (or Mann, if you like it better that way), have labored together to make the place attractive and the large crowds which daily visits there are better evidence than any words could be that they have been successful. Within three years they have transformed a wild woods and rough pasture land into a garden spot of beauty and made it the

finest picnic park in central New York."

The park is about two miles from the center of the city and comprises 70 acres, half of which is woodland. One of the first things to attract the visitors' attention on

LAKE VIEW PARK, KALAMAZOO.

tickets. These tickets are on sale at the most prominent stores throughout the city.

Kalamazoo is a very enterprising city, having a population of about 30,000 people and has some of the largest manufacturing interests in the world. It is also noted as

entering the park, is the "zoo," a neat structure, where are the quarters of animals, too numerous to name, and which are always a drawing card. Then there is, of course, the dancing and refreshment pavilion and the neat little waiting room at the park entrance.

## A McKEESPORT ROAD.

Electricity Surmounts the Difficulties of Grades and Curves.—Doing a Steam Road Business—Mail, Freight and Express.

The peculiar topography of that part of Allegheny county (Pennsylvania), near Wilmerding, caused that city and the main line of the Pennsylvania railroad to be separated from McKeesport with its two navigable rivers, its four trunk lines of railroads, its large industries and 40,000 population, by an elevation less than two miles by a direct line, but 1,200 feet high, and the contours of which proved for years an insurmountable obstacle to skillful engineers who, fully appreciating the importance of the narrow link, endeavored to discover a grade which would permit a steam road to be run from the main line of the Pennsylvania railroad to McKeesport.

This was before electric traction had been so fully exploited and before engineers knew that the electric cars could climb a grade.

POWER AND CAR HOUSE.

Engineers made many surveys, and plans covering almost every inch of the intervening ground and even the complete details of a tunnel had been prepared which was to pierce this troublesome eminence, and to cement, in an intimate commercial union, the large interests of the two sections, that were so near yet seemingly so far.

Readers of the REVIEW will no doubt remember that the early numbers of 1892 chronicled the organization of the McKeesport & Wilmerding Railway Company for purpose of constructing an electric road over this ridge to connect the two places. The enterprise was viewed with much suspicion. While all admitted what an important profitable link such a railroad would be, if finished, the majority doubted that it could be successfully operated.

Taylor, Romine & Scott, of McKeesport, Pa., were the engineers of the road, and worked industriously for almost one year surveying the ground and locating the road at the shortest possible distance and with the easiest grade, and those who now ride over the line will appreciate that the firm has distinguished itself, has largely

subdued the elevation between McKeesport and Wilmerding, and traffic between the two places can be conducted on a comparatively easy grade. The road is a trifle over four miles long from the end of Fifth avenue, McKeesport, and the Pennsylvania railroad depot, Wilmerding, Pa., and is equipped in a superior manner, heavy rails and a splendid roadbed were secured, poles and

REVERSE CURVE, ELEVEN PER CENT GRADE.

overhead work are of the latest design and of the most substantial character. A special rail brake for emergency guards against accidents on grades.

The power house of the company is located about midway on the line, and both the power house and car barn are built of iron. The fuel is supplied from a mine adjoining the power house and owned by the company. The power house has two Pierpoint boilers of 100 horsepower each, Russell engine of 250 horsepower, and one Westinghouse dynamo of 150 horsepower. The cars of the company are supplied with two 25-horsepower Westinghouse motors.

By electric cars the McKeesport & Wilmerding road connects at McKeesport with the McKeesport & Reynoldston Passenger Railway Company, which, at River-ton, joins the White Traction Company, now running through Duquesne and which will be extended to Home-

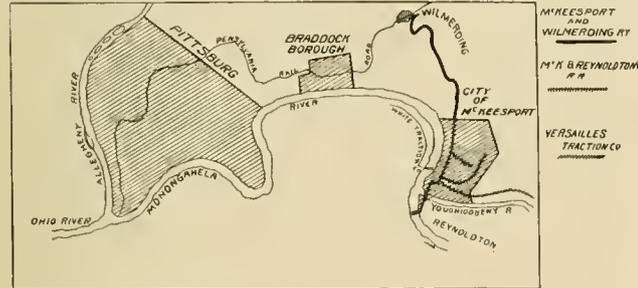

ONE THOUSAND FEET ABOVE TERMINI OF LINE.

stead. The Wilmerding end of the road connects with the Second avenue line, which extends from Market street, Pittsburg, along Second avenue to Glenwood, Braddock and Wilmerding, and the McKeesport & Wil-

merging railway is a link which makes it possible to ride on electric cars from McKeesport to Pittsburg, a distance of twenty miles.

The road was built in less than four months, and was opened June 3, 1893, and, at the close of the six months' business, December 1, it was found that over 93,000

passengers had been carried in 150 days. There has been no accident of any kind and, although containing a number of 11 per cent grades, no "tie-ups" are reported on account of snow and ice.

The road, on November 6, 1893, began carrying all the mails for McKeesport and for points up the Monongahela and Youghiogheny valleys and the Adams Express goods for the same routes. This route saves twenty-nine miles, as the mail and express was previously carried fourteen miles from Wilmerding to Pittsburg and fifteen miles from Pittsburg to McKeesport.

The freight service is conducted in the most complete form, with specially constructed cars. The cars are

companies, and in handling fifty-foot drops and other long scenery two small trucks, coupled the requisite distance apart, are used. A combination car leaves either end of the line every hour from 6 a. m. to 12 p. m., carrying mail, express and freight.

The mail service is under the post office department, and conveys pouch mail between McKeesport and Wil-

MCKEESPORT DEPOT.

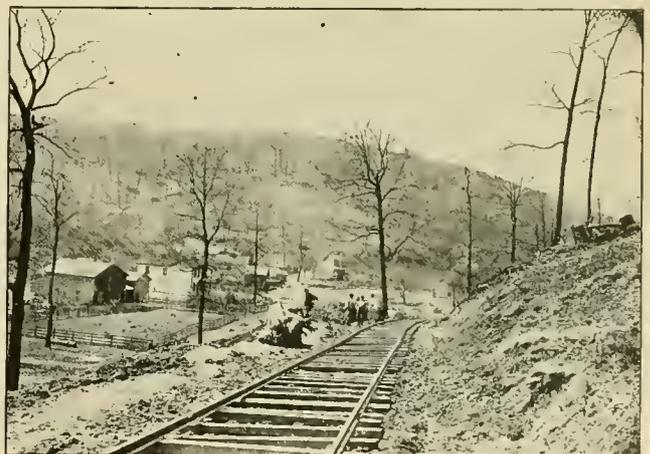

merding. The mail is delivered from the station to the post office in a light wagon and is not sorted en route. The government pays so much per mile per hundred pounds. The time of transit from the depot at Wilmerding to the McKeesport post office is forty minutes.

One feature of the mail service is the delivery of Pittsburg Sunday papers in McKeesport. Formerly, by B. & O. rail the Sunday journals arrived at 9 a. m. The Pittsburg Leader, however, created a sensation by

WILMERDING SHOWING LINE ON HILL ONE THOUSAND FEET HIGH.

twenty feet long, of which five feet is separated from the passenger portion by a partition in which there is a door. Mail, express and freight are carried in this space; doors at the side of the car permit the largest trunks or packing cases to be taken in or out. When freight is of too heavy a nature or in quantities too large to be taken in this combination car, the company has a plain box car which is used as a trailer, and in which baled hay, lumber, household furniture, and freight of such a nature is transferred. The combination car is frequently used for funerals, the casket being placed in the express portion and mourners and friends in the passenger portion. The company is called upon frequently to transfer theatrical

CONSTRUCTING THE LINE.

chartering a car over the electric road and bringing papers thus from the Pennsylvania railroad junction at Wilmerding to McKeesport by 7 a. m. The Leader was justly proud of this enterprise, and spoke editorially of the splendid electric service.

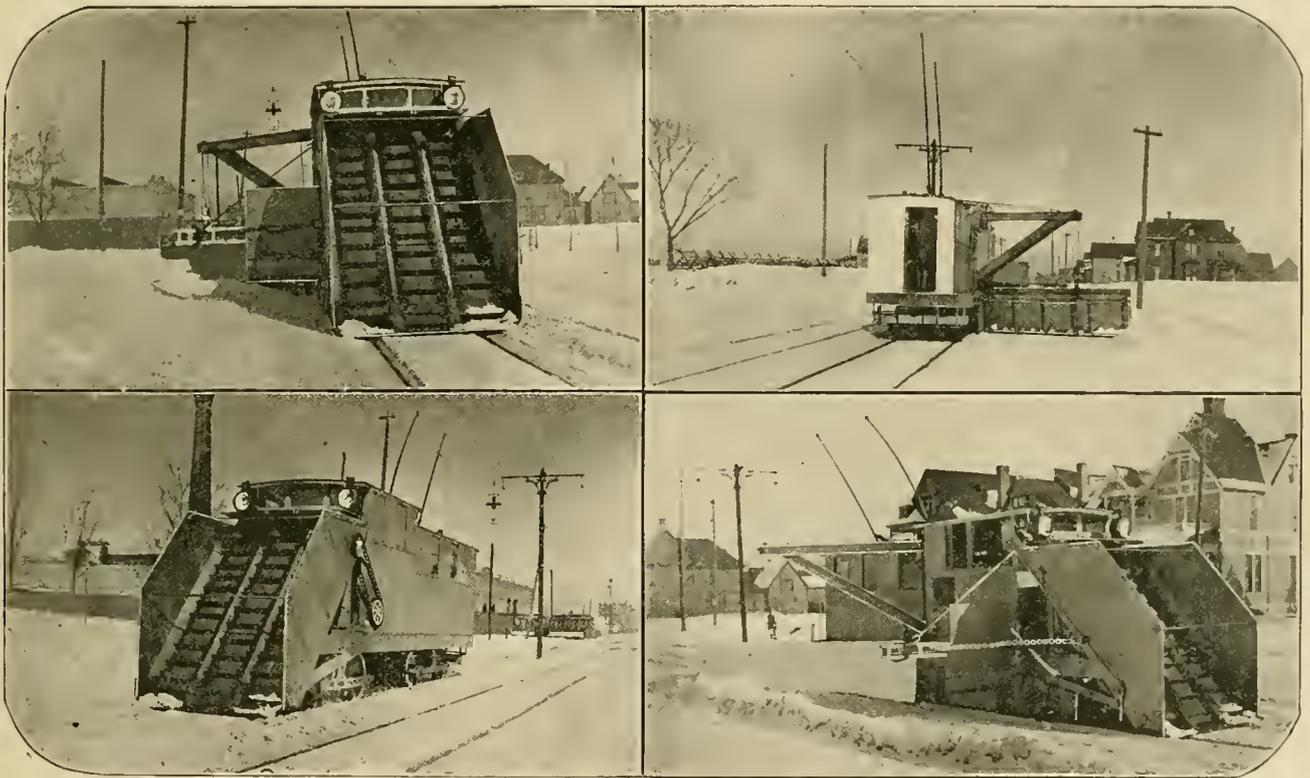

The freight, mail and express business over the McKeesport and Wilmerding road is controlled by the

## MAMMOTH SNOW PLOW AT MINNEAPOLIS.

During the past winter what is probably the largest and most effective snow plow ever run on a street railway has been in use on the Twin City Rapid Transit Company's lines, at Minneapolis and St. Paul. In its construction, the well known but poorly acted upon principle is recognized, that to successfully fight snow something more must be done than to merely shove it to one side of the track. Piling the snow up on either side simply invites that subsequently falling, to drift deeper than ever. It also invites teamsters to take to the track and stay there. It is, in addition, important that the snow cleaning apparatus should be independent of the car movement in its action: This latter principle has been made use of in

are of  $\frac{5}{16}$ -inch steel, and are riveted to endless sprocket chains running on rollers. The front conveyor drops the snow on to a side conveyor, which is thirty inches long, and throws the snow out at the side of the car, where it is taken care of by the wings. The side wings have a fifteen foot sweep, and are two in number; the smaller one in the front to start heavy banks and to keep snow away from the plow, and a larger one behind it to do most of the sweeping. The front wing is a simple  $\frac{5}{8}$ -inch steel plate 4x6 feet, rigidly pivoted to the snow plow frame, and backed up by a channel iron beam eight feet long. The rear wing is made of two 60-pound steel T-rails, fifteen feet long, bolted at the top and bottom of a 4x15-foot plate of  $\frac{1}{2}$ -inch steel. It is a floating wing, having no rigid connection to the plow frame, and being

THE MINNEAPOLIS MOGUL ELECTRIC PLOW

sweepers having the brushes independently driven, and which give excellent results. The Minneapolis plow, however, by the use of conveyors instead of brushes, disposes of a much larger quantity of snow in a more satisfactory way. The power required is, of course, enormous, but on a large system this is of only secondary importance, the main point being to do the work without delay. To remove the snow from the track, the scheme adopted on this plow is to raise the snow in front of the plow by means of conveyors. It is then dropped on a short cross conveyor, which throws it to one side. Heavy wings push back the snow coming from the conveyor, and in addition clear the roadway at the side. The front conveyor is nine feet long, and placed at an angle of forty-five degrees. The blades of the conveyor are sixty-six in number, having dimensions 24x6 inches. They

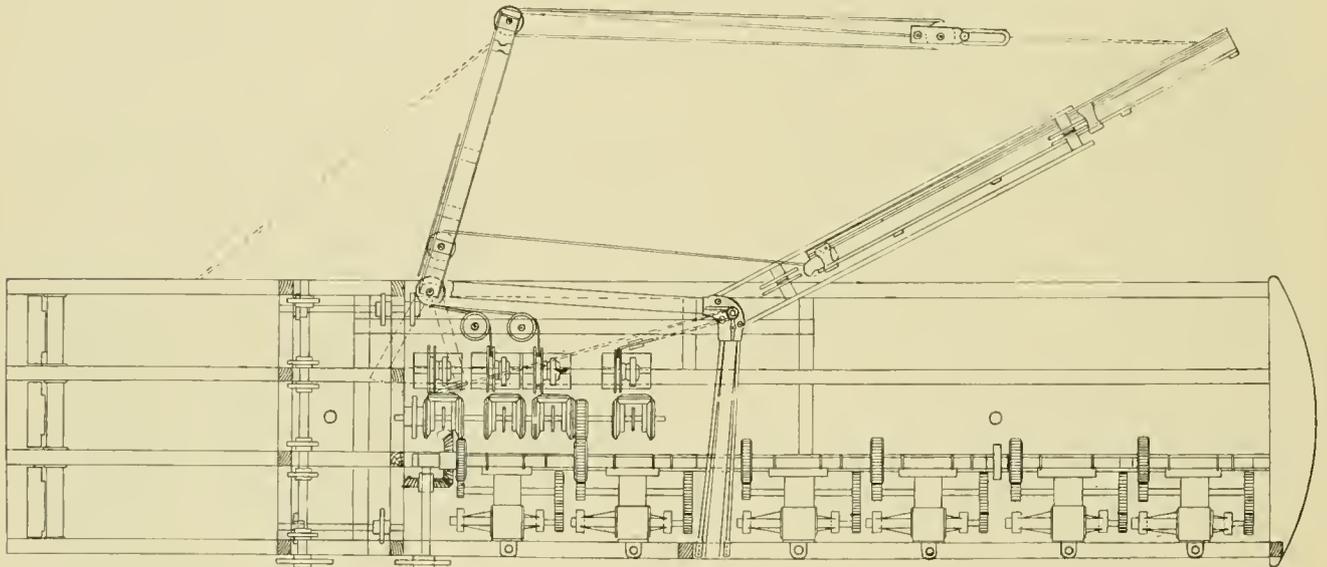

elevated and carried by a jib crane. The crane is made of 8-inch channel iron, its height and length being, respectively, seven feet and twelve feet. It is supported at both ends by  $\frac{1}{2}$ -inch steel rope running over pulleys, in several turns. This wing, which is considered the most important feature of the plow, has a weight of 3,500 pounds. Inside of the plow are six redesigned Number 6 Sprague motors, which, after a 9 to 1 gearing reduction, are connected to a heavy 26-foot shaft. These motors supply power to the conveyors by means of an ordinary chain and sprocket wheel. By means of clutches these motors also supply power to adjust the height and sweep of the heavy 15-foot wing, which may thus be quickly taken from a 15-foot sweep, and folded in its "pocket" at the side of the plow. The steel ropes which change the position of this wing run over drums

which receive their power from the motors by means of worm gearing. Each pair of Sprague motors has a controller and reversing switch.

The plow is mounted on two strengthened Bemis pivotal trucks, having 7-foot 6-inch wheel bases and 20-foot pivotal centers, giving a total wheel base of 27 feet 6 inches. Allen paper 33-inch wheels and  $3\frac{3}{4}$ -inch axles are used. Each truck is equipped with two W. P. motors, redesigned for great torque and slow speed. The horizontal effort exerted by each motor at 100 amperes with the 4.78 gearing reduction and 33-inch wheels, is 1,650 pounds or 6,600 pounds from the two trucks. The two motors on each truck are governed by a series multiple rheostat switch, such as is used on the company's cars. The clutches controlling the rear wing, and the handles governing the controllers for the six Sprague and the four W. P. motors with their reversing switches, cut-outs, etc., are conveniently placed near the upper part of

#### NATIONAL ELECTRIC LIGHT CONVENTION.

An uninformed visitor to the National Electric Light Association, held at Washington, from February 27 to March 2, might, during one of the sessions, easily have thought himself at a street railway convention. We refer to the reading of the paper on "A Complete Metallic Circuit for Street Railways," by J. H. Vail, and the discussion which followed: Mr. Vail's paper brought out no new points on this subject, being valuable chiefly as a concise review of the matter in hand. The value of the rails as conductors, as against supplementary wires, and the importance of large bonds was well illustrated by both figures and diagrams. Indeed, after showing the absurdity of using copper conductors of ordinary size alongside the rails, it was rather surprising to see him lay so much emphasis on the importance of track feeders to various points of the system, which feeders, according

PLAN OF SNOW PLOW.

the front end of the plow. On account of the drop in potential at the end of some lines, it was found impossible at times to estimate the current used by noting the speed of the plow, but by noticing a large dial ammeter the motors are kept from working too long above their capacity. In order to avoid the sputtering at the trolley wheel, with heavy currents, and the risk of burning off the overhead wire should the trolley come off, two trolleys are used. The length of the plow is 39 feet, and its weight 35 tons. It was designed and built by the engineers of the Twin City Rapid Transit Company, at its Minneapolis shops. It is built after designs on which the Railway Track Cleaner Company of Minneapolis, of which company Thomas J. Canney is president, owns the patent.

A big car factory is reported to be established at Seattle, Wash. The plant to be established on Salmon Bay, at a place called Ballard.

to his own statements, must be of enormous size to be of any value as compared to the rails. However, the specifications made by him for the construction of a ground return are in general good, and can be carried out in practice with the best of results. An extensive discussion followed, in which several street railway men took part. C. W. Wason, of Cleveland, spoke of

#### THE CONTINUOUS RAIL,

and said that in conversation with President Moxham, of the Johnson Company, he was assured that the company would guarantee perfect work from a welding point of view. The company had been rather discouraged with the work done on the West End, at Boston, where the joints were made by welding the fish plates to the rail ends, but being urged on they had continued their experiments with more success. In the welding done now, the rails were simply butted together and the weld made at the ends. They have contracts for welding 150

miles of track during the coming season. Two welding machines have been ordered in addition to the two they now have. Mr. Wason stated that the 1,000 feet of track he had laid with hot riveted joints still remained in good condition. Mr. Smith also referred to an instance under his notice where a mile of track was so riveted and the expansion was not noticeable.

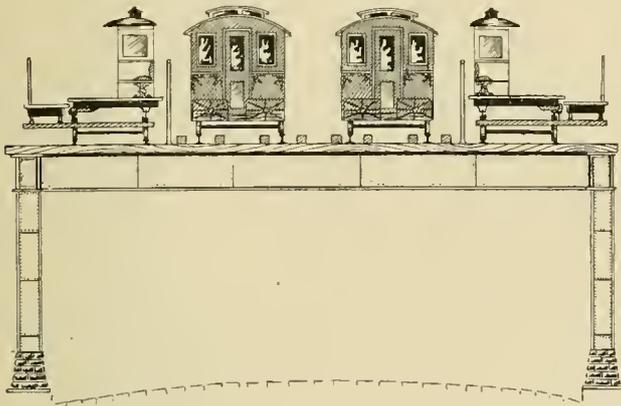

RAPID TRANSIT IN NEW YORK.

A Solution of the Problem that is Highly Effective and Comparatively Inexpensive.

New York City has for a long time occupied itself with the much vexed question of increased transportation facilities. The elevated roads at first bettered conditions by adding first more trains and later more cars to a train, until the limit was reached. Then the surface road installed cable, and offered great relief to the short-haul

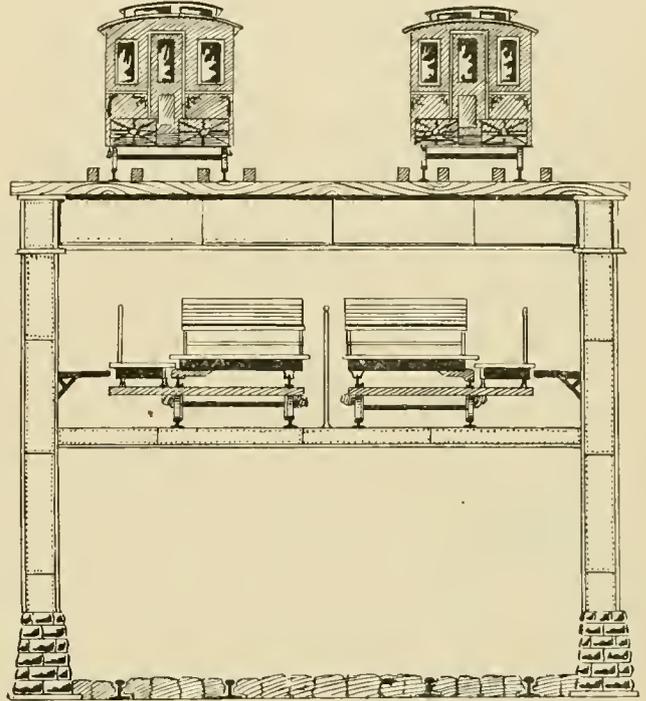

operate trains of the same weight and at the same speed as at present, unless the second story is placed on independent supports.

Gen. Herman Haupt, an engineer of national reputation, has shown that during busy hours the headway is 1 1/2 minutes, which with present facilities gives a seating capacity of only 7,852 each way per hour. Speed can-

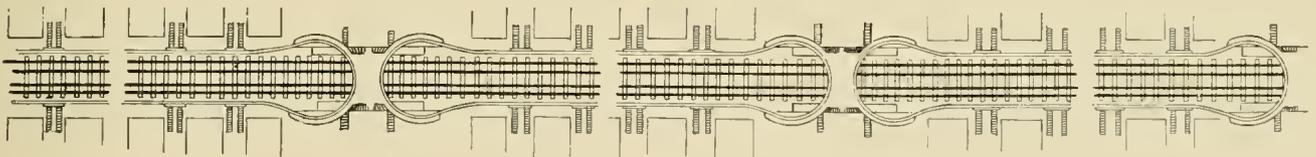

SINGLE DECK PLAN.

riders, but the continued growth of the city has brought matters to a point where radical additional facilities must be provided. Underground systems have attracted much attention, but it is doubtful if any relief can be expected for years from this source. The very unsatisfactory results of the operation of such systems in London,

DOUBLE DECK PLAN.

not be any further increased without a corresponding decrease in headway on account of danger, so what would be gained in speed is more than lost in reduced number of cars. To carry 150,000 per hour would therefore require no less than fifteen of present double tracks and equipment. Prominent engineers in New York are much attracted by the proposed solution of all the troubles by adopting the moving sidewalk system in conjunction

PLAN SHOWING LOOPS AT ONE MILE SECTIONS.

coupled with the immense expense of their construction and the length of time necessary to get them in operation, militate against them to such an extent as to almost prohibit their further application. The ideal method is, to so increase the facilities of the elevated roads already built as to largely increase their capacity. As these lines already operate along the great arteries of public travel, this would be much more desirable than to construct additional parallel lines, if indeed such were possible. The present elevated structures are not of sufficient strength to admit of placing a second story, on which to

with the present service, and by this means reducing the number of stations at which express trains would be required to stop, and in that way securing the increased speed not now possible with frequent stops. Stations for taking the cars could then be established, say at intervals of one mile, to which passengers would be delivered from the moving sidewalk, which in turn could receive at every block if desired, as no stops are made. Two methods of using the sidewalk are being considered. Both provide for one mile sections, with connecting loops at the express stations. It is understood that the turn in

the narrow space of a street is perfectly feasible, a radius of thirty-five feet having been adopted for the network of elevated moving sidewalks proposed for the business district of Chicago. Both plans are illustrated. One is to put the steam trains overhead, which has the advantage of providing covering, at no additional expense, for the moving sidewalk below. The other is to run it outside the present tracks, at the same level, except at the loops, where it crosses the express stations overhead. The Multiple Speed & Traction Company, of Chicago, controls the moving sidewalk system, and operated it with great success at the World's Fair, where it carried over a million passengers. It seems unquestionable that the addition of the moving sidewalk to the elevated roads, as explained herein, would solve the rapid transit problem for many years to come, and do it at the least expense. Everything favors the adoption of the plan, which has been fully demonstrated as effective, economical, reliable and of almost unlimited carrying capacity.

### AN ELECTRIC LIE.

VERACIOUS motorman from Brooklyn was visiting Mr. Mulvaney, who twists the juice on a North Shore car, Chicago.

"It was jist this way," said the veracious, "me an' Bill had took our car out and was running a fair gate down Mosquito Hill, (that was when I was on a Jersey line). The

bridge across Mosquito Creek was gone. 'Them Hopkins kids again,' says Bill. 'They've took the bridge down to build a raft, and now how in Podunk are we goin' ter git across that kassim?' "I don't know nothing about kassums, Bill," says I, "but we'll git across I'll bet."

"We wus jist a quarter of a mile away and the grade wus pretty stiff and we wus goin' down bent to fer election. A nervous old lady says to Bill, 'Mr. Conductor, won't you let me out 'fore we get to the bridge?' 'Yes-sum,' says Bill. He onct was a barn boss and is an awful liar, 'jist as soon as we gits to it I'll tell youse.'"

"In the meantime we wus sailin.' I turned on all the juice and ler'er go Gallagher. We struck the level with a bang, and may I drive a bob-tail all my life, if that bloomin' car didn't raise clear across the creek and land plump on the rails on the other side. We broke the trolley pole, so Bill had to take the switch hook and be trolley-pole the rest of the way to Mud Flats."

"It were a great trip!"

Mulvaney was staggered for exactly thirty seconds.

Then he shifted his quid and remarked, "That was purty good aim youse had to hit the other track, but it aint a circumstance to a little speed of mine when I was gripman on the Chicago City."

"Some movin chaps was puttin' a house acrost the tracks when their rope and wid'lass broke and there she stood plump in the middle of both tracks, I was going south just below Forty-seventh on State. I seen the

house there and knew that the old man would'nt take no excuses on the rush trip, so I says to me conductor, wot will we do? "Do!" says he "Do! Why we'll stay here and wait for the wagging."

"We'll do nothin' of that kind," says I, "we'll percede with the amoosement."

"An' we perceded."

"I jammed the lever over hard and let'er flicker. We was at that time tree blocks away and I got up some push on the bloody string, I'm tellin' youse. We struck the house on one side, somethin' gav and before anybody knew it we was comin' out on the other side wid a purty a hole as ye ever see bored plum troo dat house. It scratched some paint off and that ongrateful company called it foolhardy so I'm twistin' lightnin' now. Jest lend me a chau of yer plug will youse?"

### MR. WYMAN GOES TO MILWAUKEE.

C. Densmore Wyman, whose genial and warm hearted manner have long since endeared him to the members of the street railway fraternity, in whose estimation also he stands equally high as a manager of unusual executive ability, has accepted the position of general manager of the consolidated lines in Milwaukee, and has already entered on his duties. Mr. Payne, who has so long and successfully carried the responsibilities of both a vice-president doing the work of president and general manager, with all its details, has for some time felt the necessity of being relieved of a part of the double burden, and upon his becoming receiver for the Northern Pacific Railroad the load became unbearable. Mr. Payne will therefore be as closely as ever associated with street railway interests, and the West regains a valued and honored member.

Mr. Wyman was born at Racine, Wis., in 1850, but removed with his widowed mother to New York at an early age. Here he gained the most of his education. One year was spent at the University of Rochester, but Chicago University claimed him, and in 1872 he was graduated from the latter institution with honors. The same year he became the private secretary of G. Hilton Scribner. Afterwards, he was graduated B. L. from the Union University, and was admitted to practice. In 1874 he was elected secretary of the Central Park, North & East River Railway, of New York, the "Belt" line. Since then, until 1893, Mr. Wyman has been exclusively in telegraph and railway work, making a brilliant record. In the Columbian year Mr. Wyman was made general manager of the electric launches at the World's Fair, the success of which enterprise is well known.

C. DENSMORE WYMAN.

FORTY THOUSAND children attended the Mid-Winter Fair at the expense of the San Francisco Examiner.

### American Street Railway Association.

HENRY C. PAYNE, PRESIDENT, Milwaukee, Wis.  
 WM. J. RICHARDSON, SECRETARY AND TREASURER, Brooklyn, N. Y.  
 W. J. STEPHENSON, FIRST VICE-PRESIDENT, Washington, D. C.  
 J. R. CHAPMAN, SECOND VICE-PRESIDENT, Grand Rapids, Mich.  
 LEWIS PERRINE, THIRD VICE-PRESIDENT, Trenton, N. J.  
 EXECUTIVE COMMITTEE: D. F. LONGSTREET, Denver, Col.; T. H. McLEAN, Indianapolis, Ind.; ED. WHITTACRE; W. Y. SOPEL, Ottawa, Ont.; and E. S. GOODRICH, Hartford, Conn.  
 Place of next meeting, Atlanta, Georgia, third Wednesday in October, 1894.

### Massachusetts Street Railway Association.

President, J. H. CUNNINGHAM, Boston; First Vice-president, AMOS F. BREED, Lynd; Second Vice-president, FRANK S. STEVENS, Fall River; Third Vice-president, SAMUEL WINSLOW, Worcester; Secretary and Treasurer, A. E. BUTLER, Lawrence, Executive Committee, A. A. GLASIER, Boston; E. C. FOSTER, Lynd; CHAS. ODELL Salem; P. F. SULLIVAN, Lowell; E. P. SHAW, Newburyport; PRENTISS CUMMINGS, Boston; R. S. GOFF, Fall River.  
 Regular meetings first Thursday of each month.

### Maine Street Railway Association.

President, W. R. WOOD, Portland.  
 Secretary and Treasurer, E. A. NEWMAN, Portland.  
 Executive Committee, GEO. E. MACOMBER, Augusta; WM. R. WOOD, Portland, AMOS F. GERALD, Waterville; CHAS. H. PRESCOTT, Biddeford and FRANK W. DANA, Lewiston.  
 Next meeting at call of executive committee, August, 1895.

### Ohio State Tramway Association.

President A. E. LANG, Toledo; Vice-president, W. J. KELLY, Columbus; Secretary and Treasurer, J. B. HANNA, Cleveland; Chairman Executive Committee, W. A. LYNCH, Canton, O.  
 Meets at Toledo on the fourth Wednesday in September, 1894.

### The Street Railway Association of the State of New Jersey.

President, JOHN H. BONN, Hoboken; Vice-president, THOS. C. BARR, Newark, Secretary and Treasurer, CHARLES Y. BAMFORD, Trenton; Executive Committee, OFFICERS and C. B. THURSTON, Jersey City; H. ROMAINE, Paterson; LEWIS PERRINE, JR., Trenton.

### The Street Railway Association of the State of New York.

D. B. HASBROUCK, PRESIDENT, New York City.  
 G. TRACY ROGERS, FIRST VICE-PRESIDENT, Binghamton.  
 JAS. H. MOFFATT, SECOND VICE-PRESIDENT, Syracuse.  
 WILLIAM J. RICHARDSON, SECRETARY AND TREASURER, Brooklyn.  
 The next meeting will be held at Syracuse, on the third Tuesday in September 1894.

### Pennsylvania Street Railway Association.

H. R. RHOADS, PRESIDENT, Williamsport.  
 G. L. JONES, FIRST VICE-PRESIDENT, Reading.  
 S. P. LIGHT, SECRETARY, Lebanon.  
 WM. H. LANIOUS, TREASURER, York.  
 Next meeting at Reading first Wednesday, in September, 1894.

### Texas Street Railway Association.

WM. H. SINCLAIR, PRESIDENT, Galveston.  
 S. A. HOBSON, SECRETARY AND TREASURER, Waco.  
 J. K. URIE, VICE-PRESIDENT, Austin.  
 Next meeting, third Wednesday in January, 1895.

### Alabama.

TUSKALOOSA, ALA.—S. C. Weatherford has leased the Castle Hall Company's Street Railway line and will begin operation.

### Arkansas.

PARAGOULD, ARK.—T. B. Ketchum is made receiver of the Electric Light & Power Company.

LITTLE ROCK, ARK.—In the case of Charles A. Coffin and the Thomson-Houston Electric Company vs. Horace G. Allis and wife, a decree of \$283,200 was found for plaintiffs.

LITTLE ROCK, ARK.—In the case of the Atlantic Trust Company vs. the City Electric Railway, it has been determined that the present receivers, S. W. Fordyce and Allen Johnson, act as receivers in this cause also without additional bond.

### California.

LOS ANGELES, CAL.—W. H. Workman has begun work on his electric railway. It must operate within the year.

SAN FRANCISCO, CAL.—Sheriff attaches three cars of the San Francisco & San Mateo to satisfy claim of \$771.00 held by John A. Roebling Sons' Company.

SACRAMENTO, CAL.—Albert Gallatin is elected president and Joshua Barker secretary of the electric railway. G. P. Kingsbury has entered on his duties as superintendent.

SACRAMENTO, CAL.—Albert Gallatin and Horatio Livermore, of San Francisco, have bought the Sacramento electric system. A. Saulsbury, late of Minneapolis, is made superintendent.

SAN FRANCISCO, CAL.—Stockholders of The Consolidated order issue of \$17,500,000 in bonds, 49-years-life, at 5 per cent. A stockholder says \$500,000 to \$1,000,000 will be put into electrical equipment within six months.

OAKLAND, CAL.—Bondholders and stockholders of the Piedmont Consolidated want the line equipped with electricity. It is estimated that \$16,000 will be required for the change, in addition to the sum already granted.

SACRAMENTO, CAL.—Gallatin & Livermore have bought Oak Park, a 16-acre tract, and will make a pleasure resort of it. The entire street railway system will be renovated. New rail will be laid, new trucks will be bought, and old cars reconstructed.

SAN FRANCISCO, CAL.—Superintendent Johnson Reynolds, of the Sutter street line, is deeply interested in the Hough storage battery car, which is being built by the Main Street Iron Works. A motor of special winding is being constructed. Arthur Hough is president of the company.

### Canada

WINDSOR, ONT.—Col. J. M. Clark has recovered from his illness and will begin work on his Amherstburg line.

GAULT, ONT.—The Gault & Preston Street Railway Company will shortly be in a position to award contracts for the construction of their road.

HAMILTON, ONT.—Hamilton Radial Street Railway Company will amend its ordinance to increase capital stock, build new line to Niagara Falls and other places, and enlarge its corporate powers.

MONTREAL, QUE.—The parish of St. Martin will build an electric railway on the Isle Jesus, near Montreal, to connect that island with this city. Hon. R. Thibaudeau, G. W. Parent and R. S. Williams are interested in the scheme, which is contemplated as an extension of the Park and Island Electric Railway.

### Chicago.

CHICAGO.—Alley L officials say that the Englewood extension of the L will not be built. The company will build to the Stockyards instead.

CHICAGO.—F. O. Rusling of the Calumet Electric Railway, Chicago, goes to Buffalo to become superintendent of the City Railway Company.

CHICAGO—Organized, the Crown Belting Company, at \$50,000, by Frederick F. Warner, Russell B. Smith and Samuel S. Page, to manufacture and sell belts.

CHICAGO.—The city council grants a franchise to the North Chicago Street Railway Company to operate an electric line on Lincoln avenue between Wrightwood avenue and North Fifty-ninth street. The ordinance is for twenty years, and a five cent fare is specified.

The North Side Electric Street Railway Company has introduced its ordinance. It takes in numerous north and northwest side streets. Alderman John Sexton introduced the measure.

### Colorado.

DENVER, COL.—Geo. E. Randolph and C. S. Sweetland, receivers of the Denver City Cable Railway, file report for December: receipts, cable, \$25,537; total receipts, \$27,808; expenses, \$22,138.

DENVER, COL.—J. H. Crandall, 1637 Blake street, is in the market for 200 gross tons 50-pound steel T-rail; 375 tons 40-pound steel T-rail, and a second-hand standard gauge low-wheel 50-ton freight locomotive.

DENVER, COL.—The Eldorado Land Development Company is incorporated with a capital of \$1,000,000, by J. W. Shannon, G. A. Smith and J. M. Jones. They will build and operate electric light and railway plants in Taos, Rio Arriba, Colfax, Santa Fe and Mora counties, New Mexico. Principal offices at Denver.

### Connecticut.

MERIDEN, CONN.—The Middletown-Meriden road will be built by July 1. The company is in the hands of a syndicate represented by ex-Governor Thomas M. Waller and Attorney S. H. Wagner, of New Haven. A large power house will have to be built in Middletown.

NEW HAVEN, CONN.—The Winchester Avenue and New Haven & West Haven Street Railway Companies extensions were decided upon. The stockholders of both roads elected the following officers: Albert C. Pond, of Boston, president; Israel A. Kelsey, secretary, treasurer and manager; Albert E. Pond, superintendent; E. W. Decker, superintendent of the Winchester lines.

### Delaware.

WILMINGTON, DEL.—George E. Pratt, formerly sales agent of the Lamokin Car Company, has resigned, to take a similar position with Jackson & Sharp, of this city, in the street railway department.

### District of Columbia.

WASHINGTON, D. C.—A bill to amend route of the Rosslyn, Arlington & Mount Vernon Street Railway Company is introduced. Geo. W. Moore, Clarence Baker et al are incorporators and original incorporation was made in 1890.

WASHINGTON, D. C.—Officers elected of the Washington, Alexandria and Mt. Vernon Electric Railway Company: Griffith E. Abbott, president; F. A. Reed, vice president; Frank K. Hipple, secretary; Gordon G. Noble, assistant secretary; David C. Leech, treasurer; Daniel W. Holden, assistant treasurer.

### Georgia.

ATHENS, GA.—Robert Vandyke has sold the Athens Street Railway to Birmingham parties who will remove it to the latter place.

ATLANTA, GA.—The Atlanta Consolidated effects its reorganization. President Joel Hurt succeeds in gaining the consent of stockholders. Money is forthcoming to pay the company's debts and interest is reduced to 3 per cent for two years; after that it is to be 5 per cent.

### Illinois.

OTTAWA, ILL.—The Street Railway Company wishes to abandon certain non-paying lines temporarily.

HARVEY, ILL.—The A. Thompson Belting Co. has placed its machinery in operation and promises to become a thriving concern.

ABINGDON, ILL.—The Abingdon Electric Light Company, incorporated at \$12,500 by C. C. Travis, Annie J. Travis and C. D. Warner.

AURORA, ILL.—Manager Belden, of the street railway, has decided to put in a separate generator for power users, in accordance with insurance rules.

PEORIA, ILL.—Officers of the Fort Clark Electric are: President, F. W. Horn, Chicago; secretary and treasurer, J. W. Trawick; company physician and surgeon, Dr. C. E. Davis.

WAUKEGAN, ILL.—Incorporated, the Waukegan Electric Railway Company, Waukegan; capital stock, \$500,000; incorporators, M. C. Vanfleet, Ben L. Jones and W. C. Palmer.

FREEPORT, ILL.—C. E. Loss, of Chicago, has closed a contract for the new electric railway at Freeport, Ill. It will comprise six miles of single track with turnouts, five cars and equipments, two 90 K. W. generators, 220-horse-power in engines.

ROCKFORD, ILL.—Jason C. Ayres of Dixon, F. G. Jones, Oregon, and James S. Ticknor, George E. King, Harry B. Andrews of Rockford, have organized the Rockford & Dixon Electric Railway Company to connect the towns mentioned by sixty miles of electric railway. The incorporation will be called the Rock River Electric Railway Company, and, it is said, the men behind it are all capitalists. Mr. Ticknor is the manager of the Rockford railway.

### Indiana.

MARION, IND.—Marion Street Railway has decided to extend to Fairmount, six miles beyond present limit.

ELKHART, IND.—The Electric Light & Railway plant has been bid in by O. N. Lumbert, its old president, for \$21,000, at receiver's sale. He is supposed to be backed by outside money. The incumbrance is \$75,000.

MARION, IND.—The old Marion Street Railway Company transfers all its rights and property to the Marion City Railway Company, of which W. H. Carroll is president; Jas. V. Sweetser, secretary. Bonds will be issued to the amount of \$400,000, and the money used to build to Jonesboro, Gas City and Matter Park.

INDIANAPOLIS, IND.—The Farmers & Broad Ripple Street Railway Company organized to construct and operate street railways is Marion and Hamilton Counties. Capital stock fixed at \$100,000 and the incorporators are Secretary of State W. R. Myers, Judge John C. Green, A. N. Fisher, Henry Malpas and O. C. Myers.

### Iowa.

SIoux CITY, IA.—C. D. Smiley, of the South Sioux City, Neb., Street Railway Company, is pressing forward the building of his line.

SIoux CITY, IA.—Decree of foreclosure granted to bondholders of the Sioux City Street Railway Company will assist in reorganization.

SIoux CITY, IOWA.—Sioux City & Morningside Street Railway, incorporated by H. A. Jandt, Judge Larimer et al., is to get its franchise.

DES MOINES, IA.—A bill is introduced in the legislature here, the object of which is to compel the vestibuling of street cars in the State of Iowa.

BURLINGTON, IA.—The Blake-Ray application for franchise for a street railway line is under consideration of the council. They propose a gas motor of some description.

SIoux CITY, IA.—Court grants judgment in favor of the Fidelity Loan & Trust Company, against the Sioux City Street Railway Company, for \$558,000 on its bond issue. Trust deed will be foreclosed.

SIoux CITY, IA.—South Sioux City Street Railway Company elects officers: Frank Hunt, president; C. D. Smiley, secretary; J. P. Twohig, treasurer. It was decided to extend the line to the South Sioux City depot in the near future.

### Kansas.

FT. LEAVENWORTH, KAN.—It is reported that Capt. C. F. Roe, U. S. A., and Louis F. Goodsell and G. F. Anthony, Newburg lawyers, have a plan under way for an electric line from Highland Falls to West Point.

LEAVENWORTH, KAN.—The franchise for electric railway has passed council and been accepted by Newman Erb, the builder. He is authorized to issue scrip and electrify ten miles of track.

PITTSBURG, KAN.—Forest Part Electric Street Railway, in toto, is sold by Receiver, Sam Barratt to L. Bidell, of the Neosho Valley Investment Company. The new owners will immediately extend four miles, to Frontenac.

## Kentucky.

LOUISVILLE, KY.—The Louisville Railway Company elects officers as follows: J. B. Speed, Buffalo, president; St. John Boyle, vice-president; T. J. Minary, general manager; R. A. Watts, secretary and treasurer; J. M. Pettus, assistant secretary and treasurer.

## Maine.

LEWISTON, ME.—It is announced that the Lewiston & Auburn Horse Railway has been purchased by E. E. Proctor, of Wakefield, Mass. E. W. Gross has been made treasurer and general manager. Electricity will be installed.

## Maryland.

CENTERVILLE, MD.—I. B. Brown, W. W. Busted and Wm. Emory, of Centerville and R. C. Davidson, Bartlett S. Johnston, W. B. Brooks, Jr., and W. S. Bosley, of Baltimore, have organized the Centerville Electric Railway Company. The capital is fixed at \$500,000.

CENTERVILLE, MD.—A Queen Anne County electric railway is organized by I. B. Brown, W. W. Busted and Wilmer Emory of Centerville, and R. C. Davidson, Bartlett S. Johnston, W. B. Brooks, Jr., and William S. Bosley of Baltimore. Proposed capital, \$500,000. The plan has not been fully formed.

FREDERICK, MD.—Incorporated: the Frederick & Middletown Electric Railway Company by Peter H. Bussard, D. Edward Kefauver, Peter W. Shafer, Charles H. Coblenz and Herman L. Routzahn of Middletown, and George William Smith, Dr. U. A. Sharretts, Thomas H. Haller and Charles V. S. Levy of Frederick.

BALTIMORE, MD.—The Baltimore Traction Company has asked the city council to allow it to lay tracks in different parts of the city, and to extend one of its lines to Westport, a growing town on the south bank of a branch of the Patapsco river.

The Central Electric Railway Company has also asked to be allowed to lay tracks from the company's present tracks, at Preston and Brevard streets, along a number of streets of North and East Baltimore.

Up to date the rumor regarding the Consolidation of all street railways in Baltimore has not been verified; if such a thing has occurred, it has not been made public.

## Massachusetts.

AUBURN, MASS.—Auburn Electric Motor Company elects John C. Blake, clerk; W. A. Robinson, treasurer.

FALL RIVER, MASS.—The Dartmouth & West Port Electric Railway elects: President, Frank W. Brightman, Fall River; vice-president, Abbott P. Smith, New Bedford; treasurer, J. A. Beauvais, New Bedford; clerk, Robert S. Goff, Fall River. The line from Smith Mills in Dartmouth and the Narrows in Fall River will be in operation in July.

## Michigan.

BATTLE CREEK, MICH.—City Treasurer Corwin has levied on the engines and boilers of the electric to pay city taxes.

DETROIT, MICH.—Albert Kern, 171 Griswold street, Detroit, wants addresses of dealers in second-hand electric supplies.

ANN ARBOR, MICH.—J. E. Beal, H. P. Glover, et al., of Ypsilanti Street Railway Company, and C. E. Hiscock, H. T. Martin, et al., of the Ann Arbor road, are trying to consolidate.

SHEBOYGAN, MICH.—End, Schneider and Dean have sold their right for the street railway to F. Saeman, president, and H. E. Thomas, secretary and treasurer, of a new company. The line will run to Sheboygan Falls.

ST. JOSEPH, MICH.—Contract for grading the St. Joseph & Lake Shore Electric road has been let to A. B. Wilgus, of New York City.

YPSILANTI, MICH.—A plan is broached to consolidate the Ann Arbor Electric Railway and the "Ypsi-Ann" Railway. This means equipping the latter electrically and building a new power-house. Meeting has been held.

## Minnesota.

NORTHVILLE, MINN.—A line between Northville and Mallette is being seriously considered.

MINNEAPOLIS, MINN.—T. B. Walker, who owns the St. Louis Park Electric Railway says that his line will be extended two miles to Hopkins, this summer.

MINNEAPOLIS, MINN.—The wages of the Twin Cities' employes have been cut. The city men are reduced from 17 to 16 cents an hour and the interurban from 20 to 17.

STILLWATER, MINN.—In the case of Allan Curtiss against the Stillwater Street Railway Company, judgment for the plaintiff was given in the sum of \$67,709. The next step will be the foreclosure and sale of the property at sheriff's sale.

## Mississippi.

MERIDIAN, MISS.—The Thomson-Houston electric light plant burned February 4. Loss, \$50,000; insurance, \$40,000.

GREENVILLE, MISS.—Greenville Street Railway tracks torn up by order of the council for failure to comply with ordinance. Damage, \$3,000.

## Missouri.

SPRINGFIELD, MO.—The city gives its consent to the transfer of the Metropolitan Railway Company.

ST. LOUIS, MO.—President Chas. H. Turner, of the St. Louis & Suburban Electric Railway, contemplates buying the Clayton & Forest Park Railway, to operate with the Suburban.

ST. LOUIS, MO.—It is stated that the Missouri Railroad Company will change motive power from cable to electricity. Poles have been placed along part of the route and extensions are said to be contemplated.

JOPLIN, MO.—It is reported that the Southwestern Electric Light Company is to buy the Joplin Street Railway line and considerably extend it. The money comes from the Missouri, Kansas & Texas Trust Company.

ST. LOUIS, MO.—The city council will take steps to compel erection of an iron bridge by the Merchants' Bridge Terminal Company.

It is rumored that the Fourth Street & Arsenal Street Railway will be changed to electricity by President Chas. Green.

ST. JOSEPH, MO.—John R. Owens, receiver of the People's line, files final report. Cash received from operation of the property from June 1, 1893, to July 5, 1893, \$23,551.14; received from master in chancery, \$5,199.72; total receipts, \$33,314.74. Expenditures, indebtedness paid by receiver, \$5,199.72; total expense for operating the lines from June 1, 1893, to July 5, 1893, \$20,687.40; August pay rolls, \$8,474.57; interest paid Harriman & Co. to February 1, 1893, \$456.17; total expenditures, \$35,252.07; receivers indebtedness, \$1,937.33; bills uncollected, \$1,578.75.

## New Hampshire.

NASHUA, N. H.—John A. Fisher is elected president of the street railway, vice George H. Knowles, resigned. This is said to mean radical changes, extensions, and perhaps an interurban to Haverill, as Boston capitalists are thought to have gained control of the system.

## New Jersey.

SOMERVILLE, N. J.—The Bound Brook works of the Standard Paint Company burn. Loss, \$200,000.

ELIZABETH, N. J.—Suburban Railway and Electric Company incorporated at \$750,000 by W. B. Hosmer, of Boston, 500 shares; James B. McGiffert, of Roselle, 500 shares; Charles H. Newhall and John S. Bartlett, of Lynn, Mass., each 1,000 shares.

## New York.

LOCKPORT, N. Y.—Willard T. Ransom says that the Lockport-Olcott electric railway scheme will go through.

WILLIAMSVILLE, N. Y.—F. C. Fisk has resigned superintendency of the Buffalo & Williamsville Electric Railway.

NEW YORK CITY.—It is said that Russell Sage will build another story to the Manhattan "L" for express service.

BUFFALO, N. Y.—The Street Railway Company is about to contract for 2,500-horse-power from the Niagara Cataract Construction Company.

NEW YORK CITY.—Newburg Street Railway property has been sold to President Norton, of the Atlantic Avenue Railroad Company, Brooklyn. Electricity will be used.

NEW YORK CITY.—State Railroad Commission is asked for rights by the Metropolitan Railway Company, to change its motive power to cable: another section of its line. No opposition.

BROCKTON, N. Y.—The Brockton, Chautauqua County, Street Railway Company has been incorporated at \$10,000 capital stock, by Owen W. Powell, T. C. Moss and C. F. Ryckman, of Brockton, and others.

NEW YORK CITY.—A big interurban electric railway scheme is on foot for the uniting of a number of New Jersey towns. John D. Crimmins is at the head, and the plan is to make the most extensive system ever contemplated.

NEWBURGH, N. Y.—Newburgh Street Railway sold at auction under execution issued to the Farmers' Loan & Trust Company. Benjamin Norton, of the Atlantic Avenue road, Brooklyn, bought it for \$30,000. Electricity will be substituted, and line greatly extended.

SYRACUSE, N. Y.—The owners of the Syracuse Street Railway Company, W. W. Hazzard, of Cincinnati, O., Geo. E. Herrick, et al., of Cleveland, decide on the erection of a new and extensive power house. The other large improvements will be made this spring. The power house will cost \$160,000.

JOHNSTOWN, N. Y.—The Johnstown, Gloversville & Kingsboro Horse Railway Company has elected the following directors: H. S. Judson, John H. Stockamore, J. H. Place, James Younglove, William D. Ferres, George C. Burr, John M. Russell, Jacob Hees, James Shanahan, Jr., William P. Myers, A. Z. Wemple, Harwood Dudley, J. M. Carroll.

NIAGARA FALLS, N. Y.—Niagara Falls, Whirlpool & Northern Railway is incorporated, by Jacob B. Vogt, Niagara Falls; Elisha M. Fullin, Jr., Rye, N. Y.; J. M. Lewis, of Elizabeth, N. J.; H. Watkins, of Orange, N. J.; W. J. Duane, of New York; Eliot Norton, of New York; Burt Van Horn, Jr., of Niagara Falls; John C. Lammerts, of Niagara Falls; William H. Hodge, of Niagara Falls. Electricity is to be used.

NEW YORK CITY.—On application of A. A. Whitman, treasurer, and Percival Knauth, president, the Waddell-Entz Company of 203 Broadway has been placed in the hands of Montgomery Waddell as receiver. Knauth and Whitman hold debenture notes for \$13,000 each. Besides this Mr. Knauth is creditor for \$13,000 and the company owes \$30,000 in addition. Assets are plant at Bridgeport, patents and \$2,000 in New York.

## Ohio.

CINCINNATI, O.—John Kilgour, it is said, will build a belt line taking in Madisonville.

CLEVELAND, O.—Buckeye Electric Company increases capital stock from \$250,000 to \$300,000.

ZANESVILLE, O.—Zanesville Street Railway Company increases capital from \$200,000 to \$300,000.

CINCINNATI, O.—Cincinnati Street Railway Company will build a new power house at Cummingsville.

AKRON, O.—E. L. Babcock, of Cuyahoga Falls, et al, ask rights for the Akron-Cuyahoga Electric Railway line.

CLEVELAND, O.—Cleveland Electric Railway Company will build long extension to Brooklyn village in the spring.

WOOSTER, O.—The city council has extended the time of the franchise given to B. M. Barr, of Cleveland, for an electric line here.

OSHERLIN, O.—John F. Randolph, Judge Steel, H. C. Wengerien et al, of this place, are looking over the route for a line from Oberlin to Lorain.

TOLEDO, O.—J. A. Dawson says that the Toledo Monroe & Detroit Electric Railway Company is ready for incorporation. Surveyors will soon lay out the route.

JEFFERSON, O.—The plan of an electric railway to Geneva, via Austinburg, is fathered by Hon. Edward N. Fitch, who will look after the plans and incorporation.

NEW PHILADELPHIA, O.—Major C. E. Michener, president of the Tuscarawas Rapid Transit, says that a line will connect this place with Uhrichsville during the summer.

TOLEDO, O.—Toledo, Maumee & Perrysburg Electric Railway is incorporated, by J. K. Tillotson, Frank Ohl, Dustin Atwood, et al Express and freight service is expected.

WARREN, O.—A company is incorporated at \$10,000, to build an electric between Kinsman and Farmdale, in this county, by D. M. Yennans, E. R. Brackin, J. W. Forbes, and J. A. Russell.

CINCINNATI, O.—Cincinnati, Newport & Covington elects: John J. Shepherd, of Cleveland, president; Chas. E. Orr, of Pittsburg, vice-president; H. P. Eells, Cleveland, treasurer, and J. H. Hoyt, Cleveland, secretary.

FRONTON, O.—R. T. Greaves, engineer, of Lynchburg, Va., and J. V. Vandergrift, of Philadelphia, are here making estimates on an electric line. Will build a power house. Superintendent T. T. Johnson, of the I. & P. Street Railway Company, has particulars.

LANCASTER, O.—Lancaster Street Railway elects: Wm. Duffy, president; C. F. Nestor, secretary; A. Bauman, secretary and manager. Extension contemplated to the Boys' Industrial Home, six miles. Assessment order to be paid March 10, which will clear all indebtedness.

DAYTON, O.—The City Railway Company has taken steps towards the electrifying of its lines before July 1. Brownell & Co., of Dayton, will furnish the boilers, Buckeye Corliss engines will be used, and Siemens-Halske direct driven generators. Power house to be built very soon.

CLEVELAND, O.—John Walker, for whom the Walker Manufacturing Company was named, and one of its founders, and holding the office of vice-president and general manager, has resigned and withdraws from the company, so far as active management is concerned. Frank Billings was elected vice-president and W. H. Bone, general manager.

## Pennsylvania.

PHILADELPHIA, PA.—P. A. B. Widener says he will adopt some form of alarm gong on the trolley cars.

POTTSVILLE, PA.—Wm. H. Conrad, of Reading, is made superintendent of the Schuylkill Electric road here.

POTTSVILLE, PA.—William H. Conrad, of Reading, has been made superintendent of the Schuylkill Electric Railway.

PITTSBURG, PA.—The Westinghouse Electric & Manufacturing Company will build a big machine shop at Brinton, to make electric machinery.

LOCKHAVEN, PA.—Edward Carr, representing several construction companies in New York, is here concerning the advisability of building a street railway line.

PHILADELPHIA, PA.—Mayor Stuart has signed the ordinance authorizing the construction of the elevated electric. The Seligmans, of New York, are interested.

WEST PITTTSTON, PA.—West Pittston capital has purchased Everharts Island, and it is proposed to run the Wyoming Valley Traction Company to the place for a pleasure resort.

PHILADELPHIA, PA.—Mr. Hetzell has introduced bill into select council on behalf of Theodore Cramp, president of the Market Street, Richmond & Frankfort Elevated Railway. The line is to be eight miles long, operated by electricity, and built of iron.

LANCASTER, PA.—The Lancaster Traction Company elects the following directors: Ex-Senator John J. Patterson, J. Hay Brown, Esq., Mr. John D. Skiles, Mr. B. J. McGrann, Mr. John Hertzler, Mr. Michael Reilly, Mr. John S. Graybill, Col. James Young, Mr. Carl F. Espenshade, J. W. B. Bausman, Esq., and Dr. M. L. Herr.

PHILADELPHIA—Charter is granted the East Snyder Avenue Passenger Railway Company. Capital, \$60,000; incorporators, Henry C. Moore, David C. Golden, Hyland C. Murphy, McClellan Hersh, Joseph C. Dugan and Thomas B. Foot. The Cherry Street Passenger Railway Company, of Philadelphia, two miles in length, same incorporators as above; capital stock, \$12,000.

PHILADELPHIA.—The Robinson Machine Company asks its creditors to agree to an extension on all accounts due, and offers six and twelve months notes in settlement. Assets are placed at \$36,602; liabilities \$18,635.

## South Carolina.

CHARLESTON, S. C.—It is reported that the deal has been closed between street railway people here and New York parties, and that the property will be transferred to them shortly. Price, \$180,000, and the system will be changed to electricity in the very near future.

## Tennessee.

NASHVILLE, TENN.—Nashville Electric Railway assigns to Robert F. Jackson. The debts of the company amount to \$9,000. The creditors are the J. G. Brill Co., General Electric Company and the Continental Trust Company. The property will be sold.

MEMPHIS, TENN.—The East End Dummy Line and the Citizens Street Railway will be united and have gained legislative consent to the action. Col. John Ovington, Jr., represented the Dummy line, and Manager Frank Jones represented the Citizens. The Dummy line will be immediately electrified.

NASHVILLE, TENN.—The report of receivers J. H. Thompson and T. W. Wrenne shows: "The receipts, including \$711.52 turned over to the receivers by the old management, amount to \$16,610.28; the expenditures were \$10,737.82. The expenses for the same period last year were \$1,843.83 more than during the same month this year."

NASHVILLE, TENN.—Superintendent E. G. Connette has appointed J. A. Martin in charge of the North and Western lines and John Corlew in Martin's place as division superintendent of the East Nashville division. These changes are occasioned by the death of John Haley, former division superintendent of North and West lines.

## Texas.

TEXARKANA, TEX.—A project is on foot to build a dummy line from this city to the Normal school.

WACO, TEX.—W. W. Seley is made receiver of the Waco Electric Light & Railway plant. Plant is valued at \$250,000.

WACO, TEX.—Waco Electric Railway & Light Company goes into the hands of a receiver. Assets, \$300,000; liabilities, \$200,000.

FORT WORTH, TEX.—The North Side Street Railway, which has been operated by a receiver since January 1, 1892, will be advertised and sold to the highest bidder April 1.

BEAUMONT, TEX.—The directors of the Beaumont Street Railway decided to sell the plant to any one who will assume the \$2,000 indebtedness and pay stockholders 5 per cent on the paid up stock of \$8,600.

DENISON, TEX.—Denison Street & Belt Line Railway Company is organized. Officers elected: President, A. P. Childs, of Bennington, Vt.; vice-president, E. H. Hanna, of Denison; and treasurer, A. H. Coffin, of Denison; secretary, A. Zintgraff, of Denison.

## Utah.

SALT LAKE CITY, UTAH.—Joseph W. Summerhays is principal promotor of the Glen Park electric line, which, he says, will be built in 1894, and will be fourteen miles long.

## Vermont.

WATERBURY, VT.—Mount Mansfield Electric Railway is incorporated to build between Waterbury and Stowe, ten miles. Water power is to be used. E. D. Blackwell, Montpelier, is president; O. E. Luce of Stow, vice-president; L. A. Pike of Stowe, clerk, and L. C. Moody of Stowe, treasurer. C. N. Arms and G. W. Randall of Waterbury are also interested.

## Virginia.

PETERSBURG, VA.—Receiver Robert Gillam appoints Geo. Beadle superintendent of the Petersburg and the Petersburg Asylum roads. Some improvements are to be made.

RICHMOND, VA.—Fairmount Railway Company wants to build a line in Henrico county. Incorporators, Fred C. Brauer, Jr., John H. Dinneen, Samuel H. Pulliam, V. Hechler, Jr., and William T. Hechler, Jr. The capital stock is to be not less than \$10,000 nor more than \$500,000.

RICHMOND, VA.—The Southern Railway & Electric Company seeks incorporation. Thomas N. Kendler, G. D. Patch, Andrew Pizzini, Jr., and others are the incorporators. The proposed road is between Richmond and some point on the Potomac between Great Falls and Alexandria.

## Washington.

SEATTLE, WASH.—A. F. Burleigh, A. F. Haas, T. A. Gamble and J. L. Dudley are elected trustees of the Seattle City Railway Company. Mr. Burleigh is temporary chairman.

## Wisconsin.

MILWAUKEE, WIS.—Manager Payne says that by July 1 cars will run to Greenfield from the city.

ASHLAND, WIS.—Street Railway Company asks council to allow suspension of operations until spring. No traffic and bad streets alleged cause.

GREEN BAY, WIS.—The Green Bay Electric Railway Company is to apply for a franchise in Du Pere. This is a plan for an extensive interurban.

LA CROSSE, WIS.—The project to equip the Onalaska Street Railway with power is revived, and capital increased by \$20,000. Power will be taken from the La Crosse Railway plant.

OSHKOSH, WIS.—C. O. Mailloux of New York City; Wm. Jarvis, of Louisville, Ky., and J. K. Tillotson, of Toledo, O., are independent inquirers for the franchise to be given here to some one.

MILWAUKEE, WIS.—Milwaukee and Wauwautosa Rapid Transit Company elects: President, Charles Stickney; vice-president, Julius Wechsely; secretary and treasurer, C. W. Henning; counsel, E. S. Elliott; superintendent, E. D. Hoyt.

LA CROSSE, WIS.—The La Crosse-Onalaska Street Railway Company elects officers and decides on electrical equipment. Officers are: President, J. B. Canterbury; vice-president, S. Y. Hyde; secretary and treasurer, E. B. Magill. Hon. Frank Pooler of Onalaska and John Walker of North La Crosse were elected directors.

## Playing Cards.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

## E. C. FOSTER.

From the Milk Wagon to the Manager's Desk.—The Story of a Self Made Man.—Manager of the Lynn & Boston.

How E. C. Foster, by dint of pure self-effort, rose from the lowly position of a milk wagon driver to the managership of one of the finest electric railway constructions in the world, is the story of the life of the man whose portrait adorns this page.

E. C. FOSTER.

Mr. Foster was born in Hancock, N. H., of a stern New England ancestry. At the age of sixteen, after a year at Appleton Academy, Ipswich, N. H., young Foster left the parental roof to go it alone in the world. He headed for Boston and stopped at Lynn, where he has been ever since. Arriving at Lynn he took the first position he found, which was on

a milk wagon. With a Yankee boy's grit he stuck to the distribution of the lacteal fluid for three years, when he took to the platform of a street car. He collected fares for several years, became car starter, and finally went to California to better himself. The east had its attractions, so he returned to the rear platform at Lynn. He soon afterwards became superintendent of track construction. Just before he was thirty he attracted the attention of A. F. Breed and Stephen Green, two well-known capitalists. Through their influence and by their aid he found himself superintendent. His executive ability there found opportunity, and in 1892 he became general manager of the Essex County system.

Mr. Foster is a tall, muscular man, with keen eyes and black hair, interested in everything, capable of unlimited effort, and one of the best disciplinarians. Some of the men who have been graduated under him occupy high street railway positions; among them, W. W. Sargent, superintendent of the Fitchburg system; W. Wentworth, superintendent of the Haverhill, Merrimac & Amesbury; Frank Hunnewell, who went to Gloucester; J. E. Sewall, who went to Woburn, but returned to manage the Chelsea division of the Lynn & Boston; H. C. Page, who went to take charge at Newburyport, but was hired back to the road, these, and some others, make a list almost unprecedented for a man only forty years old to send out from under his tutelage to such important positions.

THE Lunkenheimer Company, Cincinnati, has issued a compact little folder, containing up-to-date information on the Lunken gate valve and two pages of illustrations, showing the difference between old and new style valves. A price list fills the last page.

## A SNOW PLOW FOR ROUGH STREETS.

By W. C. Fuchs, Electrician of the Cicero Proviso Electric Railway.

In designing snow plows for removing snow, ice and frozen slush from the track, it is a matter of concern to study the condition of the road bed. There are rails above and below the paving line, also cross overs, switches and loosened blocks protruding above the rest of the paving 3 or 4 inches, and frozen rigid. These are the conditions of a road a plow must run over, to clean the track sufficiently for cars to run without hindrance or delay in running time. To prevent damage to a plow running over such a track is accomplished by having the plow suspended by chains, so that if the plow strikes any rigid obstruction, the plow being suspended by chains, gives it the necessary flexibility, so as to allow the plow to accommodate itself to the irregularities met with.

When plowing over an ordinary smooth road with an uniform or almost uniform load of snow in front of the plow, if it should strike an obstruction having a greater

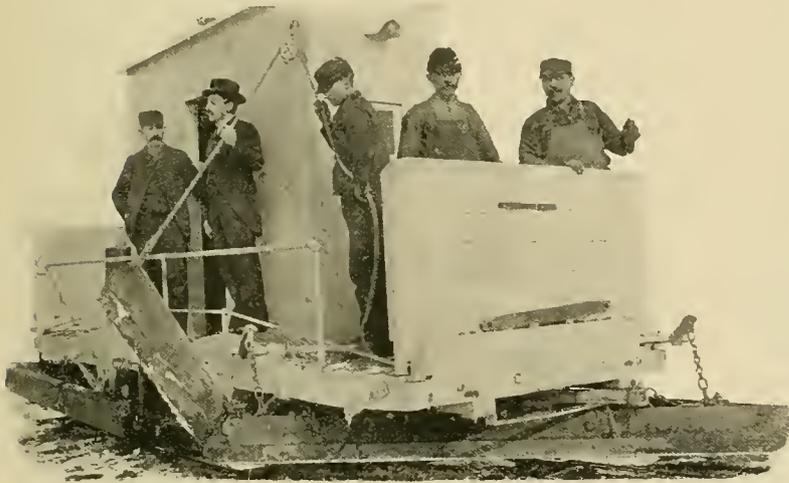

A SNOW PLOW FOR ROUGH STREETS.

resistance than that offered by the snow it is removing, the plow will place itself in a position bringing up the point struck to glide over the obstruction. Having a severe winter to try this plow, we had no difficulty in running over the road at a good speed in the severest snow storms, without interfering with the work of the plow, or delaying the running of cars at proper periods. The wheels are provided with  $1\frac{1}{4}$  flanges to prevent the plow being thrown from the track when passing through snow banks.

Two 15-horse-power motors are attached to each axle, for driving the plow, and power is transmitted to axles by gear wheels. This imparts a positive motion to the rigid portion of the plow, which is reduced to the desired flexible swinging motion by the chains on which the beams are suspended. To prevent skidding of wheels, sand boxes are used. In rear of plow a pair of "diggers" are provided, which consist of heavy iron bars placed upright in front of the wheels, connected by a wooden cross beam

and fastened to body of plow by springs, which impart flexibility to the "diggers" to prevent them being torn from their fastenings by any obstacle coming in the way. These "diggers" are also provided with V shaped stud shoes, to cut from the rail frozen slush or ice, and to clean snow from the rail in places where the rail is lower than the paving blocks. A "wing" is attached to the plow, which can be lowered or raised at will, and throws the snow four feet from the rail. The greatest angle possible is taken advantage of, so as to have an easy plowing of snow to side of road. Owing to the scarcity of room between diggers and plow and not having sufficient room in front of the wheels to place the brakes, a locomotive brake had to be used between the wheels. The cab serves for the protection of the motors and also to keep tools, extra chains and parts of plow liable to get out of order, so that quick repairs can be made to any damaged portion and thus minimize delay. In a very heavy fall of snow an extra board is attached to the plow, making it

SNOW PLOWING ON ROUGH STREETS.

wider, to go through deep snow drifts. Electricians know the anxiety felt when salt is used to remove snow. Salt should not be used under any circumstance, as its use causes rapid corrosion of the rail bonds. That a snow sweeper has advantages over a plow is admitted, but owing to their enormous initial cost and great expense of maintenance they are a luxury of which we can dream about in the future. After careful examination of the above it will be seen a snow plow of this description answers all practicable purposes at a much less cost than a sweeper. Summarizing the data and expense of a hard winter, with plenty of snow and ice, and studying the condition of road-bed, we come to these points:

- 1st. Have one plow for each three miles of double track.
- 2nd. Do not let the snow get ahead of you.
- 3rd. Have a watchful level-headed man, who is not afraid to "act," stationed with all snow implements ready; who is versed in all details of how to handle his plow. Also have him well acquainted with the roadbed he is instructed to keep clean, and men in his charge who will act according to his instructions.

## FOREIGN FACTS.

THE Matlock Cable Railway reports a net profit of \$1,522 from March to December, 1893; passengers carried, 255,000.

THE Leeds, England, tramways will be leased and operated by the city. Existing horse lines, it is reported, will be electrified.

ADRIANOPLE, TURKEY, is also discussing the advisability of a street railway between suburban stations, and the city. Plans are being prepared.

COREA, ASIA, is to have a line of tramway between Riougsan and Soul. The city of Soul has 250,000 inhabitants, without any means of transporting freight, except ponies.

THE Liverpool Overhead Railway reports for the half-year to December 31: Passengers carried, 2,475,639. The gross receipts from traffic were \$90,014.22 and the working expenses \$68,660.85.

PLANS for the utilization of windmill power for generating electricity are asked by the Holland government. Schemes of methods should be to F. W. Van Eeden, Haarlam, Holland, before July 1.

BAGDAD'S CALIPH has granted a tramway concession for the narrow crooked streets of that town of the Arabian Nights. The genii of progress will now take Bagdad's future into hand and do their best to rehabilitate departed glory.

LAST year 600,000,000 tramway passengers were carried in Great Britain and Ireland, or something less than twice the number carried by Chicago's roads alone. Thirty-five cities own their own lines, and nobody wants to ride on the slow, safe and wearisome horse cars.

A DIVIDEND of 17 per cent has been paid during the past year by one Copenhagen, Denmark, tramway company, another paid 14 per cent. Both are horse car lines with two horses for double-decked cars and one horse for ordinaries. A steam suburban line had to be discontinued for want of patronage. It seems as though electricity ought to pay among Danish lines.

THE meeting of three English companies in London not long ago was presided over by W. J. Carruthers-Wain, who is the George Washington and Christopher Columbus combined of English electric traction. The companies were the Croyden, the North Staffordshire and the London & Greenwich. The first paid 6 per cent, the second 5½ and the third 4 per cent per annum, which in view of the general depression of tramway interests in England is an excellent showing.

## HIGH VS. LOW SPEED ENGINES FOR RAILWAY WORK.

Mr. Young Replies to Mr. Green's Open Letter in the Review.

EDITOR STREET RAILWAY REVIEW:

I notice a letter on page 68 of your February issue, from Mr. Green, of Altoona, criticising my remark in your December number, where I made the assertion that any engine running over 120 revolutions per minute should not be used for street railway purposes. I did not write that article for the benefit of engine manufacturers, but for presidents and directors of electric roads. But as truth is always despised by him whom it injures, I take for granted, as Mr. Green is a manufacturer of high-speed engines, that I must unintentionally have tramped on his corns. Mr. Green says, that if I am right science has been a failure. Now Mr. Green surely forgets that he lives in the last days of the nineteenth century, and that not only steam engines but everything else is being revolutionized, and that some old ideas that have been considered facts are now branded as ignorant illusions and mistaken theories, founded on dreams, instead of experience and dollars and cents. Mr. Green wished to know what experience I have had with engines, and whose make. To this I wish to say, that through twenty-three years I have had something more or less to do with most makes of engines. First, in Europe, with locomotives and marine as well as stationary, both slow and high speed. In this country I have worked on and had under my charge, Straight-line, Taylor, Armington & Sims, Ball—all of high speed type, Cooper, E. P. Allis, Hamilton and Corliss, of slow speed type. And I think I have studied the economy and regulation of these various engines as closely as circumstances would permit. In the rapid development of electricity as a light and power agent, stations have sprung up in every part of the civilized world, for the purpose of developing electric energy. The greater number of these stations were equipped on the cheap plan and no judgment exercised in regard to expenses for maintenance. High-speed engines being cheaper and occupying less space, became for a while fashionable. But remarkably enough, all new stations going up now, as well as those that can afford to change, install slow-speed and generally condensing engines, either single or compound.

Mr. Green seems to think that there is only one thing required of an electric street railway engine and that is that it must maintain constant speed under all conditions. Upon this all electrical and mechanical engineers agree. But there are other things to consider which are of utmost importance to the investor and operator, viz.: Economy in maintenance, and here we have questions of coal, water, oil, waste, repairs and reliability. Financiers now make inquiries and ascertain facts before they invest their money in engines, as they have learned from other men's experiences that if one power house with 1,000-horse-power uses up 20 tons of coal per day, as against another power-house of same capacity 12 tons, they know they can save 8 tons per day, which means 2,920 tons per year, and say, on an average of \$2.00 per ton, makes \$5,840, a good slice of the profit on one item alone. Then the repair of detail parts may be say \$100 per month in one, as against \$10 in the other. Common sense tells us, that if the financiers know this, they are going to invest their money in the engine that costs the least to maintain and lasts the longest. No engine in the world has to stand the severe strain that electric railway engines have. The fluctuation is often as high as 70 per cent. Now, the best regulated high-speed engines will

come as close as 2 per cent between minimum and maximum, while the slow speed will be 1 per cent. Besides, an engine making say, 250 revolutions per minute, as against another at 100 revolutions, will quicker wear out its detail parts, besides, the governors must be closely watched and often rebushed and new pins made, as against the slow speed. Finally, the greater danger of having the engine run away by governor failing to act. We also learn in this sharp competitive and economic age, that a power-station divided into small units is more expensive in all its details than one in large units; hence, it is economy to build a station with large units, and this is just what every well-informed president is doing to-day and what every practical engineer advises. I make a habit of questioning the engineer in charge of every power station I visit, what engine he likes best and the one he thinks the most economical, how much coal is used per horse-power, cost for same, also cost of repairs. The answer is invariably in favor of the slow-speed as against the high. Some, of course, have had less experience with both kinds than others. We can easily make the following analogy: a high-speed engine is like a new pair of shoes used all day on a rocky and graveled walk; result, quickly worn out; a slow-speed, like a new pair of shoes used on a soft carpet; result, long wear. Mr. Green surely agrees with me when I say that the slow-speed compound condensing engine represents to-day the highest grade of intelligence in obtaining power from heat and water at the lowest cost. I am no agent for either high or slow speed engine firms, but simply telling electric managers and investors what my experience has taught me, and I am duty bound to tell the truth pure and simple, no matter whom it benefits or injures.

Yours truly,

BALTIMORE, MD., March 3.

C. P. YOUNG.

## MAINTENANCE OF ROLLING STOCK.

II.

Continuing our comparison of methods of motor repair and inspection, Superintendent Geo. H. Shaw, of the

MADISON CITY RAILWAY,

reports that they have nine cars, each carrying two W. P.-30 motors. All but one of these are in use every day. The equipment is fifteen months old. The only renewal of parts, aside from trolley wheels and brake shoes, was one set of bearings on one car, and this renewal was necessitated by experimenting with cheap grease. Mr. Shaw says: "My experience has taught me that cleanliness, watchfulness and the best supplies will do much toward reducing repair accounts." The barn force consists of one night man, who does inspecting and oiling, and two day men on repair work. Motors are thoroughly overhauled and cleaned every ten days. This is at the rate of about one a day. All defects are reported to the superintendent personally. Rewinding of armatures and all general work is done in the shop. The repair and inspection pay roll amounts to \$5.25 per day. The most trouble is experienced from the burning of commutators.

NORTH SIDE RAILWAY, FORT WORTH, TEXAS.

Charles Bode, chief engineer, reports twelve double motor cars in daily use. They are 3½ years old. Three day men do all the maintenance work. Cars are

inspected and cleaned every other day. Light forging and all bench and handwork is done in the shop. The pay roll is \$6.50 per day.

### THE GALVESTON CITY RAILROAD

has given the matter of repairs a great deal of attention, and makes a very satisfactory showing. There are thirty-five single motor cars, having Westinghouse 30-horse-power motors, and five single reduction T.-H. 25-horse-power. Twenty-six cars are in regular use in winter and forty in summer. The equipment is a year and eight months old. The repair force consists of one night and six day men, the daily pay roll being \$13. This force is considered the smallest it is possible to have and keep up the equipment.

The cost per car mile of repair parts is  $\frac{24}{100}$  cents, and the cost of repair and inspection labor  $\frac{31}{100}$  cents, or a total of  $\frac{55}{100}$  cents, a very good record even for a new road. All repair work is done in the shop, even to casting brake shoes. A motorman's report blank is used, in which the motorman has to report the condition of each part. This he gives to the night inspector, who reports, in a column adjoining the motorman's, the condition of each part as he (the inspector) leaves it.

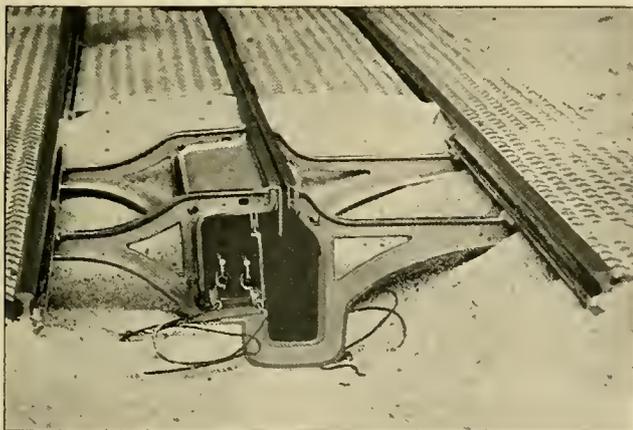

### THE PETERSEN CONDUIT.

Among the numerous systems to hover around the \$50,000 prize, is the Petersen conduit, a good idea of which can be obtained from a glance at the engraving. One of the principal points of distinction between the

CONDUIT—CLOSING PARTITION.

Petersen and other open conduit systems is that it has a normally closed compartment for the trolley conductors. The trolley arm passes along under a series of loose iron plates, dovetailed into each other, which fall of their own

SECTION OF PETERSEN CONDUIT.

weight after the trolley arm is passed, and keep the chamber closed. The conductors themselves are steel rails, and the trolleys are to make sliding contact on top of these. It is intended to keep the trolley compartment

clean and dry by the circulation of air and by carrying a conduit broom on some of the cars. The trolley rails are to be cut up in short sections, with a fuse to each section, so that trouble will be confined to a very short space. H. Peterson, of the Peterson Electrical Works, Milwaukee, is the inventor. It is claimed that a section will soon be built in New York.

The lowest part of the conduit is twenty inches deep, and the bottom of the part containing the trolley is one foot from the top of the slot rails. The feeder cables are laid underneath the trolley conductors as shown in the engraving. It would seem to be a wise move to abandon the use of trolley wire in the conduit as there is generally some trouble with the clamps and its flexibility is often the cause of the trolley coming off.

### W. S. JEWELL.

The new electrical engineer of the Toledo Consolidated Street Railway Company has had a varied and complete education in intramural transit and the science of "getting there."

Mr. Jewell was born at Brentwood, New Hampshire, on the day after the first gun was fired at Fort Sumpter. He did not join the army however on account of the strenuous opposition of his parents. His early education was acquired subsequently at the public schools of Manchester, whither he removed at the age of ten.

W. S. JEWELL.

Later he attended Phillips Exeter academy with the intention of entering Harvard. This course being precluded by ill health, he engaged in various commercial pursuits until 1889, when he entered the employ of the Thomson-Houston Company at Lynn. Once having been thrilled by the electric current Mr. Jewell made its study his life work.

He has been general superintendent of the Des Moines Street Railway Company and the Indianapolis Street Railway Company as electrical and mechanical engineer, both of which positions have been eminently successful connections and we predict continued success for Mr. Jewell in his new field of work, with Mr. Lang past-master of street railway tactics.

An express service is in prospect over the Scullin lines at St. Louis, Mo.

The first car of the Neville Island & Corapolis Street Railway was run March 1.

ELECTRICAL LITERATURE, 565 Rookery, Chicago, a monthly summary of current engineering literature, under the editorship of Professor Stein, of Armour Institute, still continues to increase its scope and usefulness, as the February number testifies.

E. F. SEIXAS has become assistant western manager for the Walker Company, of Cleveland, O.

THE New York Car Wheel Company of Buffalo has established an English agency in London.

THE 250 new cars for the People's Traction Company, Philadelphia, will be equipped with the Davis automatic curtains.

W. J. COOKE, vice-president of the McGuire Manufacturing Company, was a recent visitor at the REVIEW's New York office.

T. S. FRISBEE, representing the P. Wall Manufacturing Company, Allegheny, Pa., is in the city and meeting with good success.

THE removal of the offices of the Clayton Air Compressor Works to the Havemeyer building, New York City, is announced.

MR. COOK, formerly of Madison, Wis., is now at 25 Rialto Building, Chicago, working on a new street railway device that will soon appear in the market.

WILLIAM HAZELTON III, general eastern agent of the Fulton Truck & Foundry Company, New York City, was a recent caller at the Chicago office of the REVIEW.

THE DAVIS CAR SHADE COMPANY, of Portland, Maine, has established an agency in Chicago, with J. M. Denniston as representative. Office, 911 Monadnock building.

A CONTRACT for fifty eight-seat open cars for the Metropolitan Traction Company of New York, has just been closed by the John Stephenson Company of New York City.

THE Canadian General Electric Company has been given a contract by the Toronto, Canada, Street Railway Company for 80 street car motors and about 3,000-horse-power of generators.

THE FULTON TRUCK & FOUNDRY COMPANY has rearranged its officers as follows. W. E. Haycox, president and general manager; M. B. Bushnell, vice-president; C. J. Langdon, Jr., secretary and treasurer.

P. H. CAREY and E. J. Shrader have been appointed agents for the Dick and Church engines, manufactured by the Phoenix Iron Works, Meadville, Pa. The office will be located as heretofore at 519 The Rookery.

THE DODGE MANUFACTURING COMPANY, has made arrangements, through Chicago agent, M. W. Mix, to open a New York branch. A double store room in Dey street has been arranged for that purpose.

JOHN W. BAKER, representing the E. T. Burroughs Company, Portland, Me., is taking advantage of recent good weather to cast his excellent car shade in the west and is meeting with his customary good success.

P. H. CAREY, of 1137 Monadnock Block, Chicago, is distributing the '94 catalog of the W. T. C. Macallen Company, giving illustrations and prices on the extensive line of Macallen sheet mica insulators.

THE BABCOCK & WILCOX COMPANY has removed its main office to 29 Cortlandt street, corner of Church street, New York City. A neat folder, giving views of their various branch offices, bears the tidings.

JOHN DICK, general manager of the Phoenix Iron Works Company, has been putting in a few days reorganizing his Chicago office, at 519 Rookery, where he has installed Carey & Shrader as Western Managers.

THE BALTIMORE CAR WHEEL COMPANY, Baltimore, Md., has remembered the REVIEW with a very handsome framed photograph of their "Lord Baltimore" truck, which is a welcome addition to our collection of photographs of street railway apparatus.

A READER of the REVIEW writes us that the Oil City Street Railway, which has been running since Thanksgiving, has six double motor cars of Curtis make and they are making a good record. Four cars are in use and they have not been blocked this winter, "which," the writer remarks, "is saying a good deal."

THE Baltimore City Passenger Railway Company has now under construction a new power house. It will be finished in seven weeks. The new electric lines of the company will be put into operation early in April. The cars have 18-foot bodies, 4-foot platforms, and are finished in ash and bird's eye maple, with double doors.

JOSE ELIGIO MOSQUERA, of Havana, Cuba, has removed his offices and stores to No. 88 Calle del Obispo, that city, where he will continue to keep on hand a large variety of electrical house, telephone, telegraph, electric light and railway apparatus. Mr. Mosquera invites correspondence on all matters pertaining to the above.

THE great and growing Pacific coast electrical industry has necessitated the establishment of a San Francisco agency by the Westinghouse Electric & Manufacturing Company. It will be established in the Mills building and H. A. Russell, assisted by R. B. Elder will be put in charge. Both are well known on the coast and eminently fitted for the work.

THE CHARLES MUNSON BELTING COMPANY, Chicago, has received an order for 141 feet of 60-inch three-ply Eagle Belt, from the American Wire Company, of Cleveland, O. The company put in two 44 inch three-ply belts four years ago and they have been most satisfactory ever since they were first placed on the pulleys. These belts travel 7,000 feet a minute and are subject to very severe strain, but are still in excellent condition.

---

TWENTY-FIVE new cars, for the Lake Roland Elevated Railway Company, were shipped recently from Elizabethport, N. J., by the Fowler Car Company. They are equipped with the Lord Baltimore four-wheel trucks, made by the Baltimore Car Wheel Company, and have two 25-horse-power motors each. Fourteen are painted orange and black (Baltimore colors), and the others yellow and cream. The former will be used on the Roland Park and Lakeside lines and latter on the Walbrook line. There will be respectively three and five minute service on the lines.

---

J. F. EASTERBROOK, well known as a former engineer of the Edison Company, and as the designer of several plants, including that of the South Chicago City Railway, has opened an office at 527 Rookery, Chicago, as western representative of J. G. White & Co., electric railway contractors. Mr. Easterbrook combines engineering ability with qualities which make him very pleasant to meet in both social and business relations. We wish and predict for him great success in his new work.

---

THE WARREN WEBSTER COMPANY, with works at Camden, N. J., and western headquarters at 2 Canal street, Chicago, has just sold to the Pullman Palace Car Company, among other orders, three more Webster vacuum feedwater heaters and purifiers, aggregating 5,000 horse-power. Past orders from this company amount to 2,700-horse-power. The Pullman Company has also bought a system of Williams' vacuum steam heating of the same concern. This will utilize the exhaust steam for heating without back pressure on the engines. This constant increase of orders from such conservative buyers is a great compliment to the worth of the Warren Webster goods.

---

PROF. W. L. PUFFER, of the Massachusetts Institute of Technology, delivered a popular lecture on telephone receivers recently, before an appreciative Boston audience. In the course of his remarks he stated, that as the result of his trials and experiments with various telephone instruments, he had found the particular receiver telephone of the National Telephone Manufacturing Company to be the most powerful and strongest. He remarked that the two Bell receiver telephones shown were good instruments, but that the National was first. The National Telephone Manufacturing Company is naturally much pleased with such praise from this authority.

C. C. PECK, Rochester, N. Y., has received the contract for the boilers to supply the Detroit city electric light plant, the well-known Peck boiler having been selected after strong competition. The order is for seven 300-horse-power boilers, to carry 165 pounds of steam, working pressure. Each boiler is required to evaporate 9,000 pounds per hour of feed water at 100 degrees into steam at 165 pounds gauge pressure, and to evaporate 10 pounds of water from and at 212 degrees per pound of combustible in Hocking Valley coal. The duty is that of supplying triple expansion vertical marine engines used in running dynamos.

---

H. F. J. PORTER, who was first assistant mechanical engineer at the late exposition, during its period of construction, and afterwards assistant chief of the machinery department, has formed a partnership with Albert Fisher, formerly Chicago representative of the Ball, Watertown and Green Engine Companies, and together they have opened an office at 1025 Monadnock block, where, under the name of Fisher & Porter, they will carry on a contracting engineering business, in the line of complete equipment of steam plants, giving especial attention to large work. They have been made western representatives of the Providence Steam Engine Company, sole builders of the Improved Green Engine, and of the Altoona Manufacturing Co., builders of the H. A. Green Engine. Thus handling engines of very high grade of both slow and high speed types, they are prepared to meet any demand for first-class work in that direction. They are making arrangements with other eastern manufacturers as agents, and expect to be ready in other lines to take advantage of the incoming tide of business of which they already see indications.

---

J. L. BARCLAY is now occupying his new business quarters on the sixteenth floor, south end of the Monadnock building, Chicago. The suite of offices are admirably planned for conducting Mr. Barclay's electrical interests, and primarily selected by him for exploiting the sales of the Walker Manufacturing Company's electric railway, and electric power transmitting machinery. The central and western selling departments of that company's business being under Mr. Barclay's immediate supervision. H. McL. Harding, who also represents the above company, has his headquarters for the eastern department in New York. While the general electrical interests of the Walker Manufacturing Company will receive the combined attention of Messrs. Harding and Barclay, all selling business directly connected with the western and middle states will be exclusively transacted at the Chicago headquarters. District and sale agents are now being appointed in the various districts. Among the latter are men who have the confidence of street railway managers, and thoroughly posted in the details of their business. Mr. Barclay feels very much encouraged at the business outlook, notwithstanding the financial depression, inquiries being numerous for the heavy types of generators and motors, such as the Walker Company manufacture.

## PERSONALS.

ELMER HOVEY has been appointed master mechanic at the shops of the Chicago City Railway.

G. J. MELMS, formerly receiver of the Hinsey line, Milwaukee, has returned from a trip through Europe.

H. R. WOODWARD, builder of the first street railway in Peoria, Ill., and president of the line for many years, died recently.

F. E. HANDY has accepted the superintendency of the the Hamilton, Beamsville & Grimbsby Electric Railway. He begins his duties April 1.

F. O. RUSLING, superintendent of the Calumet Electric Railway, Chicago, took the superintendency of the Buffalo City Railway, March 1.

SUPERINTENDENT SLOAN, of Superior, Wis., says: When a woman stands on a corner and frantically waves her parasöl, the street car conductor knows what the wild waves are saying.

BEN WILLARD, constructing electrical engineer of the New Orleans (La.) Traction Company, spent a few February days in Chicago. He is making a magnificent road of the line upon which he is working.

PRESIDENT DANIEL F. LEWIS, of the Brooklyn City Railroad Company, has returned from his trip to the South, made necessary by the attack of the grip from which he suffered. He now feels able to resume his duties.

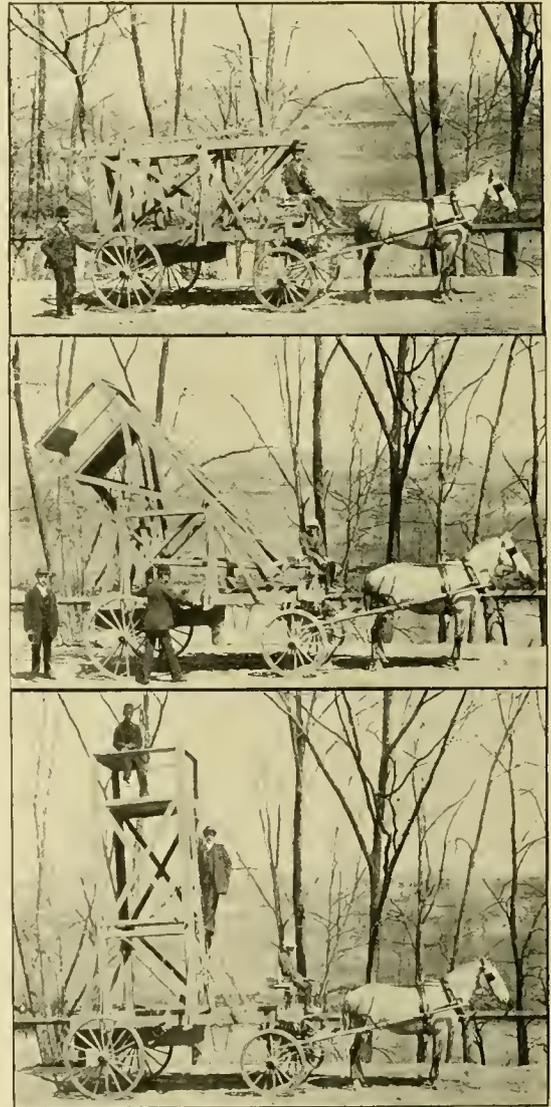

JOHN R. PAYNE is the constructing engineer of the Middlebrook Street Railway, which is a suburban branch of the Knoxville Street Railway. Col. S. B. Crawford is building the line to develop some valuable acre property. Extensions in other directions are expected.

THE former editor of the Car, of Philadelphia, W. W. Hess, has departed from journalism and become general manager of the Car Equipment Company, of Philadelphia, at 741 Drexel building, that city. The company will be the exclusive agent in the middle, south Atlantic states and Ohio, for the Graham truck, and may probably soon have the territory as far west as the Mississippi. It will also handle the product of the Allen E. & S. Company, the Johnston portable power house hoist, the Johnston oil insulation, and eventually a full line of line material. It will sell also the Ajax metal trolley wheel, bearings, etc., for electrical purposes, in the middle states. We congratulate Mr. Hess upon his new departure, and feel sure that his genial personality will carry forward his new business to success.

JAS. MCBRIER, of Erie, Pa., president of the Ball Engine Company, was a Chicago visitor recently.

## THE BREED TOWER WAGON.

The tower wagon shown in the accompanying engravings is the design of E. S. Breed, general manager of the Central Railway & Electric Company, New Britain, Conn. It has been in constant service on that road for one year, often being bumped over high rails and ties, without damage. It is very light, strong and portable. The highest point when closed is but little above the driver's head. The tower swinging, as it does, from the

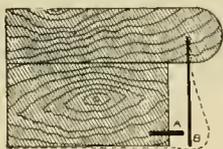

top forward uprights, is thrown ahead when down, so that it hangs over the rear but 2½ feet. The wagon is made of 7½-inch stock and 3x4 timber, and is braced, to be very rigid. It is not a collapsing tower, but a tower swinging on a pivot. It is raised by a windlass geared four to one, and is raised by one man in nine seconds. It is locked in position by a gate hinged in the bottom of the wagon. The driver can leave his seat, raise the tower, and be on top ready for work in less than a minute. On top of the tower railing there is a swinging shelf, which can be used as a platform for getting higher or as a table for tools. When at work it can be swung over the side

of the tower out of the way. The ladder is fastened to the tower permanently. Additional bolts are fastened to the back end of the tower, which are slid through the rear upright. These are used in ordinary construction work as an additional safeguard in holding the tower up, but in ordinary work the hinge gate is all that is used to hold the tower. The lower part of the body is extended downward so that tools can be carried without interfering with the tower.

**A NEW SIGNALING DEVICE FOR STREET CARS.**

A device for signaling the conductor of a street car by means of an electric bell is the invention of Robert Thuner, of Detroit, Mich. We illustrate it herewith. The plan is to furnish the connection by means of two copper strips extending around the sides of the car, with terminals at the bell on the platform, and connected with a dry battery. The section shown in the engraving is the molding at the top of the back of the car seat. A is a copper strip  $\frac{1}{4}$  of an inch wide and  $\frac{1}{8}$  of an inch thick. B is the contact strip  $\frac{1}{2}$  an inch wide and thick enough to be resilient. These when in the car are covered by the cloth of the seat furnishing. When a passenger wishes to ring the bell the strip B is pressed into contact. The main idea is that the passenger may sound the bell at any time without leaving his seat. Mr. Thuner says that a car can be equipped at a nominal cost with his device, and that a Detroit car has successfully demonstrated its practicability.

A circuit connection can easily be made between motor car and trailer, or between grip and trailer. The convenience of this arrangement, where one conductor controls two cars, can easily be seen.

The device is simple, strong and positive in action, does not mar the car, and is easily placed.

**OBITUARY.**

THOMAS CORRIGAN.

This well-known gentleman and pioneer street railway builder of Kansas City, Mo., died March 1. He was associated formerly with John Scullin of St. Louis, and acquired control of all the Kansas City street railways. These he sold out in 1886 for \$1,000,000. Since then he has not been actively engaged.

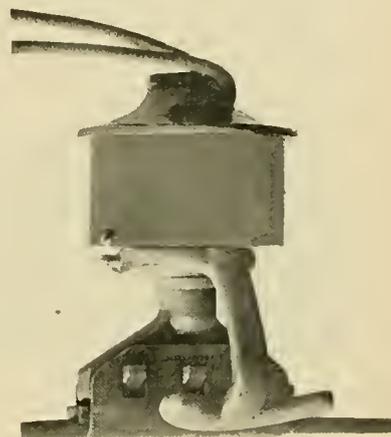

ALBERT S. ROSENBAUM.

This well-known Hebrew capitalist died in New York City, February 16, at the age of 63. He was born in Germany, coming to this country at an early age and settling in California, where he made the greater part of his money in real estate. He was a prominent director in the Third Avenue Railroad Company with large holdings in other New York surface roads.

**A BLOCK SIGNAL FOR SINGLE TRACK ROADS.**

Very often in the operation of single-track roads there is much difficulty from meeting between the turnouts, and even on well regulated roads the delay of one car means the delay of all the others. H. J. Wightman & Co., of Scranton, Pa., are making a block signal for single track roads which is automatic in action and does not introduce prohibitive complications.

As the trolley wheel passes the signal hanger, shown herewith, it enters between the trolley clip and the signal lever, raising the latter and closing a contact inside the case. This causes a signal to be established at both ends of a stretch of single track. The near signal indicates to the motorman that

he has thrown the danger signal at the other end, thus giving him the right of way. The signal remains established until a similar hanger is passed at the other end of the block. The signals themselves may be either colored incandescent lights or semaphores. But one line, usually a telegraph line, is needed to signal in both directions. A bell may be included in the signal circuit. The same signal system may be used on crossings, to advantage.

THE lamented death of Mrs. Josephine Smith, of New York, on February 23, who for so many years has been the principal of the large business conducted under her name, leaves the entire charge and interest in this large business to Charles G. Smith, her son. Mr. Smith, whom all of our readers know as the conductor and general manager of this concern, will continue the business at the same address and in the name of Charles G. Smith.

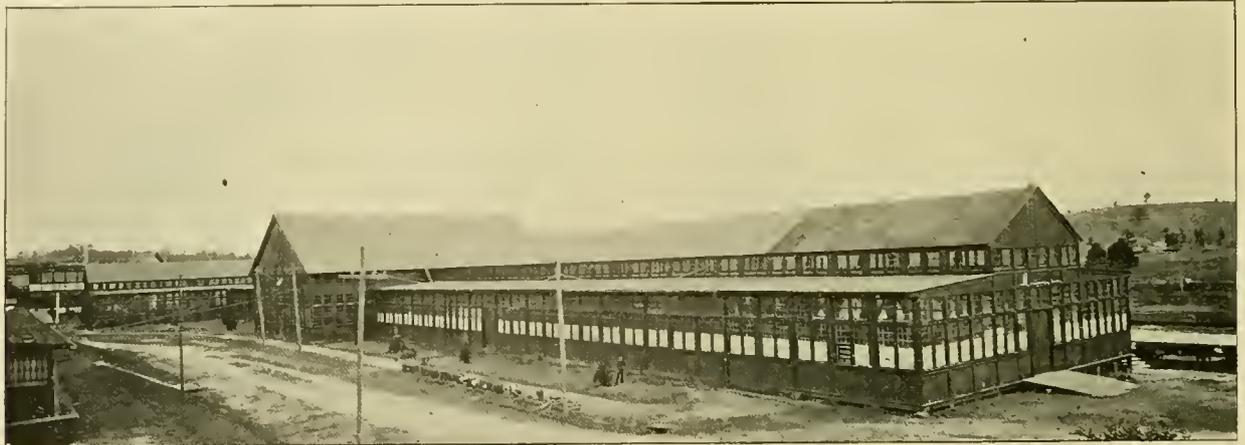

NEGOTIATIONS are in progress between the town council of Cornwall, Ontario, Canada, and Mr. W. R. Hitchcock, who is seeking a franchise to operate an electric street railway to carry both passengers and freight. It is proposed to form a company for this purpose, and utilize power from the Cornwall canal.

THE New Orleans (La.) Electric Club has elected the following officers for 1894: Professor Brown Ayres, president; H. J. Malochee, secretary and treasurer, and William Oswald, E. Leloup, G. A. Hopkins and B. V. B. Dixon, managing committee. The club discussed the street railway return circuit, upon which subject Mr. Malochee read a valuable paper.

EXHIBITS AT ATLANTA CONVENTION.

Arrangements for the comfort of delegates, and the success of the annual convention of the American Street Railway Association, at Atlanta, are not being forgotten, and the several local committees already have accomplished a great deal.

feet, with a wing at one end 64 by 74 feet, in which the sessions will occur. Exhibit space has been plotted as shown in the diagram and applications are already being made and exhibitors will do well to apply at once. A railroad track and unloading platform extend nearly the entire length of the building and better facilities than ever before are thus secured. One-half the building is sup-

MACHINERY HALL, WHERE CONVENTION WILL BE HELD.

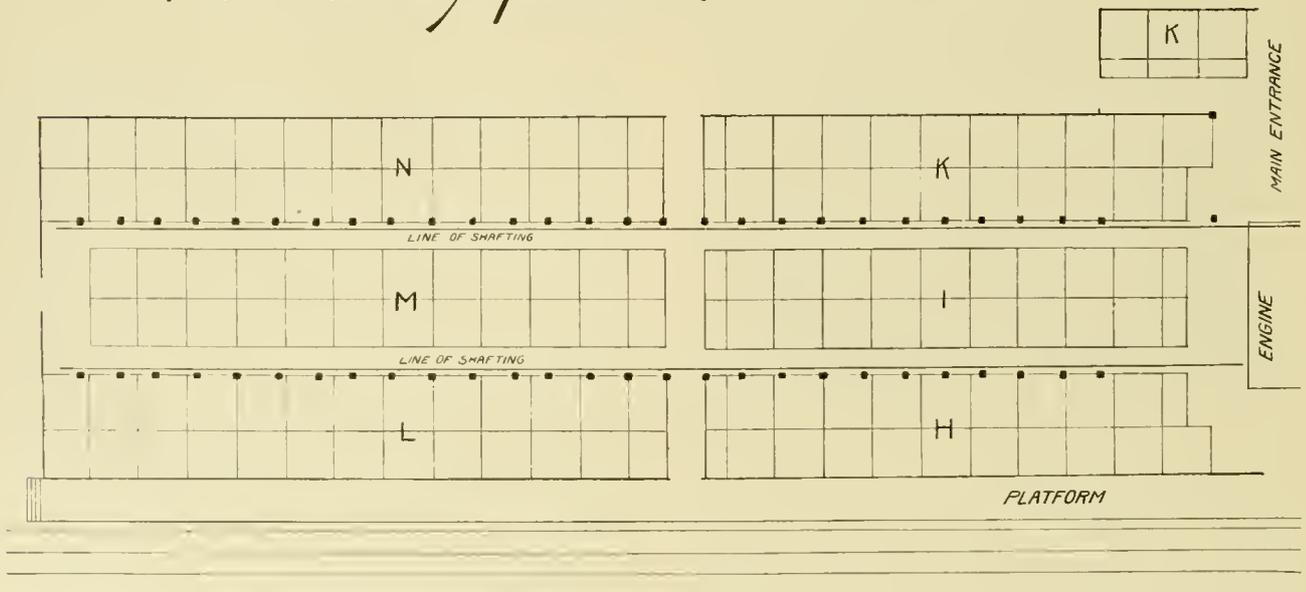

Exhibitors whose interests are large will have specially to do with L. R. Shellenberger, Equitable Building, Atlanta, and who as southern agent for the Johnson Company, has a large and pleasant acquaintance in the fraternity. Mr. Shellenberger is chairman of the local

plied with shafting and steam power, and there will also be an abundance of electrical power at hand. The probability is a larger number of exhibits than ever before will be shown in actual operation.

Machinery Hall is in the beautiful Piedmont Exposition

American Street Railway Association Exposition.

floor plan

committee, which has the exhibits in charge, and as previously announced in the REVIEW, both sessions and displays are again to be under the same roof, an arrangement most devoutly to be desired. The building selected is Machinery Hall, the dimensions of which are 74 by 520

feet, with a wing at one end 64 by 74 feet, in which the sessions will occur. Exhibit space has been plotted as shown in the diagram and applications are already being made and exhibitors will do well to apply at once. A railroad track and unloading platform extend nearly the entire length of the building and better facilities than ever before are thus secured. One-half the building is sup-

HEADQUARTERS HOTEL.

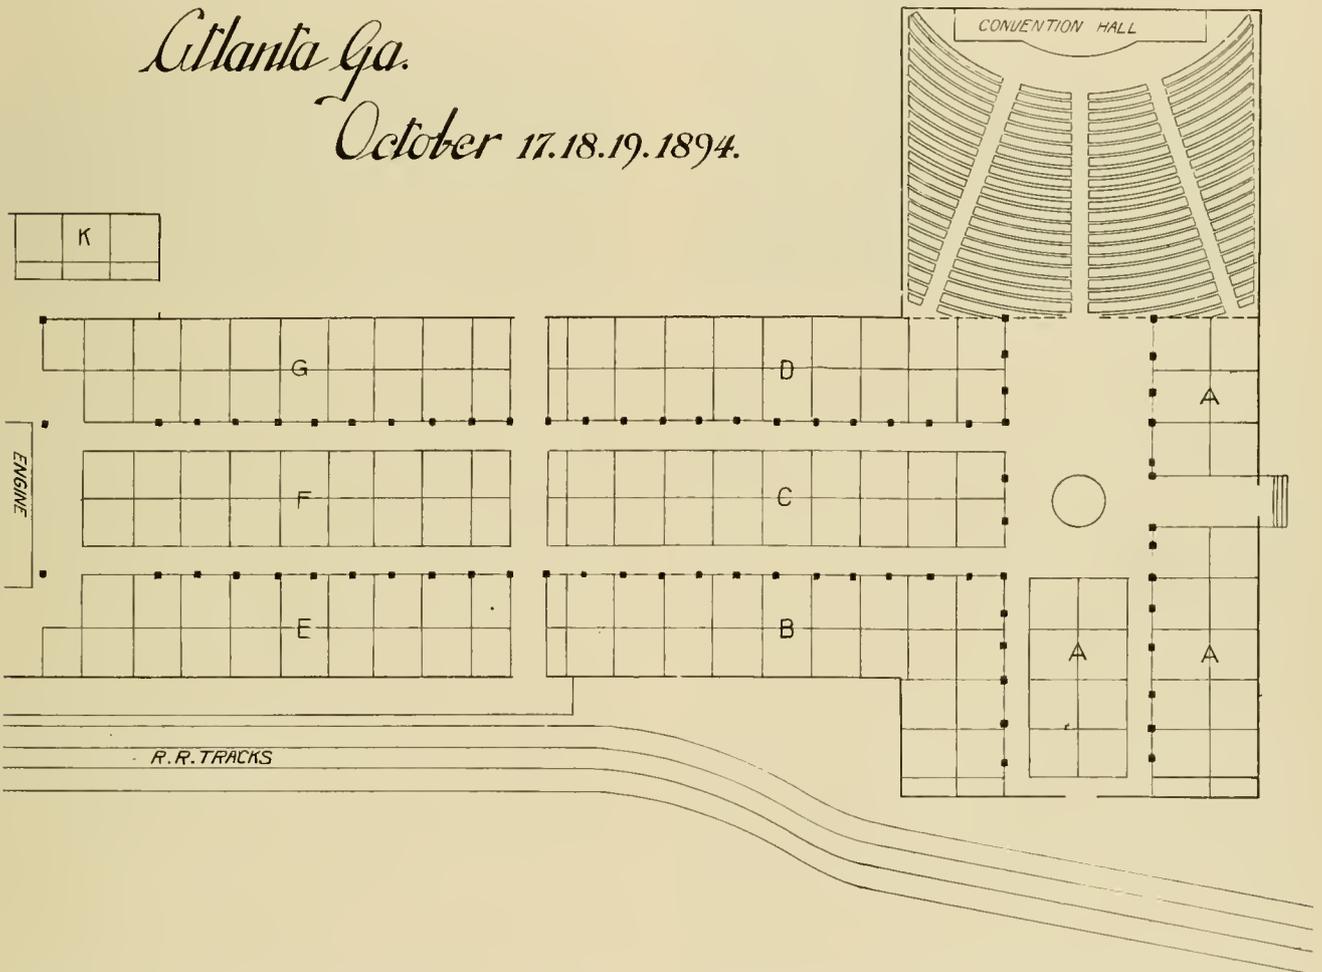

The committee could not have made a better selection in its choice of headquarters than in the magnificent Hotel Aragon, representative of the most complete and modern hostelrys in the country. It is beautifully located at the corner of Peachtree and Ellis streets, and is honored with the presence, in the same block, of the Grand Opera House, the Governor's mansion, and the Capital City Club. The hotel embodies every known improvement tending to promote comfort and elegance, and was completed only last November. The Association, therefore, will enjoy its elegance and beauty while

FROM the Risdon Iron & Locomotive Works Company, of San Francisco, comes this commendation of Charles A. Schieren & Co.'s belting. The Risdon people write, as follows:

"The two double perforated electric leather belts purchased of you last summer for the Union Ice Company's factory, Mentone, San Bernardino County, Cal., are doing splendidly. The 20-inch belt on 26-inch motor pulley has a velocity of about 5,000 feet per minute; the 30-inch belt has a velocity of about 3,000 feet per minute. Each transmits 1,500 horse power, and both are as perfect as when first put on."

Atlanta Ga.

October 17.18.19.1894.

it is still fresh and new. The building is six stories, in Spanish-Romanesque style, with first story of Georgia marble and the other five of pressed brick and terra cotta. The house is fireproof, the public and private rooms are richly furnished, and the cuisine is justly famed for its excellence. The house is conducted on both the American and European plan.

Delegates will do well to make application at once for desired accommodations, as the attendance at convention this year will be larger than ever. Many have already secured rooms and, from their orders, it is evident that visitors are coming from one to three days in advance in order to have more time to enjoy the beauties of this charming southern city. All applications for rooms should be sent to the Hotel Aragon, Atlanta, Ga.

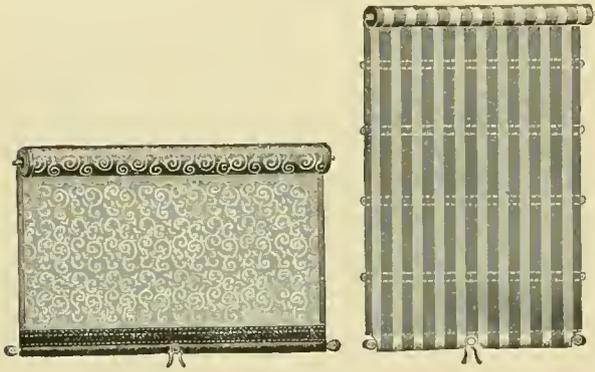

YOUNGSTOWN, O., has just gone through a miniature street railway riot. It seems that manager A. A. Anderson was thoughtless enough to want to run his own road and the fifty or sixty employes objected as a union. In consequence, non-union men were put to work, and the riot ensued. Fifty of the new employes were besieged in the power house by the strikers and sympathizers.

THE TECHNIC, the engineering annual of the University of Michigan, is again making its yearly rounds and is full of information of practical value. Safety Fuses and "Heating a Shop for Nothing" by exhaust steam, are articles of special interest in our line.

J. H. CARSON, of New York City, has been in the city for the past week.

## THE DAVIS SHADES AND HOLDERS.

Among the luxuries of modern street cars the cloth shade, with its ease of adjustment, is one of the foremost, and in the front rank of cloth shades is found the Davis. The Davis shades all have automatic fasteners, which enables the placing of the curtains at any height, instantly and without trouble. This method of fastening makes it also possible to employ a strong roller spring, which will practically never wear out. Probably the most popular style of fastener for street car use is the "pinch

FOR CLOSED CAR.

FOR OPEN CAR.

handle" herewith shown. It does not require an expert on shade fastenings to find out how to work the curtain with this device. The company also makes a turn button handle for places where the curtain must be brought clear down to the sill. The open car curtain is another neat and substantial improvement. The edges are held to a rain tight fit by bars, the ends of which extend into the grooves. These curtains are as far ahead of the "furled up" kind as the electric car is ahead of the horse car. The 250 cars of the Peoples Traction Company, of Philadelphia, will have the Davis shades.

THE JOHN STEPHENSON CAR COMPANY, LIMITED, of New York City, has just received as a second order, a call for fifty more open cars for the Metropolitan Traction Company, of New York. These, with other smaller orders bring up the car works to full force and full time.

MANAGERS of steam roads have looked with no small jealousy upon the innovation caused by the inter-urban electric railway. But, we believe, that feeling is gradually but surely giving way to the better judgment, that constant advance in all avenues of business is the inevitable, and that even there may be more gain than loss eventually from this new and popular competition. The cabmen hailed the first street car as the hearse which was to carry to its last resting place the dead body of their vocation. But is there any less number of hacks, cabs and kindred conveyances to day than ten years ago. So with the inter-urban. It will undoubtedly lessen local passenger traffic in certain localities at first, but it will also act as a feeder and make possible the shipment on steam lines of much perishable freight not now cultivated for lack of transportation to the railroad, and give two for every dollar it takes.

## REPAIRING ELECTRICAL APPARATUS.

The equipment of the Stanwood shops stands ready on short notice to repair any description of electrical specialties, from the most delicate testing instrument to the heaviest type of generator, and from the most simple to the most complex light or transmission of power apparatus. Special provision is made for street railway work, with complete facilities, skilled labor and prompt attention. The superintendent of the electrical repair department is Mr. Earl Atkinson, whose long and varied experience in building and repairing electrical machinery and apparatus of all kinds, makes him specially suited to the direction of the work mentioned. He was born in Canada in 1864, and at the age of seventeen began his mechanical career in the machine shops of Inglis & Humber, engine builders, Toronto. A year after his apprenticeship was served, he went into the Ball Electric Company's shops, Toronto, where he received his first introduction to electrical work. In 1888, Mr. Atkinson went to New York City, and after a short employment became foreman of the Marine shops of the Chas. Delamater Iron Works. After the death of Mr. Delamater, Mr. Atkinson went into the Edison laboratories at Orange, N. J., where he became head of a department. In 1892 he came west with the Edison General. After some time in this and kindred work, Mr. Atkinson accepted the flattering offer of his present association, and took charge of the electrical department of the Stanwood Manufacturing Company, of Chicago, where he is to-day, with a thorough knowledge of theory and practice and a wide acquaintance with the street railway needs.

## NEW PUBLICATIONS.

THE OHIO BRASS COMPANY, of Mansfield, appears with its catalog No. 2 of street railway supplies. Although it is for the first time dealing directly with the users of its apparatus, it has been manufacturing this line of goods for a large supply house for several years, so that it is no novice in the business, as is also indicated by the completeness of the catalog.

THE crimson and gold of the Taylor Electric Truck Company's 1894 catalog is adorning the managers' desks throughout the country.

THE growth of the Garton-Daniels lightning arrester business is best illustrated by a 20-page catalog of descriptive matter and testimonials, issued by that company in this the ninth month of its corporate existence.

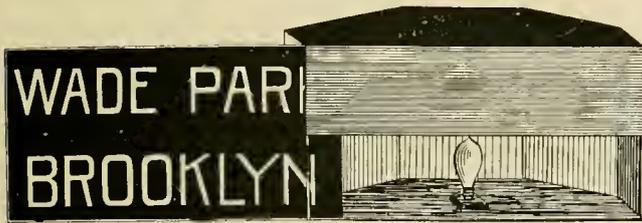

DICK, KERR & COMPANY, of London, have issued their February (1894) catalog, describing the many types of gas engines made by them.

ENGLISH METHODS OF STREET RAILWAY TRACK CONSTRUCTION, by James More and Alex. McCallum, Street Railway Journal, New York, 26 pages. Price 35 cents. A description of English as compared with American methods, with criticisms of both. The treatise is a very fair one on both sides, considering that the authors are from the other side of the water and not well acquainted with American conditions.

THE fifth annual report of the inter-state commerce commission is issued, appearing six months earlier than any previous edition. It is for the year ending June 30, 1892. We are informed that a large part of the delay is a fault of the railroads. The report cannot fail to be of value to steam roads and contains much data of interest to street railway men.

## AN ILLUMINATED CAR SIGN.

An illuminated sign for showing car routes is being put on some of the cars of the Cleveland Electric Railway, and is appreciated very much by the night-traveling public. It is attached to the dash of the vestibule. The sign consists of a box, covered on the front side by a glass slide and containing a 20-candle-power incandescent lamp. The box is made of galvanized iron and is 21 inches long, 11 inches wide and 4 inches deep in the center. The back corners of the box are tapered off to allow the hooks, by which it is fastened to the car, to be placed on the back of the box and not have the box pro-

ject too far out from the dash. A small block of wood is bolted to the bottom of the box on the inside and the lamp socket is fastened on this block. The lamp is taken from the hood of the car and the wire is extended from there to the box on the front of the vestibule, so that no extra lamp is used. The outside of the box is painted the same color as the car and the inside is painted a dark color. A glass slide is fitted into the front of the box and the name of the line is painted on this slide in white letters on a dark ground. A double sign may be made by putting on a tin door which turns on a hinge across the center of the box. This door when turned up covers the upper part of the sign and when turned down covers the lower part. This double sign is used on a through line in Cleveland, the name Wade Park being covered when going to Brooklyn, and Brooklyn covered when going to Wade Park. The name of the line is easily read at a distance of two or three hundred feet. The sign was designed by John J. Stanley, general superintendent, and is made in the company shops. It is possible to have the lettered slide of tin with perforations for the letters.

## TRACTION BUYS TRANSIT.

One of the largest consolidation deals of this year is the combining of the Allentown & Bethlehem Rapid Transit Company with the Lehigh Valley Traction Company, both of Pennsylvania. The rapid transit company was backed by Ex-Governor Ames, of Massachusetts, and other Bostonians. Congressman Tom L. Johnson and A. L. Johnson, of Cleveland, are at the head of the Lehigh Traction. The price of the rapid transit company is said to have been \$1,250,000.

Jilson J. Coleman will be general manager of the combination and an extensive scheme of interurban roads is planned.

The concerns or corporations consolidated are: The Allentown Passenger Railway Company, capital stock \$200,000; the Bethlehem and Allentown Street Railway Company, capital stock, \$100,000; the Bethlehem and South Bethlehem Street Railway Company, capital stock \$200,000; the Catasauqua and Northern Street Railway Company, capital stock \$75,000; Allentown Electric Light and Power Company, capital stock \$150,000 preferred, and \$150,000 common; and the Rittersville Hotel Company, capital stock \$100,000. The capital stock of the Rapid Transit Company is \$1,500,000. The directors of the Traction Company are A. L. Johnson, Tom L. Johnson, Howard Page, Jilson J. Coleman, W. J. Hartzell and M. L. Kauffman.

## STREET RAILWAY PATENTS.

Compiled by the Street Railway Review.

ISSUED FEBRUARY 13, 1894.

Track drill. Louis J. Crecelius, St. Louis, Mo, assignor to Andrew Warren, same place.....	514,544
Electric railway. Paul W. Lefler, Minneapolis, Minn., assignor to the Lefler Electro-Magnetic Railway Company, Chicago, Ill.....	514,561
Bond wires for electric conductors. Alfred Hoffman and Joseph Brogan, Milwaukee, Wis.....	514,714
Electric railway system. Paul W. Lefler, Minneapolis, Minn., assignor to the Lefler Electro Magnetic Railway Company, Chicago, Ill.....	514,718
Life guard for street cars. Theophile Euphrat, Darien, Conn.....	514,749
Trolley. John A. Williams, Altoona, Pa.....	514,801
Electric railway conduit. Robert I. Hampton, Athens, Ga.....	514,827
Electrically operated street indicator for cars. Henry C. Barker, St. Louis, Mo., assignor to Jacob Stocke, Jr. and Henry C. Beekman, same place.....	514 878

ISSUED FEBRUARY 20, 1894.

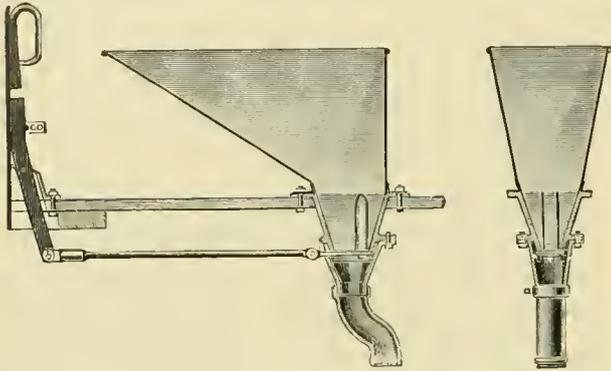

Trolley wire support. Rudolph M. Hunter, Philadelphia, Pa., assignor to the Thomson-Houston Electric Company of Connecticut.....	514,932
Electric railway system. Nikola Tesla, New York, N. Y.....	514,972
Automatic grip opener. William P. Courtney, Oakland, Cal., assignor one half to Albert Brown, same place.....	515,115
Railway switch. Ernest Leighton, Boston, Mass.....	512,122
Railway switch. William F. Stedman, Boston, Mass.....	515,135
Safety car fender. William J. Ogden, Baltimore, Md.....	515,157
Trolley conductor and support. Myron D. Law, Washington, D. C., assignor to Albert G. Wheeler, Chicago, Ill.....	515,238
Indicator for electric cars. Henry C. Beckmann, St. Louis, Mo.....	515,274
Electric railway trolley. Chas. J. Van Depoele, Lynn, Mass. C. A. Coffin and Albert Wahl, administrators of said Van Depoele, deceased, assignors to the Thomson-Houston Electric Company, Boston, Mass.....	515,208

ISSUED FEBRUARY 27, 1894.

### THE COMMON SENSE SAND BOX.

For some time the ingenuity of our inventors has been taxed to produce a sand box for the use of street railway lines, and the need has been emphasized by mechanical traction. Many have been devised that did good work under favorable conditions and possessed many points of excellence, but were not up to requirements. The com-

mon sense sand box is one of the latest and best offered. It is simplicity itself, and very easy to manipulate. Certainty of delivery is ensured by the knives attached to the gate, which thoroughly cut the sand, even if it is packed hard, and brake it up so that it flows perfectly. The sand is carried in a hopper, which is firmly attached to the floor, and lined throughout with galvanized iron. The size now in use holds a bushel. The sliding gate is of hard bronze, and the knives tempered steel. A locking device attached to the dashboard will hold the gate open or shut, or at any intermediate point. Cars are equipped with either two or four boxes, and they can be arranged to operate by either lever or foot power, as desired. The makers, E. F. DeWitt & Co., of Lansingburg, N. Y., have received very flattering testimonials, and the number of orders on the books is something remarkable, considering the short time the company has been in the business.

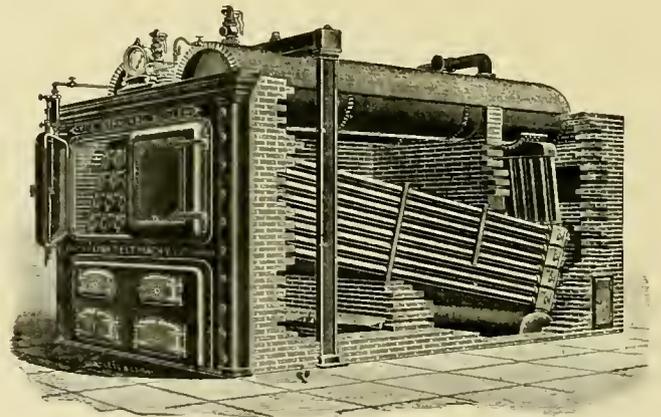

### CURTIS MOTORS FOR BROOKLYN.

The Curtis Electrical Company have just closed a large order for street railway motors with the Brooklyn City Railway. There has been a hard fight for this business and in obtaining the order the Curtis people naturally take justifiable pride that the record already made on that road, of forty of their equipments, should have been so satisfactory as to command a second and much larger purchase. The new contract calls for 120 equipments, which are to be delivered as rapidly as the works can turn them out.

MILTON H. HAMILTON, widely known in electrical and railway circles, died in Pittsburg on March 10. He was formerly chief clerk for Wm. J. Clark, of the General Electric, the news of his death will cause widespread sorrow and regret.

### THE CALDWELL STANDARD WATER TUBE BOILER.

The Caldwell water tube boiler, made by the Link Belt Machinery Company, of 21 South Jefferson street, Chicago, has a number of peculiar features of merit which are here illustrated. It is not necessary to enlarge on the advantages of water tube boilers and the safety and economy of this type, for this is already too well known to need repetition. One of the prominent advantages of the Caldwell Standard is the use of fire brick between the tubes. These are called baffle bricks and are for the purpose of directing the heated gases against the tubes. In addition to this they store a limited amount of heat, which is given out when the furnace doors are opened or the fire temporarily cooled, and gives the boiler a steady heat. It is, in fact, a kind of thermal storage, which prevents too great expansion and contraction. There are no joints in direct contact with the fire. The construction is such as to insure a rapid circulation of the water in one direction. By removing a single header cap an indication of the state of every header and tube is

had. One tube or every tube can be removed from the front openings in the headers. George H. Barrus has recently made some exhaustive tests on this boiler, and under ordinary running conditions obtained an evaporation (with the regular fireman) of 11.3 pounds of water per pound of combustible, with a semi-bituminous coal. When forced 66 per cent above its rated capacity the moisture was only  $\frac{1}{1000}$  of one per cent, a result seldom obtained in this class of boilers.

EDWARD J. LAWLESS, formerly superintendent at Paterson, N. J., has been appointed agent of the American Car Company, at 109 Liberty street, New York.

AN affidavit has been filed by President C. C. Bonney, of the Twenty-second street line, giving evidence in the Siemens-Halske injunction suit. The electric company accuses the railway company of using current for experimental purposes. The affidavit tries to give proof that the Siemens-Halske Company should be restrained from cutting off the power supply.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,  
 269 Dearborn Street, Chicago

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4. APRIL 15, 1894. NO. 4.

WHAT will you have this summer as a means to create travel?

THE interurbans have made a splendid record the past winter, and all report a good business.

INDICATIONS all point to an early, and greatly improved movement over last year's summer travel.

MUTUAL insurance is more and more forcing itself upon the street railways of the country. Underwriters pronounce railway risks poor policies, but they are not half so bad as the short sighted policy which seems to prevail among insurance men.

HERE is something which for absolute originality properly deserves the attention and comment, English journals are devoting to a new invention. It is called a "tram car starting apparatus" and stores energy in a wound up spring. The nearly 1,000 wound up inventors in this country which have sprung such "apparatuses" on the much afflicted manager, need not have any fears that the English starter will get much the start of them.

DID the editors of the New York and Brooklyn daily papers ever think what a ridiculous attitude they put themselves in by publishing accounts of the recent episode on a bridge in Brooklyn, in which a deputy sheriff had to be given the full benefit of a 500-volt shock, three times before he would let go the heads of the tower

wagon horses? The publication of this one incident knocks the props out of all the deadly trolley matter they have ever published.

THE street railway, at Bristol, England, has lost over 100 valuable horses and others are daily increasing the loss. The unfortunate animals are suddenly taken with paralysis, and the veterinaries seem unable to cope with the disease which has been traced to a poisonous Indian pea vine which was mixed in imported fodder. The poison works in a cumulative manner, hence it is impossible to tell for some time where the loss will stop. The present is an excellent time for the Bristol management to consider electricity as a motive power which does not short circuit on Indian peas.

THE absorption of street railways by English municipalities is the continued and growing subject of interest in that country. Unless conditions are very radically different from those which prevail here, we predict that five years will fully establish the mistake. Even so conservative and certainly reliable an authority as Engineering, of London, states:—"Certainly, private companies have worked the tramway system, generally speaking, more satisfactorily; and it were well that corporations should carefully weigh all considerations before entering upon enterprises simply because they conform to present ideas as to municipal socialism."

THERE'S a chance for some manager having a line running out four or five miles, to make up excursion trains of say three cars on warm summer evenings, and distinguish himself by putting music on board. This would add to the charm of the ride, and as it is purely for pleasure the music would be a strong attraction. We expect some day to see a dining car hooked on to the rear of the train, where electrical ice cream and storage battery cakes will be served en route, together with current "juice" and other light fixtures. While the liability to sparking would be increased, a proper system of feeders would doubtless secure good results.

THE official photographer of the Midwinter Fair has learned well his lesson from he of Chicago picture fame, and gone him several better. Ever since the Midwinter was opened, the REVIEW has made strenuous efforts to secure a set of views of the principal buildings, but without avail. When the show was a novelty we were willing to be bled, but even money was no object to them then and views could not be had at any price. Now that the event has almost become history, the artist man has so far relented as to allow publishers to obtain certain views by paying ten dollars each, in addition to an outrageous price for photography, but the conditions of use are such as to be practically prohibitory. Evidently there is some reason why the managers of the western fair do not care to have the world know or see that for which they have made so extravagant claims. Such treatment is very poor return for all the kind words and free advertising the press has afforded the California effort.

THE annual report of Superintendent Curtin, of the Milwaukee Fire Insurance Patrol, is an interesting document, and adds further evidence to the great increase in risk (!) where trolley wires are run. During the year just closed there were in that city 645 fires, of which smokestacks caused 22; furnaces 28; gasoline stove explosion 26; oil stove explosions 20; overheated stoves 41; while there were only three fires from electric wires, each of which were from lighting wires. Milwaukee certainly is well lighted electrically with both arc and incandescent systems, and has nearly 100 miles of trolley wires. The arc circuits are manifestly more dangerous risks than motors fed from railway circuits, and the insurance records show greater reason to refuse residences containing furnaces than buildings where the railway current is used for power. The insurance companies are radically wrong in their discrimination against railway circuits and the sooner they change front on this question the better off will they be. There has been a long stride in mutual insurance in the past three years, and the way the several State street railway associations, are going into the subject make it strongly probable something will come out.

SENATOR COGGESHALL, who has a bill before the New York legislature limiting the speed of trolley cars to six miles an hour, should change his name to Clogs-all. So wretchedly absurd and senseless a measure deserves to be relegated to a way back past, out of which the senator seems to have come bringing its fossilized traditions with him; rather than be dignified with even mention or objection. To be consistent, steam railroads should come down to 20 miles an hour, and carriages to four; the fire and police departments to a walk and mail wagons to the speed of the average messenger boy. In these days of improvement the public will not submit to street car travel at a pace which is not considered improper even for a funeral procession. It's the same old story again; legislation can never be sufficiently elastic to cover it, for at times six miles an hour may be dangerous where ten minutes later ten or twenty would be safe. The decision within reasonable bounds must be according to circumstances, and of these the man in charge of the car is competent to be the judge, for no man should be in charge of a car who is not. The scheme savors of the old school blackmail which is levied on corporations once in so often.

THERE was a strike in Youngstown, O., which the citizens thought rare sport, and better than a circus to see the ex-employees cut trolley wires and indulge in the regulation mob and riot violence. Now that the ball is over, and there is a thrifty possibility that the fiddler will send in a statement, the faces which wore a watermelon smile at the sight of wanton destruction of the railroad property, begin to lengthen like a February icicle. The corporation has been taxed, and taxed heavily, to support the police and fire departments and pay salaries of men whose oath bound them to maintain law and order and protect the lives and property of the Youngstown citi-

zens. The officers particularly neglected to do so in the instance mentioned, and good lawyers assure the company they have the clearest kind of a case for damages against both city and county. City officials, in this gloriously free country seem to be imbued with the idea that taxpayers are created and allowed to exist for the sole and express purpose of furnishing money for the aforesaid c. o. to fatten on; but the fact remains, though little recognized, that the taxpayer has rights guaranteed him by state and national constitutions, which, "though lost to sight," are "to memory dear."

MERRY music is already borne to us on the salt breezes of the Atlantic, from English municipalities, which have secured control of the street railways, and having done so do not know how to conduct them except at a loss. That more such results will follow is to be expected; not because the city is in England, for the same outcome should be looked for in any country. Witness the following extracts from the Western Morning News, of Plymouth, in commenting editorially on a meeting of the city tram car committee. It says:

"Less and less are the rate payers of Plymouth allowed to know of what their representatives in the Council are doing, and nothing at all as to the reasons for what is being done. Witness the reports published to-day of yesterday's meeting. Every report presented yesterday was adopted, with nothing approaching a debate, or clear explanation of the why and wherefore. There was a little talk on the proposal to put £200,000 more of the Corporation Stock on the market, and just a little criticism of the tramways' working, which is admitted to cost the rate payers £100 a month, although this loss might be avoided if reasonable fares were charged. But this is to be made up by charging the Chamber of Commerce an extravagant rent for indifferent accommodation, and against this not a word of protest was raised. And so the ball rolls merrily on."

SUIT was brought in San Francisco against one of the roads for \$30,000 damages. When the jury had been summoned, the plaintiff concluded to abandon the case, the effort to bluff the company into a settlement having proved futile. The judge took occasion to reprimand the lawyers, stating the county had been to an expense of nearly \$100 in calling in men to serve on jury for the case, and that the county had some rights which even litigants were bound to respect. The fact is, our system of legal procedure in damage cases is radically wrong in most states and offers alluring inducements to blackmailers and shyster lawyers. The former have all to gain and nothing to lose in case of defeat—not even reputation in many cases—while the unscrupulous lawyer struggling after practice welcomes any kind of a case which will get his name on the calendar before the public and afford him that same opportunity for legal exercise which doctors find in the dissecting room. There is little wonder that the temptation is too strong for many men whose sense of honor is not abnormally developed. The remedy for this, for there is a remedy for much of it, is in the enactment of such laws as will make the party

bringing suit liable for the court costs in case of defeat. Where defendant loses he now usually is saddled with costs also, but it is a very one-sided deal.

THE past thirty days have shown a decidedly marked improvement in street railway orders, for both repair and construction material, and the outlook for manufacturers in our field is quite encouraging. More new lines are going forward on Eastern than Western roads, for the reason that prior to the depression greater progress had relatively been made in the West, while the more conservative management of the East waited, and now find a certain and unmistakeable demand and insistence on the part of the public for betterments which were anticipated in the West. There is, however, a large volume of new construction planned for the middle and western states, and in Chicago alone, the equipments to be ordered in the near future will be surprising. Extensions of present systems and renewals and betterments in rolling stock and stations will, in the aggregate, reach high figures and create a large demand. Money is getting easier every day, and companies have in many cases completed plans and estimates and only await the necessary funds. The fact that operation during the past unfavorable year has been as successful as it has, is having a strong effect in many localities in securing locally much capital which formerly was obtainable only in the East. Altogether the indications point to a large demand for railway supplies of every kind. Dealers have generally adopted the much better plan of refusing the long credits which were resorted to formerly in their anxiety to force business, and buyers are recommended to purchase only what they can reasonably expect to settle for in sixty and ninety days at the longest. The bad effects of an abnormally large business, arising from having induced a manager to extend and equip on too close margin of successful operation, was pointed out in these columns long ago, and now that the business-like system of filling orders instead of creating them prevails, both buyer and seller will be better served in price and quality.

CONGRESSMAN WALKER, of Massachusetts, on the floor of the House, made a fair sample of himself of what the average intelligence of our present-day lawmakers is, on so important a question as is involved in street railway interests. The gentleman was decrying the trolley system, (which in his own state carried 93,000,000 more passengers last year than its steam railroads), and attributes the remonstrance of trolley interests in the District of Columbia against being put to death, as due to the fact that the two great electric manufacturers could sell to greater profit for overhead than underground construction. The gentleman, however, neglected to point out in what respect any underground system required a less number of motors to equip the cars; or generators to produce the current to propel them; or feeder wires to conduct that current; or engines and boilers for power house. He might have mentioned the saving of 500 cedar poles per mile, although we were not aware that

poles formed one of the highly profitable of the diversified crops of an electric manufacturer's farm. But throw the poles off the track and the manufacturers have more to sell an underground road than any other system. What the benighted representative ought to know, is that a legitimate road of any kind, even an old fashioned toll road, is limited to the possibilities of its maximum earning capacity; and this earning capacity is restricted to the number of people tributary to the line who can afford to ride. The track construction for underground electric is nearly or quite as costly as cable conduit, though the power house installation is somewhat in favor of electricity. But in either case a heavy business is essential to warrant the first cost and its consequent interest. While there is an undoubtedly large field for conduit electric there are 50 miles of street railway track where the expense is absolutely prohibitory to one where it is warranted. Trolleys will doubtless continue to skim the overhead wires long after Mr. Walker has ceased to be either a walker or a talker.

#### FOREIGN FACTS.

CAR lighting by gas is being tried on the South London Tramway Company's lines.

VIENNA had a tramway strike March 15, in which one car was wrecked by the strikers.

BARCELONA is up to date, with a horse car run down at a railroad crossing, in which four passengers were killed and eight severely hurt.

THE omnibus men of London are always in trouble or about to strike. The men have to work from 16 to 17 hours a day and are paid \$5 a week.

THE Buenos Ayres & Belgrano tramway, in 1893, earned £43,484; spent in operating, £30,096; leaving a net profit of £13,388. A good showing.

THE STOCKHOLM-DJURSHOLM Electric Railway is about completed and several portions of it already tested and approved by the government. The power plant is ready for work.

ENGLISH correspondents to London papers are loud in expressions of praise for American street traction and rapid transit, at the expense of the London underground steam and surface tram cars.

L'ELETTRICISTA, the most prominent Italian electrical technical magazine, published at Rome, is devoting increasing space to traction, which is becoming a prominent feature of Italian electrical engineering.

AN electric tramway, over three miles in length, is being constructed at Bordeaux, France, on the Thomson-Houston system. Six cars will at first be put into service. The station contains Babcock and Wilcox boilers.

## ELECTRICS IN THE CRESCENT CITY.

France in America—Sights in the Creole Section—Romantic History of the City—Gigantic Undertaking of the New Orleans Traction Company—Plans for a Model Modern System.

Probably no city in the United States combines more features of interest to the traveler, business man and student than the Crescent City, the great metropolis of the South; whose history constitutes a story of matchless interest, and whose name and progress are closely interwoven with nearly all the great events of national moment. Here are presented contrasts as cannot be found in any other city in all our land, for while the great French quarter is as distinctively foreign as any city in France, one has only to cross a single street to enter that portion of the city known as the American section, where art, literature and culture in its highest form prevails, with modern and American ideas of life and architecture. The visitor however is surprised to note the evidences on every hand in both the old and new city, of wealth; for hundreds of Creole families enjoy a life of luxury which accompanies the possession of large estates, and in their conversation and social and business life give unmistakable evidence of that descent which has given them the title of the "Knickerbockers of Louisiana." In passing in may be stated here that "Créole" as usually interpreted in the North is quite erroneous, and in its proper and best sense means, not a mixture of Indian, mullatto or negro and white; but those American born of French or Spanish parents, and signifies only one of pure and unmixed European blood. A clannish feeling of remarkable strength and pertinacity exists among thousands in the old city, the dividing line being Canal street, which in early days was a fortified moat and the western boundary of the city. This great business artery now in the very heart of the city corresponds to Broadway in New York, or State street in Chicago, and yet there are thousands in the French quarter who have never crossed to the other side of this street. They have their own banks, cathedrals, theatres, hotels, stores and all the requisites of a great city, and will walk upon their own side of the street, but, have no desire to cross to the

H. M. LITTELL,  
President.

other or go beyond. And the strangest feature of this strange custom is that the people themselves seem unable to give any reason for this condition; their forefathers did not, they do not and their children implicitly and without question accept the self imposed restriction.

To cross Canal street to the east is an instant transition from America to France. The language of business is French, although many speak English, but the names of the streets and upon the signs and door plates are French, and the daily papers are published in that language as are the state and municipal laws. Among the unusual sights which attract the visitor may be mentioned the printed announcement in case of death. Formerly a servant delivered these notices, which were printed on cards and carried on a silver tray. Now they are published in circular form and quite an assortment meets the eye at every corner, tacked to telegraph and other poles. Another custom which would hardly be considered proper in some places, is that of attending early mass accom-

**JOHN BONNOT, 45, Rue Sainte-Anne.**

panied by a huge market basket. To the REVIEW representative it was a highly amusing spectacle to witness the frantic struggle of hundreds of dames who with baskets and children thronged the Cathedral of St. Louis; and, after performing their devotions marched in a good sized army to the French market, where the chief dinner of the week is purchased. At this market, which includes several long buildings cut up into small booths, almost every imaginable thing pertaining to the culinary art, both cooked and uncooked, may be bought.

It is one of the sights of the city, opening at four o'clock in the morning, and presents a perfect babel of tongues as almost every known nationality is represented. Sunday is a gala day, and fortune tellers, side shows, and fakirs fill the street, with here and there a picturesque group of Indians selling herbs and charms. Fish and fowl are in great demand, the latter being sold alive and the good housewife returns home with the heavy basket on one arm and a squawking duck, goose or chicken hanging head down from the other hand. Passengers with such motley hand baggage are seen on every car in the French section on Sunday morning.

A few words historical will serve to bring us down to date. Louisiana was first visited in 1536 by Spaniards exploring the Mississippi river under Pamphilo de Narvaez. De Soto, another Spaniard, followed in 1539, after which no record is found of white men visiting the country until 1673, when Father Marquette navigated the great river below the mouth of the Arkansas. On April 9, 1682, La Salle erected a cross, fired a salute and took possession in the name of Louis XIV, of France, and named it after him, Louisiana. In 1699 a French colony of 300 men landed and established a fort at Biloxi, and in 1718 Bienville began clearing the woods on the narrow strip between the river and Lake Pontchartrain, and New Orleans had a beginning. Louisiana was ceded to Spain in 1769, with great military eclat, and strongly intrenched by the Spaniards. October 1, 1800, the territory was transferred back to France, and on April 30, 1803, ceded by that country to the United States for \$15,000,000. The official transfer was made on December 20, in the old city hall. The State of Louisiana was admitted to the Union in 1812. The important military events which occurred at New Orleans during the war of 1812 and during the Civil War add additional interest to a city full of historical scenes and landmarks.

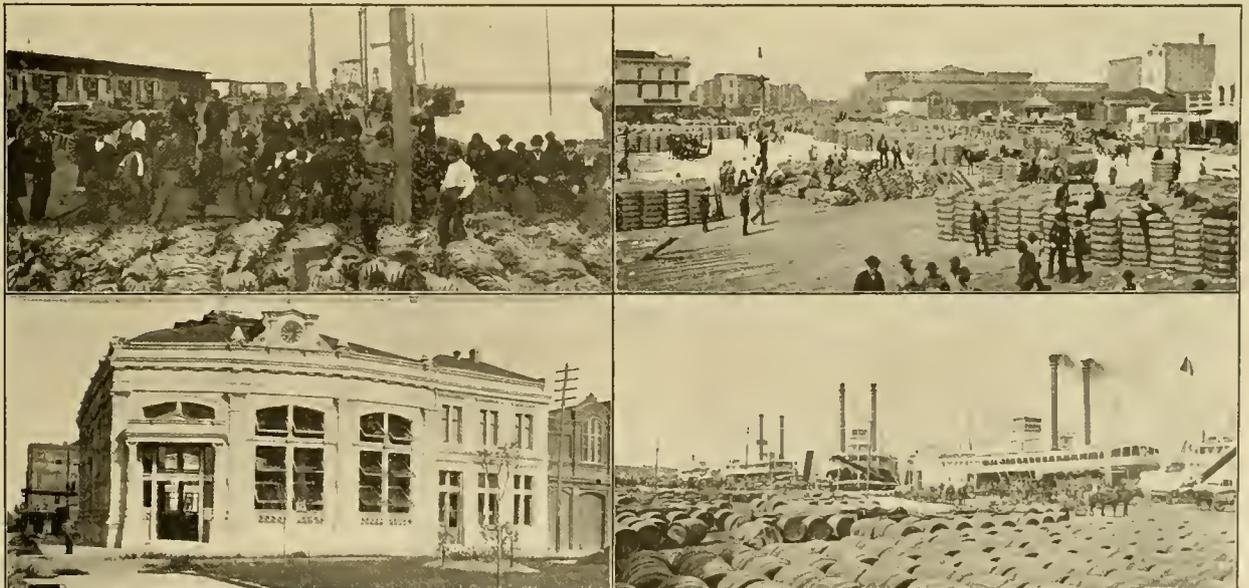

Through all the vicissitudes of war and floods the city has marched steadily on, and now boasts a population of 300,000. Its importance as a great port and business center is well known throughout the world, of which it is the greatest cotton port. Two million bales are exported annually, and this business alone affords occupation to

CEMETERY SCENES.

150,000 of its population. The Cotton Exchange is an imposing building and cost \$380,000.

Prior to the war the sugar crop amounted to 200,000 tons annually. It is now less than half this amount. It

BANANNA WHARF.  
SUGAR EXCHANGE.

COTTON DOCK.  
SUGAR LANDING.

is, however, the greatest banana port in the world, 13 swift ocean steamers plying between New Orleans and Central America alone, in this rapidly increasing industry. Rice, farm products, fruits, and all the productions of thousands of square miles of the richest soil in the world, tributary to this city, combine to make it a great commercial center; and its manufactured products are constantly on the increase in number and output.

New Orleans is the only large city in the country which has no sewers. This is easily explained from the fact that city datum is several feet below the river, which is kept out by immense embankments. In all the gutters running water may be seen, which is led to a basin and pumped into a canal, which empties into the lake. A system of water works is in use for fire, flushing and sprinkling purposes, but rain water is used for drinking. The system of street cleaning is very complete and few cities enjoy as clean streets as are found here. Owing to the excessive amount of water in the soil basements are impracticable, and everything is above ground. Even in the cemeteries this law asserts itself, and all burials are above ground. These cemeteries are beautiful parks, and many of the tombs cost thousands. The poorer classes use what are called ovens, built along the cemetery wall, and in tiers of three or four, as shown in the illustration. Frequently fraternal or religious societies will unite and erect a marble building, resembling a chapel, with spaces for from 30 to 100 caskets. As the spaces are filled the aperture is covered and cemented and the desired inscription placed upon the cover.

Among the notable buildings may be mentioned the City Hall; the Parish Prison; St. Louis Cathedral; Masonic Temple; U. S. Mint; Howard Memorial Library; and the U. S. Custom House, covering an entire block, and containing the celebrated "Marble Hall," the roof of which is supported by solid columns of pure white marble, 41 feet high, each hewn from a single block costing \$8,000. The St. Charles Hotel resembles a state capitol in size and architecture, and before the war was the finest on the continent. The Hotel Royal is also historic as the former capitol building of the state. Among the most interesting relics are the Cabildo and Court buildings, facing Jackson Square, and erected by the Spaniards. Within the Cabildo all the transfers of the country from one sovereign to another were made. In 1826 it was elaborately fitted up by the city and tendered General La Fayette, who occupied it as his residence.

The ground floor is now used as a jail and police court, and the upper part by the Supreme Court of the state. The court buildings are separated from the Cabildo by the St. Louis Cathedral, and is historic as the residence of Pere Antoine, who came from Spain to establish the Inquisition in Louisiana. He failed in this, as the governor put him on board ship at midnight and banished him for several years.

Jackson Square, above mentioned, is a lovely little park, containing a very remarkable statue (see illustra-

tion) in bronze, costing \$30,000. The horse and rider weigh fifteen tons, and simply rest on the two hind feet of the horse, without a bolt or fastening of any kind, or other support. It has passed unmoved through hurricanes which leveled buildings. Numerous other statues pleasantly surprise the tourist; the Clay statue on Canal street; the Franklin; the Lee monument, 106 feet high; the Battle monument, the Confederate, and other monuments.

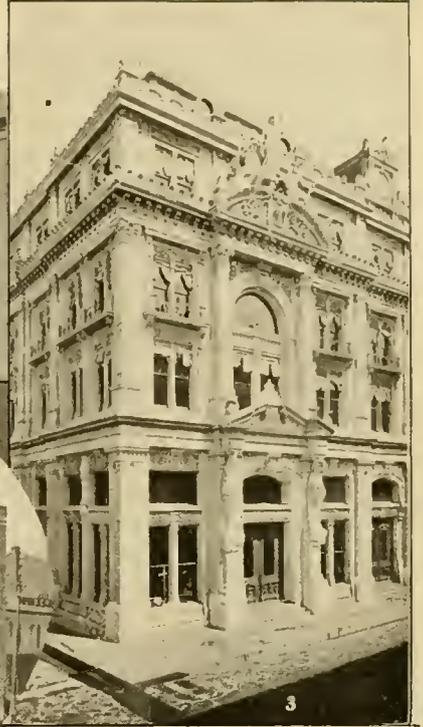

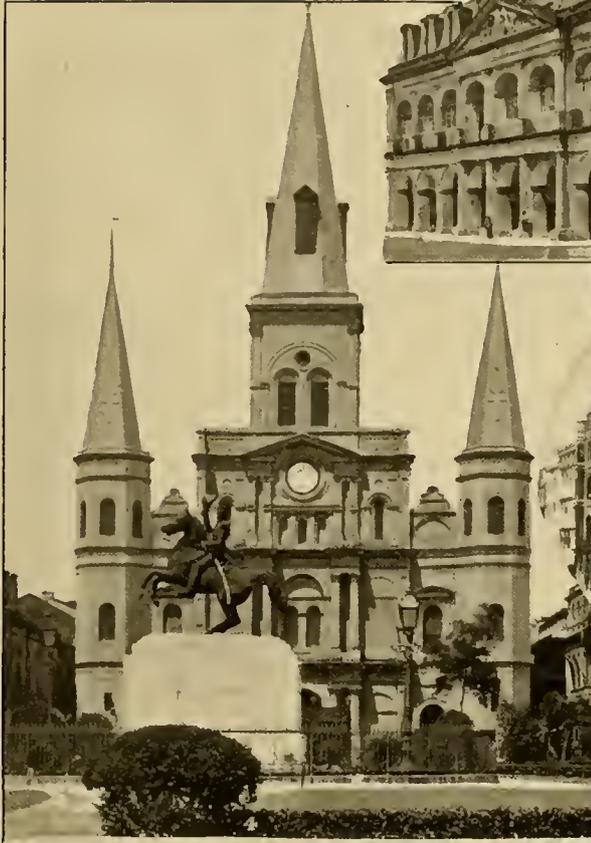

The unmistakable hospitality and cordial reception with which the stranger is everywhere greeted, is not only extremely delightful but sharply in contrast with the short cut methods of the North. A business man gladly goes out of his way to direct the stranger; and as business hours are from 9 to 3, with a liberal outing for lunch, the New Orleans merchant enjoys life to a degree entirely beyond the comprehension of a Yankee.

New Orleans is one of the best street car cities in the country, but until the Carrollton line was opened on the west side last year, there was a sad lack of suitable transportation. Canal street, from which all the lines in the city radiate, is one of the widest in the world, contains four tracks of street railway, and then has more room left than many cities with one track. This street will now be electrified, and not only Canal, but nearly all the other leading streets, and when this is accomplished there will come to this charming city a new life and impulse, which alone is lacking to give it that impetus and energy necessary to push it rapidly to the achievement of wonderful possibilities. This has been the universal history of electric traction, and it will not fail here. We believe the general introduction of electricity to be the most important and far reaching influence of any which has affected the social and business life of New Orleans during the past twenty years. This advance is already coming into existence, and a recital of what and how this will be accomplished is of unusual interest in the light of even the brief history outlined above.

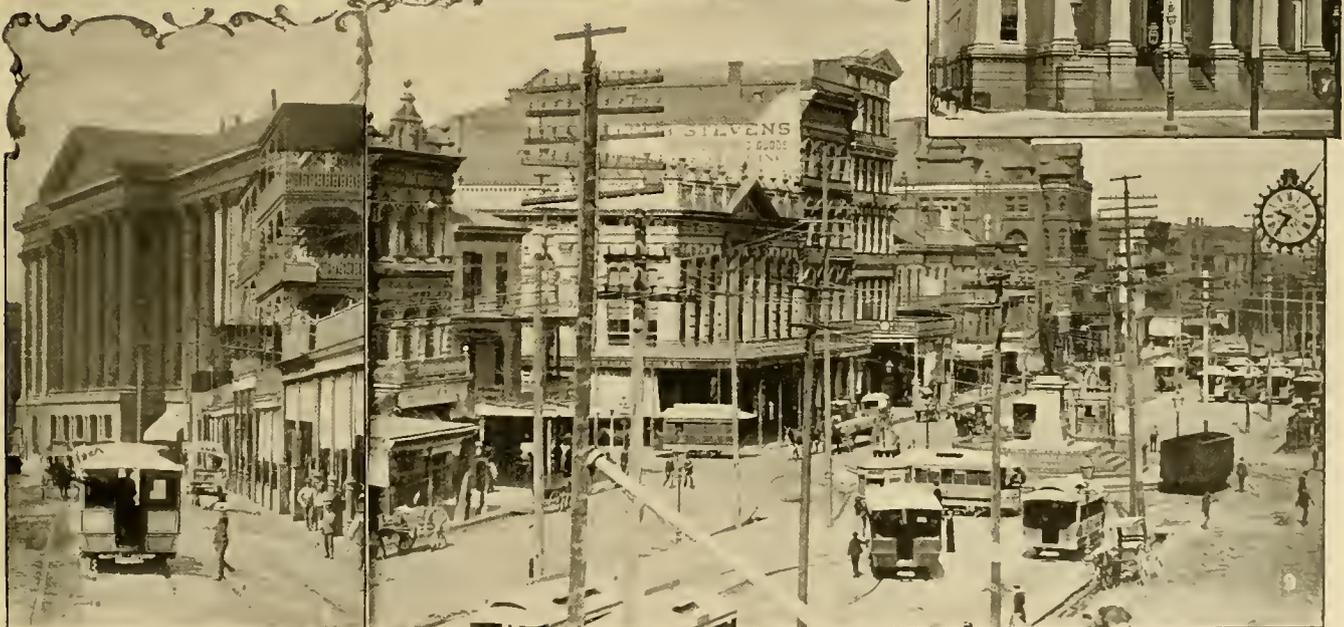

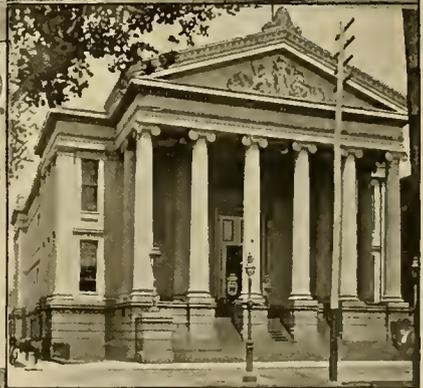

The company which has undertaken this great work is the New Orleans Traction Company, operating the New Orleans City and Lake Railroad, and the Crescent City Railroad. At its head is one of the brightest managers in the fraternity, H. M. Littell, who combines in a large degree those elements of experience and progressive ideas which have made him so successful in the past, and which will forever link his name with the city's greatest improvement. Around him he has called a corps of able workers who will assist in the endless details of reconstruction. Mr. Littell is general manager of the Traction, and president of both the leased roads. A. H. Ford is secretary and treasurer; B. B. Gilman is superintendent,

VIEWS OF THE  
CRESCENT CITY

G. A. Hopkins is chief engineer, and B. Willard, chief electrician.

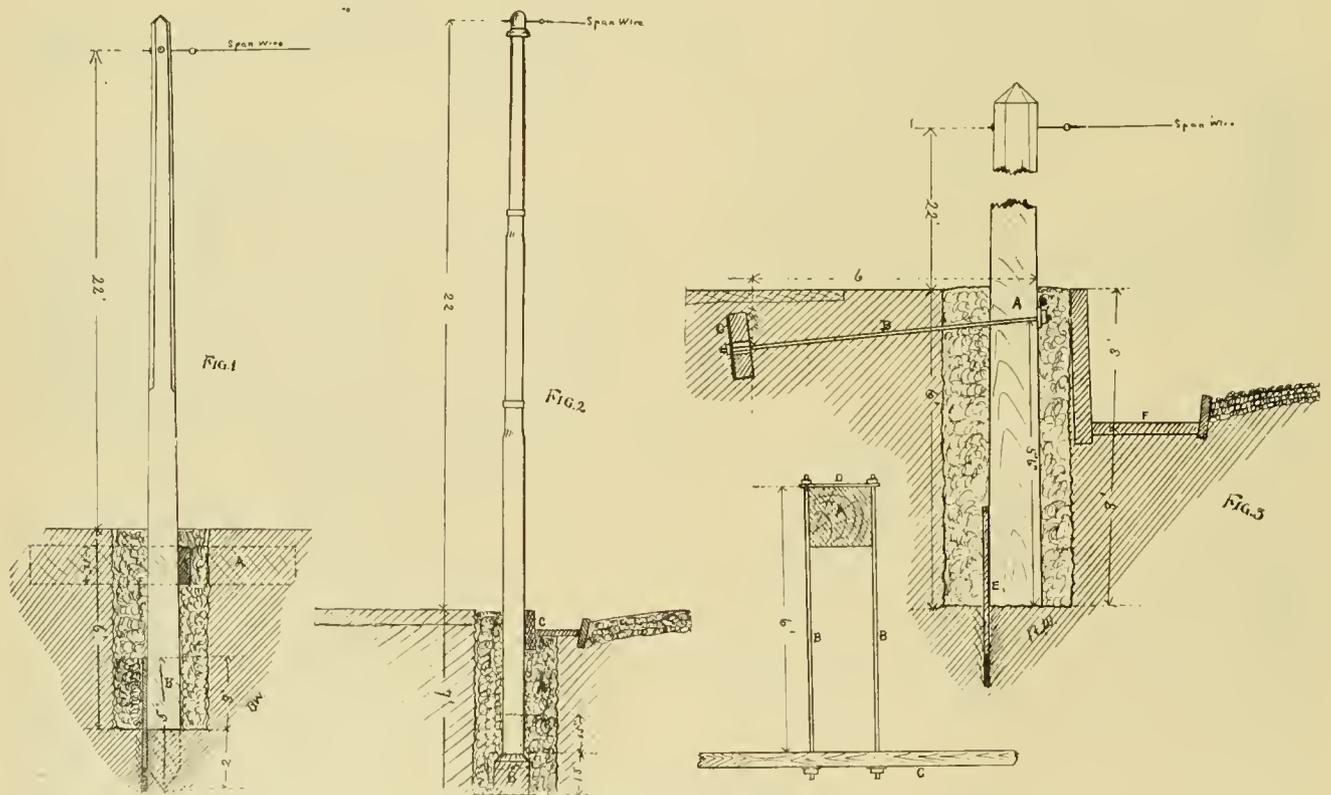

In the first place the city has many natural advantages to encourage the introduction of electric traction, among which are the absence of grades and those difficulties which attend operation in northern cities during winter months. Naturally there are some novel features of construction, which, with a statement of other plans adopted will be found extremely interesting.

There will be 120 miles of trolley construction, consisting mostly of side-pole suspension, supplemented by 125 miles of feed wires, some of which will be carried on span wire poles and some of which will be carried on separate poles erected for that purpose alone. The pole specifications are for octagonal sawed poles, 30 feet long, 12-inch butt and 7-inch top, made of Louisiana pine, as

the ground. The three methods employed in setting poles are clearly shown in Figures 1, 2 and 3, and will probably need no further explanation. However, attention may be called to Figure 3, which represents a method employed where poles are set near a deep gutter, or on the edge of an embankment where bonding in front would be of no purpose.

Each of the several lines in the city will have their respective feeder systems and be absolutely independent of one another.

The trolley lines will be divided into sections of approximately 4,000 feet each. (See Figure 4.) Each section being fed by an independent feeder, to which is attached a 500-ampere switch, fuse and lightning arrester, contained in a suitable iron box numbered to correspond with the respective sections. (See Figure 5.) In order

approved by the city government. In addition to this is about four miles of iron pole construction, part of which is located on lower Canal street, and representing construction which was commenced about a year ago. The iron poles used on this construction are what are known as pipe poles, 28 feet long, made of 6-5 and 4-inch extra heavy pipe, with shrunk joints. Additional specifications are made for special strain poles, which are of the same character, but with increased dimensions. The wooden strain poles are 33 feet long, with 14-inch butt and 9-inch top; the iron strain poles are 30 feet long, made of 5-6 and 7-inch extra heavy pipe. The soft, wet character of the soil and other objectionable features make it necessary to use additional precautions in setting poles sufficiently solid to withstand the strains without moving in

to maintain the value of the trolley wire in the distribution of the current, it has been customary to avoid the use of sectional insulators and make the lines continuous. This is detrimental, owing to the occurrence of breaks, which necessarily effect the entire system. To maintain all of the properties of a continuous and sectional trolley line, a fuse has been designed to bridge each sectional insulator, which not only serves to maintain the line continuous, but acts as an automatic device to disconnect the section in the event of a short circuit. In laying out the feed wire construction, it has been the aim to make the work appear neat and substantial, at the same time keeping within the bounds of reasonable cost. Figure 4 will give an idea of the general methods of distribution. The small feed wires 000, and 0000, are carried on poles

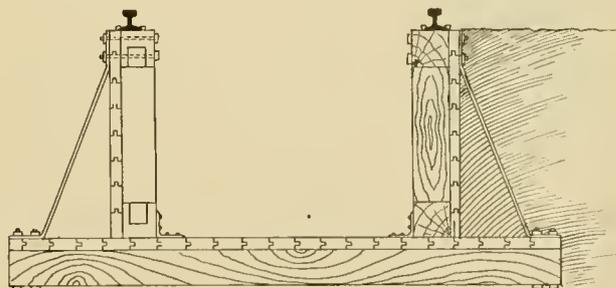

which support the trolley, and all are carried back to one centre of distribution, "A" to which connect heavy cable feeders of 500,000 circular mils capacity, connected direct to the switch board at the power house. In this way the necessity is avoided of carrying each of the smaller feeders back to the power station which would make the construction appear unsightly and costly. In estimating the necessary feed wire, it is only necessary to determine the required amount of current needed at each of the points marked "B" Figure 4, and with the desired loss, figure back to section marked "A." From section "A" must be figured the entire current for the whole system at a desirable loss in potential to the power station.

Figure 6 will give an idea of the method used in connecting the large cables with the smaller feed wires at the section marked "A" in Figure 4. Instead of ending these wires on the ordinary cross arm, a special frame is made of angle iron and firmly bolted to the top of the pole. Each feed wire is then ended and anchored to this frame by means of an eyebolt, to which is attached a strain insulator. For connecting the several wires together a solid conductor is run near the outside edge and a little above the iron frame, and supported by top groove insulators, to which is attached the several short cable connections which are fastened to the several feed wires. Should it be necessary to disconnect any one wire, it can be done by disconnecting the short cable connection and throwing out the switch corresponding to that section. The joints of the short cables are not soldered but simply connected by means of a "tee" provided with set screws. All poles used for carrying feeder wires are double cross armed and have two insulators for the attachment of each wire. Heavy top groove glass insulators are used for carrying the heavy cable construction, and no suspension cables will be used.

The rail bonding consists of No. 6 copper bonds fastened to the rails by  $\frac{9}{16}$  channel pins with cross bonds 120 feet apart. Where it will be necessary for the rails to carry a large amount of current to supplement other lines the bonding will be increased proportionately and several bonds used to each joint. No dependence is placed on the use of ground plates as an auxiliary to the rail return circuit, although some ground plates will be used for connection to the lightning arresters and to neutralize the potential between the earth and rails. The rail construction consists of 100 pound girder and 60 pound T, which affords ample cross section for the carrying of heavy currents with proper bonding and absence of supplementary wires.

The car house is located at the corner of Arrabella and Magazine streets, and its dimensions are 240 by 260 feet with a maximum height of 65 feet at the center.

A transfer table is located in the center of the house with a capacity to accommodate a 30 foot car. It will be operated by an electric motor. There will be 20 storage tracks aggregating nearly a mile of track construction, part of which will be over pit room to accommodate 15 cars. The pits will be made of seasoned pitch pine treated in hot carbolineum "to resist the dampness and prevent decay." The pits will be four feet deep from the top of the rail and sheeted up with 2-inch matched flooring with white lead between each joint. When the pit is in place it will be two feet below the water level of the

CROSS SECTION OF PIT.

surrounding country, and to keep it from rising or floating out, wings are constructed at the bottom which are 22 inches wider than the pit on either side. The pressure of the dirt on these wings serves to anchor it in place. The insurance men ought not to worry about the water supply in these pits. A repair shop will occupy one corner of the car house, which will be provided with pit room for two cars and the necessary tools for light repairs.

The car equipment will consist of G. E. 800 motors and type "K" controllers. There will be two motors to each car. Eight wheel cars will be employed for part of the service, the length of bodies of which will be 20 feet. There will also be 50 open and closed cars with bodies 16 and 20 feet respectively, equipped with W. P. 50 motors mounted on McGuire Columbian trucks.

FIG. 5.

The power to be used in operating the road will be furnished by the Louisiana Light & Power Company, which intends installing 2 M. P. 200 kilowatt and 2 M. P. 500 kilowatt generators for present purposes. The charges are to be made to the railway company on a basis of a car mile rate.

After reading the account of the extensive plans it will be fitting to know something of B. Willard, the constructing electrical engineer, who made them and who deserves great credit for the way he has overcome the difficulties of construction in a city as far under water as is New Orleans. In many of the electrical features it will be seen that Mr. Willard has profited to the fullest extent possible by past experience in electric railways.

B. WILLARD.

Mr. Willard first saw the light at Utica, N. Y., in 1863. After finishing his education he went into the employ of an electrical appliance manufacturing concern for three years. Desiring to gain a general knowledge of machine work he served a year in a machine shop at Fitchburg, Mass. Coming to Chicago in 1883 he became a partner to a builder, remaining two years. In 1885 he went to Lynn to take up his favorite line of work with the Thomson-Houston Company, and soon was sent out over the country installing electric light plants. His first railway construction was done in 1888 on the Omaha & Council Bluffs Railway. Since then he has continued on railway work in the employ of this company, until January 1, 1894, when he became constructing electrical engineer for the New Orleans Traction Company.

THE ALTOONA MANUFACTURING COMPANY, of Altoona, has had recent orders that show continued popularity of the M. A. Green engine and the reawakening of trade; besides a multitude of electric light power equipments and general business there have been shipped two 175 horse power special railway engines with boilers and steam plant complete, to the Lynchburg & Rivermont Street Railway Company, of Lynchburg, Va., which plant is now in process of erection: two 150 horse power engines with steam plant complete for the Ringing Rocks Electric Railway Company, at Pottstown, Pa. These two latter will be of special interest to the electrical fraternity, owing to the fact that they are to be direct connected to two power generators of a design imported from Germany, and are the first engines that have been direct connected to this make of generators in the United States, for electric railway service.

GIDEON KELLOGG, sales agent for the Charles Munson Belting Company, Chicago, has met with great success.

## FRANK X. CICOTT.

The recent reclaiming of Frank X. Cicott to the American street railway field is the occasion of great rejoicing among his many friends.

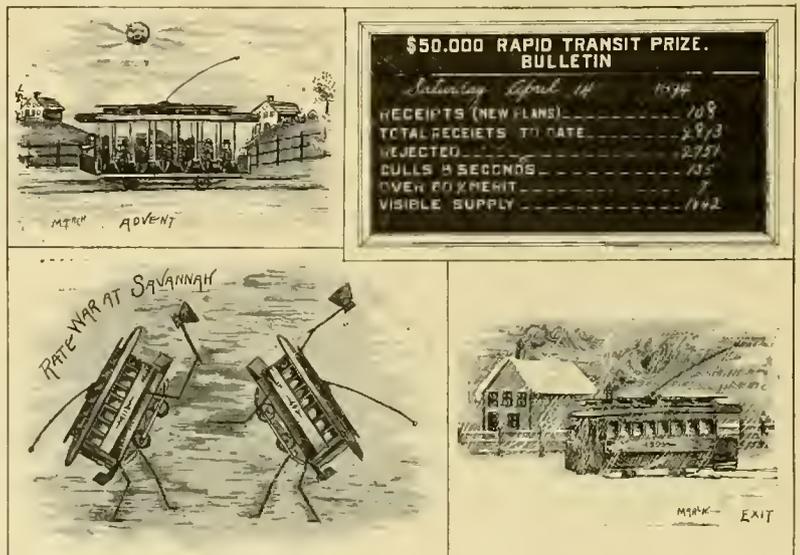

FRANK X. CICOTT.

Mr. Cicott has engaged himself as manager of the railway department of the extensive corporation of the Pettingill-Andrews Company, of Boston, after several years in Europe as managing director of the Tramway World of London. Mr. Cicott since his young manhood in Detroit, has been intimately connected with almost every phase of street railway work. For several years being agent for Holmes, Booth & Haydens on the Pacific coast, and doing a large general business—both there, and with the Electrical Merchandise Company, Chicago.

Known intimately to the tramway men of Europe and America with political honors and military standing, a newspaper man of experience, and a business man of consummate ability, the Pettingill-Andrews Company have found in Mr. Cicott a rare example of the enterprising, cultured and traveled manager, cosmopolitan in experience, and thoroughly American in the quality called "push."

SPECIAL evangelical services, for the benefit of the Consolidated Traction Company's employes, are held by the Traction Soul Saving Association, of Jersey City, N. J. A small organ is brought into the conductors' waiting room, and the service is mainly musical. Bad boys in the neighborhood have tried to break up the meeting, so far unsuccessfully.

PICTORIAL EVENTS OF THE MONTH.

ERASTUS WIMAN has resigned his presidency of the Staten Island Rapid Transit Company, New York.

**HALF FARES.**

Interesting Facts from All Parts of the Country Boiled Down for Busy Readers.

M. JABLOCHKOFF, the famous Russian inventor of the "electric candle," is dead.

THE Moline, Ill., Central Street Railway Company will lease Prospect Park and make a summer resort.

THE North Chicago Street Railroad Company declared its regular quarterly dividend of 3 per cent., payable April 17.

THE Olean, N. Y., street railway company has reconstructed a street car into a dump gondola to help the construction gang.

THE Third Avenue Railroad Company, of New York, has instituted a signal system similar to the one now in use on the West Chicago cable.

THE Covington (Ky.) Street Railway Company will probably run a funeral train to the St. John and Highland cemetery when the Lexington pike extension is made.

A NEW YORK man was thrown off a street car accidentally and lost eight teeth. He has just received \$1,000 damages or \$125 a tooth. This is expensive dentistry.

JOHN CRILLY, 123 California street, San Francisco, is handling quite a number of railway specialties, including the Pacific Coast Agency for the Peckham Truck and Wheel Company.

THE Norwalk & South Norwalk, Conn., Tramways have secured extensive rights to extend, and will build a line to Bell Island and Roton Point. A summer resort business will be done.

A NEW "model" town is to be built near Allentown, Pa., on the line of the electric railway. It will be called Manhattan, and is to be built on a copyrighted scheme of Chas. F. Molly, of Bethlehem.

MAYOR HOPKINS, of Chicago, has decided on a vigorous prosecution of the North Chicago Street Railway Company for rent claimed to be due for the use of the La Salle street tunnel to the amount of \$29,311.

AN electrical phaeton at Rheims, France, has been recently attracting attention on the streets of that city. Nine miles an hour is attained on level pavement. The vehicle weighs 2,970 pounds and carries 6 passengers.

CORNELIUS DESMOND, a Boston councilman, has absconded with \$1,000. For eight years he has been a trusted employe of the West End Street Railway Company. It seems that aldermanic associations were death to his morals.

THE new incline machinery at Duluth, Minn., has been satisfactorily tested. The new cable has a factor of safety of eleven and the hoisting apparatus a speed of 1,200 feet a minute. E. P. Allis put in the machinery.

THE Metropolitan L of Chicago will open for traffic in about ninety days. No great delay is anticipated because of the new bridge. The matter of electrical equipment is still in statu quo. Only men will be employed in the ticket selling service.

LEAVENWORTH, KAN., will have an electric fountain at its soldiers' home. The Street Railway Company, of which L. M. Erb is superintendent, will pay half the cost and the citizens the other. It will cost \$50,000. A funeral car service will also be instituted.

ALAMANDO B. RUSS is the name of the inventor of a Californian safety fender. This fender picks up the person in danger, brakes the car, and throws the trolley off the wire all at once and automatically. Alamando should invent a car starter attachment to accompany his fender.

THE Buffalo, N. Y., Express, of recent date, gives a fine map of the city, and remarks in its real estate column, the large developments consequent upon the electrifying and extending of the Buffalo Street Railway Company under the judicious management of H. H. Littell.

FOUR men who attempted to wreck and rob a West Chicago street car were recently arrested. Three escaped. The car was derailed, and during the excitement revolvers were presented by the bandits and wholesale robbery begun, when the police appeared, with the above result.

A DRUNKEN MAN recently mounted a Wichita, Kan., street car, and mistaking the fare box for a nickel-in-the-slot machine invested a quarter in vain attempts to get something out of it. The driver finally noticed him, and gave him enough good advice to last two weeks, but the money was gone beyond recall.

THE House of Representatives at Washington has directed the Metropolitan Street Railway Company to substitute the underground conduit electric for horsepower now in use. Albert Wheeler, of the Love system, will make an attempt to introduce his plan on the Chicago City Railway. The U street line of the Love conduit is thus congressionally approved.

HOTEL ARAGON, of Atlanta, the headquarters of the coming convention is second to none in the country in the completeness of its appointments, and attending delegates will find there every convenience, comfort and luxury, that can be found in any hotel in any great city of the country. It is the endeavor to make it the finest hotel in the south. Its opening ushered in a new life in this enterprising southern city and high carnival reigned supreme for a week.

THE employes of the Johnstown Passenger Railway surprised Vice-President J. B. Hoefgen with a gold-headed cane. The presentation speech was made by D. B. Mudgett, the oldest employe of the company.

A BILL compelling the use of vestibules for the protection of motormen, died a natural death in the Maryland legislature. Some day Florida's legislators will want a similar bill passed to protect sub-tropical motormen from sunstroke!

THE Traction Company, Reading, Pa., has a novel method of choosing laborers for its extension building. Two cart loads of picks were driven to the point of beginning and every man who got a pick got a job. Three hundred participated in the scramble, and 100 triumphantly bore away a pick.

EX-PRESIDENT BENJAMIN ORNE, of the Naumkeag Street Railway Company, of Salem, Mass., is suing for salary and expenses as chief executive of the line named. Among his expenses are the following items: Pew rent in a Salem church, a grocery bill and house rent. Mr. Orne's monumental nerve should get him a seat in the city council.

THE Buffalo & Williamsville Electric Railway carried 191,000 passengers last year, the first of its existence. A new summer resort will be constructed at Williamsville and a lake of 100 acres formed by damming a stream and flooding the lowland. A spouting mineral water stream and a white sulphur spring are among the attractions of the place.

IN a letter to the REVIEW dated March 20, W. E. Garstin, under secretary of the public works department of Cairo, Egypt, informs us that none of the offers for the Cairo Tramway concession were accepted, none being in accordance with the specifications published. The last date for bids is now August 1, and the American consul is F. C. Penfield, Cairo, Egypt.

A TROLLEY CAR jumped the track in St. Louis not long ago, and a passing farmer taking a crowbar from his wagon got out to help the tugging crew. The trolley wheel had not left the wire, and just as Mr. Farmer had made a good connection with his iron bar the motor man turned on the current. Like a flash the car took the track, the crowd yelled and the farmer sat down hard with a lot of electricity in him. He arose, cursed volubly and got back on his wagon.

THE Market Street Consolidated Street Railway Company, of San Francisco, has on hand a project for the building of an immense power house at the corner of Channel and Bryant streets. It is planned to have room for increased power as other lines are electrified. The first capacity will be 1,800-horse-power, and the possible amount 7,000. The Howard street line, the South San Francisco, and the Third, Fourth and Fifth street lines will be operated electrically before many months.

## PERSONALS.

W. H. WOOD, Media, Pa., the well known hydraulic engineer was a visitor at the REVIEW office during the month.

W. F. FURBECK, vice president of the North Side lines in this city, is spending several weeks in California, accompanied by his family.

GEO. O. MANCHESTER, formerly of the A. T. & S. F. R. R. has been elected vice president and manager of the Sargent Company, Chicago.

J. WM. HELM, secretary and treasurer of the North Chicago Street Railroad, has just recovered from an attack of grip, the result of overwork.

JOHN W. MARTIN, who at the expense of an arm escaped instant death under the wheels of a locomotive, is recovering as rapidly as could be expected.

CAPT. ROBERT McCULLOCH, general manager of all the lines in St. Louis owned by the Chicago syndicate, was a most welcome caller at the REVIEW office this month.

F. S. PIERSON, who was so well known as electrician of the West End road, Boston, has succeeded Major McNulty as chief engineer of the Broadway cable line in New York.

DAVID J. DUNCAN, formerly of the Hornellsville, N. Y., electric railway, has accepted the superintendency of the Carbondale (Pa.) Traction Company, which is about to build 32 miles of line.

C. S. VAN NUIS, constructing electrical engineer at 136 Liberty Street, reports that business in his line has opened much earlier than usual this year, and that he has a large amount of work in hand and that the outlook is very encouraging.

E. M. BENTLEY & G. R. BLODGETT, for some years patent attorneys in Boston, have dissolved partnership. Mr. Bentley remains in Boston, and Mr. Blodgett goes to Schenectady, N. Y., in charge of the patent department of the General Electric.

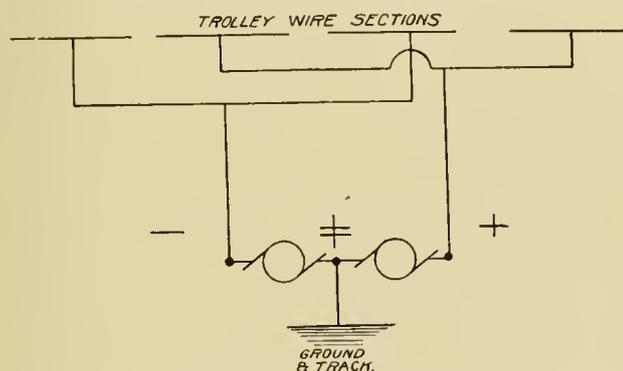

F. A. HOOVER, manager of the New Castle Car Company is a man of many talents. He is a select councilman of New Castle, Pa., and was recently admitted to the bar. He is prominent in more than one enterprise in his neighborhood.

EBEN S. ALLEN, formerly president of the Grand and Forty-second Street Railway Company, of New York City, has been released from his imprisonment at Sing-Sing, for a fraudulent issue of stock. He was sentenced for 14 years but was commuted at 4½ years by Governor Flower.

THE THREE-WIRE TROLLEY SYSTEM  
AT PORTLAND, ORE.

By A. C. Balch.

The street railway systems of Portland, Oregon, receive the greater part of their power from the Union Power Company. In order to obtain cheap fuel, the station of the Union Power Company was placed near a large saw mill, and the refuse from this mill used. The distance between the station and the centers of the systems supplied with power is about three miles and, at times, the load upon the station approximates 1,500 horse-power. Early in the course of estimating the probable cost of installing the electric systems, it became apparent that if the station were to be placed near the saw mill, to take advantage of the cheap fuel, the extra cost for feeders would be considerable. To reduce this cost it was

decided to adopt the three-wire system of distribution. This had been shown to be a success in lighting work, but had not been previously tried in the actual every-day operation of street railways, at least so far as was known to the writer, who was the engineer in charge of the installation of the station. There is now no doubt of its entire success, as the plant has been in operation on the three-wire plan more than two years without any delay whatever, chargeable directly or indirectly to its use. Further, a direct illustration of one of its advantages was had as follows: Part of the system supplied with power was in readiness and in use some months before the whole system was completed. This section had eleven double reduction Sprague motor equipments in operation and the feeders supplying the power were arranged on the ordinary plan for railway operation, but were calculated to run seventeen cars after the whole system should be completed. As the feeders were figured on the three-wire basis, it was found necessary to run the voltage at the generators at 600 volts, and, even then, at times, the voltage on the line fell to 350 volts. When the whole system was put in operation no change was made in the number or arrangement of the feeders for this section, the six cars were added, the voltage at the generators was lowered to 550, and yet the voltage at the cars never fell below 450 volts.

At the Washington convention of the National Electric Light Association, J. H. Vail read a paper advocating a complete metallic circuit for street railways. His

plan involves the use of track feeders. The three-wire plan accomplishes his results with a saving in wire of over fifty per cent.

Several companies operating water works in cities where electric traction is employed have complained bitterly of the electrolytic action caused by stray currents, or the use of the water pipes as an additional ground. In answer to a query from Omaha water works officials, as to the methods employed in Portland to obviate the pitting caused by electric action, the superintendent of the Portland company replied that no such trouble had occurred. The reason for this is, that the return circuit is all copper, and there is a pressure exerted to make the current take this path in preference to the water pipes.

The wiring of the car, the overhead construction, the track, in short all the installation outside of the power house, is done according to ordinary two-wire usage. Each feeder, or set of feeders, supplies a section. This section is insulated from the adjoining sections. The track is the neutral. Alternate sections are of opposite polarity and there is a difference of potential of 1,100 volts between the sections of trolley wire. The station installation is according to ordinary three-wire lighting usage, except that no compensating or potential regulating devices are used on the feeders.

The operation of the dynamos does not differ from the operation of the same machines in ordinary railway usage.

Among the advantages over the present two-wire usage are fifty to sixty per cent saving in copper for installation, no electrolytic action on gas or water pipes, and a complete metallic circuit. To offset these manifest advantages, the writer has yet to discover a single disadvantage, although the system has had a two years' trial in all kinds of weather and under all the conditions met in street railway work.

In conclusion, the three-wire system seems peculiarly adaptable to installations in cities like Philadelphia, where, in many instances, single tracks are laid in parallel streets; to double track roads, using a pole between the tracks to support the trolley wires and with slight modifications to long distance suburban lines.

ANOTHER ST. LOUIS CAR BARN FIRE.

Shortly before midnight March 20, a bolt of lightning struck the car barn of the Missouri Street Railway Company, on Cardinell street, St. Louis, setting the structure on fire instantly. Before an engine could be summoned the fire had taken the entire roof. There were eleven motor and twenty-eight trail cars in the building, besides sand and salt cars. All were consumed. The barn faced 210 feet on Laclede avenue and 110 feet on Cardinell. A barn on the same spot was burned two years ago in the same manner. The loss was \$80,000, fully insured.

GROUND has been broken for the new car barns of the Cincinnati Consolidated. A passenger depot will also be built.

## ON ECHO MOUNTAIN, CALIFORNIA.

The Mount Lowe Electric Railway, described last year in the REVIEW, has on hand a plan to actuate the cable incline from a separate electric plant. A fall of 1,400 feet in 3,000 through a heavy pipe will furnish the power for a Pelton water wheel, from which an independent dynamo will be run for the cable incline. Heretofore the power was transmitted from Altadena to the power house on Echo Mountain. On account of the death of Electrician A. W. Decker, the plan to use storage batteries has been abandoned.

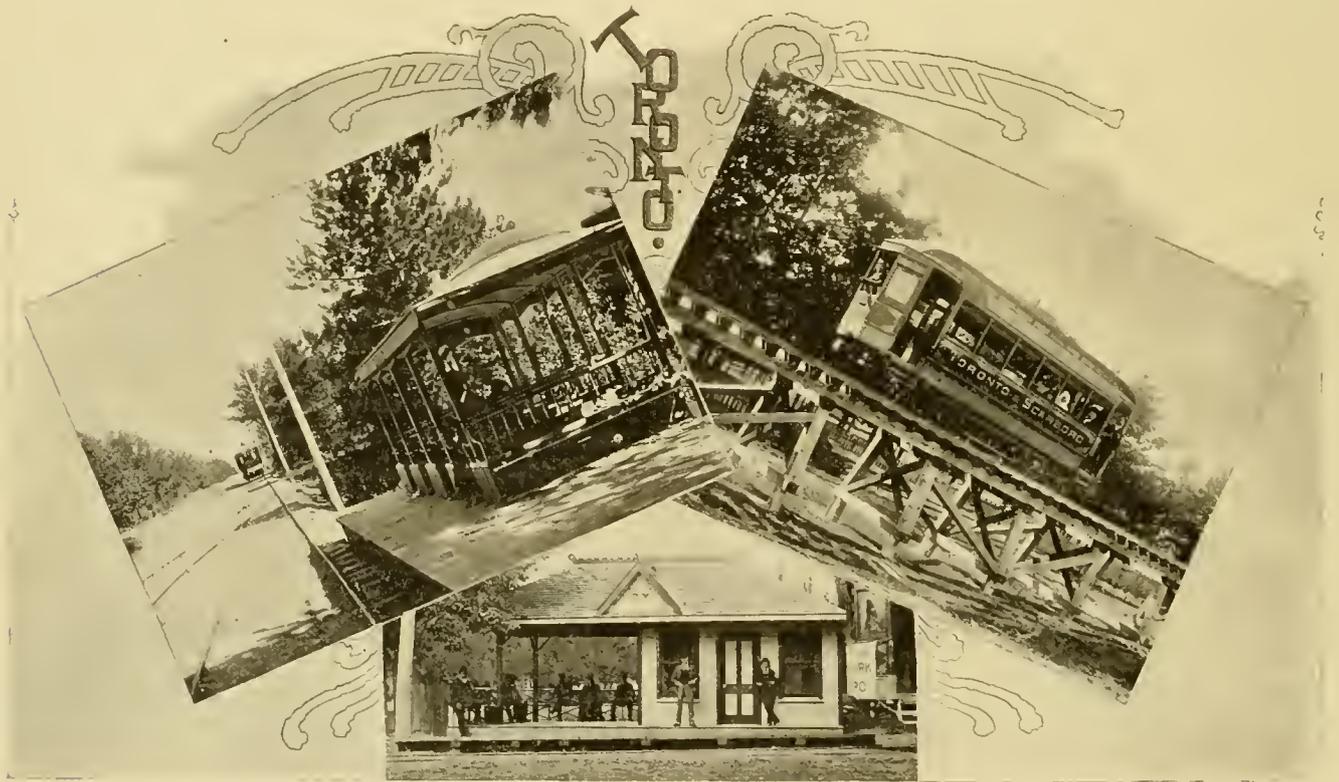

The success of the road has been marvellous. Californian tourists, since January 1, traveled to Echo Mountain to the number of 150 to 350 a day. The necessity

## PLEASURE RESORTS AND CREATED TRAVEL.

The Toronto Scarboro Electric Railway.—A Pleasure Resort Route.

## PART V.

Toronto is unusually blessed in the way of fine natural parks near at hand, but it took the citizens as a whole a long time to find this out. Among the first to discover and act upon it were the promoters of the Toronto Scarboro Electric Railway. When completed, this system will comprise about fifteen miles of suburban belt line connecting the towns located in the beautiful country east of Toronto, with that city, developing a suburban country residence district as well as a pleasure resort business. It will carry freight and express.

of an extension is conceded by the twenty or thirty tourists who daily go via burro further on up Mt. Lowe.

The very latest feature is the publication of a daily and weekly illustrated paper on the mountain, and named the Mt. Lowe Echo. G. Wharton James is the editor, and his publication is the finest of its kind extant.

THE all powerful British Board of Trade has just issued its regulations relative to the protection of gas and water pipes from electrolysis. One of the conductors between the generators and the motors must be completely insulated from the earth. The return under certain conditions need not be. All feeders must be so insulated that leakage may not exceed 1-1,000 amperes per mile. If the leakage exceed  $\frac{1}{2}$  ampere per mile, it must be stopped in 24 hours or the cars cease.

A trip over the road now laid is one of the most pleasant outings available to the Toronto citizen. Taking a King street car of the Toronto Railway Company, he is soon at Woodbine station, the city terminus of the Toronto & Scarboro. It is a neat little depot on the cottage style. Half is open and half closed. Entering an elegantly fitted up car on the new line, he glides away through pleasant hamlets until the car begins to climb a steep grade and the unfolding panorama makes the passenger aware that he is on a "scenic" route. Lake Erie spreads itself out like a boundless ocean, with Toronto on its shores to the right. It is not necessary to enlarge on the grandeur and beauty of the scenery, as our engraving tells this better than words. At the present terminus of the road at Blantyre avenue, an open car body has been placed for a waiting room. From here it is but a few steps to Victoria park. It is here that the palisades known

as Scarboro Heights begin. They are rivalled only by palisades of the Hudson. With its comfortable summer climate it will be strange if Toronto, through the medium of the Toronto & Scarboro Electric Railway, Light and Power Company, does not here establish a summer resort of national reputation. It is only a little over a year since the company was organized and the length of the present route speaks volumes for the energy of the management. The directors are all prominent business men of Toronto. The management is composed of

royalties on cable machinery manufactured by the company under patents owned by Mr. Walker.

He has now granted the Pennsylvania Iron Works Company, of Philadelphia, rights to manufacture under his cable patents in the Atlantic states, while the middle, and perhaps the Pacific states will be handled by Fraser & Chalmers of Chicago; while Fraser & Chalmers, Limited, of London, will manufacture under the same patents for Great Britain, all the British Colonies and possessions. Notice was served the Walker Company on February 12th to refrain from further use of the patents in question, which include differential drums, struts, U-frames, cable friction clutches, operating mechanism for same, etc. The engineering fraternity of Chicago will welcome his presence here as a valued acquisition to its numbers, as he is a member of the American Society of Mechanical Engineers, the New York Engineers Club, the Civil Engineers Club of Cleveland, and other engineering societies.

FROM THE HEIGHTS.

D. G. Stephenson, president; J. J. Foy, vice-president; A. W. Dingman, secretary and general manager; John Galt, consulting engineer.

The country traversed is such as to make the growth of traffic almost certain. As a place for summer country residences the territory northeast of Toronto will be unequalled. This traffic in addition to that of temporary park visitors from Toronto ought to make the road a paying investment.

### JOHN WALKER COMES TO CHICAGO.

Chicago secures a well-known engineer, inventor and manufacturer, in the person of John Walker, founder and until February 12, last, vice president and general manager of the Walker Manufacturing Company, Cleve-

A PLAYFUL youth, at Logansport, Ind., jumped into the exhaust well of the street railway power plant. He sank into the boiling bath up to his shoulders. He was eighteen years of age and knows better now. He will recover.

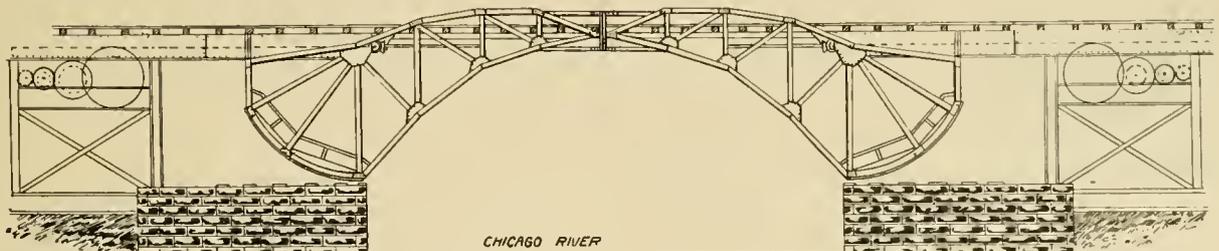

SINCE the demise of the New York Electrical Club, no one has attempted to reorganize it. The Hotel Imperial, up town, Ferdinand's in Twenty-third street, and Nelson's cafe at lunch time are the principal places of rendezvous.

### THE NEW METROPOLITAN "L" BRIDGE.

The accepted plans of the Metropolitan West Side Elevated Railway Company, for a bridge across the Chicago river, between Van Buren and Jackson streets, are herewith illustrated.

As may be seen from the engraving, the plan is for a vertical lift of the two sections. Counterbalancing weights aid in the operation, so that a 25-horse-power motor is all that is required for opening and closing the bridge.

The clear space between the piers for the passage of vessels is 108 feet, while from city datum to the top of the

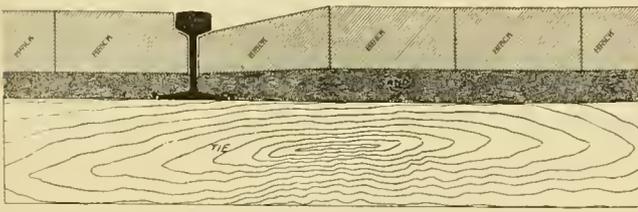

and. Mr. Walker becomes general manager of the extensive interests of the Fraser & Chalmers Company, Chicago and London, and entered on his new duties March 15th. His separation from the Walker company grew out of differences respecting the payment of

tracks is 37 feet 9 inches. Four tracks will cross the top of the structure, and its cost will be \$150,000.

In most particulars the bridge is on the same plan as the one now under construction by the city at Van Buren street.

## SPECIAL FORM BRICK FOR T RAILS.

That the T rail has come and come to stay there seems to be no question, as the number of companies successfully using it in paved streets has fully demonstrated. The only question is as to the best method to use. D. F. Wheelock, chief engineer of the Franklin Electric Street Railway, Warren, Pa., writes as follows regarding the method used on that road: "After a very careful investigation of the subject of using a T rail for street car lines I have become satisfied that it is the best and that it is a question of only a little time when it will be generally used. We will use it on our entire line, and

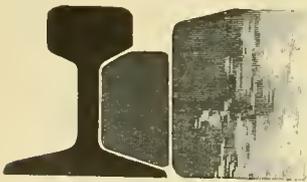

where there is a brick pavement will use a form of brick that is represented in the accompanying sketch, which has very many advantages not possessed by a girder rail, and which will be apparent from a careful study of the plan. I may mention one; that the pavement is used nearly as evenly for travel as where no street car track is laid, as the wheels of a vehicle are enabled to pass over the line at any point without the usual jar and slewing which is always so unpleasant. I might mention many others."

The regular bricks are  $4\frac{1}{2}$  inches high and  $8\frac{1}{2}$  long. The special bricks are  $2\frac{3}{4}$  inches high on the end against the rail. The rail is  $5\frac{3}{4}$  inches high.

## OSAGE ORANGE FILLERS FOR PAVING.

By C. L. Wakefield, Queen City Railway, Dallas, Texas.

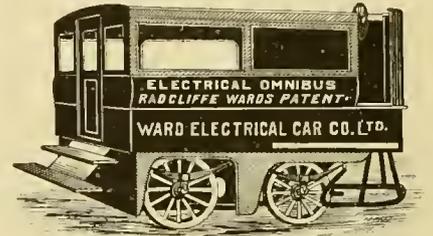

I have noticed the discussions with regard to the best mode of using "T" rail, so as to practically do the same duty as a girder. In the construction of our road we used a bois d'arc strip, commonly known as Osage orange, a wood that is practically indestructible and as hard as lignum-vitae; it has been known to last as posts in the ground as long as thirty-five years. We used a bois d'arc strip two inches square laid between the

block and the "T" rail, which we find gives entire satisfaction. We have been running now since the first of August, and there has not been any damage to wheels of vehicles passing along or crossing our tracks. These strips cost  $2\frac{1}{4}$  cents per running foot, or \$237.65 per mile of track.

## THE WARD ELECTRIC 'BUS IN LONDON.

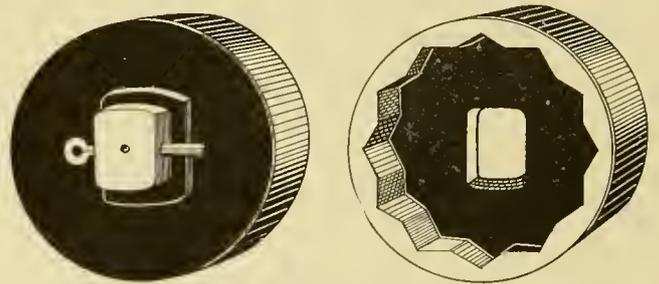

Ever since 1882, Radcliffe Ward, a well known London electrician, has been conducting experiments in storage battery traction with greater or less success. His principal aim has been to afford the 'bus traveling public of the metropolis an electrically propelled vehicle. His first storage battery 'bus was publicly tried in 1888 with results that encouraged Mr. Ward to carry out details until the present

time, at last securing what he regards as a practical and commercially successful, self-contained electrical road wagon. Some further investigations of rubber pneumatic tires will be made. The 'bus of the 1894 pattern is shown in our engraving, for which we are indebted to Industries & Iron, London.

## GENERAL ELECTRIC NUT LOCK.

The G. E. 800 motors are now fitted with a nut lock that precludes all possibility of losing a nut. It is simply a cap arranged to fit over the hexagonal nuts and held on by a split pin put through the end of the bolt. The

cap has twelve corners instead of six, so that there are twelve possible adjustments to one turn of the nut instead of six as there would be if the cap were made with six corners.

WILLIAM H. GRAHAM, secretary of the Pleasant Valley Traction Company, Pittsburg, is in California for a vacation. Before he went, the Sunday school of which he is superintendent presented a gold-headed cane to him.

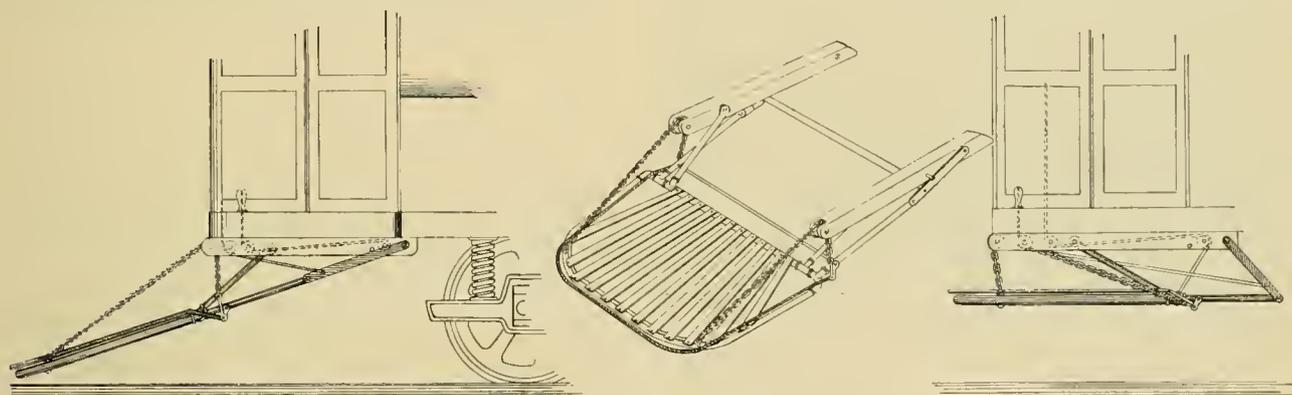

THE plan of the Oakland Consolidated Street Railway Company, of giving coupons to each passenger and attaching prizes to the largest number of coupons returned to the street railway office, has been eminently satisfactory to the company and to the patrons. The usual plan is a pooling of coupons and their presentation to some charitable object. The city papers take interest in the results and the public generally applauds the charity.

A CAR SHOP FIRE AT CLEVELAND.

The Cleveland, O., Electric Railway Company's shops on Pearl street, near Clark avenue, were totally destroyed by fire, March 21. The building was a one-story frame, within which were two cars, seven motors, lathes, drills, two engines of 20 and 60 horse-power, respectively, with all the tools of forty mechanics. The total loss was \$35,000, insured. Incendiarism is strongly suspected.

THE FALCON FENDER.

The "Falcon" fender, which is the invention of E. M. Thompson, of Indianapolis, is the result of experiments with numerous devices on the Citizens Street Railway at that place. The fender is made of gas pipe and sheet steel. The motorman, by pulling a rope, throws the fender back under the car, and by pulling another, throws it forward for business. It is carried forward all the time while on the street. When in collision with any person

THE FALCON FENDER.

the first thing to strike is the touch rail, which projects a little forward from the fender proper, and is connected with the suspension mechanism, so that it drops the fender close to the ground when struck. Nothing but collision with the touch rail can lower the fender. Although ordinarily the fender will slide along the pavement without catching, provision is made so that if it should catch by some unforeseen accident it will turn back under the car and not get under the wheels. The fender has much to commend it and has received endorsement from several managers who have witnessed its operation. It has made a desirable record on Indianapolis cars, where the fender has been running experimentally several months, and has in a number of instances saved intoxicated persons and others who but for it would in all probability have been killed. When a car goes into the barn the fender is thrown back under the platform entirely out of the way. Mr. Thompson is organizing a company and will manufacture.

The west side lines of the Big Consolidated at Cleveland were recently blocked by the grounding of the cable, which runs under the river, to supply those lines.

A COMMON FALLACY.

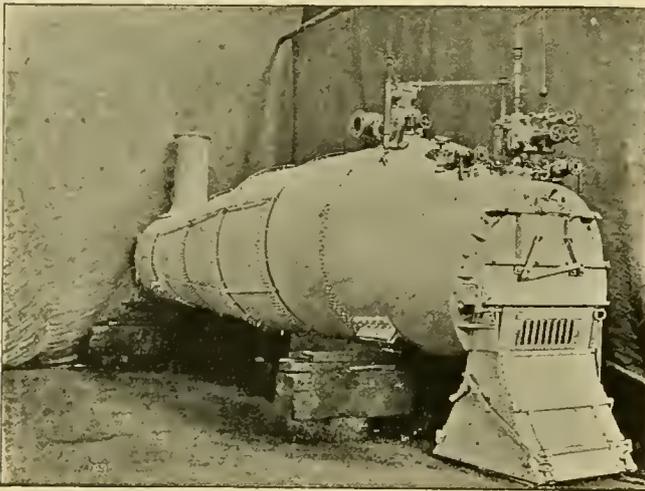

It seems to be a very common belief among electric railway men, that on the ordinary electric road as it is run at present, a heavy drop of potential between the power house and points on the line means an increased fuel bill. This would be true were it not that the potential is commonly kept constant at the power house, and loss of voltage shows itself in decreased speed of cars, and not in an increased fuel consumption. If the voltage at the cars was kept at a fixed point, and the station voltage raised to make up for any loss in the lines, the fuel would be increased, but with the prevalent practice of keeping the station voltage at approximately the same point, it is the speed and not the fireman that suffers. That this must be the case is evident on a moment's thought, yet many old hands at the business will say when first asked in regard to the matter, that reducing the voltage increases the current. It is of course true that a motor will be more efficient at the voltage and speed for which it is built than at a very much lower one. This factor in

the problem is so small, however, as to make almost no difference under any conditions of actual railway work. The fallacy has probably arisen from the fact that roads having a large line and return drop, are so poorly managed in other respects, that the fuel bill is high, and hence the drop was assigned as the cause of the heavy fuel consumption. A road having a heavy drop in the lines could save fuel and maintain the car speed the same as formerly, by reducing the station voltage and adding copper to decrease the line loss. The line loss question is very aptly illustrated by an ordinary car controlled by a rheostat. Suppose the rheostat resistance be taken up to represent the line resistance. When the rheostat is in circuit the car does not require any more power than if it was out, provided the car is not accelerating in speed. There is of course a waste of power, but it acts simply to decrease the speed, and does not affect the power house. As long as the station voltage is kept constant, an increase in the line loss cannot increase the power required at the station to move a given number of cars.

The employes of the Galesburg Electric Motor & Power Company have organized a relief society.

### THE HEILMANN LOCOMOTIVE.

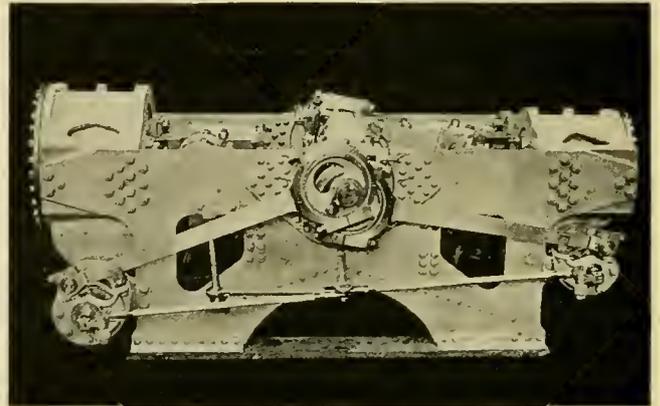

The Heilmann locomotive which is being experimented with in France, although an engineering monstrosity in itself, may possibly do some good in the way of education as to the possibilities of electric locomotives. As it now stands it is about as complicated and difficult to manage a pile of mechanism as could be devised for the purpose. The storage battery is a complication which has not been introduced however, which seems rather strange when the complexity of the present machine is considered. It consists of a dynamo engine and locomotive boiler mounted on two eight wheel trucks. Each axle is provided with a gearless motor. The engine and dynamo

BOILER; 26 FEET LONG; 6 FEET DIAMETER.

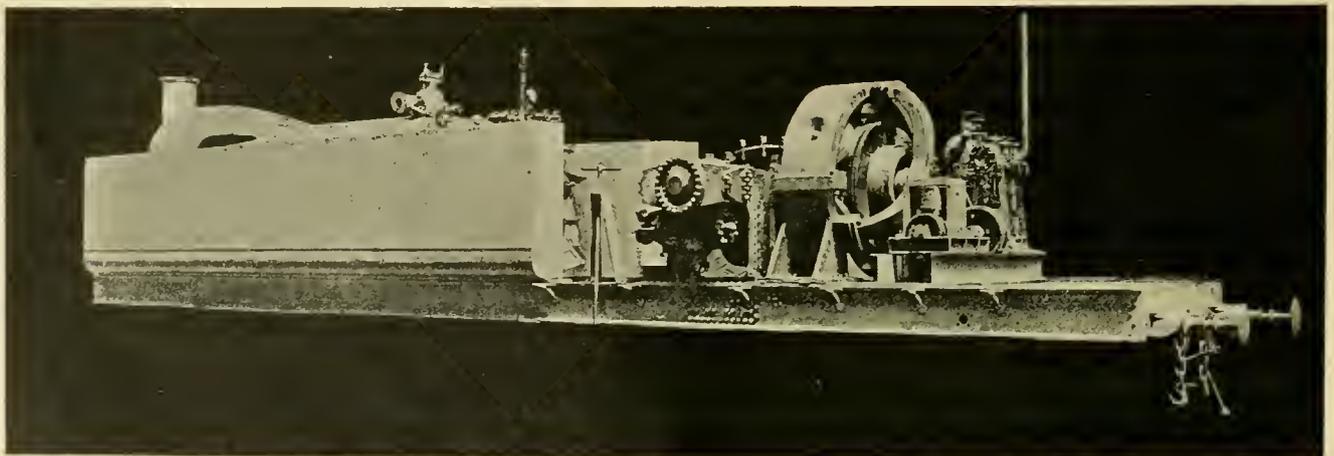

drive the motors. Besides this there is another small engine and dynamo to excite the fields of the large dynamo. The supposed advantage of this arrangement over an ordinary locomotive is that the engine can be running at full speed and developing its maximum horsepower when starting the train. The total weight is 110 tons. The engine is a cross compound, and the two cranks are 180 degrees apart. The cylinders being placed at opposite ends of the frame. The advantage of the 180 degree arrangement is to have the two pistons

and crank rods counterbalance each other. The nominal horse power of the engines and boiler is about 1,200, and the motors are to correspond. The fuel and water is carried alongside the boiler in compartments, as shown in the engraving. The stack is at the rear, to improve the draft. The length over all is 52½ feet. Some idea of the simplicity of the machine can be gained from the

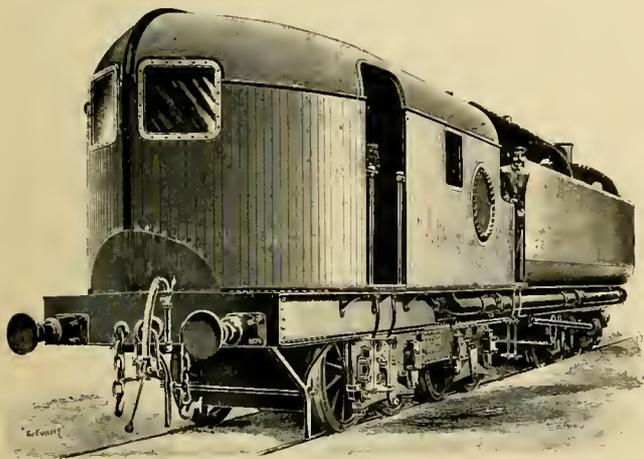

ENGINE—HEILMANN LOCOMOTIVE.

crew it takes to run it, as described by a correspondent of London Engineering. First there is the pilot to tend to the Westinghouse brake. (It must be a troublesome brake). Then there is a man to work the switches controlling the motors, the dynamo field and the steam lever. Another man tends the exciter engine and the fireman has an assistant breaking coal. There are three oilers, besides the chief engineer, so that eight men are on duty. As said before, the designers seem to have set themselves to make things as complicated as possible. By using a good self contained engine and throwing away the separate exciter and engine, the same results could be very much more easily obtained. The dynamo could have been shunt wound and its voltage regulated by a rheostat in the field circuit. This rheostat would be all that would be necessary to control the motors at all speeds. Two men ought to be able to handle all the machinery on the locomotive, had it been built on common sense principles, and this without any loss in fuel economy

over the present form. Why it should be built with such an array of steam levers, series-parallel switches and other ornamental, but not useful apparatus, is beyond

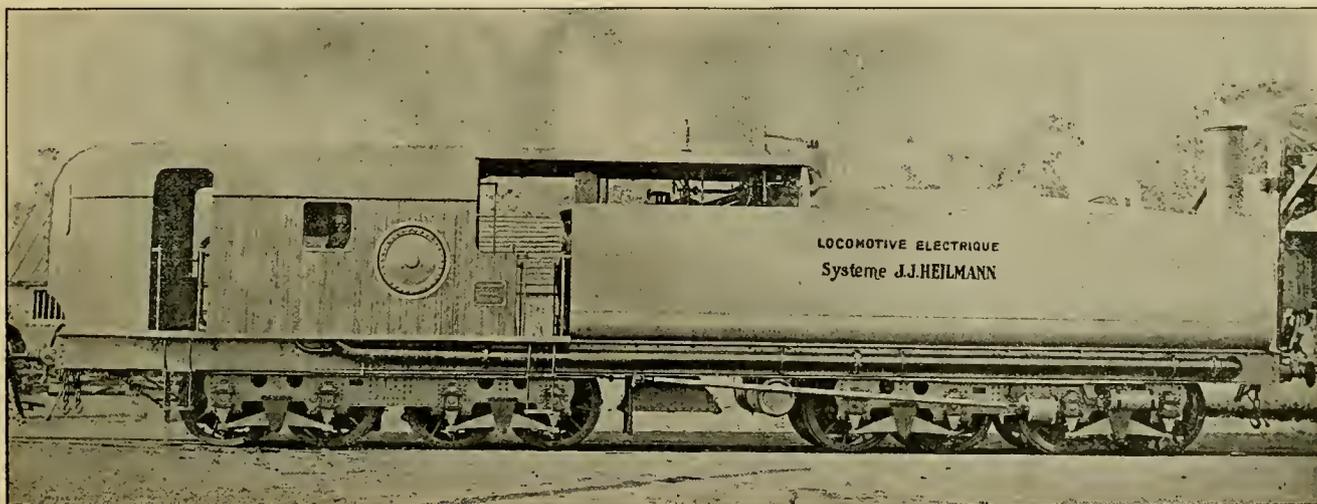

FORWARD END, HEILMANN LOCOMOTIVE.

our comprehension, unless it be with the purpose of giving employment to a few more Frenchmen. The speed attained in the trials so far is about 74 miles an hour. It is being gradually increased in each trial.

“These figures serve to show how utterly absurd it is to bond a track of seventy-pound T rails with iron rail bonds No. 4 or No. 0 in size, and to pretend to reinforce their conductivity with a No. 0 iron or even a No. 0 copper wire. It is like laying a twelve-inch water main and then putting a one-half inch pipe alongside to help it out. The No. 0 B. W. G. copper wire has a resistance of over twenty times the single track of fifty-six-pound T rails per foot, and the No. 0 B. W. G. iron wire over 112 times the resistance per foot of the same track. How, then, can either of these be of any adequate assistance for conducting current?”

“The writer knows personally of several instances where the copper supplementary wire has absolutely disappeared. The writer believes that ninety-nine per cent of the money expended for so-called supplementary wire is absolutely thrown away. The same money expended in other directions will give some adequate return. Does not this show conclusively that we should give our attention to the more perfect bonding of the rail joints, and also to apply track feeders in such a manner as to fully utilize the conductivity of the track and thereby make it fulfill the service of which it is capable when properly treated?”

THE HEILMANN LOCOMOTIVE.

### J. H. VAIL ON RAIL BONDING.

The paper on “The Importance of a Complete Metallic Circuit for Electric Railways,” read at the National Electric Light Association, by J. H. Vail, was accompanied by some practical examples of bonding, in the shape of bonds manufactured by the Electrical Engineering and Trading Company, Edison building, New York, of which Mr. Vail is president. The bond is here illustrated. We cannot refrain from quoting a few words from Mr. Vail’s paper in regard to the importance of heavy bonds above everything else in a return circuit although we have mentioned it so often before. After giving a table and a chart, showing the relative conductivities of rails and copper wires, he says :

### A CABLE ROAD PATENT VOID.

The Pacific Cable Railway Company recently brought suit against the Butte City Street Railway Company for the infringement of the Hallidie patent by the use of a “dummy” grip car or truck to assist on steep grades and where only a part of the road is operated by cable. The suit being lost by the Butte City Street Railway an appeal was made and the decision reversed, the court holding that in the state of the art at the time the patent was issued it did not involve invention.

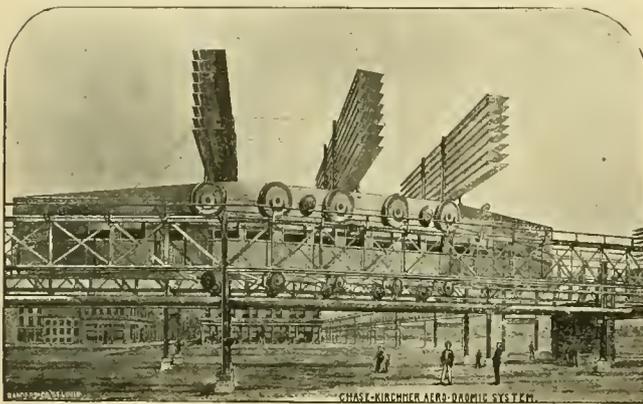

THE WESTINGHOUSE COMPANY has closed a contract with the West End Street Railway of Boston for 150 motor equipments and 50 more if needed.

RAILROADING ON WIND.

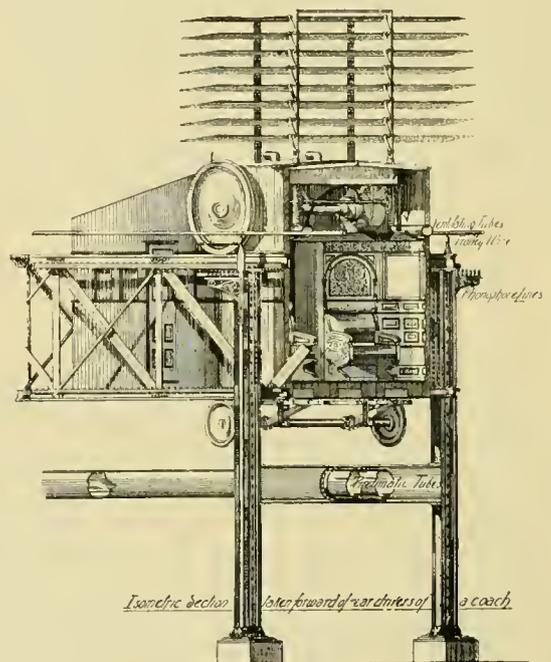

The Chase-Kirchner Aerodromic System of Transportation.

A good many railroads and some street railways have been constructed on wind, but we have yet to learn of any of them operating on that very unsubstantial substance. Under the title of "The Coming Railroad" Lieutenant G. N. Chase and H. W. Kirchner, of St. Louis, Mo., announce their radical departure from established methods and one which they claim is soon to revolutionize the world. They term their system the "Aerodromic," and the problem which they undertake to solve is the construction of a machine which shall be able to run upon the air at great speed, guided by a track. The principle is based upon the flight of a bird, especially in the act of soaring, the comparison being made that a bird with an initial velocity of 22 feet per second, soaring one

ping and acceleration to starting. Car to be from 40 to 100 feet in length, and grain and coal cars to be hopper shape and discharge through the bottom. The details of electrical propulsion involve nothing new, but upon the top of the car are to be placed the set or banks of aeroplanes, arranged in form as indicated in the illustration. The area of such surfaces according to the load vary from 2,000 to 4,000 square feet. These planes are hinged at the rear edge to an immovable standard perpendicular to the top of the car, and controlled by linked levers, so that the planes in each bank may be operated simultaneously by the engineer and capable of being set at any angle from zero to 10 degrees or more. Each plane to be from 20 to 30 feet in length and from 4 to 5 feet in

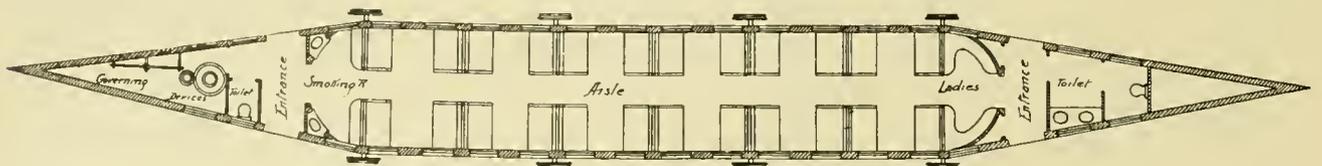

CAR UNDER FULL SAIL.

CROSS SECTION OF CAR.

minute, will cover 1,200 feet on an average velocity of 20 feet per second, and that the bird can sail down an incline of 11 feet per mile indefinitely and at a speed vastly in excess of that possible by the expenditure of the same amount of work in other means of transport. It is stated that new experiments show that if in such aerial motion there be given a plane of fixed size and weight, inclined at such an angle and moved forward at such a speed that it shall be sustained in horizontal flight, then the more rapid the motion is, the less will be the power required to support and advance it. The contemplated structure for this system is an elevated track of steel consisting of two parallel trusses

width. A hundred and fifty miles per hour is to be a practicable speed. The authors of the system have published a very complete and readable pamphlet, describing the principles involved and the possibilities of construction and operation. They do not however make any provision for a large number of difficulties, among which might be mentioned that the sleet and the snow forming upon the aerial planes and by freezing and

PLAN OF CAR.

6 feet in depth and 11 feet apart, the upper and the lower chords of these trusses forming the rails. The track is required to be a practically straight line, although curves may be introduced at stations which are also elevated somewhat, in order to give retardation in stop-

weight, prevent their being of any use. As a curiosity its suggestions are interesting, but as possessing any practical merit, it would seem that the air ship minus the air and propelled simply by electricity will always be better.

**THE UNRELIABLE AND MISLEADING DAILY PRESS.**

With all due credit to our great American dailies for enterprise in news gathering, they are not without great reproach in many ways. In dealing with corporations, particularly the common carriers, they delight in thrusting the barbs into the corporative body solely to please the populace, which seem never weary of the sight of blood. While many times, published articles which are the acme of falsehood and even impossibility, can be excused on the plea of getting the forms to press at an inflexible hour, the chief cause for censure lies in the fact that apparently no effort whatever is made to corroborate the truth of such information.

For instance, the daily and weekly papers are still harping on electrolysis and its dangers and destructive powers, when in fact this electrical disease was met and worked out promptly by electricians as soon as it became known. Electrolysis now gives the electrical engineer no more cause for uncertainty and doubt than the probability of a thunderbolt from the sky striking at the same water and gas pipes. But the news press has heard of dangers which while in existence once, no longer threaten, but seems unable or unwilling to learn that in this age of progress a few months work revolutions and solves hard problems with a certainty and rapidity formerly unknown.

The most glaring instance, however, and the one which calls forth these lines, is an item which we have traced in nearly 100 daily and weekly papers, most of which are published in cities where street cars are in operation and where reliable confirmation or denial could have been quickly secured by the use of the telephone.

For example note the following:—

IN Winnepeg, Man., an electric railway company with twelve miles of road sells fifty tickets for \$1, and last year carried 1,500,000 passengers, finding the low rate profitable. In Detroit the question of eight tickets for 25 cents is under discussion, which led to an official verification of the truth of the Winnepeg report.

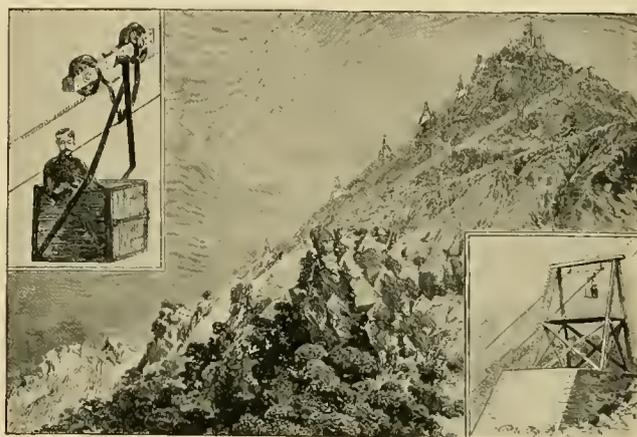

“Sells 50 tickets for \$1. \* \* \* finding the low rate profitable,” “which led to an official verification of the truth of the report.” These statements coming from a paper of standing, naturally carry great weight and are sufficiently convincing to a public already educated by these same journals and predisposed and anxious to accept such statements. In this way a strong public sentiment is created almost impossible to convince to the contrary.

Now what are the absolute facts. The REVIEW has investigated the case with the following results. There are two street railways in Winnepeg—the older one a horse line; the other an electric. They parallel for a large part of the route and in the business district. The horse road claims an exclusive franchise on all the streets in the city, and has been in litigation nearly two years, the case having now reached the Privy Council, in

England, where a decision is daily expected. On February 12, 1894, the 2-cent fare was first put in effect on the electric line, and when our Annanias brethren stated on “official verification” that it had prevailed twelve months, had been in force three weeks. The company do not find “the low rate profitable” although they are carrying their former and most of the business of the horse road, and could not keep present rates up indefinitely. As one of its utensils of war the 2-cent fare is an excellent piece of artillery but in times of peace would be suicidal. There is a good business for one of the two roads but not enough to warrant both. On forty-nine out of fifty roads on this continent passengers cannot be carried for three cents and pay expense of such operation as the American public demand, to say nothing of interest on legitimate bond issue; while improvements and dividends are out of the question.

**AERIAL RAILWAY AT GIBRALTAR.**

A suspended cable railway has recently been installed at Gibraltar to connect the signal station on the cliff with the south end of the town. The station could formerly

be reached only by a laborious climb. The span is 300 yards to the edge of the cliff, at which point a high trestle is erected to keep the cable in the air until it reaches the top. The “road” has one supporting and one propelling cable. It is used for both freight and passengers.

**BROOKLYN ROADS.**

The rumors of consolidation and sale of the Brooklyn systems have been so numerous for some months past that little seems to be known about the actual condition of affairs. There has been no consolidation in a legal sense. The Long Island Traction Company, which is simply an investment company, owns the Brooklyn Heights Railroad Company. The Brooklyn Heights Railroad leased the Brooklyn City in February 1893. The Long Island Traction Company also owns the Brooklyn, Queen’s County and Suburban, which latter road recently purchased the Broadway, Ferry & Metropolitan Avenue Railroad and the Jamaica & Brooklyn Railroad.

## RETURN CIRCUITS.

Abstracts from a paper read before the New Orleans Electric Society, by H. J. Malochee.\*

In addressing you this evening it is more particularly with the idea of courting discussion than of telling you anything new or saying something which is not already a subject of general knowledge. \* \* \* A large number of electric railroads use, to-day, the earth as the return circuit for the entire current generated, the rails serving but a secondary purpose. It is evident that the portion of the circuit, from the motor to the dynamo, is dependent upon quite a number of conditions, connections, and joints, viz.:—the connection of the rails with the ground plates, that of the ground plates with the earth, the condition of the earth as far as dampness, conductivity of strata, etc. are concerned, the junction of the ground plates at the station, and the connections from the latter to the machines themselves. The conductivity of the earth, a most important factor in the circuit now under consideration, is very unreliable and unsatisfactory, and is dependent upon too many climatic and local conditions, to be considered seriously in connection with any new installation by any well informed engineer. Take in consideration the capacity necessary to carry 1000 amperes of current or more and you will see that the earth can not be depended upon as a return circuit.

Let us consider in detail the troubles liable to arise, and the losses that may be suffered. First, it is expensive in first cost to make a thoroughly good connection between the rails and earth; second, the amount of energy lost is varying but must, of necessity, be a large factor in the operating expenses; third, the very good chances for the possible increase of resistance to such an amount as to make the cars run very slowly, and the lights burn very dimly; fourth, the constant wear and rust of the rails by electrolysis, between them and the earth; fifth, the probable law-suits by the persons or corporations whose property is damaged by the effects spoken of above. These and several other possible causes for dam-

\*H. J. Malochee, consulting electrical engineer, of New Orleans, is a native of that city, where he was born in 1865. After finishing a high school education he went into a machine shop as an apprentice. Completing this service in 1885, he entered the engineering course of Tulane University in Louisiana, graduating in 1889. While there he was appointed instructor in drawing, which position he held four years. During the summer vacations of '87 and '88 he worked as machinist in the Southern Pacific Railroad shops, getting a good idea of the requirements of railroad work. Leaving the University in 1889, he immediately entered the service of William Oswald, agent of the Edison and Sprague companies, as superintendent of construction. Last June he resigned to start for himself as independent consulting engineer. He is secretary and treasurer of the New Orleans Electrical Society, a flourishing organization of 100 members, 75 of whom were secured through his own personal efforts.

H. J. MALOCHEE.

age and losses, make me believe strongly in the advocacy of the all metal return, not by means of supplementary wires, not by means of overhead return feeders, but, by the simple use of the rails themselves. \* \* \*

Suppose we take as an example, a double track road with 90 pound rails such as are used in all large cities. These rails being each 9 square inches in cross section, and iron and copper being as 1, to 6, in conductivity, the equivalent in copper would be  $1\frac{1}{2}$  square inches, and the four rails together would equal 6 square inches of copper in cross section. The carrying capacity of this conductor would be at least 6,000 amperes. As compared with 0000 wire in order to have the same conductivity, the number of wires of this size required would be more than 28. Just think of it! 28 Number 0000 wires bunched together! How ridiculous it does sound to hear some people speak of using one number 0, wire or one number 00, or even two of the latter size as supplementary wires, when we have as an absolutely necessary part of the equipment such a splendid path for our current.

It grows the more striking when we compare the actual sizes of these would be supplementaries and of the rails in terms of circular mils.

Thus: 1	Number 0	equals	105,543	circular mils.
1	"	0000	"	211,600 " "
2	"	0000	"	423,200 " "
1 copper bar, 6 square inches, equals 7,639,000 circular mils.				

It being admitted therefore, that the rail is the proper thing to use if it is possible to make it electrically continuous, the problem then resolves itself into properly bonding the joints or otherwise reducing their resistance. For this particular purpose numerous schemes have been devised, and in order to give a better idea of the improvement in this line I will take up these devices in their historical order.

The first idea was the driving of a pin in each rail, wrapping a number 4 B. & S. wire around it and soldering. This was of course too unmechanical and temporary to be used very long and I believe that probably not one road out of a hundred could be found thus equipped to-day. Then came the channel pin, which consisted of a tapered pin with a channel in it for the reception of the wire; this pin was then driven in a hole in the web of the rail, but this, apart from the poor contact made by the wire is very objectionable on account of its liability to get loose from the constant vibration caused by the passing car wheels, it is also bad on account of the chances for moisture to get in between the iron and the copper, rust the joints out and so on.

After the channel pin came the split bushing, which nearly encircles the whole of the bond wire, and is better mechanically than the former joint. However, in an electrical sense it is not as good for the reason that there are four joints between rail and rail and the moisture can also get between the iron and the copper, and by electrochemical action injure the connection very seriously.

The welding of rail joints was next tried, and probably if this plan was carefully carried out by means of the electric welding of the entire cross section of the rail,

instead of joining only a portion of it as was done, this method would be most excellent both in a mechanical and electrical sense. Since the welding of rails was found not to come up to expectations, there have appeared several bond wires which are a very great advance over the old ones; and these I will now take up. They are the solid end bond, the hollow rivet bond, the Acme, and the Vail bonds. The solid end bond is made in two sizes,  $8\frac{1}{2}$  and 30 inches long. It consists of one single piece of from 0 to 000 wire at each end of which a rivet head and body is formed; this piece is riveted into any portion of the rail in which it is thought best to insert it. The rivet portion of the bond being larger in diameter than the wire itself, the contact with the iron is larger than in the primitive styles of bond wires; further this contact is made still larger, by the fact that the rivet head and that formed by the riveted end are pressed tightly against the side of the web by the riveting, thus forming perhaps as perfect a joint as can be made by the use of a rivet.

The hollow rivet consists in having, instead of a solid rivet at the end, a hollow wire whose outer surface is forced against the walls of the hole in the rail by a tapered iron pin which is hammered into the hollow end of the wire; this end, being split a short distance, may be turned over so as to prevent its getting loose or the pin from backing out. This is mechanically very strong and, if the surfaces are bright, there should be a very perfect electrical joint due to the fact that the metal is pushed outwardly at the same rate in every direction, and the two metals can be so clamped together as to form a very intimate connection inside of the hole. In this bond, the size of the outer diameter of the part which goes into the rail is necessarily much larger than the wire itself, and the electrical connection is thus made far more perfect as will be explained later on.

A very recent addition to the number of good rail bonds is the "Acme" bond, which consists of an iron sleeve with a tapered end. This sleeve has a channel cut on the side, thus making the wall of the sleeve rather weak in that particular place. The hole is drilled about 1-32 of an inch smaller than the largest outside diameter of the sleeve and when this latter is driven over the wire, in the hole in the rail, the connection is made very solid and the material in the sleeve shapes itself to all the inequalities in the hole and on the wire.

The Vail bond has been but very recently designed by J. H. Vail, and is probably one of the best on the market. It is substantially made and contains a number of advantages which few others have. It consists of two heavy sockets of copper, one on each rail, and connecting cables of copper wire between the two. The sockets have two or more studs which are riveted into the web of the rail and these, together with the shoulder, when the bond is in position, furnish quite a good electrical connection, provided of course the work is done in a thorough manner and the surfaces were bright at the time of their connection.

Each of these bonds has its own peculiar advantages, but the special, and by far the greatest advantage of these

last described bonds is the increased area of the join with the rail. In considering the general subject of resistance at the joint, we certainly cannot fail to remember that iron has about 1-6 the conductivity of copper and therefore the area of the junction surface should be no less than six times the area of the copper wire. This result can of course be reached either by increasing the diameter of the wire or by lengthening the joint. This latter is difficult to do and it would be costly as compared to the first method. If we adopt the scheme of increasing the diameter, what would be the result of doubling the diameter of the bond wire at the point where it connects with the rail? Suppose we have one number 000 copper bonding wire connected to two rails by holes in the web, this part being  $\frac{3}{8}$  inch thick. The area in square mils of number 000 B. & S. wire being 131,790, the area of the joint should therefore properly equal 7 times 131,790 square mils. The joint if made with 000 wire  $\frac{3}{8}$  inch long equals the diameter, (410 mils) times 3.1416 times 375 mils equals 483,000 square mils. As we want an area equal to 6 or 7 times 131,790 or 921,530 square mils, we can get at that area immediately by doubling the diameter of the wire, and the joint will have an area equal to twice 483,000 square mils, or 966,000 square mils, which makes the conductivity of the iron portion of the joint equal to that of the wire itself. However, what is the conductivity of this wire as compared with that of the iron rail itself? Take a 70 pound rail which is 7 square inches in cross section and whose value in terms of copper is 1-6 square inches. This bar of copper  $\frac{1}{2}$  inch thick and  $\frac{2}{3}$  inches wide has a section equal to 1,166,000 circular mils, and the 000 wire has a cross section of 167,805 circular mils, thus it would take 7,000 wires to equal the conductivity of the rail and make it electrically continuous. Whether the 7 wires should be used or not would have to be determined by the number of cars to run, and the distance from the power house, etc. In general, I should say that the very heaviest bonds would have to be nearest the dynamo and the lightest at the farther end of the line. Still, each installation would have to be treated independently according to the special circumstances surrounding it; but, in general, it seems to me that when considering the installation of an electric street railroad the same attention required for or given to the overhead feeders, is needed for the return circuit; and this means that the bonding of the rails should be such that the drop of voltage be the same at any point on the return, thus establishing the fact that the bonds are a function of the distance, and the number of cars on the line further away from the dynamo.

Yet, the important position of our work is not confined to the size of bond wire, or the number of such wires we shall use. Their connection to the rail is as important if not more so; for, if we choke the current at the joint, there is heating and electrolysis, and the bad connection is made worse and worse as the current is carried through it.

A suggestion which was made some time ago and which should receive some attention in my opinion, is

the increase in the length of the rails; this would decrease the number of joints per mile. \* \* \*

Another suggestion which seems to be very important, is one recently made by Professor Brown Ayers, of Tulane University: viz: The electric welding of the bonds to the rails. This means of connection is most important, for certainly if we use a bond no matter how large, if we make the area of the connection large enough to counteract the lesser conductivity of the iron, still, if the real jointing of the bond with the rail is not perfect and permanently so, the above provisions for a good return circuit are of little avail. The small cost and the light weight of the electric welding machines necessary for such work would make this further provision a very practical remedy for any trouble from electrolysis at the joint, rusting out of the same, and the consequent increased resistance of the bond and rail joint, which after all neutralize any other provision that may have been made to increase the conductivity of the entire return circuit. This method has the advantage over the welding of the rails themselves in so far as the flexibility of the joint is retained and yet the continuity of the metallic circuit is preserved.

Another thing to which I desire to call your special attention is the difference which exists between the various lengths of bond wires, in so far as resistance is concerned. For example, the number of  $8\frac{1}{2}$  inch bonds necessary for one mile of single track have a resistance of .00885 ohms: whereas the 30 inch bonds for the same track would have a resistance of .0265 ohms. This is for number 0, B. & S. wire. The loss in volts due to the resistance of the bonds themselves, independent of any loss in the joints, would be for that distance, with 100 amperes of current and the  $8\frac{1}{2}$  inch bonds, .88 volt and with the 30 inch 2.65 volts. Thus it would seem that the appliance in that direction is the one which combines shortness and large carrying capacity. We have now a good return by means of our well bonded rails; the next thing to consider is how to connect these rails to the dynamo. It is certainly necessary that the carrying capacity of this portion of the return circuit be large enough to carry the entire quantity generated by the dynamos, and this should be done with a very small loss. Too little attention has been, as a rule, given to this portion of the work and truly none demands more careful attention and consideration. Were we called upon to design a system of piping, we would certainly not think of connecting a 3 inch pipe to carry steam to an engine when it should have a 12 or 15 inch pipe. Why then should we connect say 4 number 0000 wires which have a combined cross section of 846,000 circular mils to a track which has in the case of four 90 pound rails an area of 7,639,000 circular mils; in the case of four 70 pound rails an area of 5,940,000 circular mils; and in the case of four 60 pound rails an area of 5,090,000 circular mils. The compared resistances per 1000 feet go further to prove the folly of such a piece of work. The combined resistance of the length of four 0000 wires is equal to .01253 ohms, whereas, that of the same length

of 90 pound double track is .00138 ohms, of 70 pound rails is .00178 ohms, and 60 pound rails .00196 ohms.

Is the cost of thorough bonding excessive and prohibitive? Figures will answer this question. One mile of 0000 wire weighs 3,380 pounds, at 15 cents per pound, or \$407. This is the cost of the supplementary. Now, 176 bonds 30 inches long weighing 275 pounds, at 15 cents will increase the cost \$45, making a total of \$452. As a comparison I will give you the cost of the longest bonds used, say 3 feet of wire number 0000. We have found that in order to make the 90 pound rail electrically continuous, we must have 7 of these wires bunched together, this equals 21 feet at each joint, making for the 176 joints in the rail a total of 3,700 feet, weighing 2,370 pounds, at 15 cents per pound, or \$355. Thus the cost for material is less for heavy bonding as compared to light bonding, and one 0000 supplementary wire, but the cost of manufacture being probably higher for the special form in which this material is furnished, it is reasonable to think that the entire cost in the two cases would be nearly the same. However, when it is considered that in one case the circuit has a conductivity of 7, and in the other a conductivity of two at the most, no manager would hesitate an instant to adopt the latter method, even if the cost is higher.

What are the conclusions that seem to have been reached? First, we must use our rail for a return circuit. Second, we must make this circuit of greatest conductivity and least resistance. Third, our bonding wires should be of the same carrying capacity as the rails. Fourth, the connecting surfaces of these bonds with the iron rail should be no less than seven times the circular mileage of the bonds themselves. Fifth, the connection electrically speaking should be as perfect as possible, so as not to cause electrolysis at and destruction of the contact. Sixth, the connection from the rails to the dynamo should be amply large, to carry the current which it is intended to carry with practically no loss in that distance. Seventh, the entire cost of a good rail return is no more than the return by means of a supplementary and light bond wire.

---

#### HAS PLENTY OF COMPANY.

---

"Yes, we have been favored as to the weather," said a well-known manager as he gazed at the rapidly descending rain. "Last winter we had plenty of hard weather, but our receipts were large. This winter we have had good weather, but the receipts are rather smaller and there does not seem to be much improvement. I think sometimes of leaving the street railway and going into the shoe business. There must be money in that these days the way people are walking."

---

THE twelfth half-yearly analysis of the accounts of the principal tramways in the United Kingdom has been issued by R. S. Tresilian, of the Dublin United Tramways Company. It is for the year ending Dec. 31, 1893.

## THE LIFT BRIDGE AT HALSTED STREET, CHICAGO.

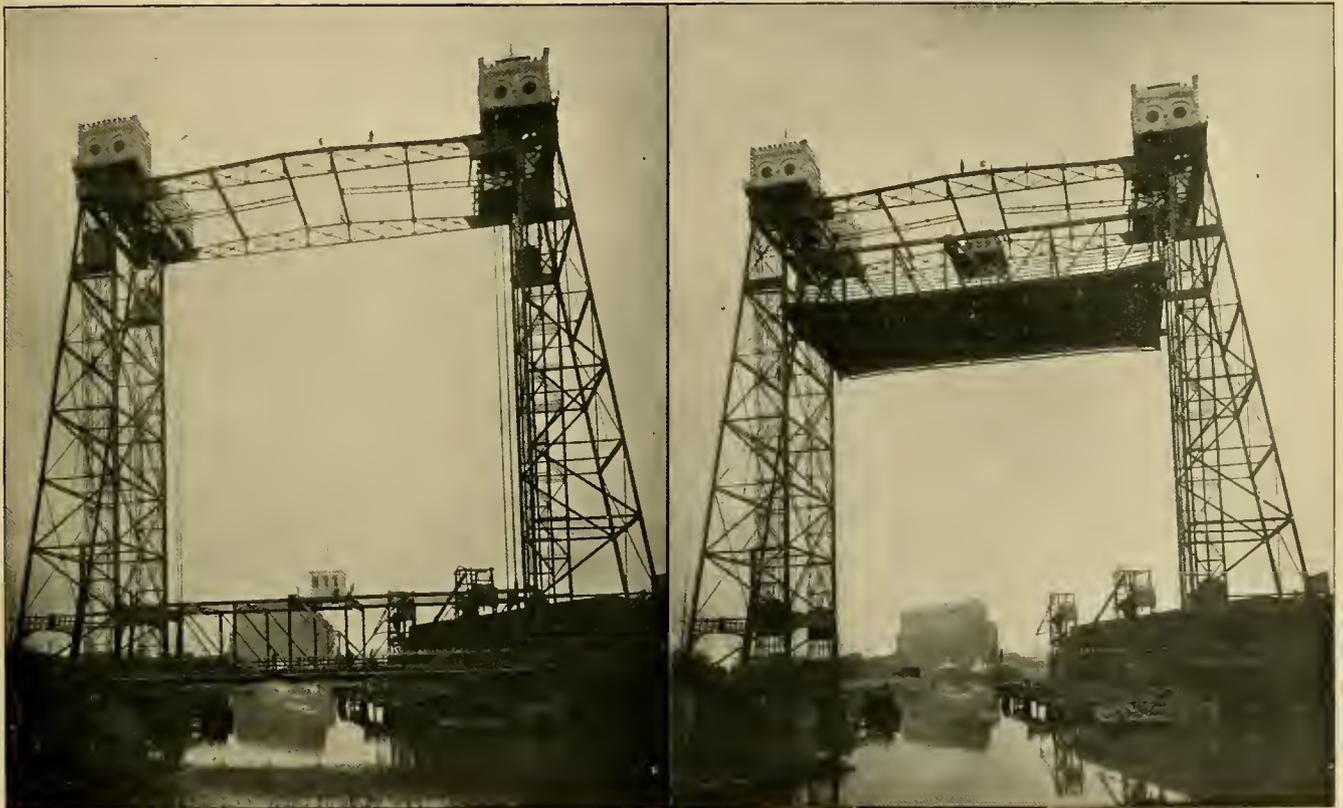

Only One of Its Kind in the World—A Place Where Street Cars  
May Come High.

Halsted street, Chicago, is said on good authority to be the longest continuous city thoroughfare in the world. It now enjoys further distinction in having a unique lift bridge over the Chicago river, where South Halsted crosses the pure and purling current of that famous stream.

The bridge is a decided innovation, being a straight

piston is forced into the cylinder the rapidity of the flow of the liquid varies as it is pressed into a separate reservoir made for that purpose. The flow is graduated to suit the rapidity of the approach of the bridge by means of tapering plugs. The lift section is 64 feet wide, over all, of which 12 feet on either side are for foot passage, leaving a 40-foot roadway to accommodate the street traffic and the double tracks of the West Chicago Street Railway Company. When the bridge is at its highest point a clearance of 155 feet above the water is secured.

The lift is operated by a separate power plant situated under the north end of the bridge. The plant is a duplicate, consisting of two 75-horse-power Crane Elevator

THE HALSTED STREET LIFT BRIDGE—196 FEET HIGH.

lift of the entire draw, sufficiently high in the air to allow the passage of vessels, as shown in our engraving.

The plan of the bridge requires two towers, 196 feet above the river level and 177 feet 7 inches above the street level. Each tower supports at the top four sheaves each 12 feet in diameter. Over these pass thirty-two  $1\frac{1}{2}$  inch steel cables, which are attached to the top chords of the bridge on one side and to counterbalancing weights on the other. The bridge (lift section) is 122 feet long in the clear and weighs 300 tons, consequently the counterbalances, which are iron, are of the same weight. At the upper and lower extremities of the tower are placed hydraulic buffers. The buffers are cast cylinders of 14 inches diameter, filled with glycerine and fitted with a  $3\frac{1}{2}$ -inch piston rod, against which the lift sections strike in raising and lowering. As the

Company's engines and two 70-horse-power boilers. This amount of power is by no means necessary to raise the bridge however, only enough power being used to overcome friction, with additional power for any traffic that may be upon the bridge at the time. Two men, an engineer and a bridge-tender, will be the working force, and a code of electric signals is arranged for communication. So delicately is the great draw balanced that the power of one man can raise it should emergency require. In addition to the iron counterbalance, four tanks are attached to the lift span proper, which can be filled with liquid or emptied so as to make the adjustment of the weights of the bridge and counterbalance more perfectly equalized. The tanks are provided with gas jets to thaw them out in case of frost.

The structure was completed in a space of thirteen

months and opened for traffic March 21, 1894. The builders state the work could be duplicated in nine months easily, the various problems which were encountered in such a novel design being now thoroughly worked out.

The time required to lift the bridge the full height at full speed is 45 seconds, or at the average rate of 210 feet per minute. The contract called for 85 feet in 50 seconds.

The designer of the bridge was J. H. L. Waddell, bridge engineer, of Kansas City, Mo., and the builder was the Pittsburg Bridge Company, of Pittsburg, Pa., through W. W. Curtis, C. E., of the Western office, in the Owings building, Chicago.

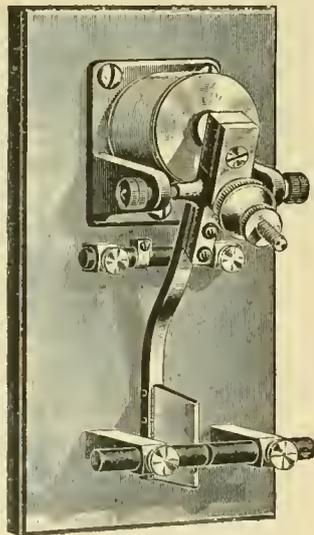

The lift bridge was made necessary as the Secretary of War refused his consent to the construction of a draw bridge with a pier in the center of the river, and there were objections to the bascule type, while the ordinary swing draw would have destroyed a large amount of valuable dockage in which to turn. The bridge cost \$200,000, and is the first of its kind. Its advantages include economy of first cost and operation; has all the merits of a fixed bridge, including granite floor paving, if required; is exceedingly stiff, rapid of movement and free from danger of collision.

#### THE DOANE LIGHTNING ARRESTER.

The Doane lightning arrester is a combination of two such old and well-known principles that it is almost a matter of surprise that they have not been combined in marketable form before.

In the majority of arresters the line is momentarily grounded and short circuited through an arc which forms when a discharge takes place.

The flow of current is consequently large. In another type of arrester the line is permanently grounded, during thunderstorms, through a high non-inductive resistance. In the Doane railway arrester the discharge passes through a 100-ohm non-inductive resistance in series with the arc. It is thus impossible for more than five amperes to flow, and the arc formed is easily put out. Referring to the engraving, the arc is formed between the two adjustable carbon points at the bottom. The flow of current energizes the magnet which attracts the arm. At the lower end of the arm is a blade of suitable material, which comes between the carbon points and breaks the arc. The W. S. Hill Electric Company, of 133 Oliver street, Boston, is the manufacturer.

#### ELECTRIC CARS AS NEWSPAPER CARRIERS.

We have all noted the facility and success with which electric cars have been adapted to the general carrying trade of other than passengers, and the descriptions from month to month of electric baggage, electric mail and express and electric funeral cars have afforded some of the most interesting and suggestive articles in this magazine. Last month was recounted the progressive policy of a Pittsburg daily, which charters a special car on the McKeesport & Wilmerding electric railway, and in this way beats its competitors into several towns by some four hours.

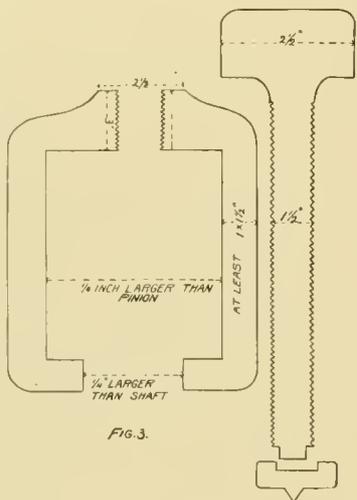

The enterprise, however, is not the only one of its kind. The Attleboro, Mass., Daily Sun, uses the inter-urban line running from city, to its own and the readers' great advantage. Formerly when bundles of dailies for North Attleboro, South Attleboro, Pawtucket and several other towns and villages were sent out on the steam trains it frequently occurred that the forms were a few minutes late in going to press and the connection was so close the train would be missed and papers had to be sent out in wagons at considerable expense and still more valuable loss of time. The new regime is to bundle the papers, which are piled up around the motorman and delivered to carriers at distributing points. As the electrics run at frequent intervals the occasional failure to catch a certain car causes no serious delay. The arrangement has been in force some months and has proved a great success.

The manager in charge also adopted a novel method of securing new subscribers. The route along the road is closely built up between the towns, and armed with several hundred copies tightly wrapped in heavy paper, the circulator made a trip for ten days, throwing off a sample copy at each door as the car sped by. The novelty of the scheme caused residents to pick the paper up and peruse it and at the end of the free distribution period it was an easy matter to canvass the route and enlist a large number of subscribers who wanted the good work continued right along. This plan is specially adapted to thickly populated interurban lines and can be worked to excellent account on nearly all such roads. The possibilities of electric cars are only beginning to dawn on people, and managers should carefully study the particular opportunities of their respective localities and find out what popular innovation can be worked out in their own case, thus increasing revenue and popularizing the road.

THE CLEVELAND MECHANICAL STOKER AND ENGINEERING COMPANY, of Cleveland, O., of which the well-known Alfred G. Hathaway, is secretary and treasurer, is meeting with great success in marketing its stoker, which is claimed to make a saving of over 20 per cent in fuel and to reduce smoke to only 10 per cent. The Hathaway transfer table still holds its own, and many foreign and domestic shipments attest its continued favor.

bination key like Fig. 2 has to be made, which is very hard to fit. Square steel bars should be bought,  $\frac{1}{8}$  larger than required size of key. Then saw the bars into right lengths ready for fitting and use at short notice. There should be one samson jaw each for removing armature and intermediate pinions (see Fig. 3). They are made of machinery steel with a center piece to be between end of screw and shaft, so as not to injure the center, in order that when the armature is put up in a lathe it runs true and saves time for the machinist. A long socket wrench should be made to fit hexagon head of samson screw, either with holes for levers or square on the end for a handle, so as to easily turn the screw with workman outside of the truck and plenty of room to move in. The method I employ to hold pinion and key in position, so as not to work loose, is the following:

Drill a hole through the keyway, making the diameter of the hole equal to the width of the key, the inner edge of the hole being even with the outside face of pinion. Have the key also even with the pinion. Then put in a split key from the side on which the pinion key is, so as to have the head of the split pin press hard against the key. This will prevent rattle and never work loose, as collar or nut is likely to do, owing to the great jolts and jars to which trucks are subjected while a car is in service; I have never known a single instance where this has failed.

Every electric railroad car barn ought to have at least one pit equipped in the following manner: A track should be laid the full length of the pit, with a small truck on which should be mounted either a hydraulic or screw jack in such a manner that the top should fit the motor-frame, so that one man and a boy can take down as well as mount a motor quickly. A traveling crane with a two ton block and fall should be over the same pit. The crane can be cheaply home-made of old rails. All pits should be dry and healthy and in cold climate steam heated, so as to make the men comfortable. They can do more and better work. When cars have to be jacked up the quickest method is to have four blocks and falls of the improved patents hung in such a way that they can be moved quickly to any part of pit by one man. Then have skids with large iron hooks shrunk on. This method will enable the man to quickly adjust the car body to fit bolt holes of truck. The car barn should have a strong bench with vises and drawers of various sizes. The day and night men's closets and tools should be separated from each other. The kind of wrenches used

has much to do with rapid work, and my experience has been (and I have used almost every make) that the Westcott wrenches, of Homer, New York, are the best for truck and motor work. Separate boxes should be kept for old brass and scrap iron.

Brake shoe lockers can easily and cheaply be put up between the pits; also track-sweeper's tools. All lockers should be under lock and key. Oil cans and grease pots should have a special locker in the car barn. Galvanized iron is the best, with a large pan to cover the whole floor of locker so that if any oil is spilt it is saved. Colored waste is good enough for all motor work, and the economy of same should be studied, as the men often will use too much if not watched closely. One day I stepped into the car barn of a sixty car road and I found forty-five men engaged in repairing the motors, trucks and cars. On inquiry I found the majority received on an average a dollar and a half per day. Seven men were busy in mounting a motor, all in each others way, each talking and swearing. Yet this road had thirty-five cars in the shop, twenty-five on the road, and several of these with flat wheels. There was a daily pay roll of no less than eighty dollars and the road a failure. The same method is to-day followed on many roads in operation. This is a fearful mistake and speaks badly for the men in charge. Cheap labor does not pay anywhere around an electric station. Very little muscle is required, but lots of brain. The right method is to employ skilled men and pay better wages, and if the above mentioned road had employed eight good men at two and a half per day, and two boys learning the business, they would have saved about fifty dollars per day and very likely have every car in good order. Nor is this all. We must remember that when a car is in the shop it is costing money, while it is out on the road it is making money.

Train your men for specialties—one man to be responsible for trucks and brakes, one for mechanical parts of motors, one for the electrical parts, as commutators, brush holders, rocker arms, cable wires, terminals, controllers, lamp circuits, fuse boxes, lightening arresters and trolleys; each man to have his own helpers. I find that apprentice boys can be successfully used in car barns without pay for about six months. After that they receive pay according to capability. They are handy in keeping shop clean, doing wiping and lifting, and in a few years, if properly trained, they often turn out splendid pit men as well as good car electricians.

#### Only One Night Out to Florida.

The morning train via the Monon Route connects at Cincinnati with the 7:00 p. m. through Vestibuled Train, on the Queen and Crescent Route, reaching Jacksonville at 10:50 p. m. the following day. The service of this popular line is unsurpassed by any line to the South. For rates, address City Office, 232 Clark street, Chicago, or Frank J. Reed, G. P. Agt., Monon Block, Chicago.

**THE NOVEL ADVERTISEMENT OF THE SAN FRANCISCO EXAMINER.**

The bright, original and generous management of the San Francisco Examiner made gala-day for all the children of San Francisco's schools, by the ticket herewith illustrated, good for one day's unlimited enjoyment, and the Examiner paid the bill.

They all went to the Midwinter Fair. As may be seen from the illustration the ticket was equal to the freedom of the Sunset City. The coupon took the young Californian from his home free of charge to the gates of the Fair. The next trip slip admitted the youngster to the inside of the great show where the fun began. Not content with merely the general admission, the Examiner day ticket was followed by eight coupon admissions to an equal number of concessions whose managers were in sympathy with the children. Then at the top a return street car ticket to take the tired sight seer to supper and to bed came next to a souvenir card, intended to remind if necessary, that the Examiner has a big, kind, heart for all the children in Frisco.

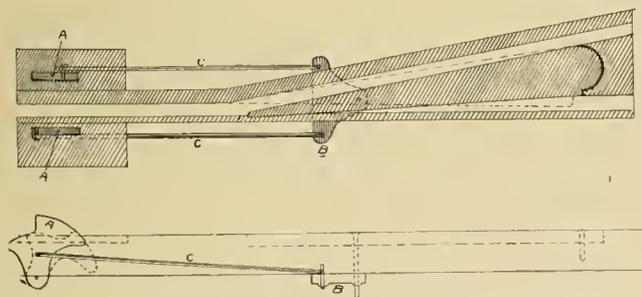

Chief of Police Crowley detailed 150 extra men to look after the infants and sort them out in case of getting lost.

Enterprising exhibitors made special effort and gave special invitations to the children to visit beef tea booths, cracker exhibits and what not, while the bands played because,—well they didn't have any work to do.

**SPEAR & SMITH TRACK SWITCH.**

This is a very simple arrangement shown in plan and elevation in the accompanying engraving. The point is

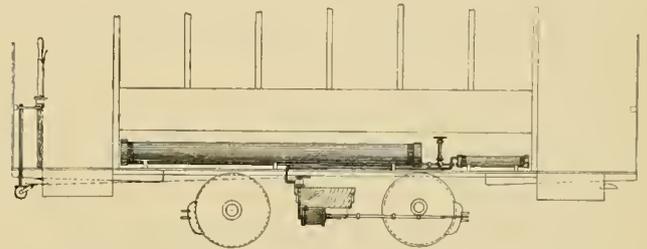

turned by having a device on the car which strikes a segment connected by rods to the three-cornered piece, under and attached to the switch point. The segments extend above the track surface, one on each side. The car attachment is turned so as to strike one or the other

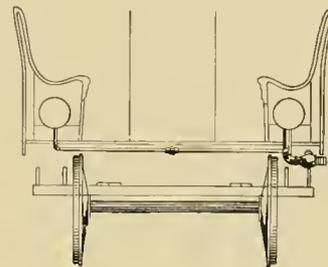

of the two segments, by a handle on the front platform. The attachment being back near the truck, motion is transmitted to it by a sprocket gear. The switch is the design of Speer & Smith, 620 Holmes street, Youngstown, O.

**THE PNEUMATIC BRAKE.**

In this style of air brake, which is made by the Pneumatic Brake Company, of San Francisco, the air is compressed by a special steam driven compressor at the power house, to a pressure of 350 pounds, and is stored

in tanks under the car seats, the intention being to have conveniently located intakes in the car house and along the tracks. It is calculated that a 300 pound charge will be good on an ordinary car for a 10-hour run.

A large compressor located at the power house is said to be cheaper to operate and maintain than a pump on each car. The car has in addition to the main air storage cylinders, two auxiliary reservoirs connected through reducing valves with the main reservoirs. In one auxiliary cylinder the pressure is about 25 pounds. In the other about 35 pounds. Air is admitted to the brake cylinder from the low pressure cylinder for a service stop and from the high pressure for an emergency stop.

**Custer's Last Battlefield.**

A visit to this spot, which is now a National Cemetery, is extremely interesting. Here, seventeen years ago, General Custer and five companies of the Seventh U. S. Cavalry, numbering over 200 officers and men, were cut to pieces by the Sioux Indians and allied tribes under Sitting Bull. The battlefield, the valley of the Little Big Horn, located some forty odd miles south of Custer, Montana, a station on the Northern Pacific Railroad, can be easily reached by stage. If you will write Chas. F. Fee, St. Paul, Minnesota, inclosing four cents in postage, he will send you a handsomely illustrated 100 page book, free of charge, in which you will find a graphic account of the sad catastrophe which overtook the brave Custer and his followers in the valley of the Little Big Horn, in June, '76.

## STREET RAILWAY LAW.

EDITED BY MR. FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Injury by Car Belonging to One Company and Driven by Employe of Another Company.*

Where a party has been injured by collision with a car belonging to one company, drawn by horses belonging to another company, and the driver is in the employ of the latter company, the action is properly brought against the latter company.

The defendants, the New York and Harlem Railroad Company, were owners of a railroad which ran through certain streets of New York City. There was an agreement between defendants and the New York and New Haven Railroad Company by which the cars of the New Haven Company were allowed to pass over defendants' track for a considerable distance in the city. A short track had been laid down in Canal street by the defendants for the use of the New Haven Company, and led from the track used by the defendants and the New Haven Company in common to the New Haven Company's depot in Canal street. The contract also provided that the defendant should furnish horses and drivers to draw the cars of the New Haven Company from the depot in Canal street to Thirty-first street.

Plaintiff was thrown out of his wagon and injured, in Canal street, by a car which belonged to the New Haven Company; but the horses which drew it and the driver who was driving it were in the employ of the defendant, the Harlem Company. The sole question which arose was whether the Harlem Company or the New Haven Company were liable.

The exact question has not arisen before in this country. It has arisen, however, in several cases in England.

The true rule is that which is stated in *Quarman v. Burnett*, 6 Mees. & Wells, 499. In that case the defendant was the owner of a carriage and had hired from a third person a driver and pair of horses to draw the same for a short time, and during this time the plaintiff's horse, through the carelessness of the driver, was injured. The question was whether the defendant, as owner of the carriage, was liable. Parke, Baron, says: "Upon the principle '*qui facit per alium facit per se*', that person is undoubtedly liable who stands in the relation of master to the wrongdoer, who has selected him from the knowledge of or belief in his skill and care, who could remove him for misconduct, and whose orders the wrongdoer, as a servant, was bound to receive and obey." It is evident that every word here said is applicable to the case before us.

The Harlem Railroad Company was the owner of the horses which drew the car, and the driver was in their employ, paid by them, bound to receive and obey their orders, and liable to be dismissed by them at pleasure.

The fact of negligence has not been in dispute at all, but we have simply to determine which of the companies is liable in damages to the plaintiff. We think the proper parties are sued in this case. The sole distinction between this and the other English cases is that the

conductor who came down in the New Haven cars might have had a supervision over the driver of the car, but it does not appear that in point of fact the conductor gave any directions in relation to these matters at all. We have, therefore, the case of the Harlem Company being the owners of the horses, and the driver being their servant and in their immediate employ. Under these circumstances it appears that the Harlem Company were alone liable.

(New York Superior Court. *Weyant v. New York & Harlem R. Co.* 1 American Street Railway Decisions, 160.

*Negligence in Running Electric Cars—Excessive Speed—Evidence—Liability of Company.*

This was an action brought by the appellee, who is a minor, by his next friend, against the appellant Company to recover damages for a personal injury. The appellant operates a street railway line, propelled by electricity, in the City of Peoria. The appellee, a boy about sixteen years old was riding with two other lads in a buggy on Adams street, when the buggy came into collision with one of the Company's cars, causing the injury complained of. The declaration charges negligence against the defendant in operating its car at an excessive rate of speed, and in failing to take notice of the buggy while on the track by reason of the shying of the frightened horse and to stop the car in time to avoid the collision.

If the average rate of speed fixed by the street railway company is excessive, in view of the stops necessary to be made in the route, the company will be responsible for an accident occurring from the fact that one of its servants was speeding a car in conformity to the schedule of the company.

Evidence of the distance of the round trip of the car and of the schedule time for making such trip is admissible in behalf of the plaintiff in connection with other testimony introduced as to the rate of speed of the car at the time of the collision.

In such cases it is for the jury, looking at all the evidence, to say whether the man in charge of the car which collided with the buggy was unnecessarily driving the car at an excessive rate of speed, or whether the company had, by its schedule, fixed such a short time for making the round trip that the motor-man was obliged to go at an excessively rapid rate in order to make all required stops and pass over the length of the line within the prescribed time.

(Supreme Court of Illinois). *Central Railway Co. vs. Allmon*, 147 Ill. 471.

*Injury to Child—Contributory Negligence—Running in front of Car—Negligence of Driver—Conflicting Evidence—Refusal to Direct Verdict for Defendant.*

The sole question for determination is whether the defendant company was guilty of negligence in the man-

ner of running its car at the time the accident occurred. This is the only question in the case, and the only one raised by the specifications of error. The learned Judge below was asked to direct the verdict for the defendant. We think this request was properly refused, as there was evidence that could not be withdrawn from the jury. It may be, as contended by the defendant, that the child ran suddenly under the car, and was not seen by the gripman, but there was evidence on the part of the plaintiff that other persons saw the child when the car was two lengths and a half away. There was also evidence that the gripman at the time was not attending to his business, that he was standing on the side of the cab, with one hand out of the window and looking towards the houses he was passing, and that he did not have hold of the grip or brake, that when called to by persons who saw the child, he paid no attention to the warning. This testimony, if true (and it has been so found by the jury) is of a very damaging character.

Judgment affirmed.

(Supreme Court of Pennsylvania). *Schnur vs. Citizens Traction Co.*, 25 Atlantic Reporter 650.

*Track Running Through Cut in Street—Excessive Speed—Injury to Horse.*

At the point where the accident occurred the defendant company had cut down the grade of the street, by the width of its tracks, some two feet. This was done in anticipation of a change of grade by the city. The dirt from this excavation was thrown upon the street upon either side of the track, and so allowed to remain for some weeks. A boy of seventeen years of age was riding a horse belonging to the plaintiff, along the right hand track, going away from the city. An electric car belonging to the defendant company was approaching on the other track. Just as the car and horse were nearly opposite each other the horse, it is alleged, became frightened and attempted to climb out of the roadway over the embankment referred to. The boy pulled him back and attempted to dismount. While he was trying, as he said, to dismount, the horse was struck by the car, and died from the effects of the collision. There was evidence that the car was going through this cut at a high rate of speed for an electric car—faster than usual. If this be so, and the jury have so found, it was gross negligence on the part of the company. Their cars should have been run slowly and with great care through a place of this description. The cut in the street and the dirt piled upon each side of the track was a work of its own creation, and for which it was responsible. It was an obstruction to public travel, and great care should have been exercised in running the cars at such a place. But for this obstruction it is not likely the accident would have occurred. The court below was entirely right in submitting the case to the jury.

(Supreme Court of Pennsylvania, *Greeley v. Federal St. R. Co.*, 25 Atlantic Reporter, 796.)

*Action Against Street Railway for Personal Injury—Evidence of Policemen Arresting Car Driver—Statements of Driver Regarding Accident.*

A policeman who arrested the driver of a car that had run against a woman was allowed to testify as to the arrest in an action against the employer of the driver for negligence. *Held*, that the evidence was inadmissible.

After the arrest, but before leaving the car, the driver, in answer to the policeman's inquiry why he did not stop the car, stated that the brakes were out of order. *Held*, to be mere hearsay, and not admissible in evidence against the driver's employer.

(New York Court of Appeals. *Luby v. Hudson River R. Co.* 1 American Street Railway Decisions 279.)

*Injury Caused by Defective Street—Judgment Against City—Action by City Against Street Railway Company.*

A city ordinance permitting a street car company to lay its tracks in a certain street required that the same be on a level with the street, and that the space between the tracks be kept in good repair. An action was brought against the city for personal injuries resulting from defects in such street. The complaint alleged that the street was full of holes, and that the rails of the street car track were some four inches above the level of the street; that by reason thereof plaintiff was thrown from his wagon and injured. The street car company was notified of the action and rendered some assistance in the defence. The jury were instructed that the city was liable, and judgment was rendered for the plaintiff. *Held*, in an action by the city against the street car company for the amount of such judgment, that the judgment was conclusive only of the facts that the street was defective, as alleged; that by reason of such defects plaintiff was injured, and the amount recovered.

It was error to reject evidence by defendant that its tracks were laid, kept and maintained in compliance with the ordinance.

The burden of proof was on the city to show that it was the fault of the street car company that the rails were above the level of the street.

(Supreme Court of Missouri. *City of St. Joseph vs. Union R. Co.* 22 Southwestern Reporter 794.)

*Street Car Colliding with Vehicle—Frightened Team—Failure to Stop Car After Knowledge of Danger.*

In an action against a street railway company which operated cars by means of steam motors, for injuries caused by colliding with plaintiff's horses and carriage, it appeared that the engineer saw plaintiff's team 150 feet away; that the moment the horses saw the engine they became frightened and showed by their actions that they could not be managed; that they plunged and backed the carriage on the track when the engine was seventy-five feet away; that plaintiff halloed and waved his hand to stop the train; and that the train could have been stopped within a space of ten feet. *Held*, that the en-

gineer could have seen the helpless condition of plaintiff in time to have stopped the train and avoided the injury.

Where the evidence clearly showed that plaintiff made every effort to avoid a collision, but, on account of the frightened condition of the horses, could not control them, the court properly refused to charge that if plaintiff could have seen the car approaching and did not escape it is presumed either that he did not look or did not heed what he saw, and that such conduct is negligence.

The fact that plaintiff could have traveled on some other street than that on which the street car track was laid is not negligence, where he had no reason to believe that his horses would become unmanageable at the sight of the engine and cars.

(Indiana Appellate Court. Muncie St. R. Co. v. Maynard. 32 Northeastern Reporter, 343.)

#### AMERICAN CAR COMPANY NEW AGENCIES

President Sutton, of the American Car Company, St. Louis, is a whole force of traveling men in one, but the varied and extensive interests of the company require his presence in so many places at once, he has gone into the field this year with additional and exceptionally valuable aides, and has secured Mr. Andrews, who leaves the J. G. Brill Company, and Mr. Lawless, another as widely known street car man.

The history of supply business in Chicago turns over a March leaf and chronicles the change of Payson K. Andrews, for the past three years the western agent for the Brill Car Company, to the Chicago office of the American Car Company of St. Louis.

Ever since 1882, Mr. Andrews has been a familiar figure at the street railway conventions. Boston was his first one '82, when Mr. H. H. Littell was president.

Mr. Andrews is about forty years of age and a son of Massachusetts. He was educated under the shadow of Andover theological seminary, at Andover academy. His father was a steam car builder, so that the son naturally became interested in the same line of work. His first connection was with steam car building, also serving an apprenticeship of three years on steam engine building. He afterwards became associated with his brother in the manufacture of car wheels and car springs, going on the road and visiting both steam and street railways. In this capacity he remained, until in 1890 he became a salesman for the J. G. Brill Company. A year later he was made western manager, with offices at Chicago, which position he now leaves to accept the attractive offer of the American Car Company of St. Louis. With headquarters in Chicago, Mr. Andrews has been very successful, having sold in a single year street cars to the value of over \$350,000.

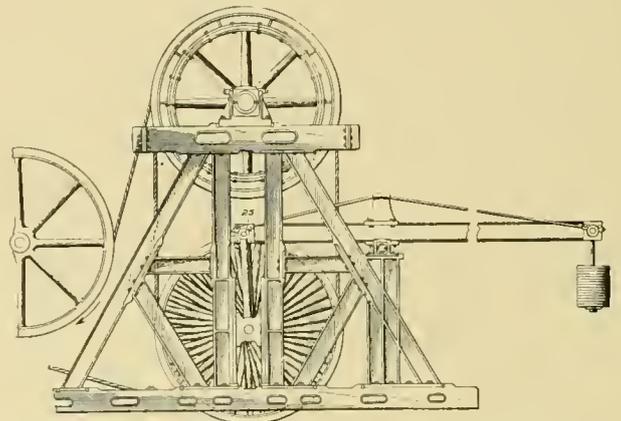

PAYSON K. ANDREWS.

E. J. Lawless of the New York office, was a cable road pioneer, having had a part in the construction of the Sutter street cable railway of San Francisco, in 1878, the first street cable road in the world. When the line was completed, Mr. Lawless says that he was "appointed assistant superintendent, assistant secretary, assistant splicer, emergency conductor and gripman, all of which positions were filled when occasion demanded." In 1885 he was made superintendent of the Kansas City cable road. In 1886 he became general superintendent of the Metropolitan Street Railway of Kansas City, remaining with it until the completion of cable construction by that company in 1888. From then until 1891 he was engaged in pursuits outside of street railway work. In the latter year he assumed the management of the Paterson, (N. J.) Railway Company, and after completing the change from horses to electricity, resigned and went to New York in 1893. It will be seen from this brief sketch that Mr. Lawless was always on hand and in demand during the most trying period of each road's existence, which tells his practical value better than words, and his friends will not be disappointed in the record he will make with the American Car Company.

#### A NEW STYLE OF TENSION WAY.

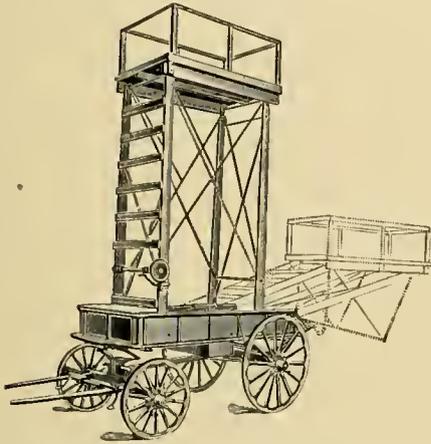

The object of this form of cable driving machinery is to do away with the space necessary for the ordinary tension way. It is the design of William H. Robinson, mechanical engineer, 1223 West Norris street, Philadelphia. The plan is to have an idler pulley underneath the driving pulley. The idler is placed in vertical ways, so that it can slide up and down. The weight of the idler regulates the tension of the cable, but this can be varied with the

counterweight shown. The idler consists of a number of independent sheaves, each being free to turn independent of the others. It is evident however that the driving drum must have differential rings, or the cable will be obliged to slip on the driving drum when the idler rises or falls. The tension carriage on many cable lines is called on to take up from 8 to 15 feet of slack rope instantly, which without the rings on the driver it would seem impossible for our illustrated device to do.

### THE HARTHAN TOWER WAGONS.

The tower wagons of this make are collapsed in rather a peculiar way, by being let down over the rear end, as shown in the illustration. The towers are made detachable from the wagons, to which they are held by only four

bolts. The wagon and tower complete weigh about 1,200 pounds, the intention being to make a wagon easily handled by one horse. The tower is elevated by a crank and can be set at any height between maximum and minimum. S. E. Harthan, of Worcester, Mass., is the maker.

### MAINTENANCE OF ROLLING STOCK.

III.

The interest aroused by the investigation of the REVIEW into the matter of motor maintenance is not to be wondered at, since the cost of maintenance on many roads exceeds the total cost of power, and instances are still more numerous where this item exceeds the fuel bill. A great deal of study has been put on the question of fuel reduction, and the question of repairs ought to receive the same study.

THE EAST HARRISBURG PASSENGER RAILWAY has 43 double motor cars, as follows: 9 sixteen-foot equipped with F-30 motors, 4 twenty-five-foot cars with S. R. G's, 9 twenty-five-foot cars with W. P.-50's, 1 twenty-five-foot car with G. E.-800, 20 sixteen-foot with S. R. G's. The whole equipment averages about two years of age. Twenty-five cars are used every day. The repair force at the barns consists of eleven day and four night men. The night men inspect each car every night. A peculiarity of the system used in this barn is that each man is held responsible for the condition of some particular part or parts. Thus one man is responsible for trolleys, another for brakes, and so on. All motors are cleaned every night by the motormen. Winding and all repairs necessary are done in the shop except refitting car wheels. The principal troubles are from grounding of armatures and rheostats on the F-30 motors and grounded commutators on the W. P.'s. Motors are overhauled once a month. The pay roll is \$18.50 per day.

### SANDUSKY STREET RAILWAY.

This road is equipped entirely with single motor cars, having 10 double reduction and 4 single reduction Westinghouse motors, the majority of which have been running three years. Nine cars are required for the regular service. Two night men do the inspection and cleaning and are assisted by an armature winder, a carpenter and a blacksmith working during the day. One of the night men does nothing but inspection and repair work and the other cleans the cars and does the oiling. The motors are overhauled about every three months. Gears and commutators on the double reduction equipments give the most trouble. The cost of labor in this department is about .75 cents per car mile. Two single reduction motors have been running for three years without burning out an armature or field coil.

### JANESVILLE STREET RAILWAY.

Superintendent A. H. Johnson reports an equipment of eleven cars with two Sprague motors each, nine of which are in daily use. They are taken care of by three day men and two night men. The force consists of an electrician, winder, blacksmith, car inspector and general workman. Cars are inspected three times a day. The only repairs undertaken are rewinding armatures. The commutators give the most trouble. In three years only five armatures have been completely rewound. The pay roll is \$7.56 per day.

### STRIKE AT LONG ISLAND CITY.

Long Island City, L. I., was in a sad plight March 16, when all the employes of the Steinway lines went out on a strike and emphasized their remarks by cutting and grounding the trolley wire, piling stones on the track and dangerously injuring Road Inspector Cosgrove with a sharp stone which hit him in the head. The men say that the superintendent only gives them 80 cents a day and that by the discharge of eighteen men he means to break up a K. of L. assembly. The superintendent claims that the men may earn \$2.00 a day if they will. Peace was restored by both sides agreeing to the arbitration of Mayor Sanford and the men helped to repair damages. The travel was so delayed that thousands of persons who do business in the various towns led into by the Steinway lines, were forced to walk many miles. The New York Advertiser says:

"Where was ex-Mayor Gleason, when the strikers were cutting trolley wires, breaking up cars and shooting officers between Steinway and Gooseygoatville - on - the - Stench? Then was the time when he should have appeared with battle-ax and pike, fist, bludgeon and the rest of his armory, in protection of his propertee and the main-tain-ance of lar and ardor. We never miss the water till the well runs dry, and it's "Oh! for an hour of Paddy" when Paddy isn't nigh.

THE Sandusky Street Railway rents its power from the electric light company at \$1.75 per car per day of 18 hours. The railway owns the generators and keeps them in repair.

## MISSED A CAR.

IT WAS a wild night without and the pattering rain mixed with sleet made all nature miserable, says the Philadelphia Press. The clock had just tolled the hour past midnight when the physician was aroused by the ringing of his door-bell. He jumped out of bed, put on his dressing gown, went to the window, raised the sash, and saw a man muffled to the ears standing on his front step. He asked:

"What do you want at this late hour?"

"I am Mr. Carr," was the answer.

"Well, go home. I am not responsible if you did miss a car. Why did you stay out so late?"

The window went down with a bang and the doctor went back to bed.

The bell rang again, the doctor put his head out of the window and saw the same man on the step.

"Doctor, doctor! I'm Mr. Carr."

"Well, if you did miss your car, what have I got to do with it?"

"C-a-r-r, doctor, C-a-r-r. Don't you understand?"

"What do you take me for, a conductor?"

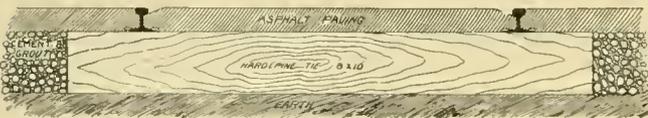

"No, no, doctor. Mrs. Carr, my wife, your patient, is very ill and requires your services."

"Oh, that's you. Carr, is it? Why didn't you say so before?"

## ASPHALT PAVING TO T RAIL.

By W. H. Smith, Electrician and Superintendent of Machinery, Ogden City Street Railway.

Street railway companies of late have been wrestling with the problem of street paving. The first thing that arises is the expense, and how it can be done the best and cheapest. Quite a number of experiments have been made with the different paving materials, and with the different styles and shapes of rails. A set rule will not hold good for every city. The condition of the founda-

tion, locality, traffic, etc., must be considered. A rule that will apply in one city will not hold good in another city or town.

I will submit to my fellow-sufferers a brief description and cross-section of track and paving put down in September, 1893. Three blocks of 750 feet each were laid on Twenty-fifth street leading from the Union depot. This is one of the most frequented streets in our city.

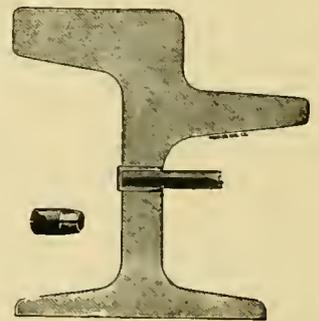

The street was graded down and thoroughly rolled with a ten-ton steam roller, and the ties were laid on the ground 14 inches between centers and surfaced up to grade. We used 30-pound T rail spiked to the ties, in the ordinary way. The rails were thoroughly bonded

with cross bonds connected to a number 4 soft copper return wire. All joints were soldered. The return wire was laid on top of the ties to keep it from the moisture, and securely fastened to the ties with staples. Crushed rock and cement were tamped in between the ties, flush with the top, and two coats of asphalt laid on top. On the outside of the rail the asphalt comes flush with the top. On the inside a groove or channel is left for the flange of the wheel. The curve at the corner of Twenty-fifth street and Wall avenue was put in as the above, with the exception that cinders were tamped under the ties. After five months' hard usage we find on a close examination that a few of the joints where cinders were not used have gone down a trifle and the paving is working loose, but on the curve where cinders were used for surfacing and between the joints the track is as good and true to surface and gauge as the day it was put in.

Our experience in paving leads us to believe that in a small city of ten or fifteen thousand, paving can be done with moderate expense in the above way, if particular attention is given to getting a good solid foundation for the ties, and by using cinders (we prefer cinders to anything else) to tamp under the ties, a road can be paved in this way that will give good results both to the railway company and the city.

## STEEL BONDING CAPS.

The accompanying cut shows views of the new track bonding device recently brought out by the Ohio Brass Company, of Mansfield, Ohio, and consists of a steel cap which fits snugly over the end of the bonding wire and into the web or flange of the rail. With this method of bonding the end of the wire is passed through the hole in the rail which is drilled  $\frac{1}{32}$  of an inch smaller than the outside diameter of the cap. The cap is then placed on the bonding wire and entered into the rail.

A few blows from a hammer fasten it in place. The crimp extending the full length of the cap allows the shell to compress firmly over the wire and into the rail, making a perfect air and moisture proof joint.

It can be used equally well with iron or copper wires of different sizes. The facility and quickness of bonding combined with the low selling price will no doubt bring it into speedy favor with the trade.

THE W. S. Knott Company of Minneapolis, has the order for four 62-inch three-ply belts, for the Cincinnati Street Railway. They have a couple of 73-inch belts in the twin city plants at Minneapolis.

THE FAIR FREEZER FROZEN OUT.

She was seated in the street car,  
 And the passengers had to frown,  
 For 'twas blowing cold as thunder  
 When she let the window down.

The people shook and shivered,  
 Pulled their collars 'round their ears,  
 While she sat there unmolested  
 In a fine, new set of furs.

She was asked to "close the window,"  
 But she merely waved her arm.  
 "No, gentlemen, excuse me,  
 For I'm comfortably warm."

Then the men, as mad as blazes,  
 Rose en masse, "just then an' thar,"  
 And they let down every window  
 That would open in the car.

And the woman in the sealskin  
 Got a blossom on her nose,  
 She began to shake and shiver  
 Till her face was nearly froze

The passengers enjoyed it,  
 And she soon was looking sad,  
 For it was the first new sealskin  
 That the woman ever had.

And she was out to show it,  
 As she took in winter's breath  
 By a great big open window,  
 Freezing other folks to death.

But she jerked the strap directly  
 And she, shivering, left the car,  
 And they laughed to hear her mutter,  
 "What a naughty set you are!"

Then they hoisted all the windows  
 And in comfort gave a shout,  
 For instead of being frozen  
 They had friz the freezer out.  
 —Will Essays in Waterways Journal.

THE WHITE-CROSBY COMPANY.

On May 1 the well known firm of J. G. White & Company, contractors, of New York, will be joined by O. T. Crosby, and the name will become the White-Crosby Company. The headquarters will be moved to Baltimore. The reasons for the change of location are, cheaper rents, good markets, plenty of storage room, and the fact that the large amount of work contracted for in Baltimore at present would require offices there for a year or more. Of the new company, O. T. Crosby will be president; J. G. White, vice-president; and G. H. Walbridge, secretary and treasurer. Mr. Crosby, who needs no introduction, was born in Louisiana, and graduated from the United States Military Academy at Brookhaven, Miss., in 1878. He served as an officer in different engineering corps until 1887 when he joined the Sprague Railway and Motor Company, soon becoming superintendent. After two and one-half years with this concern he became connected with the Weems high speed experiments which attracted so much attention. He then identified himself with the Thomson-Houston staff, and recently has had charge of the railway department of the General Electric.

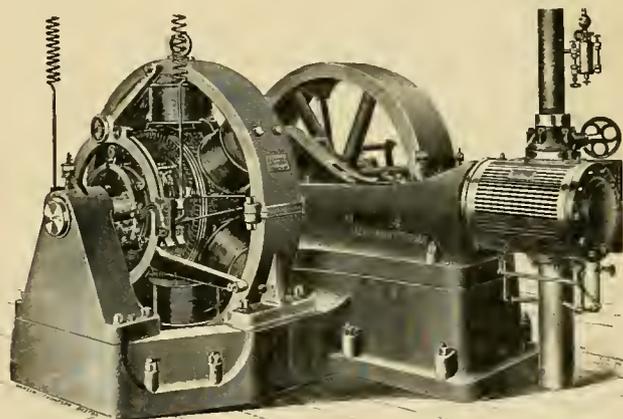

J. G. White graduated from Pennsylvania State Col-

lege in 1882 and from the electrical engineering course of Cornell University in 1885, holding a fellowship the last year. For the two years following he had charge of the department of physics in Nebraska University, when in 1887 he organized the Western Engineering Company, which did considerable western construction work, until in 1890, it was sold to the United Edison Company. In the same year Mr. White resigned and formed "J. G. White & Company."

The New York office will be left in charge of A. G. Greenburg, a graduate of Princeton, who has had experience in electrical matters with the Thomson-Houston, Ft. Wayne, and Washburn & Moen Companies. J. F. Easterbrook, a Yale graduate, and formerly assistant engineer in the Chicago office of the Edison Company has charge of the Chicago office. Altogether the combination throughout is an eminently strong and practical one, and continued success is assured in a measure commensurate with the increased capacity to plan and execute.

AMES DIRECT CONNECTED ENGINE.

The engraving herewith presented, represents an Ames high speed engine directly connected with a general electric multipolar generator, making an entirely self-contained plant. The engine is 13 by 12 and makes 275 revolutions per minute. The generator is 50-kilowatts. The floor space occupied is 7 feet, 6 inches by 9 feet, 4 inches. Two of these combinations have been put in the Continental Fire Insurance building, New York.

The advantages of this form for condensed plants are clearly evident. The Ames people insist on furnishing an outer bearing or pedestal to support the end of the engine shaft. It is very substantial and fitted with a ring oiling device similar to those on the main engine bearings. They believe that any arrangement whereby the armature is hung on the extended shaft without this bearing to be poor engineering and necessarily unsatisfactory. The Ames engines both simple and compound are well adapted to direct connection with any make of generator.

THE Chicago Lake Street "L" has been finished through to West Fifty-second street, five and a half miles from the heart of the city.

## RELATIVE COST OF STEAM, COMPRESSED AIR AND ELECTRICITY FOR THE OPERATION OF RAILROADS.

BY GENERAL HERMAN HAUPT, CONSULTING ENGINEER.

There seems to be a general misapprehension in regard to the relative economy of electricity as a motive power for the propulsion of cars upon surface and elevated railroads, as compared with steam and compressed air. It has been proposed to use electricity for the operation of elevated railroads in Chicago and New York, and it was also proposed for an underground system for the latter city.

Electricity has apparently been applied with success to the operation of street railways, hauling one or two small cars; but the cost of equipping a railroad for hauling heavy trains long distances with stations at short intervals, as compared with steam or compressed air, becomes excessive, and the cost of operation is much greater than with compressed air.

The idea is generally entertained that heavy grades are more easily overcome by electricity, but a moment's reflection ought to satisfy any one that this is a fallacy, for it requires a fixed amount of power to overcome a given resistance, whatever motive power is used.

Having been called upon recently to examine and report upon the relative cost of plants, and of operation, for the new lines of elevated railroad proposed to be constructed in New York, the writer sought an introduction to the officers of the General Electric Company, by whom he was courteously received, and who very kindly furnished all the data required for electrical installation.

The problem submitted to them was: "Given a double track elevated railroad, twenty miles long, with trains similar to present elevated trains, running at one-minute intervals, and twenty miles per hour, or two hours for a round trip; how many power stations would be required for the operation of the line, where should the stations be located with reference to the terminals, what power would be required at stations, and what the cost in detail of the installation?"

The answers, which were based on the actual experience and results of the Intramural railroad at the World's Fair, were as follows: The cars had two 4-wheeled trucks and a 150-horse-power electric motor was attached to each axle, making 600-horse-power for each electric motive power car, costing for each car so fitted, \$10,000. The trains were made up of one such car and three trailers; and it was stated that the same power would be required to operate the elevated railroad trains. It was also stated that the horse-power at the motors would be less than that at the power stations by 35 per cent, the loss being

From steam engines to generators.....	10 per cent.
Transmission along conductors.....	10 "
From conductors to car motors.....	15 "

As there would be 120 trains on the road at a time, there would probably be 100 using current at once, the balance making stops at stations, and if each train requires 600-horse-power, there would have to be supplied at the motors 60,000 horse-power; and allowing for the losses of 35 per cent, the steam engines at the power house would have to develop over 92,000 horse-power. The cost of installation at the power houses was given as \$50 per horse-power, made up as follows:

Steam engines .....	\$20.00
Generators or dynamos.....	20.00
Boilers .....	17.00
Piping .....	3.00
Buildings.....	10.00
Real estate and incidentals.....	10.00
Total,	\$80.00

Chas. H. Davis, in his hand book of tables for electrical engineers, gives the cost per horse-power at \$50 without buildings and real estate, which would increase the above to \$100, but \$50 was taken as the basis of the estimate.

The power stations were to be two in number, located each five miles from the terminals, so that the current would not have to be transmitted to a greater distance than five miles, the loss being proportional to the distance. The conductors recommended were old iron, or steel rails, as being more economical than copper of equal conductivity. Six lines of these rails being required in the first mile from the power stations in both directions.

It is estimated that the cost of installation, based on the above data, would be as follows:

Rails for conductors.....	\$250,000
Laying, insulating, and copper connections.....	150,000
Outfit for 120 motors, at \$10,000 each.....	1,200,000
92,000 horse-power at power houses, \$80 each.....	7,360,000
Total,	\$8,960,000

The writer's original estimate gave the amount as \$9,600,000, but upon reflection it did not seem as if sufficient allowance was made for trains stopping at stations and during that brief interval using no current. He now thinks 20 trains out of 120 a fair allowance. As compared with steam and compressed air plant to perform the same service, the cost would be: 120 steam locomotives at \$5,000 each, \$600,000; 120 compressed air motors and compressor plant, \$1,800,000. The compressor plant is taken at manufacturers' estimates, and what they are willing to guarantee.

It may be noted that 120 motors would not be sufficient for such a service, as there are always a number of engines in relays, in reserve, and undergoing repairs; but as electric motors cost double what steam and compressed air engines do, the comparison would be still more unfavorable to electricity if the number was increased.

The relative cost of fuel for operating is computable as follows:

Elevated steam locomotives consume about 40 pounds of anthracite coal per train mile, costing, say, \$6 per ton in Chicago and \$4 per ton in New York.

Stationery engines for generating electricity or compressing air, consume about 2½ pounds of bituminous coal per horse-power per hour, costing, say, \$3 per ton in Chicago and \$2.50 per ton in New York.

The compressed air locomotive tested on the New York Elevated Railroad in 1881, used 1,470 cubic feet of free air per train mile, which was stored in the motor reservoirs at 600 pounds pressure per square inch. The total quantity of

air stored before beginning the trip was 18,400 cubic feet of free air, the reservoir capacity being 460 cubic feet and the pressure 40 atmospheres.

The builders of air compressing machinery are ready to contract for power plants to do this work, and will guarantee that the consumption of fuel shall not exceed a rate of 20 pounds of bituminous coal per 1,470 cubic feet, compressed to 600 pounds per square inch. This is the equivalent of 20 pounds of coal per train mile for compressing the air. In addition to this it requires between 4 and 5 pounds of anthracite coal per train mile to reheat the air as it is used on the motors.

In a round trip of two hours, 120 trains will have covered 4,800 miles; and we shall compare the cost of fuel in performing this amount of work by the different systems.

Electricity—92,000 horse-power for 2 hours at 2½ lbs. per h. p per hour.....230 tons

Steam—4,800 miles, at 40 lbs. per mile.....96 tons

Compressed air—4,800 miles, at { 20 lbs. bituminous coal.....48 tons  
5 lbs. anthracite coal.....12 tons

At a cost of

Electricity, 230 tons.....at { \$3.00 = \$690.00 in Chicago  
2.50 = 575.00 in New York

Steam, 96 tons.....at { 6.00 = 576.00 in Chicago  
4.00 = 384.00 in New York

Compressed air... { 48 tons at \$3.00 = \$144.00 } = \$216.00 in Chicago  
12 tons at 6.00 = 72.00

Compressed air... { 48 tons at 2.50 = 120.00 } = 168.00 in New York  
12 tons at 4.00 = 48.00

The writer was much surprised at the result, for although he expected to find that electricity was much more costly than steam or compressed air, from previous investigations, he was not prepared for such a difference; and after reflection he began to doubt the correctness of the figures furnished. It does not seem that it should require 600 horse-power to move an elevated train, although he is positive the statement was made by the officials of the General Electric Company. The steam locomotives of the Manhattan Railway weigh about 48,000 pounds, the cylinders are 12 by 16 and the drivers 42 inches diameter. As the steam pressure carried does not exceed 140 pounds per square inch, the horse-power probably does not exceed 250, but he is also aware that these engines are worked to their full capacity in moving trains from station to station. It is not a case of urging the trains into speed and then running at an even pace, but a case of continual acceleration until the next station is reached, and this is frequently carried so far that the brake valve is opened before the throttle is closed, to avail of even the short interval between opening the valve and the brakes taking effect to accelerate the speed and gain time.\* Profiting by the experience of the Manhattan Company, Chicago and other places have built heavier structures, which admits the use of heavier engines; those on the Lake Street Railroad, for instance, weighing as much as 60,000 pounds. It is safe to say, therefore, that 300 horse-power per train would be a fair allowance, although the writer cannot understand why there should have been 600 horse-power on the Intramural Railroad, unless it is that an electric motor works best when not taxed to its full capacity, or unless 600 horse-power at the electric motor only means 300 horse-power at the rail. This seems likely, as an excess of power would slip the wheels.

After a discussion of the subject with the editor of one of the technical magazines, who also doubted the accuracy of the figures, they were submitted to a prominent electrician of the General Electric Company for revision. That gentleman reported that the estimate was excessive, inasmuch as it had been based on maximum instead of average resistances. He

returned a revised estimate, based on average resistances, with an allowance of 9 per cent for fluctuations, which gave 42,000 horse-power as all that was necessary at the power stations, and \$6,000,000 as the total cost of installation. As 42,000 horse-power at \$50 per horse-power is only \$3,600,000, the writer rather underestimated the cost of conductors, laying, etc.

After deducting 35 per cent for losses, there will only be 27,300 horse-power available at the motors, or say an average of 273 horse-power per train using current at once. It is difficult to understand how the maximum power can be 600, the average 273 and the fluctuation 9 per cent; but accepting the revised estimate of 42,000 horse-power, and six millions as the cost of installation, it will be seen that the latter is still many times greater than for steam or compressed air.

The relative cost of fuel for operating in two hours as revised would be:

	In Chicago.	In New York.
Electricity (105 tons)	\$315.00	\$262.50
Steam	576.00	384.00
Compressed air	216.00	168.00

The fuel used for operating the Intramural road was oil, and the writer is credibly informed that the average consumption during the six months of the Exposition was at the rate of an equivalent of 50 pounds of coal per train mile. This would give 120 tons for 4,800 miles, which is rather more than above.

The interest on the cost of installation is another item of the operating expenses affected, and ought to be considered in conjunction with the cost of fuel. It is for two hours at 6 per cent as follows, based on the supposition that the road is operated twenty-four hours per day:

Electricity	\$6,000,000	Int. \$82.20	for two hours
Steam	600,000	Int. 8.22	for two hours
Compressed air	1,800,000	Int. 24.66	for two hours

Making the combined expense for fuel and interest

	In Chicago.	In New York.
Electricity	\$397.20	\$344.75
Steam	584.22	392.22
Compressed air	240.66	192.66

Compressed air cannot be considered as an experiment, although the evidence that comes of long continued use is wanting. The writer and others can testify to the admirable results obtained from the street motor trials in New York. They answered every requirement of the service, proved to be economical, and no valid objection was ever raised against them. They could and did carry storage of air sufficient for trips of ten miles, so that trips of eight miles were well within their capacity. The capacity of the reservoirs was equivalent to 4,266 cubic feet of free air, and they used 290 cubic feet, equal to 22 pounds weight of air per mile on an average. The Mekarski system is in successful operation in France, although they use over 24 pounds of air per mile,\* and are clumsy in general design and appearance.

In 1881, a compressed air locomotive was designed by Robt. Hardie, and constructed at the Baldwin Locomotive Works, Philadelphia, under his supervision. It was tested the same year on the Manhattan Elevated Railway, with marvelous results. The tests were witnessed by a number of the officers of the road and others, who were enthusiastic in its praise, and some of whom gave written certificates of the performance. They are as follows:

John A. Wallace, engineer, who operated the engine on the trial trips.

E. B. Wetmore, who was train master when the trials were made. He has since been superintendent and master mech-

\*The Eames vacuum brake is used on these trains.

anic of the Suburban Elevated, New York, and of the Chicago & South Side Rapid Transit Company.

Wm. S. Hughes, who was foreman of repair shops on the Manhattan, when the trials were made, and who is now master mechanic of a division of the New York and New England Railroad, at Providence, R. I.

Col. R. I. Sloan, formerly chief engineer of the Manhattan. Since chief engineer of the Chicago & South Side Rapid Transit, and now chief engineer of the Lake Street Elevated Railroad.

Chas. T. Parry, of the firm of Burnham, Parry, Williams & Company, Baldwin Locomotive Works, Philadelphia, and others.

Too much space would be required to publish these certificates in full, but they all express appreciation and approval in strong terms. The question is naturally asked why was the system not adopted if the tests were so satisfactory and there were no neutralising disadvantages.

It may be said briefly that the main causes of its abandonment were bad management, incapacity and lack of financial ability on one hand, and prejudice, incredulity and indifference on the other.

The company organized to develop the system was composed of men who had no financial standing, and were incapable of surmounting the usual obstacles which all pioneers have to meet. The principal of these objections was the fear that damages from scaring horses would be heavy, which has since proved to be groundless. The company had not the financial ability to equip and operate the first line of road and no railroad company would adopt it without such a demonstration, although a magnificent success mechanically.

The Elevated Railroad Company not only declined to introduce it on their road, but the management declined even to give a statement of facts as to its operation on the road. It was strongly suspected that the reason for this was the fear that publicity given to such an official statement would bring the pressure of popular demand for its adaption, involving the expense of re-equipping the road with motive power; though a change would obviously be a public benefit; besides effecting a great saving in the operating expenses. Of the latter fact, however, the management is still ignorant. It is a fact, strange as it may seem, that no official test or investigation was ever made to ascertain the cost of operation, which fact implies that no such information was wanted. There is no lack of testimony, however, to show that the experimental engine fulfilled all the conditions and answered all the requirements of the tests so far as they went; in hauling trains over the road on schedule time; in making all the regular station stops to pick up and set down passengers; in ease of handling and smoothness of operation, and in freedom from noise of exhaust, gas, cinders, &c., as well as the fact that the car brake equipment was operated from the engine as usual; that the length, breadth and height were the same as the steam engines, that weight was from 6,000 to 8,000 pounds less than the steam locomotives recently built for the same road; that they can be recharged as quickly as the steam locomotives take water; that the cost of fuel for operation is less than 50 per cent of that of the steam locomotives; and that there never was any fault found or objections raised against it whatever. All these facts can be proved to the satisfaction of anyone caring to investigate. It is safe to conclude, therefore that the only difficulty was the one stated above.

\*A pamphlet recently published by the American Mekarski Company states that on one of the roads operated, 1,985,000 pounds of air was used to operate 82,250 miles, which gave  $\frac{1,985,000}{82,250} = 22\frac{1}{2}$  pounds per mile." This was an error of division.

The recent report of the railroad commissioners of Massachusetts, presented February 7, 1894, in referring to the trolley system, states that during the year there has been "an increase of 214 miles of electric road" and "over \$25,000,000 of capital invested." The report also says "It can and should be said without hesitation, or qualification, that the electric system has not shown or indicated any such margin of profit as to justify the expectation of more than ordinary and moderate returns on money legitimately invested in it. The idea which seems to have obtained some currency that the electric railway system is a bonanza of rare and inexhaustible wealth, is clearly a delusion, and has doubtless proved to some a snare. The absolute cost and expensiveness of the system, under the most conservative, able and honest management are sufficient to tax its earning capacity to its full limit. There is no margin for inflated or fictitious capitalization. It presents no safe or inviting field for speculative enterprise or manipulation, unless it be to the unscrupulous operators of an inside ring, who are willing to practice on the credulity of a misinformed public. Whenever there is reason to believe that water has been, or is about to be injected into the stock or bonds of an electric railway company, the only safe course is to let its securities severely alone."

In a recent letter from the electrical editor of a standard technical magazine, it is conceded that electricity cannot compete with compressed air for street motor purposes; that the storage battery is an ignis fatuus, and that expenditures in this direction will probably be discontinued; and that long interurban lines like those projected between New York and Philadelphia, St. Louis and Chicago, and Baltimore and Washington, are wild and visionary schemes.

Where steam can be used directly in a motor, electricity generated by steam cannot be employed economically for car propulsion. This is not so with compressed air, as the reheating on the motor almost wholly restores the losses by compression and transmission. The great field for electricity is electric lighting, and perhaps electric heating. It may also be advantageously used for transmitting power long distances from water falls, although compressed air may here again be a successful competitor; but for the propulsion of cars and trains on railroads, it must eventually give way to compressed air.

Gas motors have exploded and burned up. Cable lines can only be operated on long lines of straight track with advantage, and then only when there is a "magnificent business." Steam is intolerable, carbonic acid gas and ammonia are impracticable, and life is too short to wait for horses. It would seem, therefore, as if compressed air, which is growing in popular favor, remains head and shoulders above all its competitors; and the writer ventures the prediction that in a few years it will be in universal use for the operation of street railways. Why it has lain beneath and so near the surface so long, is past the writer's comprehension.

WASHINGTON, D. C., March 23, 1894.

THE Lake Street L and the South Side L, Chicago, have reached a traffic agreement, by the terms of which the South Side Company will allow the west side passengers to be hauled as far south as Congress street and the West Side Company will allow south side traffic to be carried to the corner of Lake street and Fifth avenue. The consummation of the compact, of course, cannot be reached until the proposed extensions up Wabash avenue and east on Lake street have been built.

## RELATIVE COST OF STEAM AND ELECTRICITY FOR THE OPERATION OF RAILWAYS.

By W. E. Baker, General Manager, Columbian Intramural Railway,

Having been shown the preceding article, in which the relative merits of compressed air, steam and electricity for elevated railroads are discussed, I gladly avail myself of the opportunity to reply.

While this article bears evidence of having been prepared with great care, there is in it the assumption of a condition in regard to the rate of speed which, in the absence of an explanation, is misleading and leads to manifest error in the conclusions drawn.

As a result of practical experience with the only elevated electric railway operated on a large scale, I beg to submit the following, which I trust will be of interest to your readers:

In the article referred to, while the writer does not himself take the position that he is fully cognizant of all the facts connected with the operation of an electric elevated road, the unfairness of the comparison from which his deductions are made, becomes apparent when the problem thus submitted is carefully examined, and particularly the clause referring to the speed of the train, which is to be 20 miles an hour.

The writer then proceeds to compare the cost of operating an electric road with trains making an average speed of 20 miles an hour with the cost of operating a steam road under present conditions, where the average speed is about 12 miles an hour, slightly less than this in New York and slightly more in Chicago, the stations in New York being about 1,725 feet apart and in Chicago about 2,000 feet, and it is plainly unfair to make the comparison on this basis. The comparison should be made either on the basis of 20 or 12 miles per hour under the different methods of operation. As all the elevated roads which have been operated, or are now being operated, including both the steam and electric roads, have been operated at an average speed of about 12 miles an hour, it would seem better to make the comparison on this basis, as, if we attempt to compare the operation of roads at the speed of 20 miles an hour, we must assume the conditions for both cases.

As a matter of fact it is practically, and at any rate commercially, impossible to operate an elevated road with trains of five cars and stations about one-third of a mile apart at an average speed of 20 miles per hour, especially with the present conditions and limitations of brake mechanism, as a very short calculation will suffice to show. At a speed of 12 miles per hour, and with stations one-third of a mile apart, it would be necessary to make three stops in a mile, averaging 17 seconds. This would leave for the three runs to be made in a mile 249 seconds, or an average of 83 seconds for each run, 30 seconds of which would be used in retardation; leaving 53 seconds only in which to make the acceleration from a state of rest to a speed of about 25 miles per hour. At 20 miles per hour or 180 seconds to the mile, and with three stops, we have 129 seconds in which to make the three runs, or 43 seconds to each run. If we allow, as above, 30 seconds only in which to make the retardation, which is not enough, as we will have to retard from a much higher maximum speed, still we have only 13 seconds left in which to accelerate to a speed of, say 40 miles per hour, and this is plainly impossible, although the electric operation of trains will approximate this much nearer than steam has ever been able to do,

The attempt (in the article referred to) to make the comparison between steam trains operating at the rate of 12 miles per hour and electric trains at 20 miles per hour, is the basis of the errors throughout the article. A calculation, which it is not necessary to enter into, will show that to make an approximation to the average speed of 20 miles an hour 600 horse power will be found not sufficient to do the work; notwithstanding the author of the article under consideration expresses surprise that this amount of energy should be required to operate an electric train at a speed of 20 miles per hour. When the speed of an electric train is reduced to that assumed for the steam train, 300 horse power will be found abundantly sufficient. The horse power of motors, for the purpose of comparison, should therefore be taken at 300 instead of 600, which will reduce the cost of the motor outfits to \$6,000 each instead of \$10,000.

Actual experience of the Intramural road, based on twelve days' accurate readings and forty-six separate observations, shows that the average horse power consumed per train was 42 horse power. As the stations on this road were only 1,590 feet apart, as compared with the distances of 1,725 feet and 2,000 feet above referred to; and as the road was further complicated by 25 per cent of curvature, which necessitated cutting down the speed of the trains in many cases after they had expended the power necessary to reach the maximum speed; and as the average speed under these conditions on the Intramural road of a round trip of six and one-fourth miles was 10 miles per hour, the horse power used there per train would be quite a sufficient amount for a speed of from one to two miles an hour more with stations farther apart and with straight track. The accelerations secured on the Intramural road were superior to those obtained on any elevated road now being operated by steam; and it is no doubt true that no locomotives at present being operated on elevated roads, and light enough to have been used safely on the Intramural structure, could have made the speed on that road which was made by the motor cars.

Therefore, instead of assuming that it will require 600 horse power to a train in the station, it is true only if the trains are to make 20 miles per hour, and not true as a basis of comparison. We know on the basis of the facts secured in actual practice, 50 horse power average per train is sufficient; but to allow for the extra car in the train and for surplus power, we will allow 75 horse power as a basis of present comparison.

It must be remembered that this horse power was measured at the station and that no allowance need be made for loss in conductors or motors.

The writer of the article makes an allowance of 20 trains out of 120 as the number stopping at stations and during that brief interval using no current. When it is remembered that it takes about 87 seconds from the starting of a train from one station to the starting of the same train at the subsequent station and of this 87 seconds, 17 seconds are spent at the station and 32 seconds are spent with the power cut off and brakes applied, being over 50 per cent of the time spent during the total run, it will be seen that instead of 20 trains using no current, a proper allowance out of the 120 would be about 70 trains.

It will also be noticed that it has been assumed that 120 trains would make a round trip, giving intervals of one minute.

In this case again the difference in rate of speed has been neglected; as a matter of fact it would take 210 steam trains to do this service, and assuming that the electric trains would make the same speed, 200 electric trains, for the reason that the electric train does not have to stop as the steam train does

for the purpose of raking ashes, building up fires, etc., which could not be less for each steam train in a round trip than ten minutes. The cost of installation, based, therefore, on the above data would be about as follows:

Conductors and feeder rails.....	\$ 100,000 00
Laying insulators and connections.....	50 000 00
200 motor equipments @ \$6,000, each .....	1,200,000 00
15,000 horse power @ \$80.00.....	1,200 000 00
Total.....	\$2,550,000 00

But this is not all, comparing the locomotives and their effect on the track and structure with that of the motor cars, the savings in construction will amount to at least 25 per cent. of the cost for the steam road. This will be about \$40,000 per mile, or 20 miles at \$40,000. \$8,000,000.00. But this is not all; it is only fair to compare the two systems completely and not fair to compare the light afforded passengers by smoky kerosene lamps with the brilliant light obtained on an electric road. The only light approximating the electric light is the most improved system of gas-lighting for cars, which would cost about \$250 per car, as against about \$40 per car to install electric lights, effecting a further saving on 1,000 cars of \$210,000, and without referring to the saving of lighting stations and the coaling and water stations, we have as the investment to be compared with the steam, a total of \$1,540,000 as compared with 210 compound steam locomotives at \$6,000 each \$1,260,000.

Now, to make a comparison of the relative cost of fuel: We have, in a round trip of two hours, 210 trains covering about 8,000 miles; and for electricity, 15,000 horse-power for two hours at 4 lbs. per horse-power hour=60 tons. Steam, 8,000 miles, at 40 lbs. per mile=160 tons. As anthracite is used on the steam trains, the price still further emphasizes the difference in operating expenses, which would be for:

Electricity, 60 tons, at \$2 50.....	\$150 00
Steam, 160 tons, at { \$4 00, New York.....	640 00
{ 6 00, Chicago.....	960 00

It will be seen that under this estimate the difference between the cost of construction of the two systems is so small that it is unnecessary to carry the discussion further, as the assumption of the different rate of speed vitiates throughout the former comparison.

The above statement of saving refers to fuel only, there are other items. The saving of wages on the two hours of a full schedule would amount to \$240 in favor of the electric road.

The writer knows nothing about the reliability of the figures given in reference to compressed air, as no experiment has been carried on in this direction on a large enough scale to demonstrate its availability, to say nothing of the expense.

One of the common errors in regard to the electric road is the endeavor to assume that an electric road is to do much more work, in a much smoother and pleasanter manner than the steam road, and still at less expense. In one of the technical magazines a statement was recently made that a locomotive generates power at a far smaller first cost than any stationary steam plant on account of the stationary plant costing from five to ten times as much per horse-power as the cost of a locomotive per horse-power. This statement, while correct in itself, neglects the underlying factors of the operation of an electric road where the steam plant would certainly not be over 20 per cent of the total maximum power required to operate the trains. In the same article referred to, the conclusion is drawn that "Very small power units can certainly be operated more economically by distributing the power electrically from a central station. With large power units it is more economical to generate the power on the spot; just

where the dividing line is to be drawn will depend upon the circumstances in each particular case." This statement ingeniously hides the truth. It is not the size of the power units which renders it more economical to generate the power electrically, but the number. Having a given amount of power to generate, it can be distributed more economically by the use of electric transmission when the units are smaller in size. Bearing in mind that the economy of the motive power is not the only reason for the application of electricity on elevated railways, that the saving in dust, noise, gas and other so-called sentimental reasons must also have great weight, it becomes evident that it only requires a careful, thorough and scientific investigation of the subject to enable one to predict that the time is already come for the operation of elevated railways by electric power.

### ELECTRICITY VS. STEAM.

Electricity is constantly knocking at the door of the domain so long ruled with undisputed sway by the steam engine, and while the locomotive still snorts in derision, electricity is hopeful and progressive. While it will doubtless be many years before steam-produced electricity can hope to supplant the locomotive, it is by no means certain that the development of long distance transmission may not be so perfected that current produced by water-power may not accomplish this result. Electricity on elevated roads is proving successful and this is a long advance toward surface railroad work. A small part of the power now going to waste over the falls of Niagara would suffice to move all the trains on all the roads leading east out of Chicago. It will be a battle of economics. On the present condition of cost of power the Engineering News states:

"The fact has recently been prominently brought forward that the locomotive generates power at a far smaller first cost than any stationary steam power plant in existence. A rough estimate shows that a stationary steam power plant has a first cost five to ten times as great per horse-power as the cost of a modern locomotive. These figures have a most important bearing on the question which has been so much discussed, whether the electric motor can economically be substituted for the steam locomotive. Apparently a long step in advance will have to be taken by builders of stationary boilers and engines, and they will have to copy some features of locomotive practice before they can successfully attempt to distribute electric power for use on railways now operated by locomotives.

One of the chief grounds on which the popular belief in electric traction rests is the fact that for street car service the electric motor has displaced the dummy locomotives, which were formerly considerably used on city and suburban railways, especially in the South. But there was a good reason for this change. Putting a miniature locomotive at work hauling a street car at low speeds was like setting a giant to do a dwarf's work at a snail's pace. Because a steam engine capable of generating 200 horse-power and doing work for which less than twenty horse-power was actually required, was displaced by a 20 horse-power electric motor, it does not follow that electricity can economically displace the fast express locomotives of the present day, generating continuously nearly 1,000 horse-power."

AN IMPORTANT INTERURBAN.

Johnstown, Gloversville and Fonda Interconnected By Electric Railway.—The Business Carried and How it is Done.

In the early summer of 1891, a party of gentlemen, al more or less acquainted with the men and matters at Gloversville, Johnstown and Fonda, New York, conceived the plan of building an electric railroad to connect those three thriving towns, Gloversville is a young city of 15,000 people, Johnstown a town of 9,000, and Fonda an important station on the N. Y. C. & H. R. R. R., with a population of about 3,000.

Like the course of true love, the course of franchises did not run smoothly, but in spite of great opposition from previously organized companies and from a steam road traversing the same territory, the franchises necessary were acquired.

Early in the spring of 1892, a corps of engineers in charge of chief engineer W. Boardman Reed, began preliminary surveys for the road which was to be built on a private right of way instead of the highway. This was made necessary on account of the proposed carrying of freight, which was to be a large part of the business of the new company. Not only was it impossible to procure franchises for the freight traffic along the main highway, but the grade of the highway would not permit it. A route was determined upon survey completed and specifications prepared for bids, in July, 1892, and on August 2, contract was signed for the entire building and equipment of the road. In July, 1893, the main line to Fonda was in operation.

The construction of the main line, about nine miles long, involved the excavation of 175,000 yards of earth and rock, the building of three pieces of trestle, two iron bridges and about 1,000 yards of masonry. The track is of 56-pound T rail, laid on 6 by 8 by 8 hardwood ties, two feet between centers. The overhead line is of bracket construction with No. 0 copper trolley wire and six 0000 copper feed wires, running from the power house in Johns-

SCENE IN GLOVERSVILLE.

town, south to Fonda 5 miles, and four 0000 feed wires north to Gloversville, about four miles.

Besides the main line there is a two mile loop in the vilage of Johnstown and a four mile belt line in Gloversville. On unpaved streets T rail, planked, is used with satisfactory results, while in paved streets, Johnson 80-pound girder rail is laid, spiked directly on vulcanized Virginia pine ties.

THE POWER HOUSE,

is a substantial brick building about 70 by 90 feet, containing three 150-horse-power horizontal tubular boilers, one 300-horse-power and one 150-horse-power Russell four valve compound engine, with condensers, pumps and heaters. General Electric M. P. 100 K. W. generators are used. The plant is located in Johnstown, on the bank of a bright pure stream of water, furnishing adequate supply for boilers and for condensing.

The car house, a plan of which we show, is a frame building 150 by 68 feet, located in Gloversville, the headquarters of the company. There is a paved pit under full length of each track.

THE ROLLING STOCK.

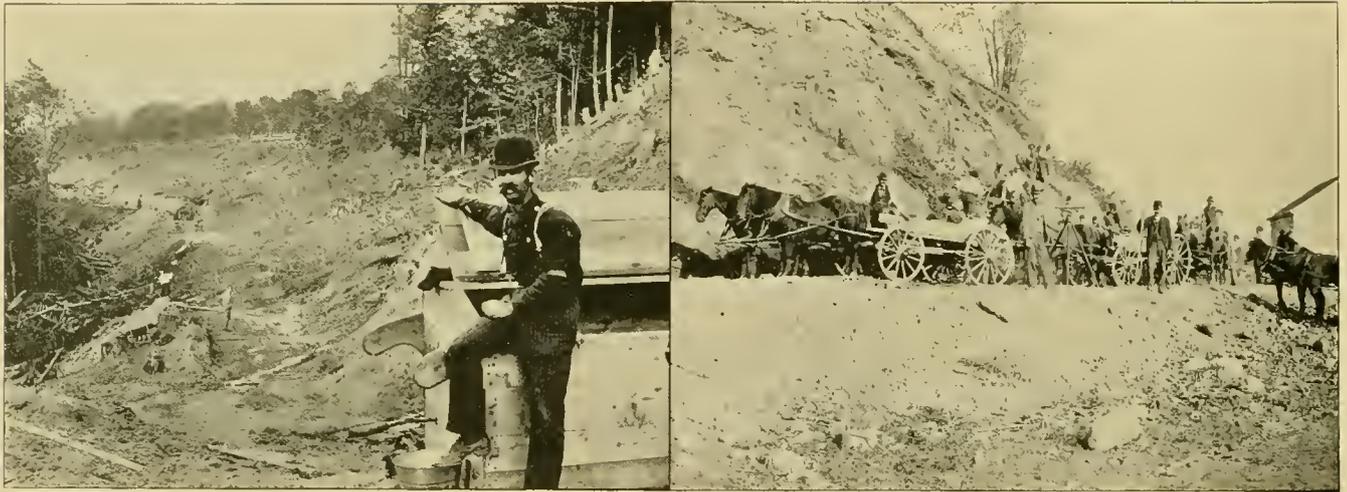

The four cars which run over the main line between Gloversville, Johnstown and Fonda, are 35-foot combina-

FIRST CAR IN FONDA.

POWER HOUSE AT JOHNSTOWN.

CONSTRUCTING THE LINE.

tion cars, running always in same direction and turning on a Y at each end of the line. First is motorman's compartment, then baggage room 8 by 8 feet, smoking room of same size, and ladies compartment 13 by 8, with four-foot rear vestibule. These cars are very popular and have been found to be the thing for this interurban service.

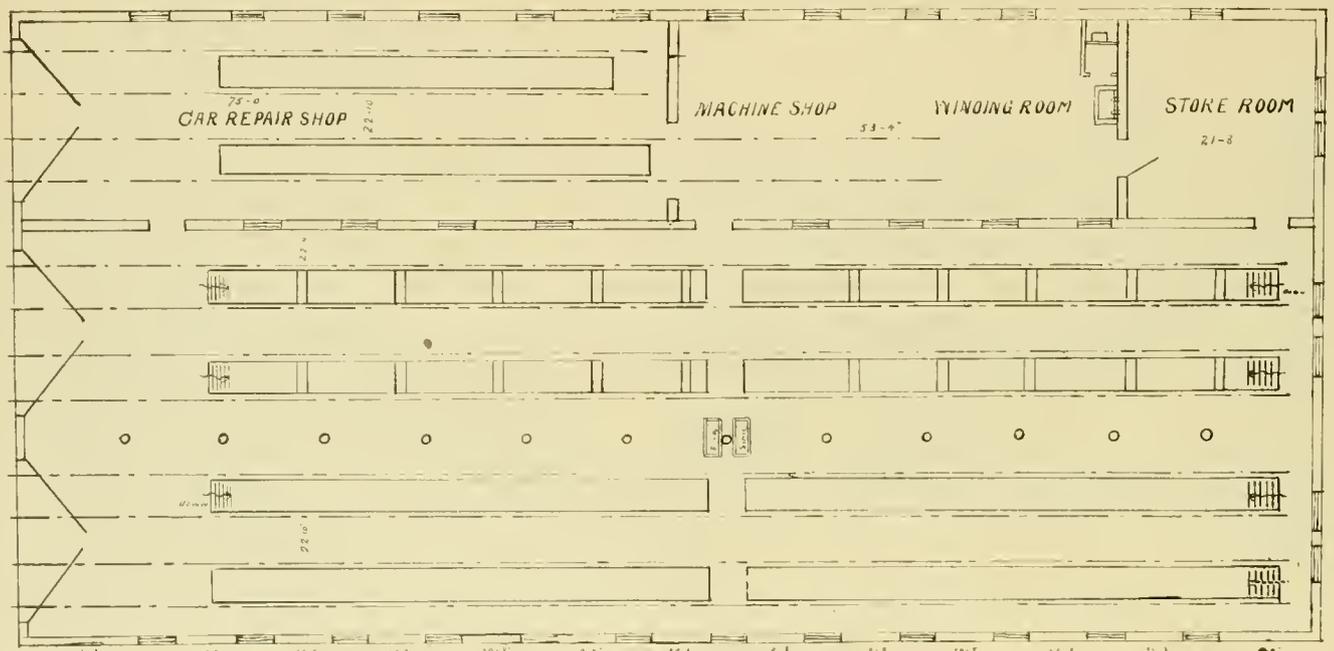

There are also eleven, 18-foot vestibule cars for the local lines, four trailers and a summer equipment of five 10-bench and two 12-bench open cars. The combination cars first referred to and four of the 18-foot cars were made by Gilbert Car Manufacturing Co., and the open cars by the Ellis Car Company. McGuire and Taylor trucks are used. General Electric W. P. 30 motors propel the 18-foot cars and Westinghouse single reduction motors the 35-foot cars. All cars are equipped with the excellent De Witt sand boxes.

An important part of this road's equipment is the snow plow manufactured by the Massachusetts Car Company,

of Boston. Gloversville and Johnstown are noted for heavy snow and the electric plough has won the highest commendation for its work this winter. It is a nose plough, the nose being 3-feet high and concaved, and is provided with wings; wings not for flying but for making the snow fly.

CAYADUTTA PARK.

The enterprising management last summer, began the development of a beautiful park on its main line, between Johnstown and Fonda. This park covers 25 acres of wild and picturesque scenery, with a brook babbling and bounding through it. A dancing pavilion, refreshment stand, band stand and numerous summer houses, rustic seats, beautiful walks, pure cold spring water, are among the many attractions. During the summer scarcely a day passed without one or more picnic parties enjoying the beauties of Cayadutta park. It is intended also to

PLAN OF CAR HOUSE AND REPAIR SHOPS.

THE TROLLEY ON THE ROCK ISLAND BRIDGE.

Great bodies move slowly. The United States government is a great body. Therefore, it took a long time to get permission to run the trolley across the government bridge between Rock Island and Davenport. However,

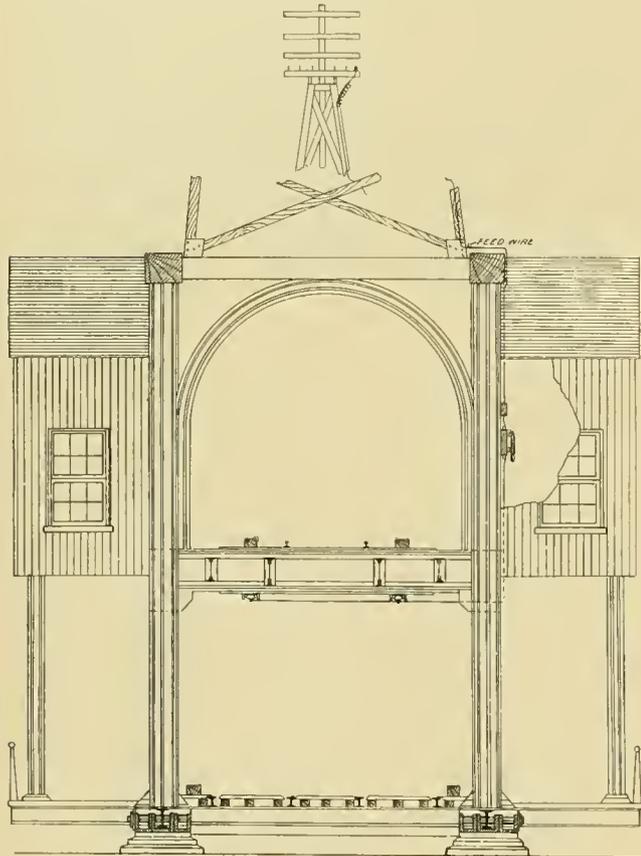

FIG. 1.—CROSS SECTION OF DRAW.

the horse car line now running on the bridge suffered by comparison with the electric systems at each end. The company knew that the affair would work out its own salvation in time, and that government permission would be refused until public sentiment was unanimously in favor of it. That time finally arrived, however, and permission has been granted and plans approved for stringing a trolley across the bridge. In crossing the bridge several

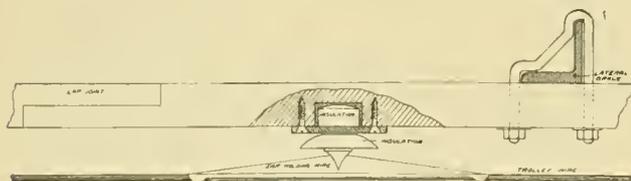

FIG. 2.—TROLLEY WIRE SUSPENSION.

different styles of trolley suspension had to be adopted. There is the bridge proper, a viaduct, and a filled-in approach. A section of the bridge proper can be opened as a draw. Figure 1 shows a section of the draw. The upper part is occupied by a railroad. Figure 2 shows

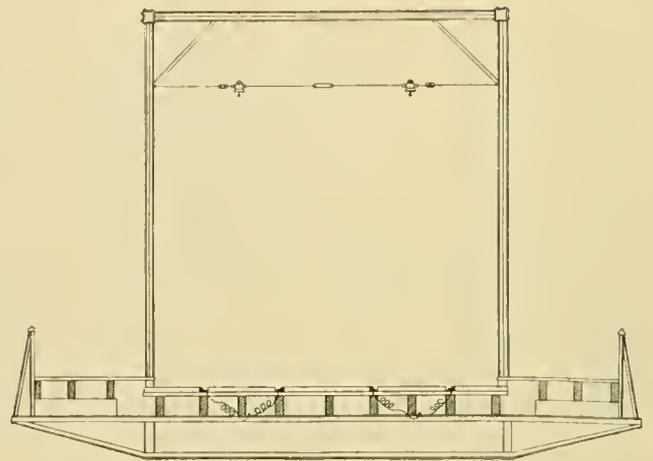

FIG. 3.—OVERHEAD CONSTRUCTION ON VIADUCT SPAN.

the method of hanging trolley wire from a 2x8 hard pine stringer. On the through spans of the viaduct a span

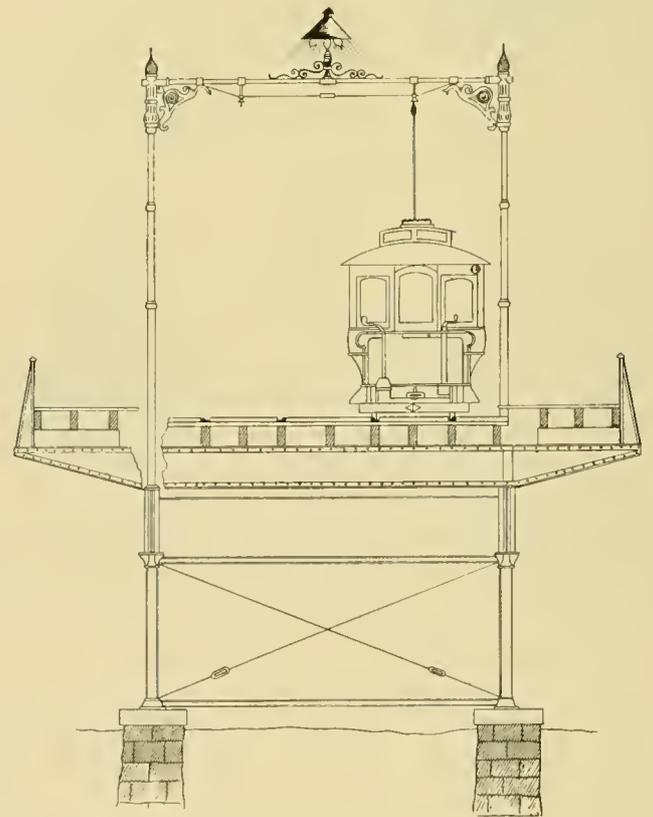

FIG. 4.—GAS PIPE ARCH ON VIADUCT.

wire construction as in Figure 3 is to be used. Figure 4 is the style to be used on a portion of the viaduct, the wires being suspended from ornamental gas pipe arches.

THE ambitious schemers for an underground railway in Chicago, are proposing a subterranean, four-tracked, electrically operated belt line to unite the elevated roads. The capital stock is placed at \$15,000,000, and the men interested as incorporators and directors are: Marcus Polasky, Morris Messenger and William M. Northrop, of Chicago, William Llewellyn, of Seattle, Wash., and A. M. Low, of Detroit, Mich., and the company is called the Chicago Central Sub-Railroad Company.

## MUNICIPAL PURCHASE OF ENGLISH TRAMWAYS.

By R. S. Tresilian, Assistant Secretary Dublin United Tramways.

The question of the purchase of the various tramway lines has again come prominently forward on the English side of the water, owing to a decision of the High Court of Justice which has just been pronounced, and which is likely to upset the calculations of those municipal authorities who thought they were going to get hold of paying concerns at, as the saying is, "the price of an old song," and a short outline of the facts as they stand at present may be interesting to readers, as contrasting the procedure in the two countries.

In the year 1870 a general tramway act (which, however, does not apply to Ireland, that country having been provided for under a previous act), was passed, and provisions were therein enacted that after the expiration of twenty-one years from the inauguration of any tramway, the municipal authority or authorities within whose jurisdiction the lines were constructed might, if it seemed well, notify the owner of its or their intention to buy, and forthwith the owner was bound to sell the whole of its undertaking at a price to be agreed on, and if not agreed on, to be settled by an arbitrator appointed by the Board of Trade; and it was enacted that this, in fixing the price to be paid, was to estimate "the then value" of the undertaking, making no allowance for past or future profits, or taking any other matter into consideration. The clause enacting this is so curiously worded that the first case was eagerly looked forward to by the tramway world, as establishing a precedent for future guidance, and, it was hoped, establishing the reading of a doubtful paragraph in the act.

The London Street Tramway Company were lately notified by the London County Council that they would, under the provisions of the aforementioned act, be required to sell their undertaking, and as the two bodies could not agree as to price, Sir F. Bramwell, C. E., was appointed arbitrator by the Board of Trade. On the hearing of the case he refused to hear any evidence as to the profits being earned by the company, either present, past or future, or as to the rental value of the lines, and gave an award, stating it was based on what sum it would at the moment cost the company, or the county council, to construct a new line, adding to that the sum it had originally cost the company to obtain powers (parliamentary and preliminary expenses), but deducting a certain allowance for depreciation, taking this to be the "then value" named in the act, and as the total sum awarded, £64,000, was only about one-third of that claimed by the company, this award was not accepted, and the company appealed on motion to the High Court to set aside the award, or to remit it back to the arbitrator with instructions that he should hear evidence of the rental value of the lines (stated by the company to be over £10,000 per annum).

This motion was heard a few days ago, and the Court, an exceptionally strong one from a legal point of view, has upheld the company's contention and referred the

case back to the arbitrator to fix a rental value, stating that the act never contemplated that the municipalities were to purchase valuable going concerns at the price of old iron, and that the words the "then value" contemplated much more than the county council thought, or perhaps wished to persuade themselves they thought.

This view was ridiculed by some of the Radical papers in London, whose whole wish seemed to be to urge the county council to buy the tramways, in order to provide free traveling for the masses; it is not at all unlikely that, owing to the interpretation of the Court, the municipalities, if they wish to buy, will have to pay a fair and reasonable price for the undertakings, and shareholders will not be mulcted out of their capital, which though now perhaps earning a fair dividend, was in the early days of tramway enterprise anything but remunerative.

DUBLIN, March 1894.

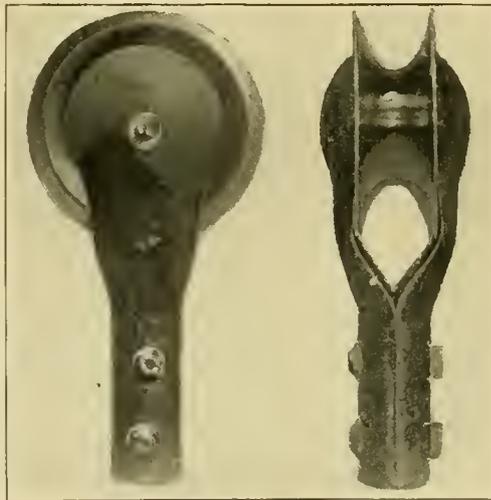

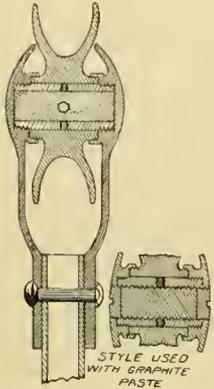

## AN ELECTRIC FRUIT LINE.

The country along the south shore of Lake Ontario, from Hamilton east, a distance of 22 miles to Beamsville, is noted as the garden of Canada. It is one of the finest fruit raising districts in the world, being protected on the south and west by the high ridge of table land which was the original cause of Niagara Falls and having the lake to steady the temperature. The district is at present traversed by the Grand Trunk Railroad, which however furnishes no adequate service for so important an industry. The Hamilton, Grimsby and Beamsville Electric Railway, now building runs east from Hamilton, through the above named towns and expects to do an extensive fruit business. By bringing fruit into Hamilton, good connections can be made with large cities over the country, especially with Toronto, which is only 3½ hours distant by lake steamer. The motor cars will be 28-foot vestibuled, with double McGuire trucks. The express and fruit cars will be 16-foot. There will also be a number of 36-foot double truck open trailers and 28-foot closed trailers to carry the crowds that will seek Grimsby Park. Beside this business there are 150 cans of milk to be carried daily to Hamilton from this district and also some general mail and passenger traffic now done by a stage line. A large building has been bought in the center of Hamilton for the purpose of a fruit market to dispose of the freight of the road.

"ELECTRICITY in warfare" is a familiar phase, but it took on a new meaning during a recent contest between the employes of the Brooklyn City Railroad Company and the deputy sheriffs of King and Queens counties, when an attempt was made to prevent hanging trolley wires on the Grand street bridge over Newtown creek. A deputy tried to arrest a workman, but the railway people were prepared for emergencies, and Foreman, McManus, arranged to touch up the deputy with the bare end of a live trolley wire. After several shocks the deputy let go and was helped off the scene of action.

## WALKER'S NEW DESIGN TROLLEY HEAD.

For some time rumors have been afloat that Superintendent I. B. Walker, of the Sioux City Street Railway, had designed a trolley head that was a model of simplicity and durability. We present herewith, a few illustrations of the device, and we think that our readers will agree that the rumor was not without foundation in any particular. Not including the wheel, this head consists of only four parts, viz.: the two halves of the harp, the journal or pin, and the bolt fastening the harp to the pole. There are no sharp corners or projections, and the whole harp presents a smooth, rounded surface. The journal is a case hardened steel tube of 1-inch outside diameter, and  $\frac{3}{4}$ -inch inside diameter. It is filled with dry graphite, which is allowed to escape and lubricate the bearing through four  $\frac{1}{8}$ -inch holes bored 90 degrees apart at the middle of the pin. If it is preferred to use graphite paste, a pin is used having screw head plugs in the ends. The feed is accomplished by giving the plugs a slight turn every night. Mr. Walker finds the dry graphite perfectly satisfactory and less trouble than the paste. The form of the harp

makes it almost indestructable. It was originally built with two bolts holding it to the pole, but one has been found sufficient, as the two halves are held firmly together by the journal. When a wheel is put in, the head needs no more attention until the wheel wears out. Judging from a five months use of this wheel, a harp will last two or three years. The ten to fifteen thousand miles run which will wear out a trolley wheel, causes a slightly perceptible wear on the bearing surface of the harp. The simplicity, strength and compactness of this head are great points in its favor.

## SNOW PLOW ON THE MOUSAM RIVER ELECTRIC LOCOMOTIVE.

The accompanying engraving shows the electric locomotive of the Mousam River Railroad, fitted with the snow plow. A full description of the road and locomotive can be found in the REVIEW for January. E. K. Day, superintendent, writes that they have not been stalled this winter and have lost no trips, being the only

electric road in Maine not blocked during a part of some day. The locomotive hauled during the year ending March 1, over 19,000 tons of freight, and 124,000 passengers were carried, being a good business for a line largely dependent on industrial operations, which were closed a good part of the year. Since our description of this road appeared, Mr. Day has received inquiries from all over the country, manifesting great interest in the road.

## WHAT FOOLS THOSE MORTALS BE.

A tall woman, heavily veiled, mounted the steps of a South Chicago City Railway car. It was while the small pox scare was at its height and everybody was rather gingerly watching his neighbor. Her veil finished it.

She sat down composedly, without raising the heavy curtain that obscured her features. The man next her edged away and whispered, "Ain't it awful?" Everybody was now on the qui vive and finally a nervous woman called a stop and bolted for the door. That settled it. Everybody was sure the woman's features beneath the veil must be bloated and noisome from the epidemic and a general exodus began.

It was then the lady raised the veil and nobody but the conductor and one passenger saw an alabaster complexion, large, dreamy black eyes, rosy cheeks and a double row of small white teeth displayed by amused and smiling lips.

She looked at the sole brave passenger and said, "I guess those people are afraid of me!"

THE street railway employes of St. Louis have organized in the K. of L. organization.

HITCHING ON ORDINANCE AT ALLEGHENY.

Superintendent Foster of the Federal Street and Pleasant Valley Railroad, Pittsburg, sends us a copy of a recent manifesto of the city council of Allegheny, which was found such good reading matter that the company printed an extra thousand copies. In the interest of publicity and promotion, these placards are prominently pasted along the route every week or two. Following is a copy:

# AN ORDINANCE

## Relative to jumping on or hanging on Street Cars while in motion.

Section 1. BE IT ORDAINED AND ENACTED BY THE SELECT AND COMMON COUNCILS OF THE CITY OF ALLEGHENY, AND IT IS HEREBY ORDAINED AND ENACTED BY AUTHORITY OF THE SAME, That on and after the passage of this ordinance it shall be unlawful for any person or persons to jump on or hang on to street cars in the City of Allegheny while in motion, for the purpose of obtaining a ride thereon without paying his or her fare. All persons so offending shall be subject to arrest, and upon conviction thereof before any Police Magistrate or the Mayor, shall be subject to a fine of not less than one (\$1.00) dollar, nor more than five (\$5.00) dollars, and in default thereof committed to the county jail for not less than twenty-four (24) hours, nor more than five (5) days.

Sec. 2. That so much of any ordinance as may conflict with or be supplied by the foregoing, be and the same is hereby repealed.

SUNSHINE IN SEATTLE.

Superintendent Hass, under date of March 21, writes us as follows:

"On page 129 of March 15 Review, you say only forty days, until the festive summer cars will begin to make their debut, but each one deserves a thorough overhauling in the meantime."

The Seattle City Railway, "calls" you, and says that on the date above written, our summer cars made their debut for the spring of 1894, under one of the balmy skies of this glorious northwest, amid scenery that you could not help but admire, to the east, the snow capped Cascades, to the west, the Olympics, in their sublime grandeur, to the south, 65 miles away, old Mount Rainier lifts its 14,444 feet of majesty, with its summit ever crowned with snow, while to the north, Mount Baker

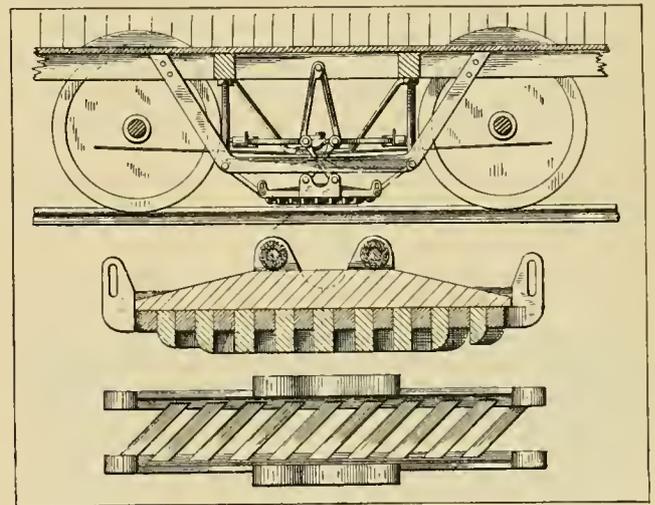

keeps its eye on our Canadian neighbors to catch the first move for annexation with Uncle Sam. The waters of Puget Sound, bathe the western and Lake Washington the eastern limits of our beautiful Queen City of the Northwest, our own Seattle. Lesche Park is carpeted in green, be-studded with many colored crocus, pansies, daisies and violets, which will soon give way to a most beautiful display of tulips and other early flowers.

The "Zoo" is in good shape, and already the travel has set in to see and enjoy the same. The open cars are all in fine shape for use, and the public say they are the finest in the city, manned by the most polite and courteous conductors and gripmen in the country.

My compliments to Decatur, Ill., on her second of March open cars, we must be a close second.

THE LAWRENCE TRACK BRAKE.

A new track brake for street cars is herewith illustrated. It is the invention of William Lawrence, of Worcester, Mass., and is intended to be used in connection with the Kane brake. The shoe consists of a frame of cast metal with diagonal slats, into which are inserted removable wedges, set securely in the frame and diagonally to the track. The end pieces are rounded. The details of the toggle mechanism are readily seen from the illustration.

The advantages claimed for this shoe by the inventor are: Economy, because the bearing sections may be easily removed when worn out; adequate bearing surface to the rail and sureness of contact, as the diagonal arrangement pushes obstructions, snow and ice from the rail. "The brake and shoe have been used on 6, 8 and 10 per cent grades at Worcester, Mass., and stopped the trains without the use of any other brake," says the inventor. It is however, intended primarily to be used in conjunction with a wheel brake.

The Chicago General Street Railway Company has made a communication to Mayor Hopkins, offering to co-operate in establishing a 4-cent fare throughout Chicago.

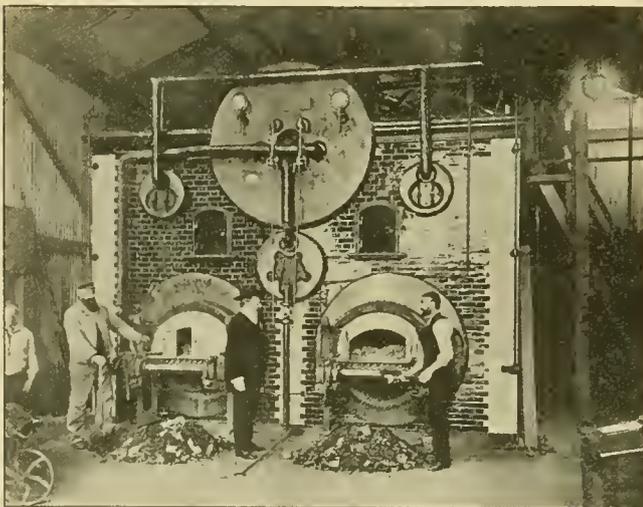

REFUSE BURNING IN POWER PLANTS.

The question of refuse burning has never been brought to the attention of power users in this country to any great extent. This is partly because of the proverbial American wastefulness and partly because of the few cities where refuse amounts to enough and is of the proper quality to admit of burning it for power purposes.

THE PLANT AT NIGHT.

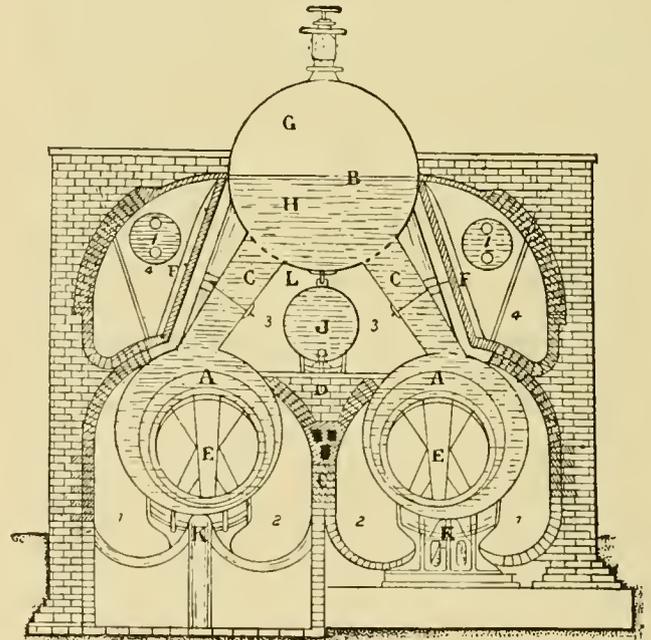

Garbage crematories, where the refuse of a city is disposed of at considerable expense, are becoming common, and the question of making steam by the burning of refuse is beginning to receive some attention. It is evident that if garbage is to be burned, the heat incident to the process might as well be utilized as to go to waste. For years the Chicago City Railway burned manure from its stables (where shavings were used for bedding) under the boilers of its cable plant at 2020 State street. From the standpoint of economy it was a great success, as otherwise the refuse had to be shipped into the country.

FRONT OF BOILER.

About 20 per cent of coal was mixed with the manure. The mixture was fired by hand, as mechanical stokers had not at that time been installed. A fan blower was used, which kept a pressure in the fire boxes of 2 to 3

pounds. Although a great success economically, the smell was such that objection was raised and the practice had to be stopped. Just now the Livet system of refuse burning is attracting attention here and in England. The principle of Livet's steam generator as it is called, is that the size of the flues is gradually increased from the furnace to the chimney. The object of this construction is to give a high velocity to the air going through the furnace bars, without losing a great amount of heat up the chimney. The gases under this arrangement are given a constantly decreasing velocity as they travel toward the stack, owing to the increasing cross section of the passages. We present herewith a sketch of the boiler showing it in section. The fire is located as in a Cornish boiler, in the space E. The gases pass to the back of the boiler and are conducted back and forth through flues 1, 2, 3 and 4, in the order named. Two 100-horse-power furnaces have been running for six months at Halifax, England, in an electric light plant.

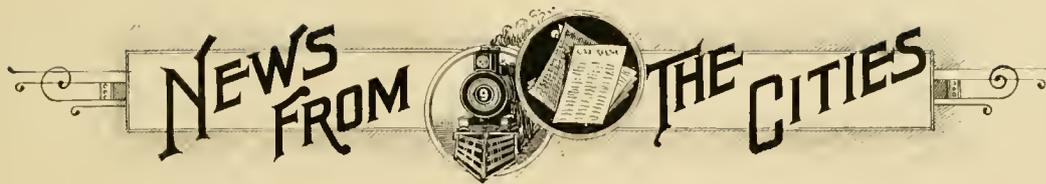

SECTIONAL VIEW FURNACE AND BOILER.

Nothing but rubbish is used in the furnace. It is stated that the cost of one indicated horse-power per annum, using coal in that neighborhood, is \$45, and with this furnace and the use of rubbish is \$15. Our engraving represents the Halifax plant at night.

A RACK railway is projected for the ascent of Ben Nevis, the famous Scotch mountain. The undertaking will use \$150,000 but it is expected that the tourists will then number 20,000 per annum. The maximum gradient will be 1 in 3 for 600 yards. The total length will be one mile.

THE Montreal (Canada), Park & Island Railway is now complete to Sault au Reclot. It was planned by the Williams-Corriveau syndicate, which transferred its franchises to the present company.

## Alabama.

**MONTGOMERY, ALA.**—The Montgomery Street Railway will relay old lines and put in eight miles of new. The whole system will be made electric.

**MOBILE, ALA.**—Mobile Street Railway Company elects: J. C. Morris, New Orleans, president; F. J. Gasquet, New Orleans, vice-president; R. Semmes, Mobile, treasurer, and general manager, and R. B. Owen Jr., secretary.

## Arkansas.

**FORT SMITH, ARK.**—Calvin S. Brice and other Ohio men are interested in the million-dollar trust deed filed by the Fort Smith and Van Buren Electric Street Railway, Light & Power Company to the Continental Trust Company of New York. It will provide for great improvement.

## California.

**OAKLAND, CAL.**—The board of supervisors has granted a franchise for an extension on the San Leandro & Haywards line.

**POMONA, CAL.**—Reports that the electric railway scheme has been abandoned are denied, and it is said the line is to be put through soon.

**SAN FRANCISCO, CAL.**—The court has decided that the trolley may be used on Mission street. This is a victory of the Market Street Cable Company over the city.

**SAN FRANCISCO, CAL.**—Oakland, San Leandro & Haywards Electric Railway, records mortgage of \$250,000 in favor of the California Title & Trust Company, to secure bonds.

**REDLANDS, CAL.**—There is some prospect of a belt electric line being built in Redlands. Power will be used from the Light & Power Company's plant. Eastern parties have just bought \$40,000 stock in the latter.

**SAN FRANCISCO, CAL.**—Frank Simpson retires from the superintendency of the San Francisco and San Mateo Electric Railway, and Behrend Joost takes the place of general manager as well as president. New lines and extensions are to be built.

## Colorado.

**PUEBLO, COL.**—The State Trust Company of New York asks the federal court for the foreclosure of a trust deed to secure payment of \$500,000 first mortgage bonds of the Pueblo City Railway.

**DENVER, COL.**—D. H. Moffat, president of the First National Bank, J. C. Montgomery and J. B. Thompson, of Chicago, are reported to be negotiating the purchase of the Detroit, Mich., Street Railway franchise. The city claims the old franchise with the Detroit Citizens expires this year.

## Connecticut.

**BRIDGEPORT, CONN.**—Col. Hest has notified the council that his company will be ready to begin the construction of the electric system in about a week.

**NEW HAVEN, CONN.**—Edgewood Street Railway Company, Fred S. Wardwell, president and general manager, wants bids on two and a half miles of line material. The company has charter for five miles of road from center of New Haven to Westerville.

**NEW HAVEN, CONN.**—The officers of the Manufacturers Street Railway Company are: President, George S. Barnum; vice-president, N. W. Kendall; secretary, F. L. Bigelow; treasurer, S. J. Fox. They will build a street railroad for freight hauling to the factories owned by the men who will build the road.

## Chicago.

**CHICAGO.**—The West & South Towns Street Railway files specifications of damages to the amount of \$600,000 against the West Chicago Street Railroad Company.

**CHICAGO.**—Judge Tuley dismisses the Vanderpool injunction against the Twenty-second street line. It may now be finished. C. L. Bonney, Tacoma Building, president.

**CHICAGO.**—J. W. Casselman, of the North Side Electric Railway Company, says that the road, if franchise is granted, will be built by the men behind the Jefferson Street Railway.

A new elevated railway ordinance is introduced into council by Alderman Finkler. The company is called the Chicago North Division Elevated Railway.

**CHICAGO.**—The Chicago & Morgan Park Electric Railway Company, files incorporation to build from the city to Morgan Park & Blue Island. Stock \$500,000, incorporators, B. Frank Deacon, Charles S. McCoy, Samuel P. Hubbard, Frank Foster and Ralph Bogle, all supposed to be of Chicago. The Chicago City Railway franchise has been passed over the mayor's veto, but incorporating some of his suggestions for amendment. The rights cover about 100 miles and do not compel the lighting of the streets, vote was 51 to 11.

**CHICAGO.**—The ordinances introduced into the city council asking for extension trolley franchises for the City Railway have been passed. The lines granted trolley rights are: Twenty-sixth, Thirty-first, Thirty-ninth, Fifty-first streets; Archer avenue, from State to Thirty-eighth street, thence to the terminus; Forty-third, from the eastern terminus to State along Root street to the terminus; Halsted street, from Archer avenue to the southern terminus; Ashland avenue, from Ashland avenue to the southern terminus; on Hanover and Wallace streets; on State street and Sixty-third street south to its intersection with Vincennes avenue, and thence to the terminus. Poles are to be between the tracks, Indiana avenue excepted.

## Illinois.

**AVON, ILL.**—The Milling Company wants to build a commercial electric tramway to carry fire clay.

**LA SALLE, ILL.**—The City Electric Railway will build a one-mile loop this spring. A. G. Danas is general manager and purchasing agent.

**PICKNEYVILLE, ILL.**—Incorporated: The Pickneyville Street Car Railroad Company; capital stock, \$4,000; incorporators, Herman C. Henke, Philip Gruner, Henry Driemeyer, H. P. Huntsinger, and W. K. Murphy.

**DIXON, ILL.**—President J. S. Ticknor and H. B. Andrews, of Rockford; M. K. Bowen, superintendent of the Chicago City Railway, and Clift Wise, of the Complete Electric Construction Company, Chicago, have held conference with citizens in regard to the Rockford-Dixon Electric Railway. Work will begin soon.

**QUINCY, ILL.**—A citizens' committee, consisting of Charles T. Hayward, Dr. D. H. Shields, Judge Jasper Turner, Hon. J. C. B. Thomas, of Palmyra, and Col. H. A. Buchanan, of Philadelphia, met recently to consider the building of an electric road between Quincy, Hannibal and Philadelphia. Such a road is said to require a \$200,000 investment.

## Indiana.

**MARION, IND.**—Howard Cale has been appointed receiver of the Queen City Electric Railway.

**INDIANAPOLIS, IND.**—City Attorney Scott is preparing a complaint against the Citizens' Street Railway Company urging that the company be ejected from the streets.

LAFAYETTE, IND.—Permission is granted J. Levering Jones, of Philadelphia, to extend the Lafayette Street Railway into the fair grounds. The work is to be completed by June 1.

NEW ALBANY, IND.—John McCloud has been made receiver for the New Albany Street Railway Company, which has been declared insolvent, having defaulted interest on \$150,000 bonds.

MICHIGAN CITY, IND.—F. H. Root, manager of the Lake Cities Electric Street Railway Company, says the change of horse to electric traction will begin soon. Power house will be built here. Some supplies bought.

INDIANAPOLIS, IND.—Leon O. Bailey, Dr. R. C. Light et al, have returned from the East, where a consultation has been held concerning the Broad Ripple road. The Farmers' Electric Railway Company and the Citizens' Street Railway Company are both after the franchise also.

RICHMOND, IND.—It is reported that the electric road now in receiver's hands, is in danger of collapse. The Union Trust Company, of St. Louis, foreclosed some time ago on a \$212,600 mortgage, and now the court admits a General Electric claim of \$32,000 and the Cambria Iron for \$5,000; City also claims \$15,000.

INDIANAPOLIS, IND.—In the receivership of the Marion Street Railway Company, Judge Woods has allowed Chas. B. Catting, E. Packard, et al., trustees of \$60,000 of the company's bonds; Metropolitan Trust Company and the General Electric to file cross bills for foreclosure of mortgage. Permanent receivership decision reserved.

### Iowa.

DAVENPORT, IOWA.—D. A. McGugin, of this city, railroad construction contractor, will receive bids on oak ties for a street railway line.

SIoux CITY, IA.—The South Sioux City Street Railway will enter the city via the Pontoon bridge, and will electrify entire line and extend to Crystal park.

KEOKUK, IA.—Judge Banks orders Gate City Street Railway to be sold in four weeks, foreclosing mortgage securing \$85,000 in bonds held by Central Trust Company, of New York.

SIoux CITY, IA.—Execution is issued against the Sioux City Street Railway Company in favor of the Fidelity Loan & Trust Company, on a judgment of \$563,000. Property will be sold in three weeks. Bondholders propose to organize a company and operate the road.

SIoux CITY, IA.—A mortgage for \$400,000 has been filed by the Consolidated Street Railway Company to William Tod, of New York. This means change of cable to electricity until such time when traffic shall warrant resumption of cable.

SIoux CITY, IA.—Form of decree granting foreclosure against the elevated railway is complete. Claims are declared a lien in this order: Unpaid court costs; receiver's bills of J. A. Jackson, \$1,925; fees of receiver's attorneys, \$2,000; receiver's accounts and certificates, \$1,334 and \$15,000 respectively; Kings Bridge Company, mechanics' lien, \$9,465; Northern Car Company, mechanics' lien, 10,008; other liens \$7,000; Manhattan Trust Company, mortgage, \$302,906; Railway Equipment Company's claim continued for further hearing.

### Kentucky.

NEWPORT, KY.—The Evergreen & Newport Electric Railway will begin construction within a few weeks.

HENDERSON, KY.—The Henderson Street Railway will put in three and one-half miles of electric road this spring.

NEWPORT, KY.—Newport & Evergreen Cemetery line contract has been let to M. J. Degnan & Co., of Cleveland, O.

COVINGTON, KY.—South Covington & Cincinnati Street Railway Company, is arranging to build a fine summer resort at Ludlow Park.

### Louisiana.

NEW ORLEANS, LA.—The St. Charles Street Railway franchise is extended for twenty-five years, and the line is to be operated electrically. Bids will be asked for the privilege by the city.

### Maine.

AUGUSTA, ME.—Augusta, Hallowell & Gardiner Electric Railway reports earnings, gross, \$41,348; total expenditures, \$27,463.

BANGOR, ME.—Chartered: the Bangor Electric Light, Heat & Power Company at \$30,000 by Milton Flory, B. F. Miller, David Huddleson, Thomas Dichett, John H. Werner, Bangor; William Bray, East Bangor.

### Maryland.

BALTIMORE, MD.—A senate bill is engrossed authorizing the Baltimore & Washington Transit Company and the Edmonson Avenue, Catonsville & Ellicott City Electric Railway Company to consolidate as the Baltimore & Washington Electric Transit Company.

BALTIMORE, MD.—Incorporated, the Randallstown, Granite & Harrisonville Electric Railway. The incorporators named are James W. Offutt, Edward W. S. Choate, R. P. Choate, Aaron Weber, Dr. H. J. Hebb, Henry C. Luttgerding, Albert Weber and George E. Lynch. The capital stock is \$50,000.

BALTIMORE, MD.—The Baltimore & Loretly Railway Company is incorporated to build extensive suburban electric system and to connect with Baltimore railways. Incorporators named are: J. F. Waggaman, of Washington; Walter Townsend, of Baltimore county; Robert D. Carter, Harry Hebden, D. C. Bennett and A. J. Robinson, of Baltimore city.

BALTIMORE, MD.—A new electric line from here to Washington is contemplated. The incorporators of the new company are: Dr. Francis Thomas of Montgomery County; Harper Carroll, of Howard County, George Yeakel, of Baltimore County, and Alexander Brown, Samuel E. George, N. W. Williams and Henry W. Williams of Baltimore. The capital stock is \$1,000,000. This is not the "boulevard line."

### Massachusetts.

SPRINGFIELD, MASS.—The Springfield Street Railway has begun work on its new Margaret street power house.

BOSTON, MASS.—The West End Street Railway will extend to Somerville this spring. The Highland avenue line will also be extended to Davis square.

NORTHAMPTON, MASS.—The Northampton Street Railway Company is making moves to run branches to Easthampton and Williamsburg this year.

BOSTON, MASS.—It is reported that the General Electric will furnish \$1,000,000 worth of machinery to the Cataract General Electric Company, of Niagara Falls, N. Y.

SPRINGFIELD, MASS.—The Springfield Street Railway has filed a petition with the city clerk for a location of its route from the Liberty street terminus to Chicopee Falls.

NEW BEDFORD, MASS.—The contract for building the Dartmouth & Westport Electric road has been let to Arthur Hodges, of Boston. To be finished by June 20.

HAVERHILL, MASS.—The Lowell, Lawrence & Haverhill employes form benefit association. President, James H. Forum, Haverhill; secretary, Harry Holmes, Lawrence.

SOUTHBRIDGE, MASS.—Contracts are being arranged to build the Southbridge, Sturbridge & Brookfield Railway between the points named, thirteen miles; president, Frederick D. Fisk, of Boston, and Samuel L. Minot, of Boston, engineer.

### Michigan.

DETROIT, MICH.—The City & Suburban has secured all of its franchise, from the city limits to St. Joseph's retreat

ANN ARBOR, MICH.—Efforts to consolidate the Ann Arbor and Ypsilanti lines are finally abandoned, as no agreement was reached.

NEGAUNEE, MICH.—The Negaunee & Ishpeming Street Railway and Electric Company holds its annual meeting April 16, at Negaunee.

BATTLE CREEK, MICH.—There seems to be little chance of the Battle Creek Electric Railway starting up this summer. The finances of the road are in a bad tangle.

DETROIT, MICH.—P. J. Jacobson, of Detroit, and J. A. Dawson, of Toledo, O., say that the Detroit-Toledo Electric Railway will soon be running.

DETROIT, MICH.—Another syndicate, this time of New Yorkers, is said to be after the Detroit franchise. John B. Corliss and Henry M. Duffield are said to be the promoters.

GRAND RAPIDS, MICH.—The long talked of electric line to North Park will now probably be built by the Consolidated Street Railway Company, which will change the dummy line to electricity.

GRAND RAPIDS, MICH.—Consolidated Street Railway Company has begun work on the North Park line, changing it to electricity. The summer resort business will be extensively worked this summer.

DETROIT, MICH.—An agreement is said to be effected between the Citizens Street Railway Company and the city, by which the company grants eight tickets for twenty-five cents, five-cent single fare, and eventual municipal ownership of street railways. There is no confirmation of the story from the company.

DETROIT, MICH.—The Detroit & St. Joseph's Retreat Electric Railway Company will be known as the City & Suburban, and is incorporated by Elwood T. Hance, John A. Russell, J. E. Sullivan, John C. Calahan, Charles C. Kellogg and William P. Lane. The railroad will be known as the City & Suburban Traction Company.

## Minnesota.

STILLWATER, MINN.—The date set for the sheriff's sale of the Stillwater Street Railway is May 7.

STILLWATER, MINN.—It is rumored that local capital will reorganize and work the Stillwater Street Railway, which will soon be sold at Sheriff's sale. Judgment is for \$67,709.

DULUTH, MINN.—The City Railway Company, of Duluth, is officered as follows: Andrew H. Burke, president; Henry E. Harris, secretary and treasurer. Financial backing is secured and the city franchise has good prospects.

MINNEAPOLIS, MINN.—Master Mechanic William Cooper has resigned from the Twin City's Company. The work will be divided at present, Assistant Master Mechanic Keister taking part. Mr. Cooper goes to Brooklyn, N. Y.

DULUTH, MINN.—Receiver J. P. Johnson, of the Tower & Soudan Street Railway, finds nothing to receive, and asks to be allowed cease operation of road, which, he says, is absolutely worthless and mortgaged for \$25,000 to the American Loan & Trust Company.

## Missouri.

ST. LOUIS, MO.—Lindell Electric Railway Company has bought 18,000 ties, and will immediately push proposed extensions.

ST. LOUIS, MO.—The Fourth Street & Arsenal Street Railway is about to change from horse to electricity.

ST. LOUIS, MO.—Clayton & Creve Coeur Railway Company has applied for a franchise to construct electric railway line between points named.

NORTH KANSAS CITY, MO.—The Kansas City Street Railway is owned by the Kansas City & Atlantic Railroad Company. It is not being operated at present, but will probably start again soon.

ST. LOUIS, MO.—J. H. Bobring has secured a franchise for an electric road to the park to be built by the Central Sharp Shooters' Association. It will be operated as a branch of John Scullin's Carondelet line.

SPRINGFIELD, MO.—Springfield-Robberson Avenue Electric Street Railway is sold by sheriff for \$5,500 to local capitalists, who will immediately push construction and improvement to make it a rival to the Metropolitan line.

ST. LOUIS, MO.—At its next session the County Court will consider the application of the Clayton & Creve Coeur Railway Company for a franchise to construct and operate an electric railway between Clayton and Creve Coeur Lake.

KANSAS CITY, MO.—Waldo Land & Investment Company is formed to buy 600 acres from 47th to 76th streets and build a boulevard electric line of three miles. Eli S. Young, president; Willard E. Winner, secretary. Cincinnati capital.

ST. LOUIS, MO.—It is reported that W. L. Johnson, of the South St. Louis Electric Express Company, has retired to take charge of Cincinnati street railway property owned by himself and brothers A. L. and Tom Johnson, of Cleveland, O.

ST. LOUIS, MO.—J. B. Case, L. R. Blackmar, S. F. McCormick and other well-known capitalists have taken charge of the Manchester Road Electric Railway and a Land and Improvement Company. They will complete the railway immediately.

KANSAS CITY, MO.—Incorporated: Kansas City & Waldo Railway, of Kansas City. Capital, \$150,000. Incorporators: W. E. Winner, George Law, E. S. Young and others, to construct a railway from Kansas City to Waldo Junction, a distance of five miles.

KANSAS CITY, MO.—Judge Henry has appointed Robert Gillham receiver for the Northeast Electric Street Railway Company, owing to the pressure of the Westinghouse Electric & Manufacturing Company with a claim of \$20,000 against the road. The request was made by the officers of the road.

ST. LOUIS, MO.—The Union Railroad Company, the Northern Central Company, Citizens' Railway Company, the Cass Avenue & Fair Grounds, united in the National Railway of Chicago, elect directors as follows: D. G. Hamilton, C. L. Raymond and George P. Smith of Chicago and Robert McCulloch, Smith P. Galt, C. N. Duffy and Henry Crosman, of St. Louis.

KANSAS CITY, KAN.—Merriam Park, Rosedale & Kansas City Railroad Company files amended charter to build six and one-half miles of road. Capital stock, \$50,000. Officers: A. A. Rearson, president; B. F. Hollenback, vice-president; T. J. Wilson, secretary; and C. W. Brown, treasurer.

The West Side Street Railway Company will improve Brown Park and add summer attractions. This is in Kansas City, Mo.

ST. LOUIS.—The board of public improvements has approved the plans of the Grand Avenue Railway and construction will, it is said, begin within two months. The officers of the company are St. Louisans: C. G. Stifel is president; J. W. Buel, vice-president, and Edwin H. Conrades, secretary and treasurer. The other directors are J. G. Butler Edward Taussig, D. P. Slattery, E. C. Donk, J. E. McKeighan, Thomas Halpin and George O. Carpenter.

## Montana.

ANACONDA, MONT.—The Gravity Cable Way & Transportation Company is figuring on the construction of three miles of cable way, southwest of this city, for hauling cordwood.

ANACONDA, MONT.—The Anaconda (Mont.) Electric Railway, Light & Power Company, C. R. Holmes, superintendent, is in the market for one 30 or 50-arc-light machine, with full equipment, including lamps. They are in a big hurry and want full particulars, prices, and everything to enable them to judge whether writers have what is wanted. No time for lengthy correspondence. This plant is for lighting the new converter of the company, and noise of lamps is no objection. Must know how soon shipment can be guaranteed.

## Nebraska.

SOUTH SIOUX CITY, NEB.—The South Sioux City Electric Motor Street Railway, of which Frank Hunt is president, J. P. Twobig, treasurer, and C. D. Smiley secretary and general manager, will build three miles additional at once, either horse or electric.

## New Jersey.

JERSEY CITY, N. J.—The North Hudson County Railway Company gets extensive franchises in this city.

PLAINFIELD, N. J.—The Street Railway Company elects: President, Thomas Nevins; vice-president, Dr. J. T. Fritts; secretary and treasurer, Chandler Riker.

BRIDGETON, N. J.—The new car house of the South Jersey Traction Company has been wrecked by a storm. Three new motor cars smashed.

WOODBURY, N. J.—The Camden, Gloucester & Woodbury Electric Railway Company has made formal application for the extension of the road through this city.

JERSEY CITY, N. J.—The new officers of the Consolidated Traction Company have been elected with the following management: Executive committee, Edward F. C. Young, M. R. Shanley and B. Naughton; director general, M. R. Shanley; general manager, David Young.

PLAINFIELD, N. J.—The Plainfield Street Railway Company elects the following officers: President, T. N. Nevins; vice-president, T. J. Fritts; secretary, Chandler W. Riker; directors, James Jackson, J. M. Hetfield, Cortlandt Riker, T. N. Nevins, Jr.; superintendent, Mr. Adleman. The matter of extension was not discussed, and nothing will be done for the present. The condition of the system was reported to be excellent.

### New York.

GLOVERSVILLE, N. Y.—Fire guts building of the Cayadutta Electric Railway.

CHARLOTTE, N. Y.—The Grand View Beach Railroad has decided to build a new power house to replace the one burned some time ago.

SYRACUSE, N. Y.—The Syracuse Electric cars are to be equipped with life guards.

BUFFALO, N. Y.—F. O. Rusling appoints W. A. Reddy assistant superintendent of the City lines.

HOMER, N. Y.—Cortlandt & Homer Street Railway will change to electricity. Rights to change are being acquired.

NEW YORK CITY.—The Jarvis-Conklin syndicate reorganization committee represents 75 per cent of the assets and is at work reorganizing.

OGDENSBURG, N. Y.—Ogdensburg Street Railway, five miles horse, seven cars, is for sale. H. B. Hickok, superintendent; W. H. Daniels, president.

SYRACUSE, N. Y.—Consent of the necessary number of property owners has been obtained for the installation of the trolley on the People's Railroad.

NEWBURG, N. Y.—Newburg Electric Railway contracts with P. Delaney & Company for power plant. The Dixon Steam Engine Works will build the engines.

WATERLOO, N. Y.—The Highway Commissioners have granted the Seneca & Waterloo Electric Railway right to build a road through the turnpike. Construction will probably begin soon.

NEW YORK CITY.—A. W. Field, vice-president of the Peckham Motor, Truck & Wheel Company, has opened a Boston office at room 315, No. 53 State street, and will take charge of same.

ONEONTA, N. Y.—The Oneonta Street Railway, a horse line two and a quarter miles long (a good line to change to electricity), will sell to right parties. T. D. Tallmadge, Jr., is general manager.

BROOKLYN, N. Y.—Long Island Electric Railway Company is organized at \$600,000. The officers are: A. R. Hart, president; Charles H. Mullin, vice-president; Clarence Wolf, treasurer, and J. C. Von Arx, secretary.

NIAGARA FALLS, N. Y.—The Niagara Falls, Whirlpool & Northern Electric Railway has secured its franchise for fifty years for a trolley line to the northwestern part of the city. The line must be completed by October 1.

SYRACUSE, N. Y.—Preliminary steps are being taken to foreclose the Central Trust Company's mortgage on the Syracuse Consolidated Railway Company, given to secure \$1,250,000 in bonds. Louis Marshall, of Butler, Stillman & Marshall, is attorney for the Trust Company, and C. L. Stone for the receiver.

NEWBURG, N. Y.—Newburg Electric Railway Company incorporated at \$150,000, by George L. Nichols, George M. Huyett, William M. Tobias and Henry R. Newkirk, of Brooklyn; Harry C. Norton, B. B. Odell, Jr., Joseph M. Dickey, Wilbur H. Weston and William D. Dickey, of Newburgh. Road to be operated by July 4.

NEW YORK CITY.—The Long Island Electric Railway Company is incorporated, by Alex. R. Hart, Brooklyn; Chas. H. Mullin, Mount Holly Springs, Pa.; Chas. M. Cooper, G. W. Miller, Wm. H. English, et al., of New York; Clarence, Benjamin and Edwin Wolf, of Philadelphia; capital, \$600,000. Office at Fairport, Queens County, N. Y.

CANANDAIGUA, N. Y.—The consolidation of the Canandaigua Street Railway Company and the Canandaigua Electric Street Railway Company has ceased operation of horse cars and will equip entirely with electricity this spring. President, M. D. Munger; superintendent, C. J. Purdy.

NEW YORK CITY.—The Nassau Electric Railway Company of Brooklyn has let contract for 100 miles of city and suburban street railway. One half is to be completed by July 15. R. T. Wilson of New York, Congressman Tom Johnson and A. L. Johnson of Cleveland, and P. H. Flynn of Brooklyn are the principal capitalists interested in the new railway. W. A. Boland, of Boston, has the contract.

### North Carolina.

RALEIGH, N. C.—The Raleigh Street Railway Company will be sold at auction at the U. S. postoffice at Raleigh, April 14, 1894, to satisfy the Mercantile Trust & Deposit Company, of Baltimore. For particulars, apply to R. T. Gray, commissioner, Raleigh.

### Ohio.

AKRON, O.—The Akron & Cuyahoga Falls road has resumed construction.

TIFFIN, O.—Tiffin Electric Railway will probably extend to Port Clinton this summer.

JEFFERSON, O.—Stevens & Kinney, of Windsor, are here in the interests of the proposed Jefferson-Conneaut line.

DAYTON, O.—The City Railway Company has just purchased a site on the west side, on which it will erect a central electric power-house.

UTICA, N. Y.—Gentlemen interested in Utica belt line are considering a road to connect Utica with Oriskany.

WARREN, O.—W. H. Rosensteel has resigned his receivership of the Mineral Ridge & Niles Electric Railway, and W. H. Smiley is appointed in his place.

IRONTON, O.—Engineer R. T. Graves writes Superintendent Johnson, of the Ironton Railway that work will begin immediately on the Electric line here.

TOLEDO, O.—A new electric railway applies for right-of-way. Men interested are: J. H. Ainsworth, J. Ellery Eaton, W. G. Gardiner, J. A. Bick and J. A. Dawson.

TOLEDO, O.—The Toledo, Maumee & Perrysburg Electric Railway is incorporated at \$150,000, by J. K. Tillotson, Frank M. Ohl, Dustin Atwood and Norman McCarty.

CLEVELAND, O.—The Cleveland Moto: Company is incorporated at \$36,000, by G. D. Breck, E. R. Kelly, C. L. Saunders, F. I. Kuhn and F. L. Carter, to manufacture motors, cars, etc.

VERMILLION, O.—Mayor Cummings, H. S. Carter, Judge Steele and John Randolph, of Oberlin, have been here on business pertaining to the proposed Wakeman-Vermillion-Oberlin line.

YOUNGSTOWN, O.—Youngstown & Canfield Street Railway Company elects directors: J. H. Shields, W. P. Arms, J. W. Canfield, Samuel Ewing, John Delfs, John Fink and J. Cal Ewing.

CLEVELAND, O.—The Ohio Interurban Railroad Company is incorporated by James L. Saunders, Frank J. Lewis and William C. Scorer at \$200,000. It will build and equip street railways.

AKRON, O.—E. L. Babcock and T. F. Walsh of Cuyahoga Falls have been granted rights to extend the Akron-Cuyahoga Electric Railway into this city. The line will now be rapidly pushed.

YOUNGSTOWN, O.—A settlement was reached yesterday afternoon in the street car strike. The men agree to go to work at the old rate of wages, and will hold another conference soon to readjust the scale.

CINCINNATI, O.—Postmaster Hetch and the South Covington & Cincinnati Street Railway Company have agreed that the railway shall become a mail route.

AKRON, O.—Hon. Martin Dodge, Cleveland; H. S. Gray, Cleveland and General Hurst, of Chillicothe, are pushing the Cleveland-Akron Electric Railway.

TOLEDO, O.—The United States government has made a contract with the Robinson lines, whereby the mails may be carried on its cars. A mail car is in prospect.

MARION, O.—E. Durfee, E. Huber, Geo. Turner, Henry Strelitz, S. E. Barlow, and Godfrey Leffler, all of Marion, want a street railway franchise here, and intend to build this season.

CINCINNATI, O.—The Cincinnati Street Railway has bought site for its new power house, for which Engineer Bert Baldwin already has drawn plans. The house and equipment will cost \$250,000.

CINCINNATI, O.—There is a report that the Consolidated will build a line to the "Zoo" outright, in case the Mt. Auburn cable cannot be purchased. President Kilgour says that the line to Madisonville will be in operation by September 1st. It will be double tracked all the way.

NORWALK, O.—The Sandusky, Milan & Norwalk Electric Railway directors have decided to extend the West Main street line. Treasurer's report shows for past six months: Operating expenses, \$13,204; earnings, \$16,573; capital stock, \$100,000; bonds, \$100,000.

MADISONVILLE, O.—The local syndicate has made application for franchise here. The men are: Chas. S. Muchmore, W. H. Settle, Chas. L. Letz, Geo. W. Losh, and Jas. Julien. Franchise asked for 25 years and double track.

YOUNGSTOWN, O.—The stockholders of the Canfield & Youngstown Electric Railway have elected the following board of directors: J. W. Canfield, W. P. Arms, S. O. Ewing, John Delfs, J. C. Ewing, John Fink, J. H. Shields, H. M. Osborn, and Allen Calvin.

DAYTON, O.—Dayton Traction Company is chartered to build electric line from Dayton to Cincinnati. Capital stock \$500,000. The incorporators of the company are Judge Dwyer, O. B. Brown, William A. Mays, Frederick Retbald, Oscar M. Gottschalk, William Huffman and Walter Smith.

TIFFIN, O.—The Tiffin & Interurban Consolidated Street Railway Company is the name of the consolidation of the Tiffin Street Railway Company, the Tiffin Electric Railway Company, and the Tiffin-Fostoria Electric Railway Company. The understanding between the companies is now complete and the following officers are elected: President, R. W. Brown; vice president, Amandus Betts; secretary, N. W. Miller; treasurer, T. T. Rosendale, all of Tiffin except the last.

## Oregon.

OREGON CITY, ORE.—Oregon City Manufacturing Company wants to build a street railway line.

PORTLAND, ORE.—George Lumsden resigns superintendency of the Albina lines of the City and Suburban, and Superintendent L. McCoy, of East Portland lines, takes his place.

SALEM, ORE.—The Salem Motor Railway Company contemplates the extension of its electric line north on Broadway to the Polytechnic Institute in Highland addition.

PORTLAND, ORE.—The Portland Traction Company has been organized at San Francisco to operate street railroads in this city. Only one Portland man, Thomas N. Strong, is on the directorate. The directors are Isaac Hecht, S. Prentiss Smith, Frank L. Brown, S. Schwabacher and Thomas N. Strong. D. O. Mills holds \$129,000 worth of subscribed stock as trustee. Charles H. Ahearn holds \$22,000 in like manner. The capital is \$400,000, three-fourths of which is subscribed. The company is said to be composed of the bondholders in the Portland cable.

## Pennsylvania.

PITTSBURG, PA.—The North End Passenger Railway has its ordinance passed.

ALLEGHENY, PA.—Mayor Kennedy has signed the ordinance giving right of way to the Sharpsburg, Millvale & Etna Electric Railway.

BRISTOL, PA.—The Trenton & Bristol road has purchased an old mill at this place for a depot and power house.

FRANKLIN PA.—The Franklin Street Railway, to be built this spring, had been granted the right to use T rails on the streets.

WEST CHESTER, PA.—West Chester & Downingtown Electric Railway is bought by a syndicate represented by James McGraw.

EASTON, PA.—The Easton Transit Company has let contract for extension to the Chain Dam to the Lehigh Valley Construction Company.

SCRANTON, PA.—General Manager Archer says the Scranton Traction Company will adopt fenders and equip all cars within three months.

CHESTER, PA.—The Chester Traction Company applies for a charter Eugene Harvey, George Potteiger, Charles F. Wagner, Col. S. A. Dyer and William Wilson are interested parties in the new corporation.

CARLISLE, PA.—The Cumberland Valley Traction Company has let its contract for a power house to the Harrisburg Foundry & Machine Company.

READING, PA.—The highway committee grants the Reading Traction Company a number of extensions and connections with the Never-sink Mountain line.

PITTSBURG, PA.—Work on the Pittsburg & Mansfield Electric Railway, ordinance for which has been granted, will begin soon. A bridge across the the Monongehela will be built.

PHILADELPHIA, PA.—Stern & Silverman, of this city, are awarded the contract for rebuilding the Brigantine Traction Company's Railway at Brigantine Beach, opposite Atlantic City, N. J.

PHILADELPHIA, PA.—It is now decided that the Hestonville, Mantua & Fairmount Passenger Railway Company will erect an electric plant. The stockholders authorize \$750,000 in thirty-year 5 per cent bonds.

ALLEGHENY, PA.—The Federal Street & Pleasant Valley Traction Company will build the North End Passenger Railway, three miles, this summer; suburban line, T rail.

MANAYUNK, PA.—The Manayunk-Roxborough Inclined Plane & Railway Company has been granted trolley rights. It will operate along Ridge avenue, from the Philadelphia & Reading to the county line.

LOCKHAVEN, PA.—Lockhaven Street Railway Company elects J. B. Myers secretary and treasurer. The secretary will try to secure charter of the old Lockhaven Street Railway Company and whatever rights still remain.

PHILADELPHIA, PA.—Philadelphia Elevated Railway Company incorporates at \$42,000. Directors are: Walter N. Boyer, Radcliff B. Mills, John R. Bowman, Samuel R. Russell and David McKee, all of Philadelphia.

FOREST CITY, PA.—The officers of the Forest City branch of the Lackawanna Valley Passenger Street Railway Company are: William Walker, of Mayfield, president; J. R. Fleming, J. J. Walker and J. D. Caryl, of Forest City, directors.

**CHESTER, PA.**—The Chester Traction Company has consolidated the Chester Street Railway, the Chester & Media, the Chester-Darby & Philadelphia and the Union Railway. Col. S. A. Dyer, president of the Union Railway, is at the head of the syndicate.

**HARRISBURG, PA.**—Charters have been granted to the Athens & South Waverly Railroad Company, of Bradford County; length of line, four miles; capital stock, \$40,000. The Hanover & Newport Railroad Company, of Luzerne County: length of line, ten and one half miles; capital stock, \$500,000.

**CHESTER, PA.**—Capt. S. A. Dyer, of the Union Street Railway, has succeeded in consolidating the street railways of this city, and as soon as the charter is obtained the Chester Street Railway, the Union, the Chester & Media and the Chester, Darby & Philadelphia companies will be merged under one management, to be known as the Chester Traction Company, with a capital stock of \$500,000. Capt. Dyer will be manager. New connecting lines will be built.

**PITTSBURG, PA.**—The Allegheny city council committee on corporations ordered three street railway ordinances printed. The first grants the North End Passenger Railway Company rights to run an electric railway continuing the Charles street line; two, the Pittsburg Union Passenger Railway Company and the Pittsburg, Allegheny & Manchester rights to build to Watson Park and return; three, grants the Millvale, Etna & Sharpsburg Street Railway Company right to pave with Belgian block, and so removes obstacle to construction.

### South Carolina.

**COLUMBIA, S. C.**—The Land & Electric Railway Company is drawing up contracts for an extension of the line to the suburb of Kleinbeck, a summer resort. Extension to be finished by June.

**COLUMBIA, S. C.**—Electric Street Railway & Land Investment Company has decided to lay out a suburban town to be called Kleinbeck Park, and extend the street railway thereto, adding summer attractions of various sorts. It is to be completed in two months.

### Tennessee.

**NASHVILLE, TENN.**—The United Electric Railway will be sold at auction at the U. S. Custom House, April 18.

**NASHVILLE, TENN.**—Receivers have asked for the appointment of day and conditions for sale of the United Electric Railway Company.

**KNOXVILLE, TENN.**—It is reported that Receiver Duncan, of the Knoxville Electric Street Railway, will soon be ousted and the road re-organized after being sold. H. S. Morse, attorney for the Thomson-Houston Company, is consulting local attorneys to that effect. The Thomson-Houston holds large claims and first lien.

### Texas.

**RAVENNA, TEX.**—John A. Russell will probably extend his Bonham dummy line to the fair grounds here, seven miles.

**FT. WORTH, TEX.**—S. R. Williams, general manager of the Ft. Worth Gazette, wishes to buy a second hand 500-volt street railway motor.

**HOUSTON, TEX.**—A. Christenson, Wm. G. Wilson and E. W. Cave incorporate the Houston & Suburban Street Railroad Company, at \$100,000.

**DALLAS, TEX.**—Major Ewing, Superintendent of the Oak Cliff Railway, says that his road will be changed to electricity this summer. St. Louis Trust Company owns the line.

**FT. WORTH, TEX.**—T. A. Hall, Memphis, Tenn. is here representing an eastern syndicate for the acquirement of various street railway plants in the State.

**DENISON, TEX.**—On application of J. J. Fairbanks, R. S. Legate is made receiver of the Denison Street & Belt Line Railway Company, and the Land & Investment Company.

**DALLAS, TEX.**—Incorporated: The Dallas Belt Line Railway Company; capital stock, \$100,000. Incorporators, Wm. Shotka, A. T. Perkins, Chas. H. McDonald, Wm. H. Cothren, J. M. Witherspoon, F. G. Adamson, S. L. Terrell, Chas. C. Cobb, Thomas Scurry and J. M. Avery.

### Utah.

**OGDEN, UTAH.**—The Ogden & Brigham City Railway Company incorporates. Officers: J. C. Sprunt, president; E. Reed, vice-president; J. C. McCoy, treasurer, and George F. Phillips, secretary; these, together with Mark L. Fletcher, constitute the board of directors. It is to be an extension of the motor line.

### Virginia.

**RADFORD, VA.**—Radford Street Railway Company, M. A. Riffe general manager, will operate electric, May 1.

**RICHMOND, VA.**—Richmond City & Seven Pines Railroad is sold to George E. Fisher, of the Richmond City Electric Railway, for \$50,000. Line is seven and a half miles long.

**RICHMOND, VA.**—The Virginia Electrical & Railway Company, chartered at the last session of the legislature to carry on electric railway enterprises, wants a franchise to build on Broad street to the fair grounds. This includes the building of a viaduct. The company's officers are: John C. Robertson, president; E. A. Catlin, secretary; R. H. Smith, treasurer, and E. T. D. Myers, Jr., engineer in charge.

### Washington.

**SPOKANE, WASH.**—The Spokane Street Railway Company has had its franchise over Front avenue and Post street granted for electric freight hauling privileges.

**SEATTLE, WASH.**—W. J. Grambs has been appointed receiver of the Ranier Avenue Railroad Company at request of C. E. Cotting, Charles S. Tuckerman, F. G. Webster, et al. Indebtedness, \$45,000.

### West Virginia.

**NORFOLK, W. VA.**—The council has granted extension privileges to the City Railway.

**WHEELING, W. VA.**—Organized: The Bluefield Electric Railway Company, to run from Bluefield to Graham, Va., principal office at Bluefield, W. Va. Capital, \$20,000.

**CHARLESTON, W. VA.**—Philadelphia capitalists have organized the Bluefield Electric Railway, which proposes to build a twenty mile freight and passenger electric in the Bluefield coal region.

**KENOVA, W. VA.**—The Kenova Railway Company is incorporated by L. T. Peck, of Kenova, and J. M. Wirginan, W. H. Triol, J. W. White and F. M. Halsley of Philadelphia. The company will construct and operate a street railway or a dummy line from Ceredo to the mouth of the Big Sandy river.

### Wisconsin.

**LA CROSSE, WIS.**—La Crosse & Onalaska Street Railway Company increases capital from \$30,000 to \$50,000 and will use electricity on proposed line.

**ONALASKA, WIS.**—General Electric Company, Chicago, has contract for the Onalaska Street Railway Company's plant. James Canterbury is manager.

**KENOSHA, WIS.**—F. M. Kringle wants to build a street railway line here. He has built lines in Dubuque, Ia., and seems willing to risk a line in Kenosha.

**MILWAUKEE, WIS.**—Vice-president Payne and a committee of citizens agree on a plan to build the Prospect Hill line by July 1, one mile long. A cash bonus of \$5,000 is guaranteed.

### Canada

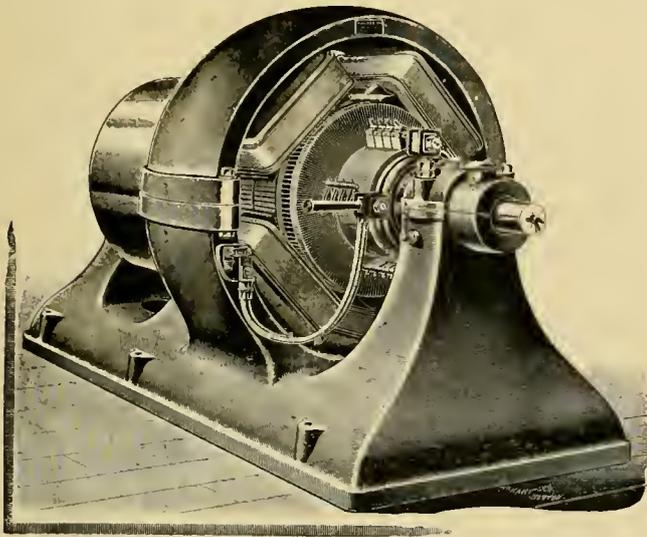

**TORONTO, CAN.**—Hunter & Hunter, barristers, on behalf of a syndicate, ask for rights to build an electric railway on the island. They claim that the syndicate has plenty of money, and will begin at once.

**MONTREAL, CANADA.**—Montreal, Park & Island Railway Company has decided to build the Notre Dame de Grace line and the road to St. Vincent de Paul. Hon. Louis Beaubien is elected president, and J. R. Thibaudeau vice-president.

**BRISTOL, ENGLAND.**—The Bristol Tramway Company has secured permission to build an electric road on the trolley system.

THE ELECTRICAL MACHINERY OF THE WALKER MANUFACTURING COMPANY.

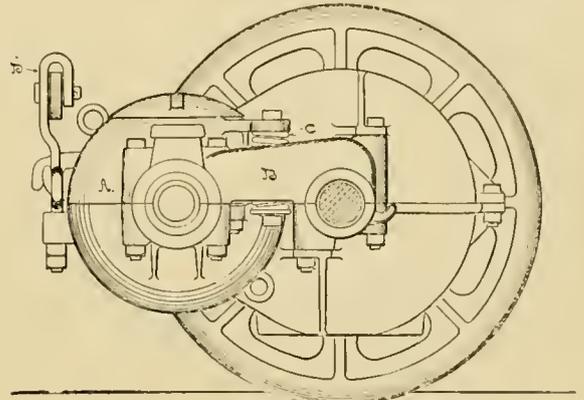

The announcement several months ago that the Walker Manufacturing Company, of Cleveland, would start an electrical department, caused a profound sensation, as it was known that if this company undertook this class of work it would be done on an extensive scale. The electrical public has therefore been waiting with interest

WALKER MULTIPOLAR GENERATOR.

for further announcements as to the particular form of the machinery to be manufactured. The Company now is on the market with direct and alternating current generators of from 150 to 500 horse-power at from 500 to 10,000 volts, and motors to correspond. It is unnecessary to enlarge on the facilities of this concern for handling heavy machinery as they have been previously described

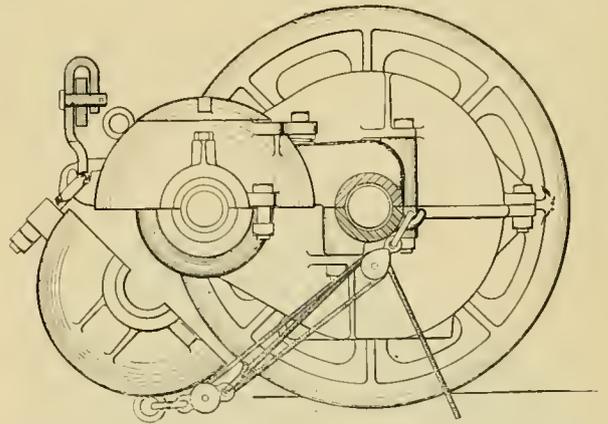

are wrought iron. The armature has no windings or binding wires on its surface, and there are no joints in the windings except at the commutator. The two circuit winding is used so that the circuits can not be thrown out of balance by a change of the relative distances of the

METHOD OF MOTOR SUSPENSION.

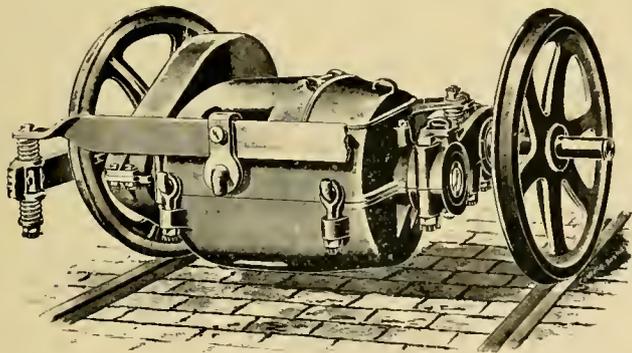

pole pieces. Armature and commutator are thoroughly ventilated.

The street railway motor while appearing at first glance very similar to those already in use is seen on closer

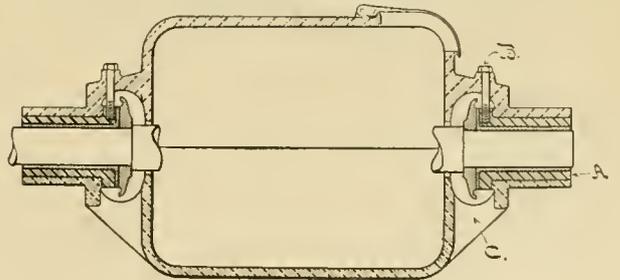

METHOD OF OPENING MOTOR.

inspection to be radically different in a few important particulars. In the first place the motor is so suspended as to have practically no rigid connection with the axle. This method can only be understood by a look at the

WALKER STEEL RAILWAY MOTOR.

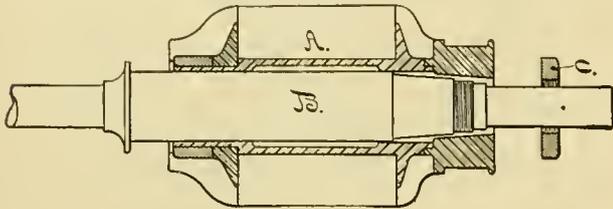

in our columns. Iron galleries have been fitted up at either end of the three long bays, of which the factory is composed, for winding and manufacturing insulating material. In the large foundries adjoining, fifty tons of iron can be handled at one time and consequently their large machines can be cast in few parts. This is well illustrated by their 250-horse-power, four pole generator which is seen to have but two parts to the frame. The bearings are self oiling and self aligning. The field cores

SECTION THROUGH MOTOR CASE AND BEARINGS.

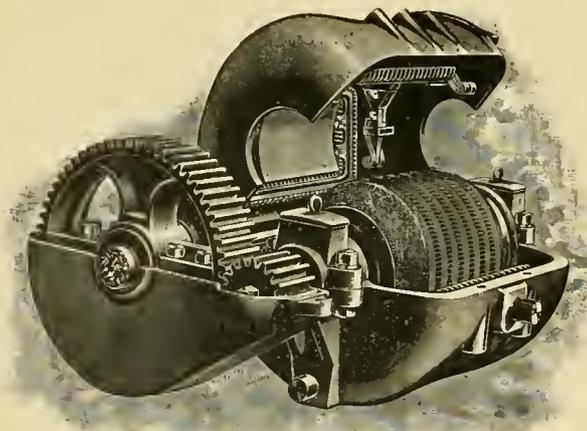

illustrations. The motor shaft is kept parallel with the car axle by a frame of which the gear case forms a part. This frame has bearings on the outer ends of the motor axle but is not connected with the motor case so that the motor proper is free to turn independently of the frame.

The motor is held in place by springs. Thus the motor is flexibly suspended as far as weight on the tracks is concerned. It is of steel, (four pole type) and rated at 25 horse-power. The weight of the motor proper is but 1,200 pounds, and the complete machine 1,600 pounds. Series-parallel controllers are used and the maximum speed of the motor is 25 miles an hour. That the designer was a practical man can be seen by the excellent provisions made for the taking apart of the motor. Both the upper and lower halves can be easily removed and a

SECTION THROUGH AXLE AND CORE.

lid is provided over the commutator. The armature can be removed from below or above. When closed the motor is entirely dust proof. The bearings are outside of the motor casing as is shown in the longitudinal section through the case. A space is left open between the bearings and case into which the grease works and falls to the ground through an opening in the bottom which is so large that it cannot be clogged. In the section, A is the shell filled with babbitt and held from turning by the bolt B. The armature is a drum with two circuit winding. The armature core and commutator are built on a sleeve,

WALKER CAST IRON MOTOR.

so that by removing one nut, (C. in the longitudinal section of the armature) the shaft can be taken out without disturbing the armature. The commutator is on a tapered part of the sleeve and can easily be drawn off. Besides this motor another one of cast iron rated at 35 horse-power and weighing 2,500 pounds is made for heavy work. It is not flexibly suspended. Designs are completed for large motors for operating suburban and elevated trains at high speed.

The apparatus is certainly all of remarkably ingenious design and with the quality of its workmanship the Walker factory finds a ready market for its output.

**STREET RAILWAY PATENTS.**

Compiled by The Street Railway Review.

ISSUED MARCH 6, 1894.

Electric switch signal. Thos. L. Dalton and Nelson W. Dalton, Sandy Hill, N. Y. ....515,751  
 Strain insulator. Henry H. Luscomb, Hartford, Conn, assignor to the John Pratt Company, same place .....515,779  
 Street car fender. Randolph C. Lothrop, Somerville, Mass .....515,868  
 Fare register. Edward T. Taylor, Oakland, Cal. ....515,888  
 Hanger for trolley wires. George Forbus, Williamsport, Pa. ....515,907  
 Street or station indicator. Bernard Barnett, New Orleans, La. ....515,929

ISSUED MARCH 13, 1894.

Electric railway. Mark W. Dewey, Syracuse, N. Y., assignor to the Dewey Corporation, same place .....516,188  
 Street car fender. Thomas Davies, Toronto, Canada .....512,266  
 Wagon railroad. Thomas M. Galbreath, Memphis, Tenn. ....516,327  
 Closed conduit electric railway. Frederick S. King, Chicago .....516,374  
 Electric trolley device. Charles P. Knapp, St. Louis, Mo., assignor to Ashton G. Bean and Herbert O. Rockwell, same place .....516,492  
 Sanding device for cars. John Ballard, Boston, Mass, assignor one half to Thomas W. Berry, same place .....516,515  
 Electric motor for street cars. William Baxter, Jr., Baltimore, Md. ....516,516  
 Electric railway supply system. James F. Cummings, Detroit, Mich., assignor one half to Eugene M. Engleman, Milwaukee, Wis. ....516,565  
 Closed conduit electric railway. Edward H. Brown, Salem, assignor to the Magnetic Electric Company, of West Virginia, Boston, Mass. ....516,626  
 Closed conduit for electric railways. William Lawrence, New York, N. Y., assignor to the Lawrence Electric Company, same place. ....516,631

ISSUED MARCH 20, 1894.

Electric railway system. Elihu Thompson, Swampscott, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut. ....516,666  
 Track cleaner. John W. Warren, Sydney, New South Wales. ....516,714  
 Electric railway switch. Charles M. Fitch, South Norwalk, Conn., assignor to the Fitch Excelsior Switch Company, New Jersey .....516,731  
 Awning or curtain for cars. Edward T. Burrowes, Portland, Me. ....516,762  
 Car truck. Norman C. Bassett, Lynn, Mass., assignor to the Thomson-Houston Electric Company, of Connecticut .....516,791  
 Block system for electric railways. John W. Gibboney, Lynn, assignor to the General Electric Company, Boston, Mass. ....516,806  
 Overhead electric railway. John C. Henry, Westfield, N. J. ....516,808  
 Electric motor. Walter H. Knight, Lynn, assignor to the General Electric Company, Boston, Mass. ....516,818

THE SIOUX CITY ENGINE AND IRON WORKS have resumed work with a force of 200 men.

HERBERT McNULTA has been appointed superintendent of the Calumet Electric Railway of Chicago.

J. W. PARKER & Co., agents for the Ball engine, have removed from 18 to 30 Cortlandt street, New York.

THE WALLACE ELECTRIC COMPANY has secured quarters in the Manhattan building, 307 Dearborn street, Chicago, and will remove there May 1.

THE GOUBERT MANUFACTURING COMPANY, of New York, is mailing on request a valuable pamphlet on "Dry Steam the Foundation of Economy."

THE SIEMENS & HALSKE ELECTRIC COMPANY of America are building generators to the extent of 3,000-horse-power for the Toronto Street Railway.

THE LACONIA CAR COMPANY, Laconia, N. H., has contracted to furnish the West End Street Railway, of Boston, with 150 trucks of the Laconia pattern.

THE GOUBERT MANUFACTURING COMPANY announces a change of its New York office from 32 Cortlandt street to 14 and 16 Church street, corner of Cortlandt.

THE SHULTZ BELTING COMPANY, St. Louis, has a large number of domestic and foreign orders. One from Russia calls for 10,000 feet and one from India 3,500.

THE BERLIN IRON BRIDGE COMPANY, of East Berlin, Conn., is constructing a large iron roof for the new car barn of the Colonial Electric Railway at Kingston, N. Y.

THE BERLIN IRON BRIDGE COMPANY is to make the roof for the new car barn of the Colonial Street Railway, of Kingston, New York. Its orders for bridges are very numerous.

THE MCKAY CURTAIN COMPANY, of Wilmington, Del., is becoming rapidly well known to the street railway field. Its railroad business is one of the largest in the country.

THE MATHER ELECTRIC COMPANY, of Manchester, Conn., has appointed S. N. Blake, of Elmira, N. Y., contractor Mather apparatus in northern and western New York State.

F. S. PIERSON, formerly of the West End, of Boston, succeeds Major McNulty, who will hereafter be engaged in the construction work of the Columbus & Ninth Avenue line, New York City.

THE OKONITE COMPANY, 13 Park Row, New York, has given out a dainty desk clock enclosed in glass to signify to its friends that time has no effect on the quality or quantity of okonite cable.

THE Consolidated road, at Grand Rapids, Mich., has introduced one of the Jogada furnaces in their power plant with excellent results in consumption of smoke and reduction of amount of fuel used.

THE FULTON FOUNDRY & MACHINE WORKS, 21 Furman street, Brooklyn, N. Y., is doing a good business. E. B. Willcox has reorganized the casting department and has a good basis to begin work.

THE STERLING SUPPLY & MANUFACTURING COMPANY, of New York City, has moved into new and commodious quarters in the Ross building, corner of Hudson and Bank streets, where its shops are situated.

THE LACLEDE CAR COMPANY, of St. Louis, is distributing an elegant morocco-bound catalogue of the most modern types of car bodies manufactured by it. No less than twenty-five styles are illustrated and described.

THE ELECTRICAL AND MECHANICAL ENGINEERING & TRADING COMPANY, 39 Cortlandt street, New York City, is the new address of this well-known company, which formerly held offices in the Edison building, 44 Broad street.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY has secured one of the largest orders in a long time, being 150 motor car equipment for the West End Street Railway, of Boston. This was secured through Lemuel Bannister.

HORACE E. ANDREWS, president of the Cleveland Electric Railway Company, and of the Cleveland General Electric Company, has been appointed a member of Gov. William McKinley's military staff, to succeed Col. Myron T. Herrick.

JACKSON & SHARP, Wilmington, Del., have taken large orders for cars from the Derby Street Railway Company, Derby, Conn., Hartford, Conn., Philadelphia, Pa., and Pottstown, Pa. They report a large number of inquiries and a bright outlook for trade.

B. J. ARNOLD, consulting engineer, has removed from 565 Rookery to 463 in the same building. This gives more space for the growing business of the different members of the "happy family," of which Fred De Land is the senior representative.

G. F. STAMBAUGH, succeeds George B. Merrill as Chicago and western representative of the Falls Rivet & Machine Company, of Cuyahoga Falls, O., with offices at 10 South Canal street. The western branch is known as the Chicago Shafting & Pulley Company. Mr. Stambaugh, has an intimate knowledge of trade, having been for some time connected with the Chicago branch in another capacity.

A BIG shaft, weighing 111,800 pounds, was recently shipped to Brooklyn, N. Y., by the E. P. Allis Engine Company of Milwaukee. The Pennsylvania Company's gun truck was used, the same which transported the great Krupp guns to the World's Fair.

THE annual meeting of the Short Electric Railway Company, of Cleveland, resulted in the re-election of the old board of directors and the following officers: President, B. F. Miles; secretary and treasurer, Bethune Duffield; S. M. Hamill, general manager.

GENERAL MANAGER MIX, of the Rice Machine Company, 166 South Clinton street, Chicago, has issued one of the most attractive little volumes containing eighty World's Fair views which he will mail to any address on receipt of four cents in stamps to cover postage.

THE first annual dinner of the Boston West End Street Railway Association was held March 15. John H. Dudley, Jr., presided. Paul Winsor spoke on transportation in Paris, and other good speeches were made. Employees of the company in attendance numbered 120.

MCINTOSH, SEYMOUR & Co., have put three 700-horse-power engines in the Ridgewood power station. Three more are to go to the City & Suburban Railway of Baltimore and four to the Cincinnati Street Railway. This company seems to be getting its full share of railway business.

THE NATIONAL WATER TUBE BOILER COMPANY of New Brunswick, N. J. has erected a plant of national boilers, amounting to 2,500 horse-power for the Ohio Steel Company at Youngstown. The boilers from the World's Fair will also be used, making the plant of 4,000 horse-power.

THOMPSON'S scenic railway at the Midwinter Fair has already carried 200,000 passengers, and as high as 15,000 in a single day. It is one of the three types switchback, gravity cable, and serpentine, invented by L. A. Thompson, several of which are already in use at street railway pleasure resorts.

ABOUT 150 invited guests assembled on Saturday, March 31, at the works of the Ball & Wood Company, Elizabeth, N. J., to witness the first operation of their new vertical engine for electric work. The occasion was a successful and delightful one in every way, and a fine lunch was served.

WESTINGHOUSE, CHURCH, KERR & COMPANY have removed their New York office from 17 Cortlandt street, to the Havemeyer building. The new quarters, on the sixth floor, comprise four rooms and a connecting hall, elegantly furnished and fitted. They report a large number of late orders.

B. W. PAYNE & SONS of, Elmira, N. Y., have recently closed a contract for the complete power equipment of the Middletown-Goshen Street Railway, of Middletown,

N. Y. Two Payne improved Corliss engines of 100-horse-power each and two 125-horse-power horizontal tubular boilers will be used.

THE SAFETY BRAKE SHOE COMPANY, of Boston, reports so great an increase in sales that another foundry has been started to keep up with the demand. Western connections are contemplated for the near future. Many prominent roads have adopted the shoe, and further popularity is but a matter of time.

THE BALL ENGINE COMPANY, of Erie, Pa., shows among recent shipments of its well-known engines, seven hundred horse-power for various public buildings in various parts of the country. Two hundred horse-power will be used in the Criminal Court building at Chicago, and one hundred in the House of Correction.

THE GRAHAM EQUIPMENT COMPANY sends out a postal card which bears a section of the Carnegie I beam used in the frame of the new Graham truck especially designed for long 10-bench, 30-foot open cars. This beam has a coefficient of 67,000 pounds to the foot, has a  $\frac{3}{8}$ -inch web, is five inches high, and makes an extra sill for the car body and prevents "hogging."

THE JEWETT CAR COMPANY, of Jewett, O., has several orders to report this month. Among them are four 34-foot open cars for the Brigantine Traction Company, of Brigantine Beach, N. J., office at Philadelphia; and four 18-foot vestibule cars for the Middletown-Goshen Traction Company, of New York, besides five smaller orders. The Jewett Company is meeting with deserved success.

AMONG recent sales of the Bates Machine Company's well known engines may be mentioned the following: Three 100-horse-power at Kansas City, Mo.; one 100 to San Antonio, Tex.; one 125 to Richmond, W. Va.; one 300-horse-power at Milwaukee, Wis.; one 150 at Philadelphia, and a 1,000-horse-power compound to DeKalb, Ill. The Bates engine is a superior machine and its success is deserved.

SPEAKING of business these days a prominent western engine builder says: "We cannot see much of an improvement in our business over that of the past six months, although inquiries seem to be a little more frequent and the actual contracts entered into are of a less experimental nature than usual. Such parties as are now engaging in business are in earnest and seem to feel assured of success in their ventures."

GEORGE B. MERRILL, formerly of the Falls Rivet & Machine Company's Chicago management, has entered the power transmission field for himself, and has taken quarters at 42 South Clinton street, as manufacturer and dealer in all kinds of machinery pertaining to power transmission of power. Mr. Merrill is well-known to the trade, and will be, naturally, as successful in his new connection with trade as of yore.

THE MCGUIRE MANUFACTURING COMPANY, of Chicago, has shipped to the Third Avenue Railway Company, New York, a carload of their steel frame grip trucks. These trucks are designed to carry the car body 24 inches from the rail, and have a 9-inch wheel base with a 17-foot, 8-inch spring base. In other words, the spring base is within 6 inches of being double the wheel base, which is certainly an extraordinary construction.

J. HOLT GATES, western manager of the Waddell-Entz direct coupled dynamos and motors, has taken the western contractorship for the Mather Electric Company of Manchester, Conn., belt driven railway and light generators and motors. Mr. Gates celebrated his new connection by selling two 500-light dynamos on the first day. He will do a general electrical contracting business also, with headquarters at 1139 and 1140 Monadnock Block, Chicago.

CLIFT WISE, of the Complete Electric Construction Company, 1401 Monadnock, Chicago, is at work on the promotion of a road up the Rock river between Rockford and Dixon, Ill. When completed it will be 40 miles long, deriving its power from water-power plants along the river. It seems to be a good location both from a scenic and commercial standpoint, as Rock river is the Hudson of the west. J. S. Ticknor of Rockford is president of the company.

THE GENETT AIR BRAKE COMPANY has just shipped an air brake equipment for the Kings street cable system, of Sydney, Australia. The company is also filling an order for the Chicago & North Shore Electric Railway Company, and an additional order for the Buffalo Street Railway Company. The success of the Genett brake has been of the most positive and encouraging character and Manager Rothschild has every reason to push further this successful air brake.

WARREN WEBSTER & CO., of Camden, N. J., manufacturers of Vacuum Feed Water Heaters and Purifiers and Oil and Steam Separators, report that the number of orders they received for the above-named specialties during the month of March was very satisfactory and showed a marked improvement over the few former months. Rapid progress is being made upon the new extension of their wrought iron department connected with the new works which they just built last year.

THE PENNSYLVANIA IRON WORKS COMPANY, of Philadelphia, has become sole licensee for the manufacture and sale of the Walker Patent Differential drums and friction clutches, for use in cable roads for the New England, Middle and South Atlantic states. The Walker's patents upon the efficiency of which so many cable roads have achieved success are too well-known to require other mention than that with such strong backing and efficient manufacture they will have increased usefulness.

THE LACLEDE CAR COMPANY, of St. Louis, Mo., report a full rush of work in all stages of construction. The Philadelphia Traction Company has an order in for 250 closed and open cars and a second call for 150 additional closed. These are to be mounted on Bemis trucks. The Cincinnati Street Railway Company has placed an order for 30 cars, 16-foot, besides a large grist of smaller orders from various parts of the country.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY has issued a new pamphlet describing the experiments which led up to the invention of the Wurts non-arcng railway lightning arrester. The Wurts device is suited to any direct current circuit, and sells for \$7.50 for the station arrester and \$4.50 for the car or line instrument. Its performance during the past season has been most creditable. Its claims are: simplicity, reliability and cheapness. The new pamphlet will be sent on application.

AHEARN & SOPER, of Ottawa, Canada, agents for the Westinghouse Electric & Manufacturing Company, have been awarded the contract for the electrical construction of the Gault & Preston, Canada, Electric Railway, as well as the cars. Goldie & McCulloch, of Gault, will supply the engines and boilers. Electric heaters will be used on the five cars, with which number the line will begin traffic. M. Hartnet, of Toronto, has the construction of the road bed and culverts. It is hoped that the line will be commissioned by May 24.

THE MCGUIRE MANUFACTURING COMPANY, of Chicago, is making two very peculiar pairs of trucks to go under the new welding machines of the Johnson Company. They are constructed to run on any gauge of track from 3 feet 6 inches to 5 feet 3 inches. The wheels are common 33 inch, with  $2\frac{1}{4}$  inch tread and  $\frac{3}{4}$  inch flange. The axle is threaded on the wheel-fit and the wheels are screwed on. The wheels can thus be easily adjusted to the gauge. The key ways are cut so as to give a quarter turn adjustment.

THE INTERNATIONAL REGISTER COMPANY, of 300 Dearborn street, Chicago, finding its present accommodations too small removed April 1, to much more commodious quarters, at 195-197 Canal street, where may be secured not only more space, but the most modern manufacturing facilities for the making of its well-known fare register. The factory is convenient to the central business district. The company reports a marked improvement in business, with a number of recent new contracts, among them the Chicago General Street Railway Company.

THE LYNN MANUFACTURING COMPANY, 620 Atlantic avenue, Boston, is a new concern making overhead equipment and supplies for electric railways. The factories are at Lynn, Mass., and the officers are: A. F. Hallbauer, president, and James C. Barr, treasurer. Both

these gentlemen are fully conversant with the peculiar needs of electric railways, and will market only the best material. The necessity of a well made and reliable overhead construction is one of the most important details of railway work, and the fraternity will watch the new firm with great interest.

THE ELSON & BREWSTER ENGINEERING COMPANY, New York representatives of the W. S. Hill Electric Company, of Boston, is a second time obliged to move into larger quarters, and can now be found at 143 Liberty street, New York, where with better facilities and larger stock, they are better prepared than ever to take care of a constantly increasing trade. The deserved success of the company is a matter of great satisfaction to the many friends of the management.

THE NEW YORK OFFICE of the Buckeye Engine Company, of which H. T. Porter is sales agent, removed April 1 from 18 Cortlandt street to 39 and 41 Cortlandt street, where larger and more commodious quarters will greet visitors, and in addition to the regular line the new vertical compound engines for railway and light service will be shown. The new engine has created something more than ordinary comment, and is particularly adapted for direct connection. Business at the Eastern office is considered to be on the increase.

E. J. SPENCER, who will be well and favorably remembered as in charge of the affairs of the General Electric Company at the World's Fair, has severed his connection with the General Electric Company, and has opened an office at 513 Security Building, St. Louis, where he will do a consulting and contracting electrical and mechanical engineering business. Mr. Spencer's nine years' experience in the electrical corps of the United States army and three years' special work at the Lynn factory of the General Electric, particularly qualify him for his new association.

A TELEGRAM to the REVIEW dated Cincinnati, March 19, brings the not unexpected news that another order of 75 Peckham standard trucks has been placed with the Cincinnati Street Railway Company. The recognition of the Peckham trucks by this conservative road is substantial, and shows that this line regards them as worthy of a large place in the economy of this excellent system. It may be stated further that P. S. Bemis was the missionary into Cincinnati who has wrought this work and added both to his own laurels and to the reputation of the Peckham Motor Truck and Wheel Company.

THE HALE & KILBURN, MANUFACTURING COMPANY, Philadelphia, has a house full of orders for street car seating. The Hale & Kilburn seat is to be used in 500 cars in Philadelphia and New York. A complete rattan spring seat is being made for 135 cars of the Philadelphia People's Traction Company. A plush covering will be drawn over it in winter, but removed

during the summer months. The Nos. 71 and 71½ reversible seats for electric cars are becoming very popular. They are made for plush, Wilton velvet carpet and other coverings, besides in rattan and elastic wood slat.

FISHER & PORTER, 1025 Monadnock Building, Chicago, report evidence of good business in the immediate future. They report a number of plants now in process of equipment, among them machinery for W. H. Roesle, of Pittsburg; a gold mine in Tennessee, and two 75-horse-power M. A. Green engines for the Leland Hotel, Chicago. The makers of these engines, the Altoona Manufacturing Company, of Altoona, Pa., report the works running full time with full complement of hands, and the Providence Steam Engine Company, maker of the Improved Green engine, also finds its factory full of work.

THE MCGUIRE MANUFACTURING COMPANY, has built within the last month seventy steel frame trucks for the Electric Traction Company, Philadelphia, fifteen for Memphis, Tenn., five for Davenport, Ia., twelve for the Cicero & Proviso Electric Railway, Oak Park, Ill., and they have orders yet unfilled from the Derby Street Railway, Derby, Conn., Buffalo & Williamsville Street Railway, Buffalo, N. Y., Philadelphia, Neville Island & Coraopolis Railway, Coraopolis, Pa., Hamilton, Grimsby & Beamville Railway, Hamilton, Ont., Sandusky, Milan & Norwalk Street Railway Company, Sandusky, O., Philadelphia & Delaware County Railway, Philadelphia, Pa., and others.

THE BUCKEYE ENGINE COMPANY, of Salem, O., reports trade lighter by far than for the corresponding period of last year. However, the Buckeye holds its own and reports show recent sales of two 300 horse-power, mediums, to the Richmond, Ind., Light, Heat and Power Company; 80 horse-power, medium, to the McKeesport & Wilmerding Street Railway Company; three 500-horse-power, tandem compounds, to the Dayton, O., Street Railway Company for direct connection with Siemens-Halske dynamos; one 600 horse-power medium speed cross compound to the Coplay Cement Company, Coplay, Pa., besides 17 other orders ranging from 25 to 150 horse-power to various other power users all over the United States.

### California in Three and One-Half Days.

If you are going to California and desire to make the journey in the most economical, quick and comfortable manner, purchase your ticket via the Chicago & Northwestern, Union Pacific and Southern Pacific Railways. Pullman drawing-room sleeping cars are run from Chicago to San Francisco without change, in three and one-half days. Completely furnished tourist sleeping cars are also run in which accommodations can be procured by passengers holding either first or second-class tickets at a cost of only \$4 per berth from Chicago to San Francisco and other California points. The hour of departure of trains from Chicago affords prompt connections with all trains from the east and south. Variable route excursion tickets, allowing nine months' stay in the health-giving climate of California, second-class tickets of low rates, sleeping car reservations and full information can be procured of any ticket agent, or by addressing W. A. Thrall, General Passenger and Ticket Agent, Chicago & Northwestern Railway, Chicago.

THE C. D. MORSE COMPANY'S CAR.

The accompanying illustration is a "song without words" concerning the beautiful car built by the C. D. Morse Car Manufacturing Company, of Millbury, Mass., for the Worcester, Leicester & Spencer Street Railway Company, of Worcester, Mass.

What the observer cannot see may be told in a few words of explanation as to dimensions and material. The car body is twenty feet long, with a 4-foot 1-inch platform inside of the dash. It is mounted on the well-known Bemis truck, and the Boston trolley, made by Albert & J. M. Anderson, is borne proudly above. The

Davis car shade, made by the Davis Car Shade Company, of Portland, Me., protects the passengers' eyes completely from the rays of the sun. The car is elegantly decorated inside and out and the white exterior denotes suburban service. It is, of course, unnecessary to state that every detail is of the best and most workmanlike design, and that the material is the most perfect procurable. Such is the method of the C. D. Morse Company, as many street railway men may testify.

The photograph from which our engraving was made was taken at Millbury, famous for its inventors and manufacturers, of which the Morse Car Company is perhaps most prominent.

OBITUARY.

WILLIAM H. GOODRICH,

treasurer of the Suburban Electric Railway Company, of Hartford, Conn., died recently. He was one of Hartford's best known citizens, a thirty-second-degree mason, and a prominent business man.

J. L. BARCLAY.

The fraternity learned with equal regret and surprise of the sudden death at the American House, Pittsfield, Mass., on March 26, of J. L. Barclay, of Barclay & McHarding. The cause of his death was an operation for appendicitis. Mr. Barclay was widely known as one of those earliest in the electric lighting field in the

east, and later as Chicago manager of the Westinghouse Electric Company, which position he assumed in 1888 and held until April, 1892.

For the following year he traveled and rested. Recently he joined with Mr. Harding for the purpose of handling the electrical output of the Walker Manufacturing Company, and was absent on a business trip at the time of his death.

THE GAGNIER-GRIFFIN SUSPENSION BRIDGE.

The cable way which is being exploited by the Gagnier-Griffin Suspended Railway Bridge Company, of the Masonic Temple, Chicago, provides an unique, practical and safe method of crossing chasms, streams or valleys by means of cars suspended on cables and running on trolleys. A separate cable gives the car action.

At present negotiations are in progress which look forward to a line across Niagara Falls and another for transporting passengers and horses across a river in Texas. The system is built with a factor of safety of 8, and has many advantages of cheapness, novelty and speed. For a summer resort attraction it is worthy of close investigation, and few other means of entertainment afford greater interest than a safe spin across a river or ravine, via the Gagnier-Griffin suspended car.

YOUNGSTOWN, O., HOUSE-MOVING ORDINANCE.

The Youngstown, O., city council has passed a complete and fair ordinance governing the moving of houses across electric street railway lines, telegraph and telephone lines, and fire and police patrol electric signal systems.

The ordinance provides that houses to be moved across street railway lines shall be so moved between the hours of 11 p. m. and 6 a. m.

Besides this, the ordinance requires that: "The mover of such house, building, or other structure, desiring to move the same across, through or under any of the lines or wires, shall give the local manager or agent thereof twenty-four hours previous written notice of his intention so to do, and shall specify the streets and routes along which he proposes and desires to move the same. It shall then be the duty of such manager or agent in charge of such lines or wires to raise or remove the same at a reasonable expense, not to exceed the actual cost of cutting and repairing said wires or leads, to be paid by the person or corporation giving such notice, so that such house, building or other structure can be moved through or past the same without injury to said lines of wires."

The violators of this ordinance shall upon conviction be fined in any sum not less than \$10 and not more than \$50.

THE Burlington & Winooski Street Railway Company of Vermont will attempt a large summer resort business, and to this end has increased capital stock.

## INDUCING TRAVEL AT OTTUMWA.

"Let those now ride who never rode before,  
And those who always ride, now ride the more."

The above are the introductory lines of an announcement made by the Ottumwa Electric Railway in regard to a reduction of fares. The plan is that of W. R. Daum, president, and has as its object a general stirring up of the community and an increase in the number of rides per capita. Small communities need something of the kind occasionally, and Mr. Daum's scheme seems to be a very good one. "Do you want to make 10 to 25 per cent a month on your money?" is the first question asked in the circular. As the majority of people are willing to do this, they read on into the announcement and learn that the company will make a special issue of non-transferable 100-ride ticket books as follows: One 100 ride book, \$4.50; three books, \$12.90; five books, \$20.25; ten books, \$38. Each book is good only for one person, but several members of a family or a number of persons can purchase books together at the reduced rates. After May 15 they will not be sold at less than \$4.50, but as an additional inducement to buy these books, the covers, if presented at the office, will be accepted as cash toward the purchasing of more books at the following values: If presented within 90 days from date of issue, 25 cents; if presented within 60 days, 50 cents; if presented within 30 days, 75 cents. By buying with nine others the individual can save 39 per cent the first month. If 1,000 tickets are sold by May 15 the company agrees to extend the time of selling at "club rates" one month.

The conditions, etc., printed on the cover, are as follows:

### OTTUMWA ELECTRIC RAILWAY.

REFUND 100 RIDE TICKET.

No. .... Issued to

NOT TRANSFERABLE.

This ticket is subject to the following rules and conditions:

1. It is good only for the use of the person named above.
2. Coupons are not good unless presented with the cover bearing the same number and must be detached by the Conductor. Only one coupon can be accepted as fare on any one trip, and then only for the person presenting the ticket.
3. In consideration of the reduced rate at which this ticket was purchased, I hereby accept the conditions and agree not to loan, give away or sell it, nor to tender coupons from it as fare for any one but myself.
4. This ticket is not good unless signed by the person to whom it is issued and also by the General Manager.
5. Any Conductor known to accept a coupon from this ticket as fare for any person that he KNOWS to be other than the one named on it will be discharged.
6. If this ticket is presented by any person known by the Conductor NOT to be the person named upon it, the Conductor will take it up, demand fare, and turn the ticket into the office of the company.
7. Conductors must read the name on each ticket when presented, and take care to prevent any but the proper person using it; also, use punch on coupons detached, ring for same and turn them in as cash fares.
8. If this cover is presented at the office of the company it will be accepted as cash towards the purchase of another coupon book at the following values: 25 CENTS if presented within 90 days, 50 CENTS if presented within 60 days or 75 CENTS if presented within 30 days from the date punched below, which is the date of issue. Only one cover can be applied toward the purchase of any one book.

Jan.	Feb.	Mar.	April	May	June
July	Aug.	Sept.	Oct.	Nov.	Dec.
1	2	3	4	5	6
7	8	9	10	11	12
13	14	15	16	17	18
19	20	21	22	23	24
25	26	27	28	29	30
31					

The coupons, of which there are four on a leaf, are numbered from one to 100, and also a running number including the entire issue. Coupons read as follows:

OTTUMWA ELECTRIC RAILWAY.

GOOD FOR ONE RIDE.

IF PRESENTED BY PERSON NAMED ON COVER.

NOT GOOD IF DETACHED.

## NEW PUBLICATIONS.

THE ELECTRICAL AND STREET RAILWAY REPORTER, is the title of a new candidate in the fields mentioned, and the first number, dated March, is well filled with interesting matter and illustrations. Publication office: New York.

CATALOG No. 53 of the Westinghouse Electric & Manufacturing Company, deals with the Direct Current Series Arc Light System, and is as handsomely printed and illustrated as is the Westinghouse custom. It sets forth the advantages of the direct current arc generator, and may be had on application.

RULES AND REGULATIONS FOR CONDUCTORS AND MOTORMEN, by J. E. Hutchinson, superintendent. This is a rule book for the employes of the Ottawa (Can) Street Railway Company. It is very complete in every detail, and particular attention is paid to the motormans' knowledge of the car and its parts.

CATALOG No. 56, of the Westinghouse Electric & Manufacturing Company, contains 45 elegantly printed pages, with many illustrations on the Wurts Non-Arcing Railway Lightning Arrester, with practical hints on protection against lightning. It contains much valuable matter and may be obtained on application.

NEW YORK SECURITIES, published and edited by J. P. Crittenden, C. B. Helffrich and R. V. Page, Jr., of New York and Philadelphia, will this year be published in two volumes. No. 1 will embrace all kinds of transportation both land and water, while miscellaneous, municipal and industrials will be cataloged in Part II. The name will be changed to "THE RED BOOK, UNITED STATES SECURITIES." It is a valuable and complete work, giving the best, latest and most reliable data in regard to all the numerous industries that put securities on the market. The New York office is at 45 Liberty street.

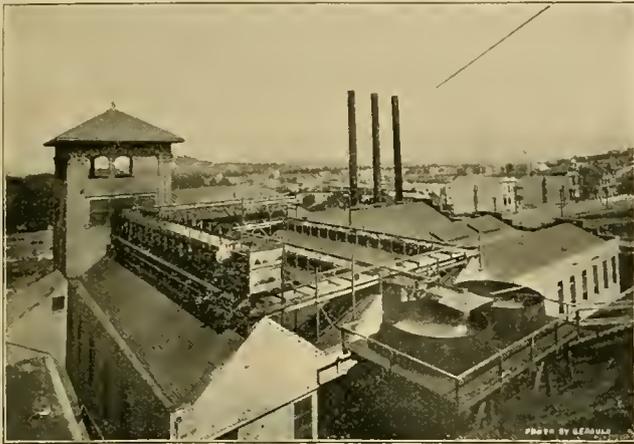

A REFERENCE BOOK OF TABLES AND FORMULAS FOR ELECTRIC STREET RAILWAY ENGINEERS, compiled by E. A. Merrill, author of "Electric Lighting Specifications." W. J. Johnston Company, Ltd., New York. 6 by 3 inches, pps. 95; flexible morocco; price \$1.00. This vade mecum is a logically arranged and concise collection of tables and formulae intended to aid the engineer in making estimates, ordering material, etc. All examples and explanations that are superfluous are excluded. Several original formulae are added to those compiled, and the whole is practically indexed. It is essentially a book for the practical man.

PERMISSION to use electricity as a motive power on the Erie Canal has been granted to the Cataract General Electric Company, of Niagara Falls. The company, it is provided, shall not charge for use of such power by the canal boatmen at a rate exceeding \$20 per electrical horse-power for each season of navigation, and it is promised that the rate will be much lower.

## Playing Cards.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

WE present on this page two views of the terminal power station of the Metropolitan line, San Francisco, built for the Midwinter Fair extension, and located near the grounds.

TERMINAL POWER HOUSE OF METROPOLITAN RAILWAY AT MIDWINTER FAIR.

JACKSON I. CASE, the young and progressive mayor of Racine, Wis., may resign his municipal office on account of his connection with the Belle City Electric Railway Company, which has a city lighting contract, as no one interested in a city privilege may hold city office.

TERMINAL STATION OF METROPOLITAN RAILWAY, MIDWINTER FAIR

THE Sandusky, Milan & Norwalk Electric Railway has closed a five-years' contract with the American Express Company for carrying packages along its line.

THE March meeting of the Massachusetts Street Railway Association brought out 21 members to hear a paper by G. E. Cutler, of New York City, on "Insurance Risks and Accident Insurance in General," and an interesting discussion of car wheels and brake shoes.

CALIFORNIA MIDWINTER FAIR.  
(Photographed expressly for the Street Railway Review.)

## THE CONNECTICUT ASSOCIATION.

The Connecticut street railway men met at the Tontine Hotel, New Haven, April 3, and perfected an organization to be known as the Street Railway Association, of the State of Connecticut. The following roads were represented:

Middletown Street Railway, by I. A. Kelsey; Danbury & Bethel Street Railway, by S. Harrison Wagner; Edgewood Street Railway, of New Haven, by Fred S. Wardwell; Waterbury Traction Company, by Geo. E. Terry and J. R. Smith; Central Railway & Electric Company, of New Britain, by A. M. Young and C. S. Landers; New Haven Street Railway, by David Corey, A. W. Dodge, Harrison Wagner and Director Laughton; Morris Cove Railway Company, of New Haven, by Mr. Townsend; Norwalk Tramway Company, by Geo. W. Peirce; Hartford Street Railway, by E. S. Goodrich; Stamford Street Railway, by Robert A. Fosdick; Fairhaven & Westville Railway, of New Haven, by Henry Parmalee; Derby Street Railway, by H. Halton Wood; Winchester Avenue Street Railway, of New Haven, by I. A. Kelsey. Col. N. H. Heft, of the Bridgeport Traction Company sent a letter endorsing the movement. The officers elected were H. Halton Wood, of Danbury, president; Henry Parmalee, of New Haven, vice-president; E. A. Goodrich, of Hartford, treasurer; Robert A. Fosdick, of Stamford, secretary. The executive committee is composed of the officers with Geo. A. W. Dodge, I. A. Kelsey and A. M. Young. The supplymen present were Geo. Pratt, of Jackson & Sharp; W. G. Bushnell, of the General Electric, J. C. Boyd, of the New Haven Car Register Company and H. J. Kenfield, of the New York office of the STREET RAILWAY REVIEW.

Robert A. Fosdick, the secretary elect, is thirty-three years of age and is a practicing attorney at law, of Stamford. He has been connected with the Stamford Street Railroad since 1887, serving as secretary four years and has been president and treasurer since 1892. His legal talents will no doubt be used for the benefit of the association.

## NEW PRESIDENT AT TOLEDO.

On April 2 the directors of the Toledo Consolidated Street Railway bestowed a deserved recognition on General Manager A. E. Lang, by electing him president of the company. Mr. Lang has long since established a reputation among the fraternity as one of the most progressive, careful and popular managers in the country, and the news of his preferment will be read with pleasure. W. S. Jewell, recently of Indianapolis, becomes manager. N. B. Ream, of Chicago, is vice president.

R. A. FOSDICK.

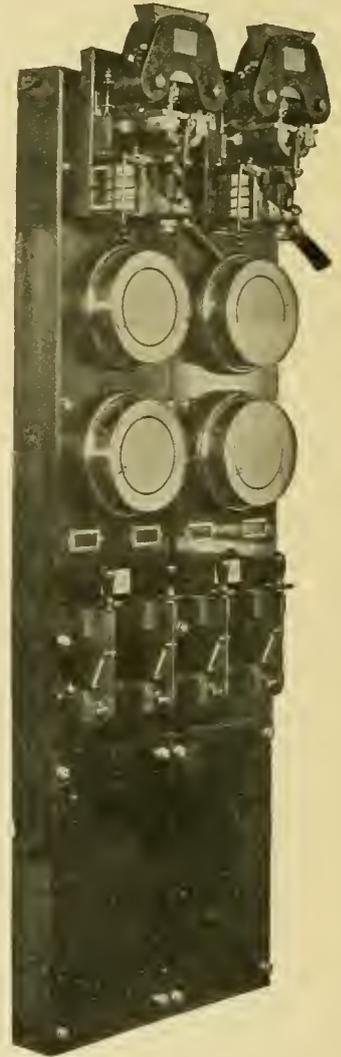

## NOT ALWAYS SO.

He was past middle age and drunk as he stumbled into a street car and slopped down beside a haughty looking woman who cast a scornful glance at him. He felt it through the booze and said apologetically in unsteady accents: "Madam, there are two circumstances about me which I know are deplorable: I am old and I am drunk, but"—and he bridled up in conscious dignity—"I was not always so." And even the haughty woman had to laugh.

## GENERAL ELECTRIC FEEDER PANEL.

The accompanying engraving is of the General Electric latest design feeder panel. The importance of sectioning trolley lines is being recognized more every day; not only because an accident on one section does not interfere with the others, but because of the mechanical and electrical strain on the entire station, on the occurrence of short circuits, when the line is not sectioned. The panel board here shown is form "C," and is arranged for two feeders on two circuit breakers with an ammeter and single pole switch for each. When fuses are used instead of the circuit breaker they are of copper and coiled in a spiral to produce a magnetic field which helps break the arc. The circuit breakers form "K" have the electric resetting device operated by shunt coils.

The panel is mechanically as well as electrically an able piece of work, and will be given deserved attention.

E. F. DEWITT, of Lansingburg, N. Y., was a welcome visitor at the REVIEW office this month. He was on a successful western business trip.

THE Isle of Man Tramways Company has been submitted an offer for the purchase of the undertaking by the Douglass & Laxey Electric Tramway Company. Price made, \$190,000, which will be accepted.

WINDSOR & KENFIELD,

PUBLISHERS AND PROPRIETORS,

Business Manager.

### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,

269 Dearborn Street, Chicago.

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.

MAY 15, 1894.

NO. 5.

FIRST, it was ye deadly trolley; now, it is electrolysis. We wonder what witchcraft will be invoked next. While the faggot fires of Salem have long since been extinguished and the ashes blown to the four winds, they seem to have sown seeds which in these latter days are springing up, and while the fruit is of another color, one can trace the same unreasonable prejudice and willful ignorance that characterized our pious but misguided forefathers.

THE first rail welding on a really large scale is now proceeding at St. Louis, and the description in this issue will be read with intense interest by all. The work is proceeding satisfactorily and rapidly and has every possible promise of entire success. A year hence, when the track has passed its first summer and winter, there may new developments have arisen which cannot now be anticipated, but we believe the joint problem has been solved and most earnestly wish our progressive friends in St. Louis the glory which belongs to pioneers and the success their enterprise so largely deserves.

THERE is now a strong probability that the movable sidewalk system will be adopted on the Brooklyn bridge. We believe the REVIEW was the first to point out the special fitness of this system as the best, cheapest and most effective solution of what has been a very vexed question. It is now being carefully considered and plans

drawn in detail, which conclusively demonstrate its adaptability to the place and work. To urge its adoption would be but to repeat what has been expressed time and again in these columns. The movable sidewalk is exactly what is needed on the bridge, and we know of nothing that so fully meets its requirements.

DELAYS on cable lines always seem of much longer duration than they actually are, and the public has been taught to believe that such stoppages are most frequent and covering a long period. The record of the West Chicago Street Railroad for the month of March is sufficient to afford a strong argument in opposition to this belief, for the delays on the Milwaukee avenue line during the entire month aggregated but nine minutes, and those on the Madison street line but five minutes; on Washington street loop, nine minutes, and on Blue Island avenue system twelve minutes. This is an exceptionally good record for any system, on any street, and is well worthy of equal prominence with the common statement made to the contrary.

SUMMER riding promises to begin early this year, in fact open cars have already been in service fully three weeks in most cities in this latitude. With less riding than in other years of workingmen going and coming from factories and other industrial plants, it is imperative that the manager encourage and foster pleasure riding to its largest extent. The various methods in which this can be accomplished have already been elaborated in our columns during the past few months, and it now remains for the fertile-minded manager to select such means as best commend themselves to the wants of his own locality. We shall be glad to be advised of all new departures in this line and to publish a full description for the benefit of others of the fraternity who are anxious to develop their own business.

THE outlook of trade for the present month is more encouraging than for some time past. The manufacturers and agents of the smaller supplies, particularly those whose wares are staples, find trade greatly improved, as the stripping of reserve equipment has come to an end and buying is a necessity. At the same time collections are improving, and there is less careless credit as well as less careless expenditure. Heavy supplies, engines, power equipment and cars have been helped considerably by large orders both East and West, particularly in New England. The same remarks as to credits applies equally in this case. Summer resort traffic promises only fairly, but many roads will open up local pleasure grounds to induce traffic. Fewer new firms have entered the supply field, but those few are better prepared for the struggle for existence.

THE consolidation of three important street railway systems in Kansas City is a wise move. A few years ago when that city was experiencing an unparalleled boom, a new road was promoted almost every month, and bank-

ing on the future, scattering lines were built in ever direction. Indeed for a time, one had scarcely more to do than print bonds, fill a satchel, make a trip to the east, sell out and return home between two Sundays. The result was a multiplication of certain lines beyond all possible reason, and the subsequent division of values into very minute parts was inevitable. The consolidation of three lines will now reduce general operating expenses very materially, and the selection of the best men from each road should afford a strong and experienced management. The deal ought to prove of equal advantage to stockholders and the public. Thus far the street railways of Kansas City have done much more for the town than the town has for the roads.

AN interesting case, which may prove an important precedent, has been decided here in the United States Court of Appeals. A male passenger, who could have boarded the rear car of a cable train then at a standstill, ran forward to take the grip car. While doing so, the signal was given to start, and while he was attempting to board the grip car it moved. He was thrown down and claims injury. The court held that the passenger has a right to select one car in preference to another, and that in doing so, he is not guilty of contributory negligence. In reviewing the case, Judge Bunn said:

"The conductor of street cars, having the safety and even the lives of patrons in his keeping, has not discharged his whole duty to the public when he has stopped his train and waited what may appear, according to his schedule, a reasonable time for passengers to embark. He is bound to exercise the highest degree of diligence practicable to protect passengers and prevent accident. He is bound to know when he starts his car suddenly out with full force that no person attempting to embark is at that moment with one foot on the platform and the other on the ground and with his hand upon the railing in the act of getting on board, or is otherwise in a position of danger."

Two managers were recently discussing operative means and methods, when one remarked he was going to make a big saving by taking off half his cars. To this the other replied: "That is the worst possible economy you can make." He then went on to state that he, too, had been inclined to the same severe resort, but after careful study of the question had become convinced that it was wrong. He had spent a great deal of money in educating his patrons up to a point where they had begun to appreciate the value and convenience of a good car service, and were getting out of the old chronic walking habit. Now to cut the service down to a radical extent would make the headway so great a very large portion would find it quite as expeditious to walk as to wait on a car, and less expensive. In this way a great part of the education necessary to bring a community up to a good riding point would be lost and they would quickly backslide. While in most cases roads have absolutely been obliged to curtail the normal service, still there is much force in the above. Economies should and must be rigidly practiced, but the saving should

come almost everywhere else before crippling the service. People in these days need little encouragement to walk, and companies can poorly afford to throw the last straw in a patron's decision not to ride, by no car in sight, and an uncertainty as to when one may be expected.

THE sentence in Toledo, by Judge Pugsley, of three men who participated in a recent street railway strike to the extent of damaging the company's property, should serve as a warning to others, who, in the desire to carry their point, overstep the bounds of law. There has been altogether too much sentiment and laxity in judicial and official quarters in dealing with those men who seem to consider that wrong doing becomes a rightful prerogative if only it be done under the license of a strike. The fact that one man, or any body of men, are dissatisfied with their employment, gives them no rights which do not exist at all times, and the mere fact that they are embolden by numbers to destroy property which does not belong to them is no excuse for the violation of the law which, under normal conditions, they would not dare to transgress; and transgressing, would expect punishment. Might falls far short of making right, and in these days when few roads are making any money and the great majority are barely paying expenses or operating at a positive loss, the employe must divest himself of the belief that by resort to force he can in that way improve in the slightest degree the ability of his employer to pay more wages. In some places the men have nobly showed themselves worthy of the name and voluntarily and unanimously agreed to work for less pay, or where it had been promised to relieve the company of its obligation to increase wages which it had expected and hoped to be able to grant. There is not a street railway employe in the country whose place to-day could not be filled for less money than he is receiving, and under these circumstances it behooves the men to exercise reason, common sense and patience, instead of trying to make water run up hill.

"Our stocks are selling for somewhat less than they did a year ago," said a prominent western manager to us the other day, "but I firmly believe they command more confidence than then, and are looked upon as a better and safer investment." In reply to our inquiry as to how this condition had been brought about, it was stated that notwithstanding an enormous shrinkage in earnings, and especially in profits, that the management had succeeded by suitable retrenchment and economy in meeting its interest payments with accustomed promptness and had kept its pay day and bill settlement day without a single postponement. There is no small food for thought in this fact, and it is encouraging to extract even this crumb of comfort out of the discouraging returns which have followed a year of exceptional trial of spirit and body to the average manager. The soldier must have a battle in which to exhibit bravery, and the surgeon a critical case to prove his skill. The manager has had both, and as mentioned, these roads which have been able to keep the

ship to the wind and plow through the stormy seas without losing a spar, now stand proudly out to sea with a confidence of the investing public which did not exist before. The manager has been able to prove the strength of his craft and his own ability as a captain, and the local capitalists who perhaps never before had inclined to the purchase of its securities, now have a confidence in the worth and stability of their road which never existed before. In the case of those roads which have been less fortunate, it does not by any means follow that their misfortune is in any degree due to poor management, for in not a few cases to our positive knowledge the efforts of the manager have been thoroughly well directed and untiring, and the fact that no greater loss has been made under the unfavorable circumstances is really quite as much to their credit as the successes of others. There are still other roads where bad management can be blamed for disaster, arising out of a mistaken economy in placing the property in the hands of cheap or inexperienced men. Such deserve less sympathy, and should lose no time in correcting this evil. The trouble, however, all too often lies in the inability of directors to intelligently judge of what is good or bad management in the officers they select, and it not infrequently happens that the superintendent or manager is the only really practical man in the lot, and his hands are so tied that he is expected to make bricks without straw, or compelled to work along lines which he knows lead to almost certain defeat.

ONE of the most difficult things to understand in connection with street railway and allied trades is the unwillingness of some manufacturing companies to publish technical details in regard to apparatus. It is easy to see why a company should be very careful of plans and drawings of apparatus that is not yet and possibly never will be on the market. But it is carrying the matter too far when a company is not willing to give out the fullest information possible about apparatus that is on the market. Anything but the utmost readiness in giving out such information is liable to create a feeling of distrust on the part of buyers. The time is past when it is sufficient, simply, for a company to call a piece of machinery "absolutely perfect," the "best on the market," etc., in order to sell it. Street railway managers are not fools. There may be a few of that kind, but the number is daily decreasing. They want, not claims in regard to apparatus, but full particulars and facts. Being of sound mind and with some technical knowledge, they are able to judge for themselves as to the merits of devices. The peculiar information withholding policy of some companies, was recently brought to our mind by an electrician of a large system, who had to use no small "engineering" skill to get certain blue prints, giving technical details in regard to a piece of apparatus being installed on his road. The apparatus had been on the market for some time and was in extensive use. By going to some trouble the information could have been obtained from a study of the apparatus itself, and the unwillingness of the

manufacturing company to furnish blue prints was simply childish. Had anyone wished to copy the device, withholding the drawings would be but a slight deterrent. Such policy invariably does more harm than good. In this particular case it was not strange that the gentleman was somewhat put out at the inconvenience caused him. There is another class of companies which, although willing to give all the information in their power, exhibit a great lack of judgment as to what should be inserted in the printed information of all kinds which is sent out by them. It is no uncommon thing to see matter purporting to describe certain devices, but which in reality is nothing but a lot of claims. As said before, the intelligent buyer in our field wants not claims but facts. He is able and will draw his own conclusions. Descriptions which do not describe simply provoke him. The mistake is a natural one on the part of the dealer, as he is anxious to show the merits of his goods, and with this end in view he forgets all else, to his own disadvantage.

THE important part which the construction and operation of interurban railways is to play in the near future, leads us this month to give more than usual space to a subject which has always been most earnestly advocated in these columns. The magnitude which this branch of electric railway construction is rapidly attaining is but faintly realized, even by those who pride themselves on advanced ideas. The introduction of these lines means even more for rural districts than the conversion of a horse line to electricity in a city possibly can, for it affords transportation where none existed before. As an educational and social reform measure, the value of the interurban raises the curtain on a future full of hope and promise, and will advance the standard of intelligence in farming communities far above what it could attain in any other way. Lectures, theatres, entertainments, and Sunday services are all brought within reach of thousands, now as effectually isolated from these privileges as though a hundred miles away. For instance, a ten mile run on an interurban can easily be made in less than half an hour, and a walk of from a quarter to one mile from the home to the line is an easy matter. This brings upwards of one thousand residents of rural districts for each ten miles of road, within easy riding distance of the town or city. The ability to secure daily papers and mail will afford the farmer the latest market reports, and furnish protection against unscrupulous buyers, especially on rising markets. The ability to daily market perishable products of fruit and vegetables opens up a wholly new avenue of profit to the farmer; and while constituting an important feature of the freight receipts, is equally helpful to the city buyers, whose variety and quantity are thus indefinitely increased. As a feeder, also, to steam roads, the electric interurban cannot be over-estimated. In short, the good offices of country lines may be counted by the score, while there is not a single valid objection which can be raised in opposition. We repeat, the future of this branch of railway work, when once understood, will eventually equal in magnitude and investment the combined invest-

ments in electric railway systems in all the cities. Country papers have a magnificent opportunity to advance immeasurably the values of farm property and the comfort and well being of farmers, by the persistent advocacy of such lines at all places where conditions are such as to insure success; but farmers must learn at the start that they cannot afford, by exorbitant demands for right of way, to stifle the enterprise which is to bring them, above all others, increased returns. No farm is so good but its owner can well afford to donate the little strip necessary to lay the track, and stocks and bonds on which the line is built should be issued in small denominations of, say, \$25 or \$50, or even \$10, to enable the raising of a whole or part of the necessary funds from those living along the road.

AFTER a hard fought battle the North Chicago Street Railroad Company has gained its electrical franchises along Lincoln and Milwaukee avenues, and will now proceed to make the bald and unattractive prairie a habitation of man, if not to blossom as the rose. The street railway company deserves the greatest credit for its enterprise and persistency in pushing the matter to completion in the face of all obstacles. The unreasonable demands of a few mossbacks along the route were reflected in the veto of the mayor, who demanded certain lighting concessions in return for "the use of the streets." At present the entire course of the line resembles a country village more than the part of a great city. Property owners should be glad to have the price of real estate raised, and residents should appreciate the ability to get somewhere this side of eternity without restrictive clauses.

#### THE LOCATION OF CAR TRACKS.

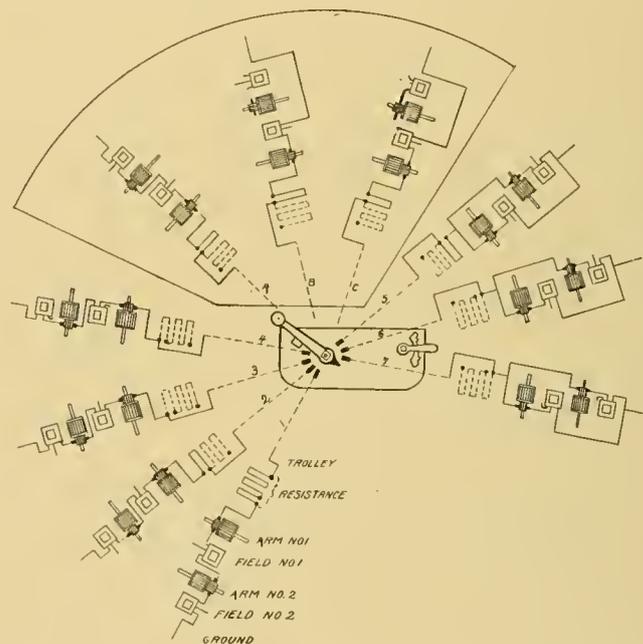

In a recent article on the question of the location of street car single tracks on country roads, Henry Manley makes objection to the two present methods and advocates a third.

Mr. Manley objects to the centering of the tracks as "taking up the whole road for the use of the street railway," and to the placing of the track on one side as "bringing the cars into the front yard and interfering with the standing places of teams, as well as preventing proper surface drainage." The theory advocated is placing the single track parallel to the center of the road and about five feet to one side. This, he claims, will obviate all the difficulties experienced with other methods. The only criticism he apprehends is that his method brings the track too near the course of ordinary travel. From the standpoint of experience, it seems to the REVIEW that the ordinary centering cannot be improved upon, as it gives down-going and up-going street traffic all the room necessary on a sufficiently broad road and takes up only the part of the thoroughfare that is of least use to the teamster, namely, the necessary division between passing vehicles. Circumstances ordinarily dictate the position of a track, and Mr. Manley may be

assured that electric railways wish the most convenient position where its tracks will be least liable to be crossed by teams.

#### AN AID IN EDUCATING MOTORMEN.

The proper handling of the controller is the most important point in a motorman's education, and it is almost impossible to train a man to handle the controller properly unless he understands the principles of what is going on and the connections that are being made as the handle is thrown from point to point. Educating a large number of motormen who have had no previous knowledge of electricity is a difficult task at its best, and anything to simplify matters ought to be gladly adopted. The accompanying illustration is from a blue print which

is supplied to every motorman on the Calumet system of this city. On the same sheet with it are a few instructions and a brief explanation of the connections. The idea of the diagram, as will be seen, is to give the connections for each controller point in the same relative positions as those taken by the controller handle in making the corresponding connections. This particular diagram is for the General Electric type "K" controller wired to W. P. motors and using the field loop method of control. Of course the idea is applicable to any controller. With plain rheostat control such diagrams would not be worth the while, but where the connections are as numerous and varied as on series-parallel controllers, anything that will simplify matters to the befuddled mind of the motorman during the learning period, should be adopted. This department on the Calumet system is under the charge of H. P. Rustling, who is doing much to save repairs by a thorough education of the men under him.

THE Grand Avenue Cable Company, Kansas City, Mo., has instituted a system of electric push buttons to signal the conductor. One car is equipped experimentally.

## ELECTRIC TRACK WELDING AT ST. LOUIS.

Three and One-Half Miles of Continuous Rail.—The Baden & St. Louis Railroad the Second to try the Continuous Rail Experiment.—The First New Track so Laid.

BY RICHARD MCCULLOCH, ELECTRICAL ENGINEER, CASS AVENUE & FAIR GROUNDS ELECTRIC RAILWAY, ST. LOUIS.

To build a track which would obviate the ceaseless trouble with joints and to perpetually insure a smooth and easy riding roadbed, was the object of the management of the Baden & St. Louis Railroad when, last

track with hot riveted rail joints. All of these trials gave satisfactory results. Last year, the Johnson Company, having procured a suitable electric welder from the Thomson Electric Welding Company, several miles of track were welded on the West End road, of Boston. There was some trouble from rails breaking near the welds, but the Johnson Company persevered with its experiments and entered the field this year prepared to guarantee its work. Street railways have shown a great willingness to try welded track and this season will be one of great activity along this line. The road under consideration is the first to begin welding operations this season.

THE WELDING CAR.

February, it closed a contract with the Johnson Company to weld together the rail ends of its reconstructed road. In the past few years there have been several experiments with continuous track, and all tend to show that the difficulties which would be supposed to arise from contraction and expansion can be neglected. The most scientific and thorough experiment along this line was made by A. J. Moxham, president of the Johnson Company, early in 1892, and reported to the American Street Railway Association, at Cleveland, in that year. In this case the rails were so bolted together as to be practically continuous. Previous to this Philip Noonan laid some track with hot riveted rail joints, on the Lynchburg & Durham Railroad, near Gladys, Va. Some time ago C. W. Wason, of the Cleveland Electric Railway, laid some

The Baden & St. Louis Railroad is one of the oldest street railways in St. Louis, its charter having been granted in 1870. It runs between the north end of the Broadway Cable and Baden, a suburb in the northern part of the city, passing on its route O'Fallen Park and the two principal cemeteries of the city. The road was formerly operated as an independent horse road, having a single track with turn-outs, but as it has recently passed under the same management as the Broadway Cable, it was decided to operate the road by electric power and use it as an extension of the cable road. The road is about three and a half miles long, and is to be double track the entire distance. There are no crossings with other roads, and although there are no sharp curves, it has a number of long bends of eight hundred to two thousand

feet radius. In making the sharper bends, the rails are curved in a rail bender and then welded in place. The street in which the track is laid is an old macadam road, varying in width from sixty to eighty feet, and is used very much by farmers in bringing their produce to the city.

The current for the operation of the road and for the welding process is obtained from the new Cass Avenue &

WELDED JOINT, SHOWING LUGS.

Fair Grounds Railway power house, this road being under the same management as the Broadway Cable. The poles for the span and feed wires were all erected before the laying of the track began. The terminus of the Baden road is about two and one half miles from the power house. Five Number 0000 wires are run from the station, four of them being overhead and one a track feeder. As there is no direct rail return to the power house, an additional track connection is secured in the following manner: The terminal sheave of the cable is well bonded to the first rail of the new electric road, and at a point where the cable track crosses an electric track, the carrying pulleys of the cable are bonded to the rails of an electric road which runs directly to the power house. In this manner, the cable and conduit act as return conductors.

Preparatory to the welding operation, it was found necessary to lay the track, tamp it, line it, and surface it completely before the joints were welded. At the start an attempt was made to weld the joints first and tamp and surface the track afterwards, but the weight of the welding car was such that the rail was bent down in the middle and raised at the ends, making joints welded in this manner high.

The road-bed is first plowed out to the necessary depth. Then six inches of macadam are thrown in and rolled. Upon the rolled surface are placed the hewn white oak ties, three feet apart. The rails are then spiked to the ties and the track tamped to grade and filled in to the tops of the ties. The rails are then ready for the welding of the joints.

The welding car is equipped with two W. P. 50 motors, with the rheostat, reversing switch, etc., of an

ordinary street car. In addition to this it has the welding circuit shown in Fig. 1. The current from the trolley passes through an automatic circuit breaker, switch, ammeter and starting rheostat to a transformer which transforms from the 500 volt continuous to an alternating current. This transformer resembles an ordinary four pole General Electric 100 kilowatt dynamo. To obtain the alternating current four leads from the windings are taken off at equal distances around the armature and led to two collector rings on the armature shaft. The speed of the transformer is about 1,100 revolutions per minute, so that the periodicity of the alternating current is about 4,400 per minute. The alternating current from the collector rings passes through a regulating induction coil with a moveable iron core to the welding machine, an illustration of which is here given. This machine is hung on a crane so that it may be set over either rail, and is simply an alternating current transformer on a huge scale in which the rail joint completes the secondary circuit. It was made by the Thomson Electric Welding Company, and operates on the same principle as its well-known machines. The insulation of the coils is paraffine oil and the secondary consists of a single turn of an enormous bundle of sheet copper strips. These strips lead to two copper contact plates, between which the welding is done. The distance between the plates is controlled by a toggle joint operated by a screw, so arranged that by a slight turn of the screw a great pressure may be brought to bear upon the weld.

In addition to this circuit, the welding car contains a motor for operating the crane, and another for driving a pump which circulates water in the welding machine.

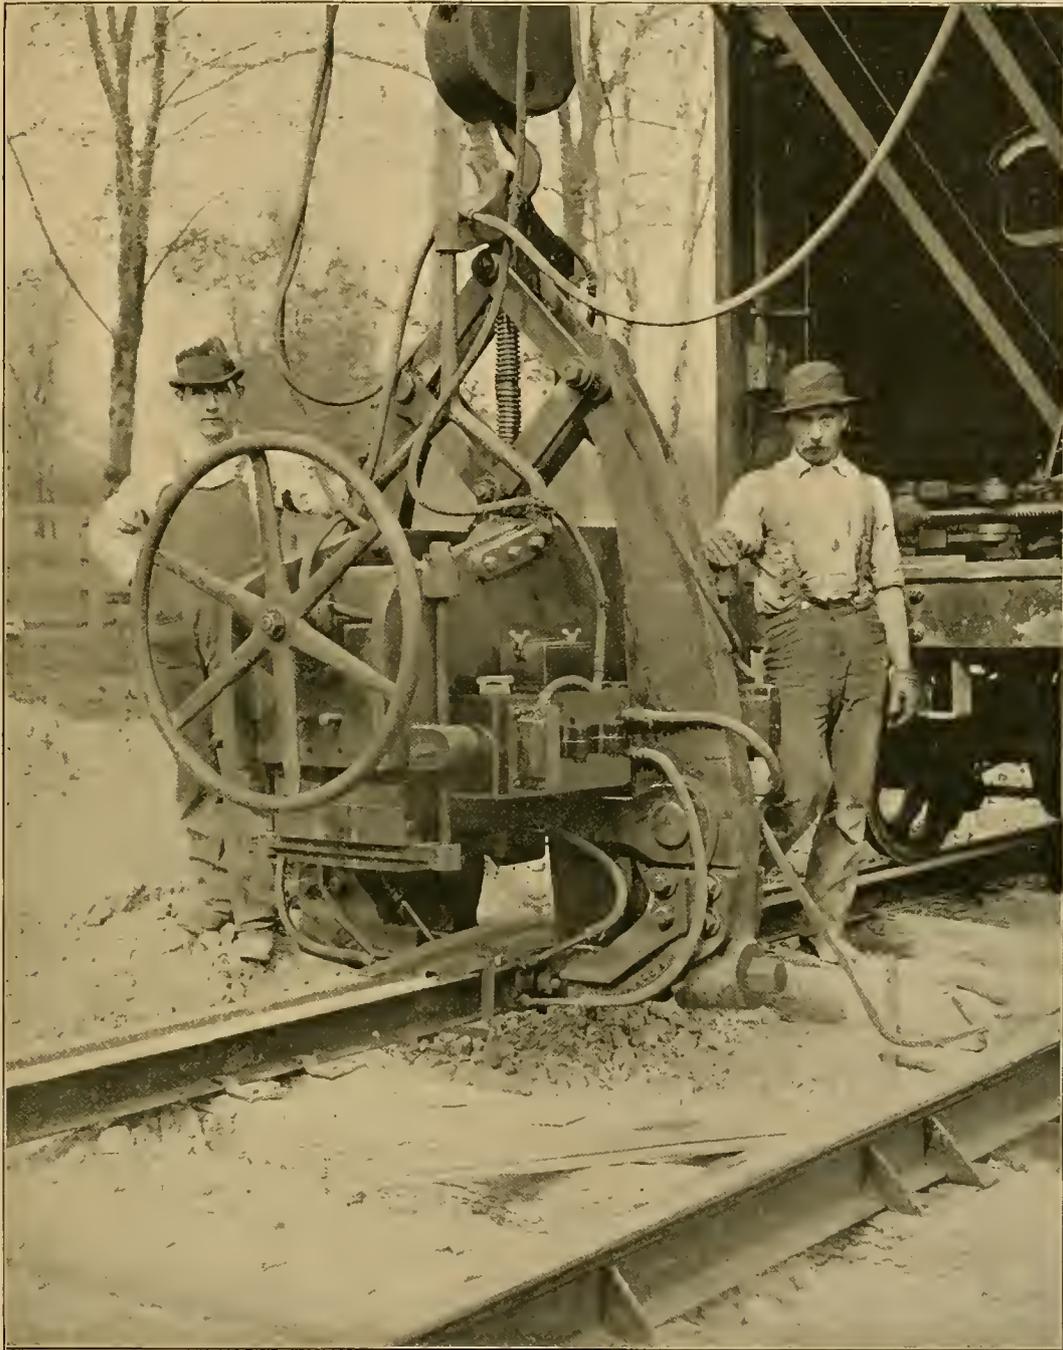

THE COMPLETED TRACK.

The car is very heavy, weighing about 30 tons when equipped for work. There is also a small car which carries two motors, operating emery wheels attached to flexible shafts for polishing the joints preparatory to welding.

The welded connection between the rails is made by means of lugs welded to the web of the rail. A section

at the joint is shown in Fig. 2. It is intended that enough plastic steel shall enter the joint to make a butt weld, and that additional security be afforded by the lugs welded to the web. The bottom lugs, numbers 1 and 2, are first welded. After they are in position, the operation is completed by welding numbers 3 and 4. It requires

to be welded, and the welding takes place at the rear of the car, so that it is never necessary to run over a hot joint. The webs of the rails are polished with emery wheels for about two inches on each side of the joint. The joint is then clamped by means of a gun metal casting, which holds the rails in proper position while the

WELDING MACHINE AT WORK.

from one to two minutes to make each weld. The potential at the welder is transformed down to four volts. The direct current transformer takes from the line about 250 amperes at 500 volts.

The operation of welding is as follows: The ends of the rails are butted together by driving a wedge in the joint ahead. The welding car is then run over the joint

weld is being made. The bottom lugs (Numbers 1 and 2 in Figure 2) are then placed in position and the contact clamps screwed down upon them. When the circuit of the secondary coil is thus completed, the switch on the welder is closed and the iron core of the induction coil slowly raised. Almost instantly a dark, ruddy color appears in the lugs which gradually brightens until the

welding heat is reached. A quick turn of the screw which operates the toggle joints brings the lugs firmly up against the rail and forces the plastic steel into the joint between the ends of the rails. The upper lugs (Numbers 3 and 4) are quickly inserted, the contacts

raised and screwed down upon them and they are welded in the same manner as the lower lugs. Pieces of carbon are previously placed upon the top of the rail so that this portion is carbonized and hardened by the process. After the lugs are welded the tread and flange are smoothed up by hammering. The welding has been so perfect in many instances, that after the track has been filled in, it is impossible to see the joint in the tread.

The greater portion of the time is consumed in preparing the joints, moving the machine, setting up the welder, etc. The machine has been completing 30 to 50 joints per day of ten hours.

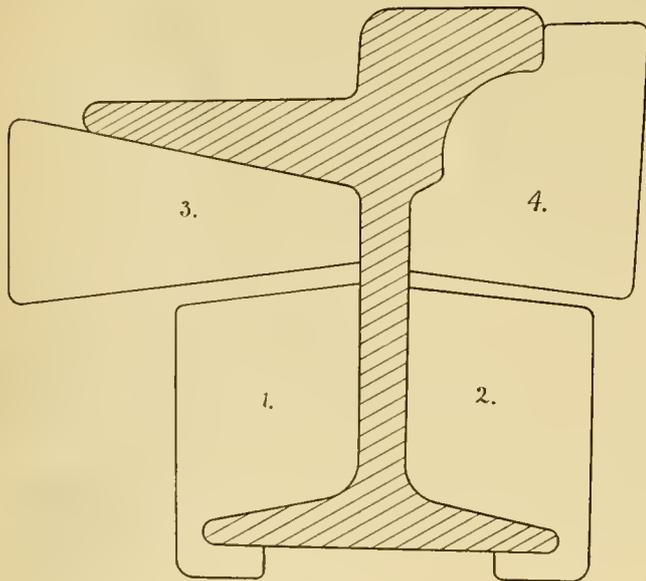

FIGURE 2.  
LUGS WELDED TO THE RAILS.

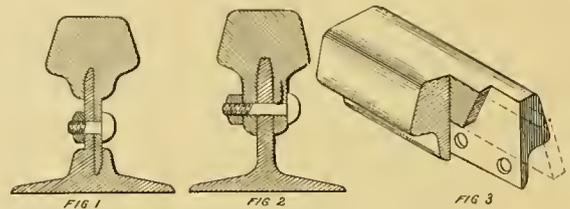

At the present writing no great trouble has been experienced from expansion and contraction. The temperature of the air has varied exceedingly. Several of the joints broke soon after welding, but these were probably imperfect welds. These joints were re-welded

as soon as the break was discovered. No buckling has thus far been noticeable on the warmest days. The track is filled in as soon as possible after welding, but on several occasions, 300 to 500 feet of welded track have been left open for several days without bad results.

The results have been very satisfactory and the management of the company is very sanguine as to the outcome of the experiment. G. Milton Brown, of the Johnson Company, is in charge of the operations.

THE M'CORMICK RAIL.

The McCormick combination rail and joint, on which letters patent have recently been issued, consists of a T rail made in two parts. The form of these parts and the manner of fitting them together may be either as Fig. 1 or Fig. 2. Fig. 3 shows the method of joining the ends

of the top part of the rail. The principle is somewhat similar to rails which were tried on steam roads in times past, but which were abandoned on account of costing too much in proportion to the advantages gained. The expense of tool work on the rail ends would in this case be very great.

POWER HOUSE FIRE AT SACRAMENTO.

An early morning fire, April 19, destroyed the electric plant of the Capital City Gas Company, which supplies power to the thirty odd miles of the Central Electric Railway, in Sacramento, Cal. Twenty-four dynamos were destroyed. The total loss was \$300,000, including two large engines, the dynamos and the building. The fire is thought to have originated in the switch board.

THE DEADLY LOCOMOTIVE.

Opposition to progress, we are relieved to discover, is not peculiar to American citizens. The Official Gazette, of Peking, China, which publishes the ukases of the emperor and the declarations of the highest courts, has severely rebuked the Buddhist priests who denounced the locomotives as causing the illness of her imperial highness, the emperor's mother. The Gazette states that the high court decreed that the smoke and noise of the locomotives in no wise injured the august lady.

THE New Jersey Consolidated Traction has a plan for freight service between Newark and New York. The freight will all be carried between one and five in the morning.

## TRAINS FOR INTERURBAN SERVICE.

The greatest activity along electric railway lines within the next few years will be in the direction of interurban roads. This service necessitates a few changes from city railway service, as has been demonstrated in a few roads already built, and as the business grows interurban roads

will probably evolve a distinctive class of rolling stock. An interurban road projected in a neighboring state, and one which has good promise of being built, is considering plans for a radically different service from that now used. The plans were made by Charles C. Caldwell, electrical and mechanical engineer, now of Shelbyville, Ind. Mr. Caldwell was born in Washington county, Pa., in 1865. He became interested

in electricity about five years ago, and was engaged in the construction of electric light plants at different points in the south and southwest. Electric traction has been to him for a year a subject of deep and broad study and of practical investigation, and he is now beginning to advocate what he feels sure is to be realized in the near future, namely, inter-

urban electric service, using the methods of station and track construction and following somewhat closely the ideas of steam roads.

In his opinion, the trains for this particular service, and the motive power and speed demand changes from those now in daily use. Specifications for such trains have been drawn up by Mr. Caldwell, and several car builders have prepared plans. The car builders' plans submitted can be seen in the engravings. The Barney & Smith train as here shown, is one of

the most elegant trains ever designed for electric service. It can be operated over a track having very sharp curves. It is intended for use with the electric locomotive described later. The cars are 36 feet over all. The width over sills is 9 feet, and the height from center of deck to floor, 8½ feet. The weight of each car here described is 25,000 pounds. The Janney narrow gauge passenger train coupler is used. The wheels are 33 inch. The Brewer & Krehbeil train incorporates the same principles

C. C. CALDWELL.

INTERIOR PULLMAN TRAIN.

PULLMAN STAIRS, INTERIOR VIEW.

as the train exhibited at the World's Fair and now in regular service on the Chicago & Alton. The dimensions are the same as of the Barney & Smith cars. The train is of four cars, having no baggage car as the other trains have. The first car shown is intended to be made the motor car, as on the Intramural road, and is exclusively a smoker. The trucks are equipped with open spoke 36-inch wheels on 4½-inch steel axles. The wheel base is 5 feet. The Pullman plans are for double-decked cars, such as have been previously exploited.

The electric locomotives to be used are similar to the one exhibited by the General Electric Company at the World's Fair, weighing 30 tons and having a maximum speed of fifty miles an hour. It will be provided with two trolleys and an electric headlight supplied from a rotary transformer.

The feeders proposed are old rails having the ends joined with the ordinary splice bar, and bonded with copper equal to the carrying capacity of the rail. Two lines of these rails will be laid along between the tracks a little to one side of the center poles. These rails are to be put on porcelain insulators and inclosed in a top with a  $\Delta$  shaped cover, so as to shed water and keep people from walking and standing on it. The feeder box is then filled with pitch and raised to the level of the rails on posts placed 4 or 5 feet apart. From this box, taps will be led up the poles to the trolley. This arrangement will, it is claimed, cost only one-tenth the amount required to install copper feeders of an equal capacity.

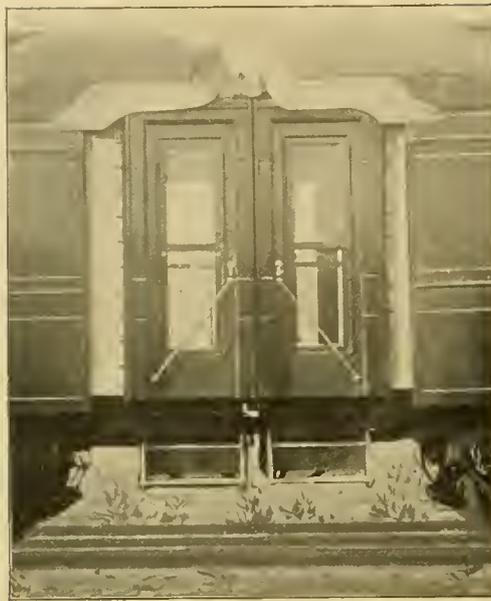

PULLMAN CENTER ENTRANCE.

C. & G. COOPER & Co., of Mt. Vernon, O., have received recent orders for two 750-horse-power engines, for the Allentown & Lehigh Valley Traction Company, Allentown, Pa., and the contract for the engines for the Nassau Street Railway Company, of Brooklyn, N. Y. The first power station of the latter will require 6,000-horse-power, and the first installation will be of three 750-horse-power cross compounds, direct connected. The second station will be like unto the first.

W. H. LeRoy, manager of the Texas summer amusement circuit, to which the greater number of Texas street railways belong, has arranged with Superintendent Urie, of the Austin Rapid Transit Company to place his line on the list. The company owns an opera pavilion.

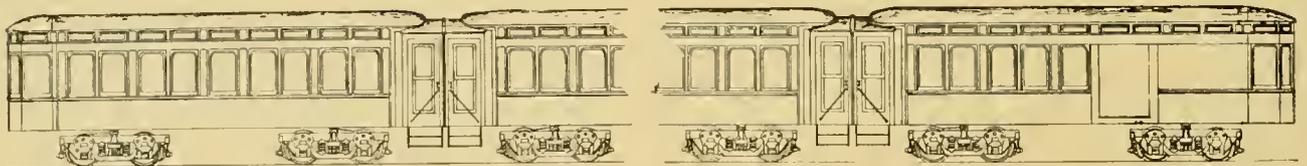

THE Electric Railway Equipment Company, of Cincinnati, O., is very busy with recent orders. One of these is 4,000 tubular poles for the City Railway, Dayton, O., the Cincinnati Street Railway Company, and two New Haven, Conn., lines. A new hanger, to be called the Star, will soon be marketed. It is an interchangeable device and will bear investigation.

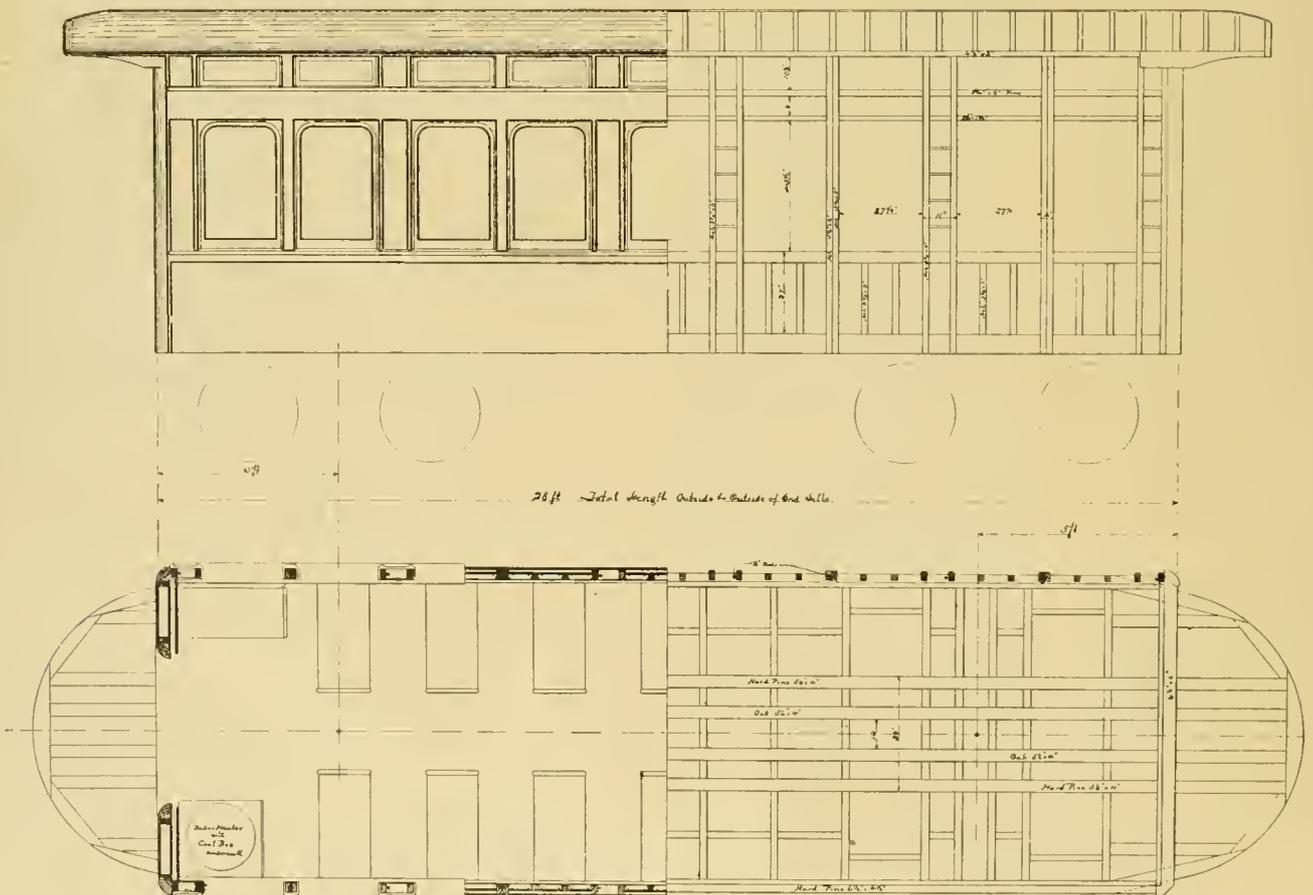

BREWER & KREHBEIL VESTIBULE.

Two cranks, supposed to be members of a suicide club, recently stripped to the waist and threw themselves under the wheels of a Hazleton (Pa.) electric car. The motorman saved their lives by a quick stop, and received only curses for his pains.

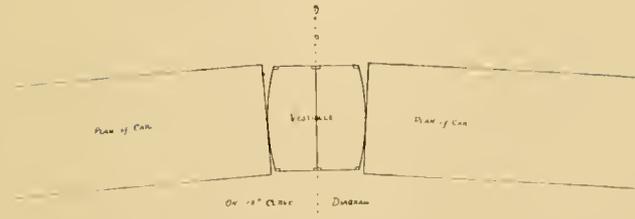

THE Austin Dam Railroad Company, Austin, Texas, has made a proposition to the city, which owns the track, to pay the rent due to date and to enter then into a new lease of the track, providing the city cuts the rent 50 per cent. The present rate is five thousand dollars a year and is not justified by the present earnings.

## THE OHIO VESTIBULE DECISION.

Our readers have followed with much interest the various steps as recorded in these columns of the Ohio law requiring electric railway companies to vestibule their front platforms. The several methods adopted by different roads in an endeavor to comply with this law during the past winter have all been illustrated and described. While each manager has felt and maintained that the law as passed was unjust, and in most cases unnecessary and unwise, it remained for the Springfield Company to actually join issue with the State authorities, and since our last issue the court has passed upon the case. The ruling is of extreme interest and importance to all managers in northern latitudes, and we therefore print it in full herewith.

*Court of Common Pleas: Clark County, Ohio.*

The State of Ohio	Plaintiff,	
vs.		Decision on
Samuel L. Nelson.	Defendant.	Demurrer.

The following is the statute to which by the demurrers filed herein I am called upon to give construction, to-wit:

“An act requiring persons, associations and corporations owning or operating street cars to provide for the well-being of employes.

Section 1. Be it enacted by the General Assembly of the State of Ohio, that every electric street car or other than trail cars which are attached to motor cars, shall be provided during the months of November, December, January, February and March, of each year, at the forward end, with a screen constructed of glass or other material, which shall fully and completely protect the driver or motorman or gripman or other person stationed on such forward end and guiding and directing the motor power by which they are propelled, from wind and storm.

Section 2. Any person, agent or officer of any association or corporation violating the provisions of this act, shall upon conviction be fined in any sum not less than \$25 nor more than \$100, for each day each car belonging to and used by such persons, associations or corporations is directed or permitted to remain unprovided with the screen required in Section 1 of this act.”

It will be observed that the title is general as to street cars, and the body of the statute special to one class only of street cars.

There are several objections urged to this statute, only three of which, however, do I find it worth while to notice.

The first is that the legislature having conferred upon municipal corporations certain powers over the streets and highways within the limits of the corporation, and also the right to grant the use of such streets and highways for street railroads and to prescribe the terms of said grant, can only interfere with the same by a direct withdrawal of such authority, and that the power to so fix the said terms remains in the councils of such corporations to the exclusion of the right of the legislature to enact such a law as the one under consideration. As to this point, it is sufficient to say that the powers granted

under Section 3,443 of the Revised Statutes, can by no possibility have any reference to such provision as is set forth in this statute, being for a purpose not inconsistent with or repugnant to the powers granted in that section or in any other section of the statute. The phrase “terms and conditions” is limited to the extent and method of use of said streets and highways and the compensation which may be required for the exercise of such franchise by a street railroad company, and does not preclude the legislature from enacting such laws as it might otherwise rightfully do for the prevention of injuries arising from the running of cars upon such street railways.

Second. It is claimed that the above statute is unconstitutional for the reason, as it is claimed, that being class legislation it does not operate alike upon all the members of the class to govern which the same was enacted, in other words, that while it professes in its title to be for the benefit of all persons who may be employed upon street cars, by the express terms of the statute it is limited to such employes on electric cars, excluding from its operation such employes on horse or cable cars, thus making it appear upon the face of the statute a distinction which otherwise the courts might not give consideration to. A large number of authorities have been cited, and I have spent considerable time in examining and weighing the same, as applied to the above statute.

It is plain to even a casual reader that the said statute is incongruous in its provisions, owing entirely to the introduction of one word, namely, the word “electric,” by leaving out which we have a law applicable to all kinds of street railroads known to the people of our state, viz., horse, electric and cable cars, to the latter two of which, at least, trail cars are sometimes used, and the employes whose business it is to guide and direct the motor power, whether horses or mules, electricity or steam applied to cables, are specially designated in the words, “driver” for horses, “motorman” for electric cars, and “gripman” for cable cars.

A statute framed in that way being both in its title and in its provisions applicable to all kinds of street railroads, would upon its face be free from the objection named for the reason that as to the subject matter of said statute, viz, the protection of such employes, street railroads are sui generis, and no other kind of vehicles which are now upon our streets and highways have need of the appliances like those described in said statute for the protection of employes from “wind and storms” and hence as to such subject matter they constitute the entire class.

How the word “electric” came to be inserted in that section it is not known, but the question is as to the legal effect of such insertion. Does it make what was before fair and proper to be “unequal and partial legislation” as classed by Cooley in his work on Constitutional Limitations? It is claimed that a statute is not necessarily bad because of its being class legislation, but only when unequally applied as between persons of the same class.

The rule laid down by Cooley is that “if the law be unobjectionable, all that can be required in these cases is

that they be general in their application to the class or locality to which they apply and they are then public in their character, and of their propriety and policy the legislature must judge." "But," he goes on to say, "a statute would not be constitutional which should proscribe a class or party for opinion's sake, or which should select particular individuals from a class or locality, and subject them to peculiar rules or impose upon them special obligations or burdens from which others in the same locality or class are exempt."

The rule is stated somewhat differently by Justice Field in *Soon Hing vs. Crawley*, Chief of Police of San Francisco, 113, U. S., 703, as follows: "The discriminations which are open to objections are those where persons engaged in the same business are subjected to different restrictions or are held entitled to different privileges under the same conditions. It is only then that the discrimination can be said to impair the equal right which all claim in the enforcement of the law."

In *Van Riper vs. Parsons*, 40, 4 J., Law Reports, page 9, the Court say: "Interdicted local and special laws are all those that rest on a false or deficient classification; their vice is that they do not embrace all the class to which they are naturally related. They create preferences and establish inequalities; they apply to persons, things or places possessed of certain qualities or situations, and exclude from their effect other persons, things or places which are not dissimilar in this respect."

In *Froher vs. People*, an Illinois case reported in 31 N. E. Reports, page 400, the Court say: "Understanding our constitution as we do, it is impossible without disregarding its provisions to sustain a statute which makes that a misdemeanor when done by persons engaged in one branch of industry, which if done by persons in another branch of industry, in like relation and under like conditions, will be lawful."

Cooley on Constitutional Limitations on page 391, says by way of further statement of the rule, "Every one had a right to demand that he be governed by general rules and a special statute, which, without his consent, singles his case out as one to be regulated by a different law from that which is applied in all similar cases, would not be legitimate legislation, but would be such an arbitrary mandate as is not within the province of free government."

The last quotation is with references to privileges granted to or burdens laid upon individuals which are not awarded to nor imposed upon others, but is illustrative of the general principle lying at the foundation of all class legislation; that is, quoting from *Smith vs. Judge*, 17 Cal. 554, "that such laws shall bear equally in their burdens and benefits upon persons standing in the same category."

Neither is the case of the *C. B. & Q. R. R. Co. vs. Iowa*, 94 U. S. 155, reviewing a statute providing for different classes of railroads, different rates of charges, and frequently quoted in support of unlimited legislative discrimination in conflict with the principles above stated, for Chief Justice Waite in his opinion says: "It is very

clear that a uniform rate of charges for all railroad companies in the state might operate unjustly upon some," and hence that all the railroads in the state did not stand as to the subject matter of the law in the same category.

It is not necessary for me to review all the authorities cited, but only enough to gather some clear apprehension of what the courts and sound lawyers hold upon this subject; and we deduce therefrom the principle not that there may not be class legislation, but to use the language of the court in *Bronson vs. Oberlin*, 41 Ohio State Reports, page 481, "the classification must be just and reasonable and not arbitrary," and from the other authorities that "those engaged in the same business shall not be subject to different restrictions"; that the classification shall not be "deficient"; that it shall not "create preferences and establish inequalities; that it shall not discriminate against those engaged in one branch of industry in favor of those engaged in another branch of industry, "in like relations and under like conditions;" and that such class legislation "shall bear equally in burdens and benefits upon persons standing in the same category."

Coming to apply these principles, or rather this principle thus variously stated to the statute under consideration, what is the result?

Counsel for the defendant claim that the Court will take judicial notice of the various kinds of street railroads, and also of the character of the street cars running upon them, and of the appliances for running the same. The matters referred to are not within the range of matters ordinarily classified as subjects of judicial notice, but what is its equivalent, the Court cannot ignore in giving construction to a statute its own knowledge of such facts as are within the common observation and experience, not only of himself, but also of all other men. It will not ignore the common knowledge of men of the difference between an omnibus and a street car, and between the latter and a railroad locomotive; neither will it ignore the points of general resemblance in street cars, and whatever points of difference there may be, that all street cars have places of entrance and exit and the character of the same; that at least all horse and electric cars have upon the front of the same a place for the driver and motorman, who respectively drive the horses or apply the electricity to the moving of the car, thus in the language of the statute, "guide and direct the motor power by which the car is propelled"; that in so doing they are alike exposed to the weather, that they both alike, unless a screen is interposed, suffer from the storm and wind, that the pitiless rain, snow and furious blasts of winter at times render it almost impossible for men to endure the position, and that the circumstances of both require some protection.

But is there any more reason for the protection of one than for the other? Counsel for the state suggest but one, and that is that the electric cars move with more rapidity than horse cars, and hence that the motorman may suffer more. The difference is one of degree, and not of quality, and is of so slight a character as not to

bear analysis in the discussion of the question—"If a motorman needs the protection of a screen, why should not the driver of a horse car"? It is as if it being necessary to provide a cab for the protection of an omnibus driver, a law should be enacted to provide, under penalty, a cab for a four-horse omnibus, and leave a two-horse omnibus driver unprotected, on the theory that four horses would move a little faster than two horses, and so by a more rapid motion create a stiffer breeze, and thus produce a little more cold. I am not aware that it has ever been found necessary to provide a protection for engineers and firemen on railroad locomotives, for as long as I can recollect, such protection has been provided, probably voluntarily. But suppose there has been such necessity. We have had in this state in the past, three classes of steam railways, viz., broad gauge, standard gauge and narrow gauge. What would have been thought of a law which, general in its title to all railroads, provided a cab for the protection of the engineer and fireman of a standard gauge locomotive only, or for both standard gauge and broad gauge, leaving the narrow gauge out, on the sole claim that it could not make quite so fast time as the other two. The fact is, that the exposure for hours to the open air of winter is hard enough upon either motorman or driver, though there be neither rain, hail, snow or high wind, and it calls for some mitigation of the hardship. And that is what makes it difficult for me to decide this question. I am in sympathy with the law, but when the defendant challenges me by his demurrer for my opinion, I must say that I cannot see any substantial reason for requiring the screen provided in this statute for the motorman of an electric car that does not apply to the driver of a horse car. Let it be observed in this connection that this is not a vestibule law as it is ordinarily termed—the word "vestibule" is not used, but simply the word "screen," and not any particular form of screen is prescribed, so that the character of the screen is not in controversy, and the form of the screen can be varied to some extent to suit the different kinds of car upon which the same may be used. So that the question of the practicability of a vestibule is not involved. They are "in the same business"; they are in "like relations" to the cars which they respectively manage; they are under "like conditions" as to exposure to the weather; they are "standing in the same category," and if both are not protected from "wind and storm," there is a "preference" created—there is an "inequality" established, and the "benefits" of the statute do not "bear equally" toward such motorman and driver, whose relations, conditions, exposure and need of protection in the same kind of business, are so nearly alike in every respect.

The question involved is not now a matter of such common observation in this city as it was two years ago before the law was enacted, when we had both electric cars and cars propelled by mules, as still is the case in many of the cities of the state. Under such a law, in the severest winter, the motorman in passing by the driver of the mule car could have looked out from his

panoply of sheeted glass with the serenity of complete protection, and with a smile of contempt upon the storm-pelted and icicled mule driver. The poor muleteer might well have asked the legislature, why is this difference made between me and the motorman? And what kind of an answer would it have been for the legislature to say: "You must get a little more motion on those mules and we will. You are too slow to have any rights which we are bound to respect in this lightning age." For that is practically the argument of the prosecuting attorney.

Another objection urged to the law is that there is not by this law devolved upon any particular officer or agent of street railway companies the duty of providing the screens mentioned in the law. It seems to me that it is a question that goes rather to the practicability than to the validity of the law. It simply makes the work of the prosecuting attorney more difficult in finding out from the by-laws of the company, or otherwise, the responsible party as he has aimed to do in these indictments, by averring it to be the duty of the defendant as superintendent of the railway company to provide for them, which if he should fail to prove, would defeat the prosecution were the law valid in all respects. It only shows another reason why those interested in this law should send the same back to the legislature while it is yet in session, for repairs.

The consequences of this decision are not bad, and if they were, I have nothing to do with the consequences, for I am simply called upon for my opinion, and a judge is of no value who does not on questions submitted to him, render his honest opinion. The consequences are not bad, for the law can be remedied in a few days by the legislature striking out of the same the one word "electric," which I cannot keep from thinking was somehow surreptitiously and unobserved inserted by the great mass of legislators.

Again: I have less hesitation in rendering this opinion for the reason that there are eight of these cases pending in this Court, and if the Court should go on to try the same at great labor and expense, and then thereafter have verdicts set aside because of the question made herein, it would be much cheaper, easier and better for the prosecuting attorney to make up the record in this case now, which would be brief and inexpensive, consisting only of the indictment, the demurrer and a brief journal entry and have the same submitted to the Circuit Court which convenes in a few weeks, upon the legal question alone, and if my opinion is wrong we can have the other cases tried in June of this year free from any complications, except the simple one of fact as to the defendant's guilt in violation of said statute.

J. C. MILLER, J.

THE town of Halle, Germany, had a horse railway, which during the year 1891 gave a deficit of \$9,500 after two years' working. Then electricity was installed and its first year's service gave a surplus of \$12,000. The mileage was extended two and a half miles, and 2 $\frac{2}{3}$  million passengers were carried.

**SAMUEL L. NELSON.**

THE portrait of the manager of the Springfield, Ohio, Street Railway Company, which single handed and alone has triumphed over the iniquitous and "granger" vestibule law of Ohio, is reproduced here. The face is a strong one with several good "fighting" lineaments.

Samuel L. Nelson was born June 23, 1859, on a farm near Hicksville, O., and gained his early education in the village. In 1874 he learned telegraphy and filled positions from operator to train dispatcher. In 1884 he became manager for the Central Union Telephone Company at Springfield, Ill., and later served the same office at Dayton, O. In 1886 he was appointed secretary and treasurer of the Electric Light and Water Company's plant at Champaign, Ill.,

but in 1890 left for McPherson, Kan., where he built the waterworks and electric light plant and became its vice-president. During the same year the purchase of the Champaign and Urbana horse-car line by W. B. McKinley put Mr. Nelson into street railway work for the first time. Later he became manager of the Defiance, O., electric light and street railway plant, and in 1892, in conjunction with Mr. McKinley, syndicated the Springfield, O., lines, of which Mr. Nelson assumed management. During the same year the two roads at Bay City, Mich., and West Bay City were purchased by the syndicate and Mr. Nelson made general manager. Such is the history of the successful life of Samuel L. Nelson.

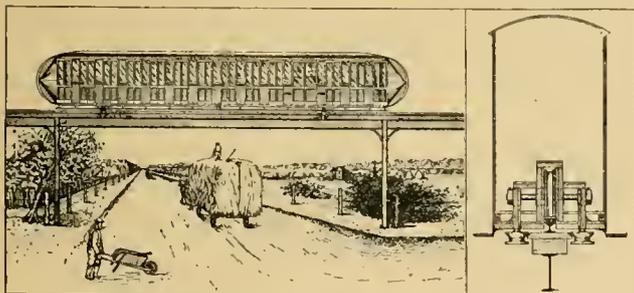

S. L. NELSON.

**THE BATAVIA BICYCLE RAILWAY.**

The Batavia & Lake Ontario Elevated Railway Company is about to undertake the building of a one rail rapid transit system, designed by Captain L. Beecher, of Batavia, N. Y. J. W. Holmes, Batavia, is chief engineer.

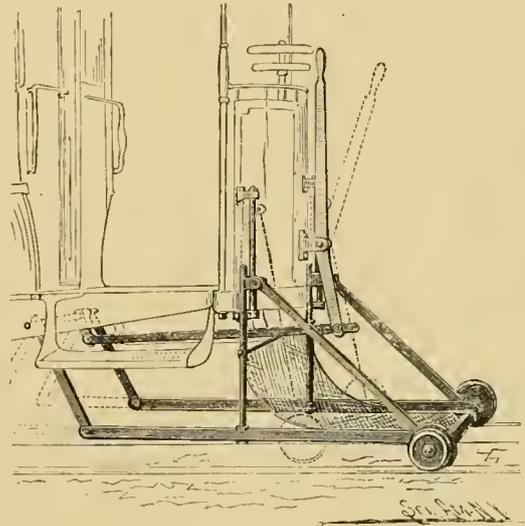

The scheme is represented in our engraving, and opens itself to the fatal objection of top heaviness, especially at

high speed. The car is to be 45 feet long, 3½ feet wide, and is to carry 40 persons. The motive power, as now determined, will be storage battery. The cross section shows the plan to be a center rail, bearing the car on a single wheel, with two guard wheels, to maintain the none too steady equilibrium. Captain Beecher makes the usual claims of bicycle elevated railway inventors.

**THE TRANTER FENDER.**

The invention of Benjamin Tranter, of 533 Park avenue, Brooklyn, N. Y., is shown in the accompanying engraving. It is a frame suspended in front of the car by hangers, and designed to be moved in and out at the car end. The front end of the frame runs on small wheels upon the track, while at the lower ends of the suspension rods are rollers against which the side bars of

the frame move with little friction. The rear ends of these side bars are pivotally connected to swinging hangers on a transverse shaft beneath the car floor, and on this shaft is a crank connecting with a pitman pivoted to the lower end of a bent lever which acts as a handle by means of which the fender is raised and lowered for use by the operator of the car. The platform of the fender is a netting into which the person struck is intended to be "dropped."

**THE W. W. LIGHTNING ARRESTER.**

The W. W. lightning arrester, which has been in successful use for a number of seasons and is already well known, is one of the standard articles handled by the new Wallace Electric Company of Chicago. It is specially suited to street railway service, as it can be placed in buildings, on poles, or in cars, and is made in a very convenient form for all these uses. It has no moving parts to wear or rust out and is water and dust proof.

**THE VALE OF MINNEKAHTA.**

Is the title of a beautifully illustrated booklet recently issued, descriptive of the Hot Springs, South Dakota, and the efficiency of their waters for the cure of rheumatism, neuralgia and kindred diseases. Copy of this pamphlet will be mailed free by W. A. Thrall, General Passenger Agent Chicago & North-Western Railway, Chicago, Ill., upon receipt of request, enclosing two-cent stamp.

A NEW transfer ticket, of large size, has been introduced upon the Cleveland, O., Little Consolidated Lines.

## SOME WEST END RAILS.

The following article and the accompanying sketches are taken from an article by Superintendent of Streets Carter, of Boston, printed in Good Roads, the L. A. W. magazine. C. S. Sergeant, of the West End Street Railway, gave Mr. Carter the history of West End tracks.

Figure 1 represents the earliest form of girder rail for street railways. Its principal advantage was the fact that the fastenings were underneath the surface, and not subject to the jar of street traffic. This rail was laid on 4 by 6-inch stringers, the stringers being laid on ties four feet apart. Fastening used was a four-hole fish plate. This track would cost about \$9,000 a mile, with usual amount of special work, not including pavement. Rail now obsolete.

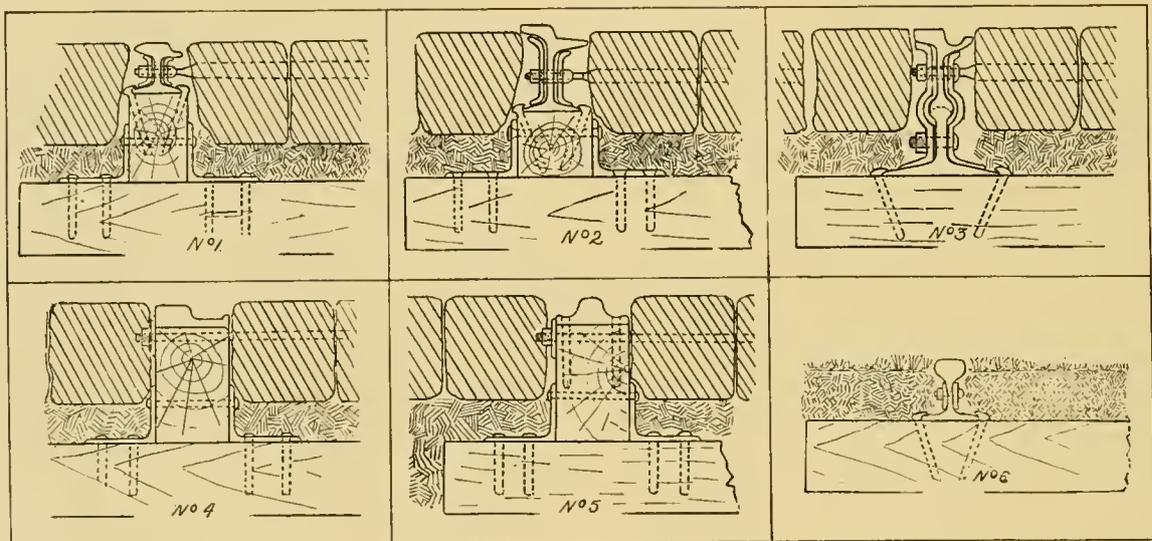

In Number 2, we see the next advance in girder rail, giving a 3-inch tram. It is 6 inches high, with a 4-inch base; laid on  $4\frac{1}{2}$  by 5-inch stringers, on ties four feet

The center bearing tram marked Number 5 became obsolete fifteen years ago. It weighed 45 pounds.

The last, Number 6, is for suburban use, weighs 35 pounds, and costs \$5,000 a mile. It is laid on cross ties. On some lines, sidings, and for laying at the side of the street, is its main usefulness on the West End. The street superintendent seems not, however, to be cognizant of the improved methods of paving to T rail, although he admits that a girder rail ordinance may be fatal to street railway enterprise in a small town.

As to the proper paving, Mr. Carter thinks that "it can be left to the city officials of the town," which proposition may be disputed in different localities, where unusual pig-headedness, denominated "progress" by the owners of the heads, wish a \$10,000-a-mile track and road bed construction on a \$1,000-a-mile street.

THE United States express has made arrangements to run into Ann Arbor, Mich., over the motor line.

SOME WEST END RAILS.

apart; first, fish-plate fastening; afterwards 36-inch girder joint. West End has put in 6,000 of these fastenings in the past two years, none of which has as yet given out. This track costs \$11,000 a mile, exclusive of paving and special work. The rail is 78-pound.

Figure 3 is a new type of rail, used in the congested districts of Boston, ordered specially by the superintendent of streets. Its feature is the grooved head, which can be used only in constantly cleaned streets, where there is great traffic. This rail is laid with welded chairs, three feet apart, on ties with a channel bar joint, using two rows of eight bolts. The base of this rail is not rolled now. The estimated cost of this type is \$13,000 a mile, exclusive of special work and paving. It is an 86-pound rail. Its use is necessarily very limited. The groove is half an inch deep.

The next, Figure 4, was used exclusively by the best horse lines until within eight years. It was 50-pound, and cost \$8,000 a mile, excluding paving. It was laid on a stringer 5 by 8 inches, on ties five feet apart, and with a  $3\frac{1}{8}$ -inch steel plate, 16 inches long, under the joint.

A COMPROMISE has been effected between Congressman McGann, president of the Twenty-second street electric line and President Yerkes of the West Chicago, whereby the former is allowed to cross the tracks of the latter. By June 1 the new road expects to operate from Lawndale to Twenty-second street bridge.

A CHICAGO mail carrier who made a little "on the side" by walking and then selling the street car tickets furnished by the government has been dismissed from service by the Assistant Postmaster General. A heavy item of postoffice expense is street car fare, and the man should have returned unused tickets.

THE Westinghouse Manufacturing Company has removed its Chicago headquarters from the Pullman building to the New York Life building, at the corner of Monroe and LaSalle streets. The new quarters are on the seventh floor, south front, and are capacious and comfortable. The same working force and management is still in charge and all are pleased with the situation.

## OVERHEAD CONSTRUCTION.

Abstract of a Paper Read Before the Wisconsin Electric Club by  
O. M. Rau, Milwaukee Street Railway.

The overhead trolley line construction of the future will probably not show much improvement over the best construction of the present, as this class of work has nearly reached its highest development, and inventors are turning their attention to other fields. From the first little four-wheeled cart pulled along by the car (from which the present trolley received its name) to the present simple, substantial and reliable system is a great advance, but it must be admitted that little has been done to improve the appearance, the main effort being to make it safe and reliable. The appearance could be greatly improved by a little more attention to neat poles and wiring. The system of three years ago is as a flimsy spider web compared to the system of today. Number 0 trolley wire has replaced number 4 or 6, and heavy steel poles have taken the place of light gas pipe.

The matter of side or center poles is still under discussion. The first cost of the side pole is more, but the maintenance is less. The side pole is also a disadvantage at fires. Its main advantage is the limited cost of repairs, due to the flexibility of the system. The blow of the trolleys on the hangers is less and the life of the trolley wheels much longer. A thoroughly well constructed center pole system ought not to be any more expensive to maintain, with the exception of wear on the trolleys, than a side pole system. The danger from poles being close to the cars is very slight, and up to date not a serious accident has been attributed to this cause. Cars must be provided with gates, as the danger from jumping into a car on the other track is as great as that of striking a pole. If the gates are securely fastened there will be no accidents from this source. There is nothing that improves a pole line more than systematic construction. Iron poles should be set in concrete about 6 feet in the ground. Side poles should be set at 20 to 25 inches rake, and fitted with an insulating pole top of wood.

The trolley wire bell or insulator, of which there are about as many forms as there are men selling them, cause the principal expense in the maintenance of a trolley line. This should receive most careful study before a specific bell is adopted. Of the numerous forms the only satisfactory one from a financial standpoint is the metal covered one having the means for fastening to the span wire on the outside shell. The center pole has brought out several patent hangers having springs to prevent rigidity. Of the numerous forms I have tried, all have proved not only expensive but of little value in aiding the flexibility of the line. A fastening very much employed with center poles is the swivel joint, which allows the bell to hinge forward or back as the wire may draw it. This gives rise to many trolley wire breaks because an unbalanced strain will pull the wire out of line at the clamp, causing short turns in the wire which soon break. This plan of fastening was made necessary by the large number of clamp studs or screw eyes which

would break when the bell was bolted to the pole rigidly. The improvements made in overhead parts have changed this, as the screw eye and stud are either done away with entirely or increased in size so that they will stand any reasonable strain. When the bell is fastened as a rigid fixture and the trolley wire held firmly in it, each pole will receive its own share of the strain from the wire and need only take care of the span between it and the next pole. The clamp will then remain in line.

The choice between a mechanical clamp or soldered clip is a difficult one but is usually in favor of the former. The soldered clip, although the neatest in appearance and smoothest in surface, is expensive to put up and interferes considerably with repair work. In fact, any device which requires soldering is not to be recommended on a trolley system. The average lineman is not careful enough with this work, and will invariably heat his solder too hot, which will soften or anneal the wire. This is most noticeable with the soldered sleeve and over 20 per cent of the trolley wire breaks can be traced to the heating of the wires during soldering. Many clamps have too many parts or are too weak. Another point usually overlooked is the rusting of the threads of the screws holding the clamp. In numerous cases I have seen it necessary to cut the clamp loose from the wire. The stud in the bell should be not less than  $\frac{5}{8}$ -inch as this part is specially liable to break. On center poles the strain on this part of the hanger is very great and the number of patrol calls is largely governed by their strength. From the record sheets of a line having about 80 miles of road and 4,000 bells on center poles, it is seen that a total of 3,700 calls were recorded for the year '93-'94. Of these 3,230 were to replace bells on which either the screw eye on top or the screw stud on the bottom of the bell had broken. These were 7-16-inch in diameter. From this it is apparent that almost every bell on the system was replaced during a period of one year. With proper construction on a center pole system there should not be more than 100 calls per 1,000 bells per year or a depreciation of about 10 per cent, not including the value of bells taken down which can be replaced or used again, reducing this considerably. Brass has been used on the hangers but it is more expensive and far less strong than malleable iron. Corrosion is so small as to be left out of account. Number 0 trolley, the standard at present, was used on the first road. Silicon bronze has proven a costly line to maintain. With good road bed and rigid inspection the breaks should not exceed one per mile of double track road per year. The distribution of the current to an electric railway has not received the attention that it should. A great many roads simply take the ends of the trolley wires and connect them to the station bus bars and "let her go." On an extensive sectioned system it is an interesting study to equalize the potential and obtain the best results under the particular conditions. This I have done on the system of this city. By some slight changes, the drop, which was found to be 25 per cent on one feeder and 2 per cent on another was nearly equalized.

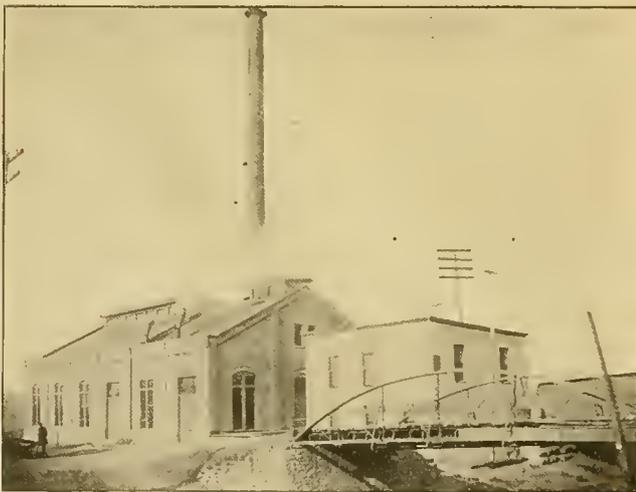

The advantages of having the line in sections are very important yet the only practical way to equalize the pressure over the entire system is to have all the feeders connected together as one large network similar to an electric light distributing system, where the mains would resemble the trolley wire. To obtain this advantage I placed a fuse box between each section with a fuse  $\frac{1}{4}$  of the carrying capacity of the main fuse on the feeder in the station. This fuse was fully capable of carrying all the current necessary to equalize the pressure between the adjoining sections and still light enough to blow if the station fuse was out.

Lightning protection is another important question. The Wurts tank arrester, in which the line is grounded through a tank of water, has proved very efficient at the station.

In closing I will say that although the overhead trolley system has been abused, and it is often remarked that it has seen its day, the next generation will see more overhead trolley lines constructed than any other system and for cities of 200,000 or less population it has come to stay.

#### CHANGE OF POWER STATIONS AT LAFAYETTE.

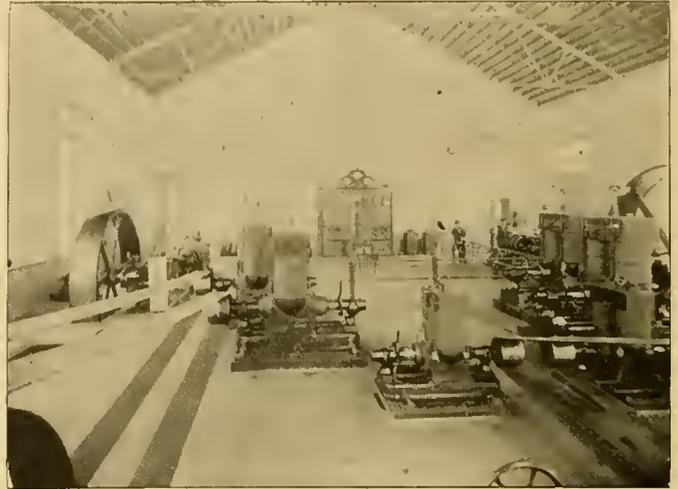

Since the REVIEW representative visited Lafayette in January 1893, the power house of the Lafayette Street Railway has moved itself—no, that is not right, Manager Hill would never admit that it moved itself—has been

THE POWER HOUSE.

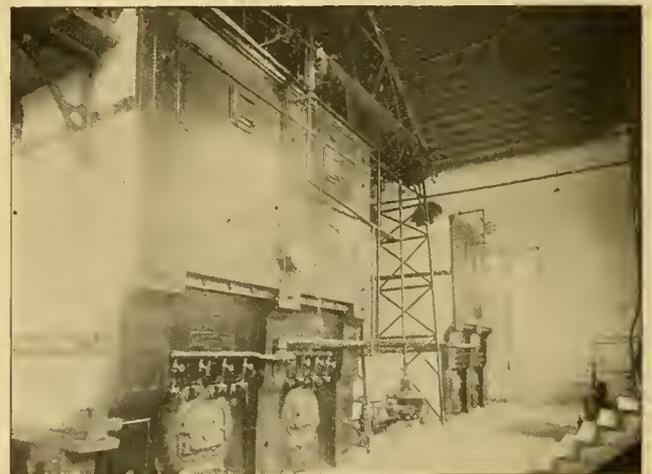

moved, into new quarters and the plant presents a very different appearance from that of a year ago. An elegant new car barn has also been built. Our engraving shows the new power house, with the old power house made over into a house for the engineer, in the foreground. The change of power houses was effected without a moments delay of traffic. The new engine room is 75 by 55 feet and the boiler room 55 by 35 feet. The steel stack is 125 feet high, built by the National Boiler Works of Chicago. Two 250-horse-power Sterling boilers are giving splendid satisfaction and have in General Manager

Hill a firm friend. They are fed through a 500-horse power Stillwell-Bierce feed water heater, by two Marsh steam pumps. In addition to a 130-horse-power Hamilton Corliss, moved from the old station, there is a new one of 250-horse-power. These are belted to a line shaft,

INTERIOR OF STATION, LAFAYETTE.

which is supplied with Hill clutches for throwing off and on the different machines. Munson belting is used throughout. There are two 100-kilowatt and two 50-kilowatt Edison railway generators and two 250-volt generators for stationary motor work. The station uses natural gas as a fuel, which is piped from the Indiana gas

BURNING NATURAL GAS.

fields, 40 miles from Lafayette. The pipe line pressure is from 160 to 200 pounds. At the city limits it is reduced to 25 pounds. At the center of the city it is again reduced to 2 pounds, for domestic use. For use under steam boilers the 25 pound pressure is continued into the boiler room, where the pressure is automatically regulated by the steam pressure. The meter rate for this gas is 7 cents per thousand feet. Mr. Hill says that this is 50 per cent cheaper than the best coal, including the cost of firemen, which are not required. However, they stand prepared during the extreme cold weather to start a

coal fire when the gas supply is liable to be shut off. The gas pressure at the boilers varies from  $\frac{1}{2}$  to 2 pounds. The boiler room is as clean as a parlor and is scrubbed out every day. A home made burner is being used

CAR HOUSE, LAFAYETTE.

under the boilers with good results. A 3-inch pipe connecting to the gas meter is carried along in front of the boilers and is tapped with  $\frac{3}{4}$ -inch pipes, provided with globe valves, as seen in the engraving. These  $\frac{3}{4}$ -inch pipes lead into elbows attached to 3-inch pipes, extending through the boiler front. On the ends of the  $\frac{3}{4}$ -inch pipes are caps having a large number of small holes. These spray the gas into the 3-inch furnace pipes and allow it to mix with the air entering those pipes, thus securing good combustion.

INTERIOR CAR HOUSE, LAFAYETTE.

The new car house is 126 by 96 feet, having seven tracks and room for 32 cars. The transfer table is across the center. Offices, machine shops and waiting rooms are located in this building and also means for the incandescent lighting of the building.

During the last year over five miles of track have been laid with 56-pound T rail, and more will be built the coming spring.

## SPARK ARRESTERS NEXT.

The daily press report a singular accident whereby two men working on natural gas pipes in a trench, were badly burned by the ignition of leaking gas, which was set off by a flash from the wheels of an electric car passing above. We presume this adds one more head to the deadly trolley monster.

## "ALL IS FAIR IN LOVE AND WAR."

The arrest of one George L. Ward, in New York city, brings out a story of competition. Ward had been haunting Third avenue just below 125th street, and hailing nearly every uptown cable car. When the car stopped Ward would count the passengers, glance at the fare register and walk away. His arrest and a fine of ten dollars brought out no word except that he was curious to know how many people were in the car. He is thought to be an employe of the Third Avenue Elevated and to be gathering traffic data.

## REQUIREMENTS FOR A CAR FENDER.

The small army of fender men, both present and prospective, will be interested in the following which is furnished by one of the most experienced managers in the country as embodying, what in his judgment constitutes a good street car fender. He says:—

"It must always be in position, ready for emergencies, must not depend upon any act of the motorman, because in emergencies he often gets excited and confused, and would forget to do his part. It must travel near the ground in order to pick up a prostrate person or child, and should not be so constructed that the fender itself could run on to and crush the person. As it must run near the ground in order to be reliable, it follows that when the car plunges, as all of them will, and the fender strikes the ground, that it shall not be broken or injured thereby, though it so strike the ground hundreds of times each day. It must be light, decidedly strong and reasonably cheap. It must be adjustable to any kind of car, simple and easily repaired, therefore it should be made to templates, so that repairs can be kept in stock. It should be easily and quickly removed and put on, so that it could be done right in the street. It should hang so that in collisions with cars, or when one motor is called upon to haul another, back or front, the fender is not in the way and is not injured thereby. It cannot be practical if not strong enough to collide with buggies or wagons without injury to it. It should be made of steel or iron and have no perishable parts of rope, wire netting or canvas. It should add to rather than detract from the appearance of the car. If it hinders the handling of cars in the barns, transfer sheds or shops it is impracticable. The demands upon the elements of an electric street railway system are such that there is no time to waste on impractical devices. I will never adopt a fender for the system under my management which does not, at least, come up to the above specifications."

## HIGH VS. LOW SPEED ENGINES.

Reply of President Green, of the Altoona Manufacturing Company, to C. P. Young, in March Street Railway Review.

*Editor Street Railway Review, Chicago, Ill.*

DEAR SIR:—I notice on page 184 of your last issue, an answer from Mr. Young to my letter of inquiry as to his open letter in your December number, in which he stated, an engine running above 120 revolutions a minute should never be used for electric railway work. Now, Mr. Young, in answer to my inquiry states, in his letter that he did not write the article for the benefit of engine manufacturers, but for the presidents and directors of street railways. So I take it for granted that Mr. Young would gladly have deceived the presidents and directors of street railways, and, by so doing, would expect engine builders to adhere to the same deception. I do not say this with the view to use any slighting language, as Mr. Young has done, simply because I asked for information. In the first place, I wish to say that in answering my inquiry Mr. Young has departed entirely from the text from whence he drew his former letter. He now only goes on to ridicule me for asking the questions, by saying he supposed he has stepped on my corns, etc., and would now endeavor to shield himself behind the theory of economy between high and low speed, and, in endeavoring to shield himself behind the walls of economy, he cites to the problem of a 1000-horse-power station, which is not common to the general public, as, it must be remembered, there are one hundred small stations with less than 1,000-horse-power where there is one station with as much as 1,000-horse-power. But let that be as it may, he says that a 1,000-horse-power station uses twenty tons of coal per day, as against another power station of the same capacity using twelve tons of coal per day; then he makes a comparison between the two, which would leave a difference of eight tons per day. Now, to make such a comparison as this without giving any data, is simply ridiculous. It might be possible that such a margin might exist, provided one power house was equipped with triple-expansion condensing engines, while the other power house was equipped with single cylinder non-condensing engines. He further tries to impress us with the fact that the slow speed engine is newer than the high speed engine. It may have been in the country where Mr. Young came from, but I am sure it is not in this; and if Mr. Young imagines he is bringing to light some new idea to induce people to use slow speed engines, I am sure the slow speed engine, as above stated, is no new thing.

In regard to regulation, he claims that the regulation of a high speed engine is two per cent between minimum and maximum load, while a slow speed engine, he claims, will regulate within one per cent. It is thoroughly understood and acknowledged by all practical and scientific men that the higher the speed the closer the regulation; and that a high speed engine as a rule is far superior in regulation where the load is constantly changing, to a slow speed engine; for the nearer the engine becomes the speed of the generator, the less the generator changes relative to the engine in regard to speed. For instance, a high speed engine running 250 revolutions a minute, belted to a dynamo running 1,000 revolutions a minute, the ratio of speed is four to one; while a slow speed engine running 100 revolutions a minute, belted to a dynamo running 1,000 revolutions, the ratio would be ten to one. So you see that if both engines were to regulate the same, the generator would increase and decrease double in its speed with

relation to the speed of the slow speed engine from what it would with relation to the speed of a high speed engine. So that from that standpoint alone, the high speed engine would be preferable for close regulation, for it is the generator we look after for regulation.

A high speed engine is especially adapted for railway work, for the reason that a high speed engine running 250 revolutions a minute, and say we suppose it to be 150-horse-power, running a railway where the units are few and the grades are great, the engine has to respond from nothing up to full load, and vice versa, continually. Now, the shock of 150-horse-power coming in upon an engine will be divided by 250 revolutions per minute, which would average about .60 of a horse-power per revolution of speed. While an engine running at 100 revolutions per minute, and the shock of 150-horse-power coming in per minute, it would be 1.5-horse-power per revolution per minute. So it seems that this alone is in favor of the high speed engine. It is a fact (and facts are stubborn things) that in all the motions the greater the number of revolutions per minute to produce certain power, the less strain and shock there is per revolution. I will endeavor to show that a slow speed engine will not regulate with a high speed engine from a practical and common sense standpoint. To begin with, I have shown clearly that the slower the speed the greater the shock will be per revolution; and taking Mr. Young's own comparison, it shows more than double. For instance, a slow speed engine is running absolutely light; the piston has started on its journey toward the opposite end of the cylinder, and the valve has opened and admitted sufficient steam to carry the piston to its journey's end with the existing load; the trip has let go and the valve has closed. At that moment there is flashed in 150-horse-power, and the engine running at only 100 revolutions a minute, there is no alternative but the speed will decrease considerably by the time the piston has reached its journey's end; then the governor will have dropped down, and the piston will receive a blow of the full boiler pressure, which is inclined to send the engine above its normal speed. In a well designed high speed automatic engine, it is possible for the valve to re-open and admit additional steam, provided the load is constantly changing. We have made many tests on both high and low speed engines on railway work and on electric welding work, and we have proven without a doubt that a high speed engine is far superior to the low speed engine where the load is constantly changing. Another reason, that it requires less than one-half the time to make a revolution, so that if the valve would not re-open the advantages are double in favor of the high speed.

Further, Mr. Young attacks the high speed engine as to its durability. To this I wish to say that an engine running at 250 revolutions a minute does not require as fine adjustment of the bearings as an engine running 100 revolutions a minute, for the reason that we use on high speed engines a certain amount of compression that arrests the reciprocating parts, forming a cushion as they pass the centres; and an engine running at this speed seems to have no dead centres, producing a smooth rotary motion, equal to a turbine wheel. An engine running at 100 revolutions a minute seems to check upon the dead centres, and unless the reciprocating parts are finely adjusted will hammer when passing each center. I am well aware there have been engine builders who build light flimsy engines and have tried to reach a point of speed far beyond the ability of their engine, and of course they have come to grief. Every engine builder in this country aims to run his engine just as fast as he has found it will stand; and the Corliss type of engine which you seem to favor so greatly, would be run much higher in speed but unfortunately the

construction will not permit. I am quite sure that if as many high speed engines had come to grief as have slow speed engines, destroying as much property and causing as much loss of life from the bursting of fly wheels, etc., they would have been cried down long ago. Mr. Young would now put forth an idea, which is ridiculous, to make the large fly wheels of the slow speed engines of malleable iron, which would mean enormous furnaces to be able to anneal such wheels. Now, if it requires all such unnecessary expense simply for the sake of securing the slow speed, and when you take into account the additional expense, room, counter shafting, keeping up of counter shafting, large belts, etc., why do we want to go to this expense to secure something that a high speed engine will furnish with one-fourth the room, expense, annoyance, etc.? While I will admit that the high rotary motion of the high speed engine compared with the slow speed engine (provided each shaft were equally loaded) would be greater than the slow speed engine, yet when you take into account the enormous fly wheels that have to be used on slow speed engines, the friction per square inch is reduced in favor of the high speed. Now, if Mr. Young had come out in his first letter and said that large power stations that would use 1,000-horse-power and upwards should use 500-horse-power engines, which of course would only run from 100 to 120 revolutions a minute, were preferable to putting in ten 100-horse-power high speed engines, then I should have never asked for the information; but he failed to do that, as he does now; he simply wrote his letter covering the whole ground in saying that no engine was fit for street railway work that run over 120 revolutions a minute. For in a large power station operating a street railway, where 1,000-horse-power is required, the units of power is so great in number (that is to say, there are so many cars on the line being operated at the same time) that the engines do not feel the shock of the cars letting go and taking hold alternately, as there are always sufficient cars moving to produce practically a steady load upon the engines. But as stated before, there is only here and there a power station equipped where it requires 1,000-horse-power. There are many railroads running to-day in America (and we have equipped many ourselves) that only require from 100 to 200 horse-power engines; and as stated before, the units being few and the grades heavy, I have in many cases noticed the power would change from nothing up to full load constantly. For instance, the engine was 200-horse-power, a portion of the time it would only be working say 50-horse-power, and then the next instant it would be called upon to furnish 200-horse-power.

In regard to economy, this depends on a variety of conditions, one of which the high speed engine has exclusive possession of, and which I will endeavor to explain. The great cause of loss of heat in the cylinder is the condensation of the entering steam upon the surfaces which have just been chilled by the re-evaporation of the water formed by the previous condensation. We shall see that on a given extent of surface and under given alterations of temperature, a fixed amount of condensation and subsequently re-evaporation must go on a given time. It follows, that the greater the quantity of steam worked through a cylinder per minute the less will be the percentage of loss when this condensation comes to be divided by the whole quantity. Many experiments, among them some of a very striking character, have proven the truth of this. It is found to be easy to condense nine-tenths of the entire steam, or indeed any proportion whatever, by running an engine slowly; on the other hand high speed means economy. Again, in a high speed engine superheating is more efficient and a less degree of it is required. This is

obvious, since to prevent a given condensation, and consequently re-evaporation, it is necessary to bring into the cylinder a given amount of superheat per minute, and as the quantity of steam brought in increases with the speed the degree to which this temperature must be raised in order to do this, diminishes in the same proportion. The most startling truth of this fact also is obtained by running an engine very slow when no amount of superheating avails to prevent condensation, in a degree increasing just as the speed is reduced. The high speed engine, if properly built, enables us to secure in the construction of the valve gear a compression at the end of each stroke which completely fills the entire clearance. On the other hand, the slow speed engine would be allowed to exhaust into the air, and new steam would be required to fill up the clearance space and reheat the surfaces.

Now, as it is acknowledged by all, that condensation is the greatest enemy to economy in steam engines, and as it requires more steam to heat and maintain a certain degree of heat on two feet of surface than on one foot, I will simply give an illustration. A slow speed engine to produce 100 horse-power, having cylinder 16" diameter and 42" stroke, would contain 8,444.62 square inches. While to produce 100 horse-power in a high speed engine the cylinder would be 13" bore and 12" stroke. This cylinder would contain 1,594.79 square inches of surface to be heated. So it is plainly seen that there is a fraction over five times as much surface to be heated on a slow speed engine as on a high speed engine; and as above stated, as condensation is the greatest enemy to economy there is no question to be discussed along this line.

Now, as Mr. Young came out in his first letter and made an assertion I asked him to give his reasons why he made such an assertion; he gave me his reasons and I now answer him, and have endeavored to set forth the advantages of high speed engines over low speed engines for street railways; and as we have both given our opinions on the subject I propose now that the public shall judge for themselves who is right and who is wrong, as life is too short to waste any more time on the subject. For there are lovers of slow speed engines and there are lovers of high speed engines, and there are places for slow speed engines and there are places for high speed engines; and it don't matter what Mr. Young or myself might say in regard to them, the lovers of each kind of engine will continue to float in the same channel. For it must be remembered that the "mills of the gods grind slowly, but they grind exceeding fine."

M. A. GREEN.

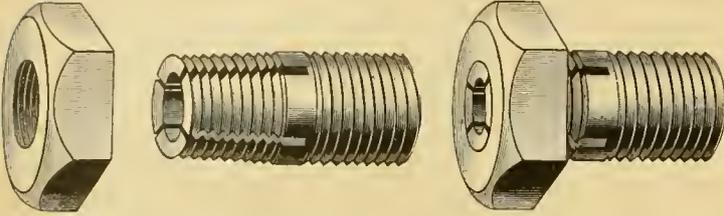

#### A NOVEL WHEEL.

In France, the ingenious plan has lately been adopted of making wheels for cars by bending up seven pieces of bar iron in such a shape that the center fits inside of a hand or false felloe, which, in turn, is hammered into a groove in the tire, felloe and tie being riveted together, the cars bent round to the center of the wheel, their ends having a model placed between them; cast iron is then run in, forming the hub, which is afterwards bored out, and the cast steel axle forced in by some fifty-five thousand to sixty-six thousand pounds hydraulic pressure, and the life of the center of the wheel is said to be practically interminable under ordinary conditions.

HAMBURG, Germany, has a street railway on the electric plan.

## A BONDING CHUCK.

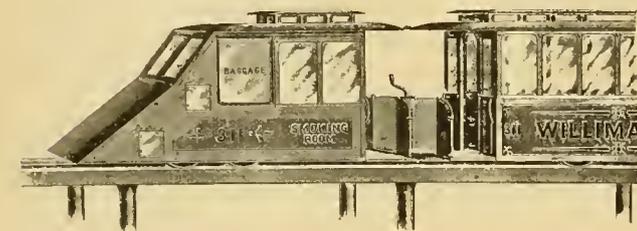

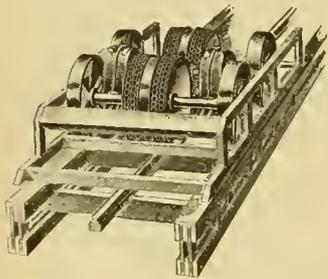

The latest addition to the list of bonding devices is the "bonding chuck" made by Stern & Silverman, 707 Arch street, Philadelphia. It necessitates the cutting of threads in the hole in the rail. The chuck having been screwed in tight, the bond is placed in the split end, and the nut

screwed up until the three segments are brought together so as to clamp the bond. The labor required to install these bonds is somewhat more than that with other forms, but once put in, good contact is absolutely certain, and the cost will still be less than that of heavy copper feeders.

## THE BARROWS ELEVATED ROAD.

In this system the inventor has in mind the cheapening of the elevated structure so as to make it practicable for cross country construction, and cheaper than building a surface road with cuts and fills. Instead of having the ordinary rails, a part of the weight of the train is taken by the flat tired wheels running on the girders, which girders are a necessary part of the elevated structure. The cars are held on the track by the central double flanged wheels. The motors are

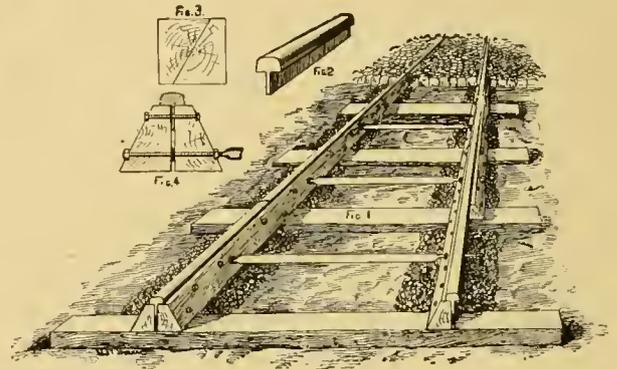

geared by sprocket chains as shown in the engraving. The inventor claims that a single track country line can be built for \$2,000 a mile.

THE Mohnsville & Adamstown (Pa.) Electric Railway will be constructed on a new plan. At least new for electric railway work. It is a reminder of primitive days of railroading and road building. No bonds will be issued, but farmers along the way are to furnish labor, teams, wagons, poles and ties, taking stock of the company in part payment. If the plan is a success, it ought to greatly increase the possibilities of country electric roads.

## THE STILLMAN TRACK.

The Stillman system of track, is simply a T rail with the base left off. The track is laid by inserting the web between two wedge shaped stringers. The stringers are made by sawing through a square timber as shown in Figure 3. The stringers and rail are firmly bolted together and tie rods placed frequently. It is claimed that this construction is specially adapted to a continuous welded rail. In this system the ties are placed several feet apart. It has been found that with a track so laid,

the rail becomes so tightly forced between the stringers by the wedge-like action that they are separated with difficulty. In a trial of eighteen months on a steam road some track laid without fish plates showed one-eighth inch drop at the joints. Since then a light fish plate has been added. H. L. Stillman, of Kenyon, R. I., is the agent.

## ACCIDENT INSURANCE.

Since the introduction of mechanical traction the matter of street railway insurance has become an important one in practical railroading. But a few years ago the practice of insuring the management of a horse cable or electric road, became an entirely new feature in accident insurance and the numerous agencies and brokers for nearly all of the accident companies were active in their efforts to obtain these risks. The amount of the premium charged was based on the annual gross earnings. These premiums were from  $\frac{3}{4}$  of one to  $2\frac{1}{2}$  per cent. of the gross traffic earnings, being determined by the condition of the road, ability of the management and its previous record. In the majority of instances the contract provided for a limit of \$15,000 to \$25,000 for any one accident, no matter how many persons might be injured, and not more than \$5,000 to any one person injured. Experience has taught that this class of business is not very desirable from the underwriters standpoint, and as a result, in some circumstances they have declined to renew these policies except at a much greater premium and in other cases have sought to avoid liability by a procedure which looks very much like a repudiation of the contract. The Utica Belt Line has recently developed an important question in this regard. A five years policy was taken out by it in the Travelers of Hartford. It was to run five years and the premium was a per cent of the gross

receipts. The policy was dated September 28, 1891, and on September 1, of each year, the railway was to give the insurance company a statement of its earnings and throw its books open to the inspection of the insurance people. The second year of the policy a statement was requested by the insurance company and was furnished by the railway. The premium was computed therefrom by the insurance company and a bill sent the railway which was promptly paid. The statement of earnings was requested and sent again the third year, but the insurance company remained silent and sent no bill. Soon the railway wrote the insurance company asking a statement but received the reply that as the policy was dated September 28, and had not been paid by that date it was no longer valid. The Belt Line management then made legal tender of the premium computed from the traffic earnings as required by contract. Nothing of the nature of an accident had occurred in the meantime which would appear to justify the Travelers in refusing to accept the premium. The Belt Line claims that the insurance company is trying to crawl out of its policy by taking advantage of a technicality regarding the time of payment, having established by its act of the previous year a wrong and misleading precedent.

It is only fair however to state the other side of the case which is presented with sufficient strength by the following letter from the president of the Travelers Insurance Company.

HARTFORD, CONN., Feb. 13th, 1894.

EDITOR STREET RAILWAY REVIEW:

The copy of a statement made by the Utica Belt Line Company, which you send me, is unfair and in the most essential points untrue. It was an annual policy, renewable each year for the term of five years, on condition, that at the close of each year the premium for the next year should be paid in advance. The amount to be paid was a percentage of the gross traffic earnings, which amount was known to the railroad company and unknown to the insurance company. The computation could be made by any clerk in less than two minutes, and was not "presumably" the duty of the insurance company, but "presumably" the duty of the railroad company, which alone had possession and control of the data at the time when it was to have been made.

There is no dispute about the first and second year, and the insurance company has paid and continues to pay the losses for those years.

For the third year, the author of your letter says that he received a letter requesting the statement of traffic earnings for the year, which statement he says was made, but he does not give you the dates. The payment was due September 28th, but as he neglected until October 20th to notify us that he was "ready to pay the premium," and allowed the policy to lapse, we claim that its continuance is therefore optional with the insurance company and not with the railroad company. If they had the right to continue they lost it by their own neglect, and not by any act of ours.

The Travelers Insurance Company will fulfill its obligations to the utmost; but when a bankrupt corporation neglects to fulfill its part of the contract, we shall retire from the wreck as speedily as opportunity will permit, pay our losses, and have done with it.

If the managers of any other road think that we are "sneaking out of our contract," for the reason that we will not allow this road to pay premiums whenever it sees fit to do so, regardless of the contract, they have only to express their displeasure by requesting us to return the unearned portion of the premium paid, and give their patronage to some other company, whose business requirements are less exacting than ours.

J. G. BATTERSON, President.

#### THE RELATION OF VOLTAGE TO SPEED AND TIME TABLES.

Has the superintendent ever thought of the relation the few units of electrical pressure carried on the trolley line bear to the time table? These two items are apparently very far apart, but they have an essentially vital relation to each other, and the relation is briefly expressed by the well known rule; the speed varies with the voltage.

One of the most economically operated small roads in the country has reduced its voltage from 500 to 400. The reasons for the change were excellent and should be considered by every road operating under similar conditions.

The problem presented to the managers of the line was as follows: The system consisted of a number of single track routes and a five mile interurban. Being a small city it was necessary to run cars on a certain schedule time, and to save complications it was important that cars should make trips on the even divisions of the hour, in the majority of cases every 20 minutes. It was found that the time required to make a round trip was something less than 20 minutes, yet it was not practicable to increase the speed sufficiently to make round trips every 15 minutes. The 20 minute schedule being adhered to and the waiting time at the termini being excessive, the question arose; why not lower the voltage and decrease the speed of cars? It was found that the running time of of all the lines including the interurban favored this move, and consequently the voltage was lowered 100 volts. The fuel consumption was, as a result, very noticeably lowered. This is as would be expected, as it is well established that it takes less energy to move a car a given distance at a low than a high speed. In addition to this the wear and tear on motors and their insulation is less the lower the speed. It may be argued that lowering the speed is a step backward and that the tendency is toward higher speeds. While this is in general true, especially on long lines, it has little weight in the case under consideration. On the other hand there may be places where a slight raise in voltage would be desirable.

## TROUTING BY TROLLEY.

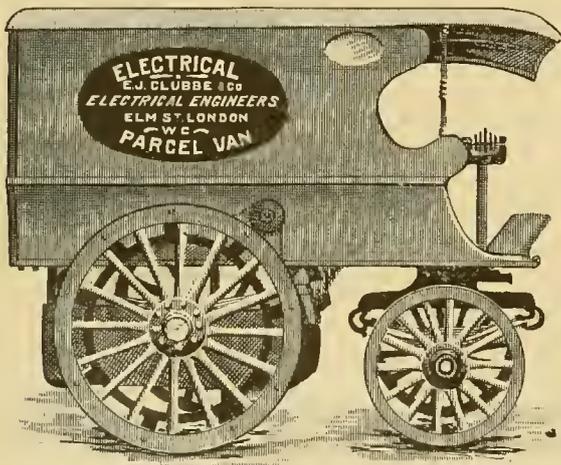

GOING fishing is the easiest thing in the world for the sportsman of Tacoma. All he has to do is to rise early, catch his breakfast, grab his rod, run down to the corner, board the first car and in twenty minutes is landed at Chamber's creek. Ten minutes later he is thrashing the water, alive with trout that rise to a No. 2 Royal Coachman as though they had never snapped at a fly before in their career.

This method of inducing traffic we particularly recommend to managers just outside the larger cities. A fine trout stream and some primeval forests may easily be had.

## ANOTHER LONDON BUS.

The country is saved again. Clubbe & Company of London, have an electric bus which will operate (on paper) at a cost of 5 cents per mile. Yea, even more than this. The company is prepared to "undertake contracts to build and run full sized tram cars carrying 46

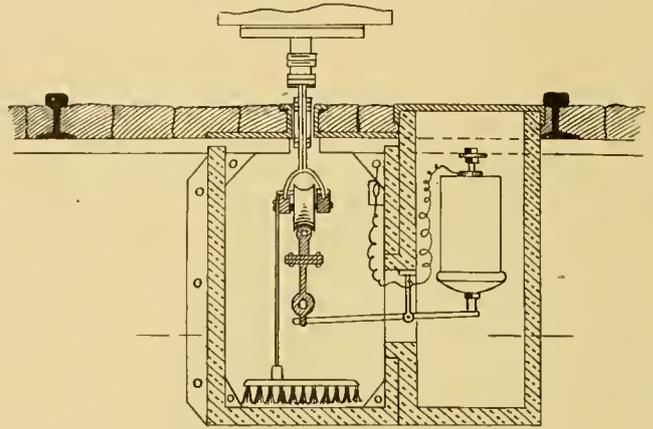

THE ELECTRIC BUS.

passengers, speed—up to 8 miles per hour—the cost of electrical force being 1.5 cents per mile when generated by steam power at 2 cents per unit." We fear that the company will not do much more than "undertake." When a storage battery has been found that can do good service on a street car running on smooth iron rails and moderate grades it will be time to seriously consider the electric bus for paved streets.

THE Lake Street Elevated, acting under a court decision, began extending its line from West Forty-eighth street, Chicago, to West Fifty-second street. The trolley wire of the Cicero & Proviso Electric Railway was disconnected, to make way for the construction, which occupied but thirty minutes and hardly disturbed the 10-minute schedule of the electric cars.

## THE LAWRENCE CONDUIT.

One of the few systems which entered for the Metropolitan Traction prize with a section of track in actual operation, is the invention of William Lawrence, of Wilmington, Del. The section of track referred to is located in the yards of the Harlan & Hollingsworth Company, of

THE LAWRENCE CONDUIT.

Wilmington. The accompanying engraving shows a section of the track and conduit as arranged for a single track loop. It is slightly modified for double track. The trolley conductor is a girder laid in 32-foot lengths and supported at either end by levers attached to junction bores as shown in the section. The weight of the trolley on the girder causes a connection to be made in the junction box, throwing the section which the trolley is on into circuit.

## BRACEY'S IMPROVED RAILROAD SPIKE.

The spike herewith illustrated is the invention of Smith H. Bracey, Monadnock Block, Chicago. It is undoubtedly a great improvement over the ordinary spike, claiming these advantages: Its head is not broken nor spike fractured in the operation of driving. It cannot be canted on or pushed outward by the outward pressure of the rail caused by the flanges of the wheel. It thus prevents spreading of the rail. The spike consists of a rectangular body with a driving point at the lower end and an enlarged head at the upper end, forming inner and outer shoulders, the outer shoulder being arranged below the inner shoulder, agreeing with the thickness of the rail. Thus the outer shoulder forms an anchor and blows upon the spike will not break the head on one side or fracture the body of the fastening.

THE Bellaire, Bridgeport & Martin's Ferry Electric Railway, in Ohio, enjoyed a little strike during March. It lasted but a few days, and ended by the men accepting a 1 cent per hour reduction in wages.

## EXPERIENCES OF A SUPERINTENDENT.

By C. P. Young.

## PART IV.

The best machinist to employ in the machine shop of an electric road, is a man who has served his time either in a locomotive, marine, or jobbing shop, and who has traveled around and gained experience from several other shops. Of course the first few weeks all motor parts will be new to him, but by a little instruction he will soon catch on, and when he has learned the various relations of parts it can be relied on that his work will be right and not botched. A simple swinging crane (which can be home made for a few dollars) should be at his lathe so that he can handle the armatures alone. To turn a commutator as it really ought to be turned is a very delicate operation. When finished it should be so round that when the lathe is speeded up, the finger resting on the commutator and the face of the tester turned away, it should feel as if the commutator was standing perfectly still. Waste should never be put on a commutator. I find cheese cloth gives splendid results. Men who handle armatures should be trained to imagine that an armature is as delicate as an egg shell, and that between its usefulness and failure is only the thickness of a tissue paper. An armature should never be laid on a bare floor but should always rest on something soft. The coverings around bales of waste do very nicely or what is better still a truck with padded top.

Now to the armatures and fields. I think I can safely say that no item has cost investors more than the burning out of armatures and fields. In the early roads the loss was simply fearful. I have seen a road with 14 cars and with 42 burnt out armatures on the floor at one time.

This was all wrong and due to imperfect insulation, careless winding and rough handling of car by ignorant motormen. No material or workmanship is too good for an armature. My method is the following: First, I turn down the core about  $\frac{1}{16}$  of an inch, so that I can get more insulation on than the factory generally uses. I glue asbestos all around the core; then a layer of pure mica equally thick; then several layers of mica cloth. Allow this to dry thoroughly. Each and every wire is then shellaced not only on top but every particle of wire is well covered.

I find that shellac at no less than three dollars per gallon gives the best results. I have tried several compounds but found them to corrode more or less. On the corners of the cores and for each layer of wire I use mica cloth cut to fit. When armature winding is finished take a trolley rope and wind very tight around the whole so as to make it as tight as possible, and then allow it to dry.

In winding it is best to have two or three armatures under construction at the same time so as to allow each layer to dry thoroughly before the second is put on. In connecting armatures and commutators I use flexible wire. I also fill up the space back of the commutator and in front of the armature with old canvas and tape, so

that the flexible wires rest on an insulated bed. I have had armatures made in this way run over 1,000 revolutions per minute, at full speed, from 18 to 20 hours per day, for over three years, and they are running yet.

In winding fields I follow the same method. I use no metallic spools but vulcabeston only, thoroughly shellac each layer and dry well; then cover with a layer of thick canvas well shellaced; then several layers of tape; finally put a rope around it very tight. I have several times had the lower fields almost covered with water and as yet no short circuit or burn out. In putting commutators on the armature shaft they should never be driven on by hammer or sledge, as every blow is liable to jar the segments, but they should be pressed on either by a hydraulic or screw press.

A very simple and effective screw press can be made in any shop in the following manner: Have two  $\frac{7}{8}$ -inch machinery steel bolts with large heads. The body of the bolt should be 6 inches longer than the armature shaft and threaded according to the length of the shaft.

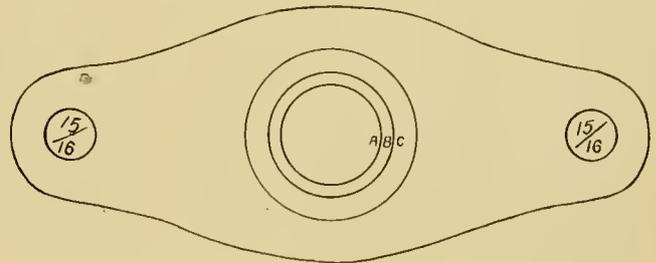

FIG. 1.

The nuts ought to be at least  $1\frac{1}{2}$  inches long. Two pieces of iron  $2\frac{1}{2}$  inches thick and shaped as in Figure 1 are next necessary. The distance between inner edge of the bolt holes is at least one inch more than the diameter of the armature. Have the back piece counter bored to fit the diameter of the pinion end of the shaft about  $\frac{3}{8}$ -inch deep. The front piece should be bored out at least one inch larger than the commutator sleeve bore and then bushed with a brass sleeve having a strong shoulder, said sleeve to be bored about  $\frac{1}{8}$  inch larger than the shaft. The shoulder of the brass sleeve should be slightly smaller than the bottom of the thread on the commutator sleeve, so that when pressure is applied on the clamp it will press only on the sleeve and not on the nut.

Commutator sleeves should never be counter bored but should fit the whole shaft throughout. The key should fit the full length of shaft and sleeve. To take a commutator off the shaft I use a sampson, the same as for pinions, with this difference; instead of end lugs a straight sampson is used, with flat holes right through, and having steel keys to fit the same, so as to press against the sleeve and to occupy as small a space as possible between back of commutator and front of armature.

In every electric railroad shop there should be a man who understands something about blacksmithing so as to be able to weld broken brake-rods, dash-boards and posts. The carpenter should be a man of versatile ability; able to cut glass; a good upholsterer; a fair pattern maker; besides being a good carpenter and car repairer. In the

front of the shop there should be a desk with a book nailed to the top of desk, where the slightest defects on cars, motors or trucks should be reported, including date, number of car, defect found, and name of motorman. This book should be inspected every hour, and when the damage has been fixed, should be marked O. K. by the foreman or man in charge of the department to which the repair belongs. The night crew should be so organized as to allow every car to be thoroughly cleaned and windows washed. Every motor and controller in all details from the trolley wheel down should be inspected and all defects remedied; hence, the man in charge of the night men should be a good machinist and electrician. He should have worked day time in the shop, so as to be familiar with the methods employed and be friendly with the day men, so as not to put the blame on the wrong shoulders when mistakes have been made. The shop should be handed over to the night men in perfect order with all tools in their proper places, and it should be found the same way in the morning. Cleanliness first, last and all the time. All shop men should be impressed with this great law "that every car should leave the shop cleaner than when it entered." It is a crime to send out cars full of grease spots and black dirt. We have no right to ruin passenger's clothes, yet, alas, this is frequently done. Every car that has been in for repairs should be thoroughly examined from top to bottom. Every nut, bolt, split-pin, wire, and in fact everything should be right, and the motors tested by trial before the car is handed over to the motorman. One of the most important points of all, is the brake on cars, where the chains wind around the staff. The third, fourth and fifth links wear the most and every link ought not only to be examined when the car is in for repair every night, but by the motormen themselves every day.

In hiring an armature winder it is best to get one who is also a machinist, so when work is slack in the winding department he can help the machinist. Men in the shop should be organized like a fire brigade so that each man knows what to do in case a car gets off the track or any other trouble occurs. There is sometimes a great tendency to jealousy, existing between the shop men. This can be easily averted. The men should all be like brothers to each other. The work should be made cheerful and not burdensome. The good will of all should be obtained, so that sometimes when work is being rushed, and perhaps only a few minutes are allowed for dinner, no complaints or kicks should be heard, but instead, this sentiment will prevail; "We will do anything for our superintendent, and we know it is all for the good of the road."

I may as well say something here in regard to the art of soldering. All electrical work requires soldering and every shop man thinks he understands it. This is not so. The first thing to learn in mastering this art is cleanliness. Clean acid, clean contact surfaces, clean solder, and above all a clean soldering iron well tinned. It is not sufficient to melt the solder, but the pieces that are to be soldered must be brought to the temperature of the melt-

ing point of the solder so as to well fill all the space with solder; when the work has been finished the soldering iron should be put in its place clean and well tinned, so as to be ready for use without any waste of time. A splendid non-corrosive soldering fluid can be found in the following formula:

Saturated Solution of Zinc 5 parts.  
Alcohol 4 parts.  
Glycerine 1 part.

---

#### ARTHUR W. FIELD.

There is no branch of the street railway business that Vice-president A. W. Field, of the Peckham Motor Truck & Wheel Company, has not touched. His motto has been, "Know something of everything and everything about something." The latter "something" is the street railway truck.

Arthur W. Field was born at Providence, R. I., in 1861 and received his education in the city schools and at the Scholfield Commercial College. In 1879 he entered the office of the Union Railroad Company of Providence and learned the office routine in all details. In 1884 when the company opened up its large repair shops, Mr. Field took up mechanical matters in the same thorough fashion and spent five years in this thorough schooling ending as assistant master mechanic.

Next as general agent of the Frank H. Andrews Car Wheel Company, of New York City, he spent 18 months on the road. Resigning from this position Mr. Field became agent of the railway department of the original Thomson-Houston Company, but at this time his health failed, and after unavailing medicine Mr. Field took to the fir and pine woods of Maine where he roughed it for eight months, returning fully recovered.

On his return to civilization he accepted the position of general sales agent for the American Steel Car Wheel Company of Boston, remaining until its re-incorporation. Then, as Wells & Field, the subject of our sketch, found much experience and some money as contractor and builder of street railways. Finally, on the dissolution of this business, Mr. Field became agent for the Peckham Motor Truck & Wheel Company, and in 1893 was unanimously elected vice-president of this substantial and widely known institution, for which position his wide acquaintance, thorough knowledge of detail and long experience particularly fit him. Mr. Field's headquarters are at 53 State street, Boston, where the visiting street railway man will be hospitably received.

---

THE Buenos Ayres, S. A., tramways, have increased fares twenty-five per cent.

THE NEW POWER HOUSES OF THE WEST  
CHICAGO STREET RAILROAD  
COMPANY.

The Two Palaces of Mechanic Art Built by the Pennsylvania  
Iron Works—The Special Devices and Standard  
Machinery—The Largest Tunnel  
in the World.

To give to the great southwestern portion of the city of Chicago rapid transit, the West Chicago Street Railroad Company has built two fine power houses, laid several miles of expensive cable conduit and has driven to completion in the face of difficulties, the largest tunnel of single span in the world.

The two power houses known respectively as the Blue Island power station and the Van Buren street power house, are situated, the one at the corner of Blue Island

The boiler room is well arranged, with a view to economy and convenience, the batteries being placed on a level with the driving machinery. They are eight in number, of the tubular type, made by John Mohr & Sons, Chicago, for the Pennsylvania Iron Works. Each boiler is of 225-horse-power making the total capacity of the plant 1,800 horse-power at 150 pounds steam pressure. The furnaces are now fired with oil. They are equipped, however, with the Gulickson grate, so that coal may be used should necessity arise.

Automatic pressure regulating valves are provided for each boiler and the piping is so arranged that the boilers can be used together or separately. The main header is 60 feet long and 30 inches in diameter.

Two Berryman heaters of 1,000-horse-power each and Snow pumps of the duplex pattern are used to supply feed water to all boilers. There are also, by way of reserve, two Monitor injectors, which can supply the

WEST APPROACH OF TUNNEL ON JANUARY 15, 1894.

WEST APPROACH OF TUNNEL SIXTY DAYS LATER.

avenue and Twelfth street, and the other at the corner of Jefferson and Van Buren streets.

The Blue Island station, now operative, drives 60,600 feet of cable, operating the two systems of cars known as the Blue Island avenue and the South Halsted street lines.

To the exterior view, the power house is a handsome structure of pressed brick, trimmed with Bedford stone, fronting 120 feet on Twelfth street and 183 feet on Blue Island avenue. The power house proper, that portion used in the power production, is 116 by 100 feet. The rest of the building, at the street intersection, is carried to the height of six stories and sublet as offices.

The stack is 150 feet high, carrying the gases well above the offices. An abundance of light and air is provided the power plant by means of a system of ventilators and skylights. The roof is of double iron, the peak of which is 60 feet above the floor level.

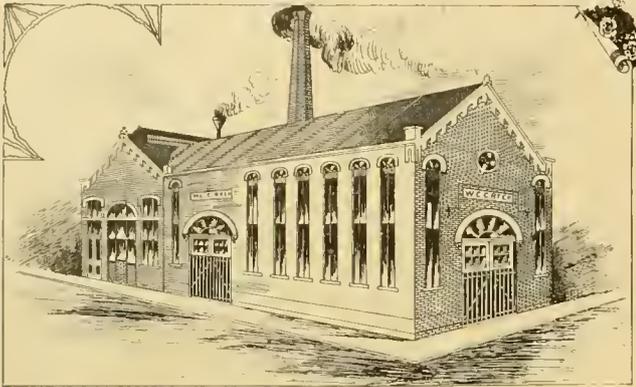

The entire exterior is a great improvement on the surrounding property and an ornament to that section of the city.

entire battery when necessary. It will be noticed that every precaution for continuity of power is provided.

The engines are of the E. P. Allis type, two in number, of 1,000-horse-power each. The cylinders measure 40 by 72 inches, and the fly wheels weigh 100,000 pounds each. They make fifty revolutions per minute and are 24 feet in diameter. These wheels are of very handsome design, built up in eight sections and magnificently proportioned.

The line shaft is 18 inches in diameter, running the entire length of the engine room and coupled to both engines at right angles by means of steel cross-key plate couplings. Four sets of drums are driven from the shaft, three of which are 13 feet 4 inches in diameter, the fourth one being 16 feet in diameter. The former weigh 16 tons each, and the latter tips the scales at 20 tons. They are all equipped with the famous Walker differential rim. One hundred and fifteen tons of steel cut gears are used to transmit the power from the line to the drum shaft. The bed plates are of hollow rectangular

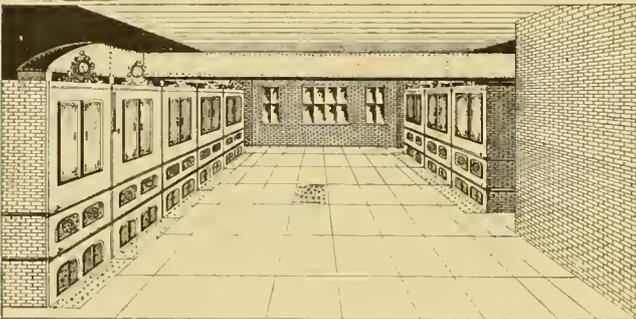

form. The cable drums are provided with 1,000-horse-power Walker friction clutches, by means of which they can be stopped or started at the will of the operator. Three sets of drums are in active service, the fourth being kept in reserve. With an arrangement of vault

VAN BUREN STREET POWER HOUSE.

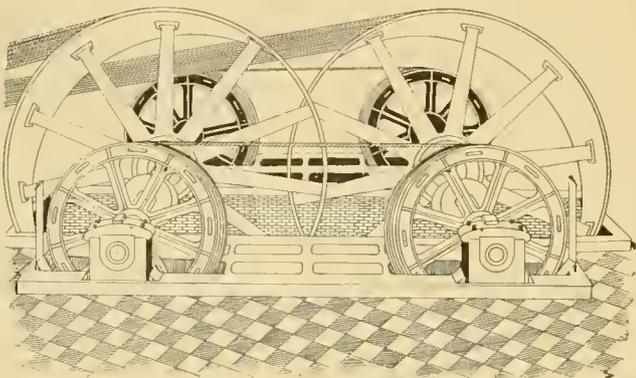

sheaves any cable can be driven from the fourth set of drums in case of necessity.

The tension carriages are of the usual Root pattern, as used in San Francisco, St. Louis and Chicago. The

BOILER PLANT, VAN BUREN STREET STATION.

tension runs are underneath the boilers and 84 feet long. Two cable winding engines are placed between the tension runs for taking in the old cables. There is also in the basement a steam shears for cutting up the cable for shipment.

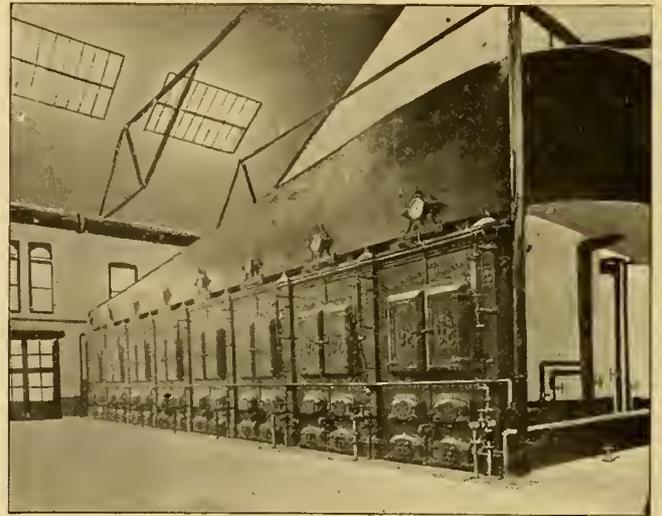

WINDING MACHINERY, VAN BUREN STREET STATION.

The entire building is lighted from its own plant of the Siemens-Halske description, running twenty arc lights. The sheave pits are also thus illuminated.

During the erection of this power house, almost end less difficulty was experienced in finding bottom for the foundation, as the chosen site had once been a marsh. At a distance of 40 feet below the level, however, a hard stratum was found. This made it necessary to excavate 100 by 52 by 40 feet, which was filled with concrete, upon which foundation and walls were erected.

Without doubt, the West Chicago Street Railroad Company has performed as difficult engineering feats in

BATTERY OF BOILERS, BLUE ISLAND AVENUE STATION.

combating sinking clay and sand, as any other power plant builder ever experienced in blasting rock or bridging chasms.

#### THE VAN BUREN STREET POWER STATION,

fronts 175 feet on Jefferson street and 50 feet on Van Buren. From it is driven the rope for the loop, which is 13,000 feet long. This station is also of pressed brick construction and trimmed with Bedford granite. It is almost Ecclesiastical in appearance and the architect has shown great taste in the design. The machinery of this station is bedded on brick. The stack is 150 feet high and the fuel used is oil.

The distinguishing feature of the Van Buren street plant is the rope drive, which is one of the longest in the country, being 75 feet from center to center. The engines are from the Allis works, measuring 30 by 60 inches and two in number. They are of 1,300-horse-power each and have 20-foot fly wheels of 100,000 pounds avoirdupois. The boiler, water heater, piping arrangement and attachments of the boiler room and engine rooms are exact counter-parts of the Blue Island plant.

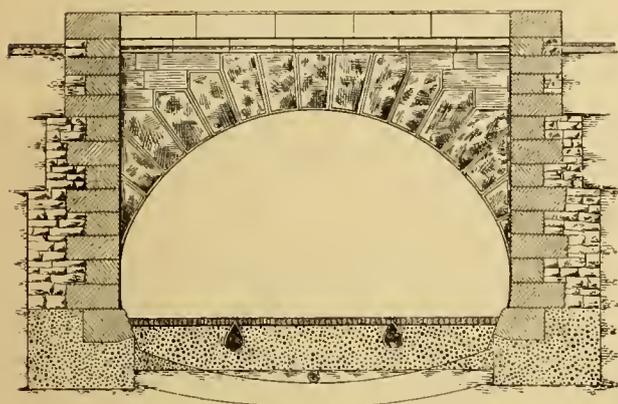

The plant is so arranged that there is a 32-foot rope wheel, the shaft of which connects with the drum shafts driving both drums. The rope used is of the celebrated Brigham cotton, three inches in diameter. The cable drums are 13 feet 4 inches in diameter and are in two sets, one always in reserve. The tension carriage is of the Root pattern and runs 100 feet. A reel engine is also provided for bringing in the cable.

The Pennsylvania Iron Works, which was the builder of these two magnificent power houses, deserves the greatest credit for the successful consummation of a most difficult task. To any one in the least cognizant of the latter day power house building, these two stations need no word of commendation, but even the lay brother must acknowledge the beauty, grace and strength of the

The signal reads on the ribbon thus:

10 10 10 I I I = 33

The Blue Island and the Van Buren street power houses are also connected by similar signals. Above the signals are the steam pressure gauge and low water alarm.

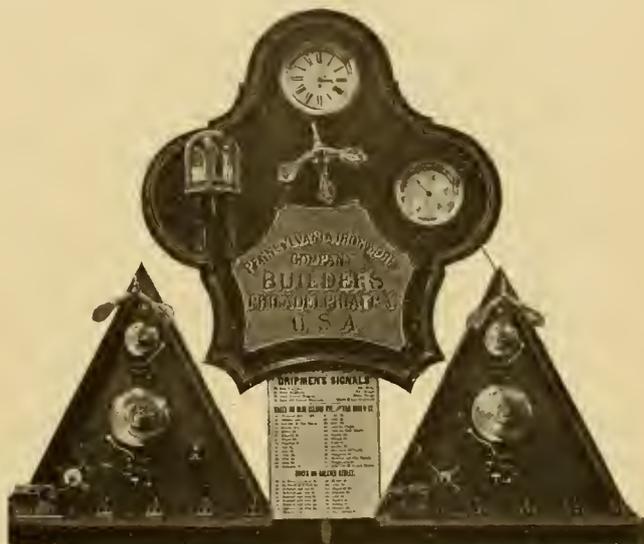

ELEVATION OF TUNNEL PORTAL.

pulsating, almost animated, mass of machinery which fills the tasteful buildings. William Elkins, Jr., the president of the Pennsylvania Company, B. W. Grist, C. E., and Engineer S. Potis, of the West Chicago Street Railroad have acquired more than passing distinction in the success of this great work.

THE SIGNALING DEVICE.

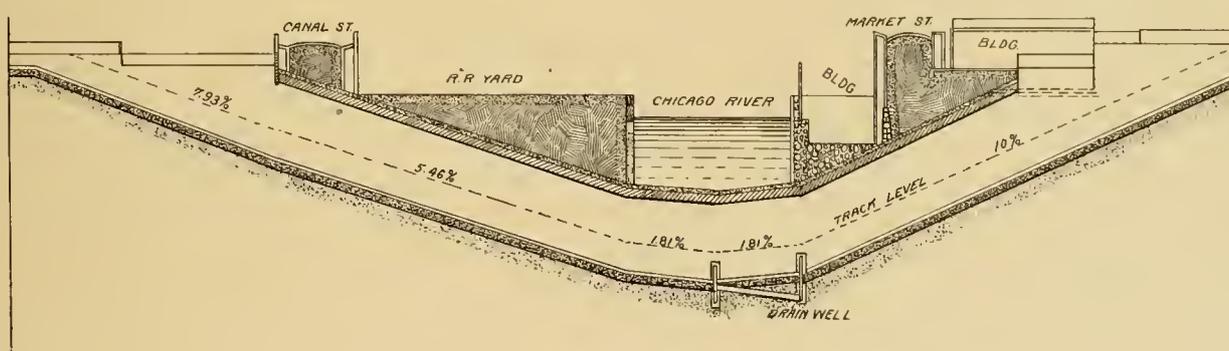

The signaling device shown in our engraving is placed in the Blue Island station and connects each block of the Halsted street and the Blue Island avenue lines with the power house. At a convenient point in each block, and

ELECTRIC SIGNALING DEVICE.

THE VAN BUREN STREET TUNNEL.

Just between Van Buren and Jackson streets and running from Franklin street on the east to Clinton street on the west side of the river is the greatest single span tunnel in the world. It is built on private property, at the expense of \$1,600,000 and in the face of almost insuperable difficulties. It was begun early in 1891 and has now triumphed over mud, madness and misery of law suits. The tunnel is 1,514 feet from entrance to entrance and

LONGITUDINAL SECTION OF TUNNEL.

at two places in a long block, is placed a call box, to which every gripman has a key. In event of trouble, strand or blockade, an alarm is turned in. One turn rings the gong once and calls for the stopping of the cable, three rings summon the wrecking wagon and two rings means "start the rope." At the same time a relay telegraph device prints on a paper ribbon the number of the block. There are 61 boxes on the line, 31 on Blue Island avenue and 30 on Halsted street.

consists of one elliptical span of 30 feet. The length of the tunnel proper, from portal to portal is 920 feet. The east approach is 278 feet and the west approach is 316 feet. The gradients run as shown in the diagram.

During the progress of construction, the buildings too valuable to be destroyed, but whose foundations had to be undermined, were elevated on hundreds of hydraulic jacks each capable of lifting 30 tons. In no case was a wheel disturbed of the manufacturing interests in the

INTERIOR OF TUNNEL DURING CONSTRUCTION, SHOWING METHOD OF BRACING.

building nor an elevator stopped. The network of railroad tracks was passed in safety as well as the docks and the river. The shifting clay which has marvellous power of torsion was successfully restrained until the brick was laid. Three million bricks were used in the work, 6,000 barrels of hydraulic and 15,000 barrels of Portland cement. The tunnel is of brick in seven rings, aggregating 32 inches thick, and the portals of Bedford stone. The two tracks for the cable are spaced about 15 feet from center to center, thus giving safe clearance along the walls and between cars.

The sumps and drains for seepage and storm water are amply sufficient and the tunnel will be dry but interesting even in wet weather. The tunnel is 15 feet 9 inches high at the center. The river section is concreted, covered with asphalt mortar and laid with flagging, so that by no mischance can the tunnel be broken into by a vessel striking the river bottom. Samuel G. Artingstall was chief engineer and C. V. Weston was superintending engineer.

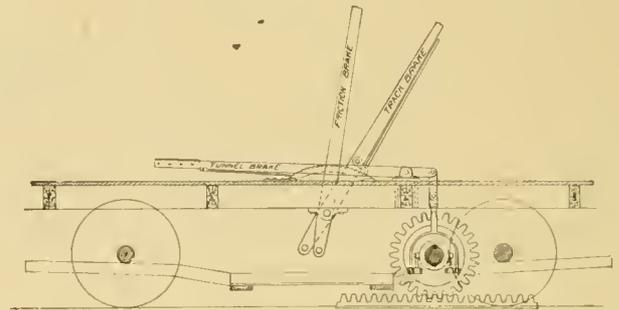

The appliances for the safety of passengers, include an unique feature, namely

#### THE RACK RAILWAY.

When the new Van Buren street tunnel of the West Chicago Street Railway was proposed, it was also determined to introduce absolute safety devices on the grades. To this end, a rack railway plan has been adopted. On

each side of the slot rail half way between the slot and track rails is set a rack rail which will engage with a pinion on a separate axle of the grip car. The rack will extend entirely through the tunnel except the 200 foot level stretch at the center.

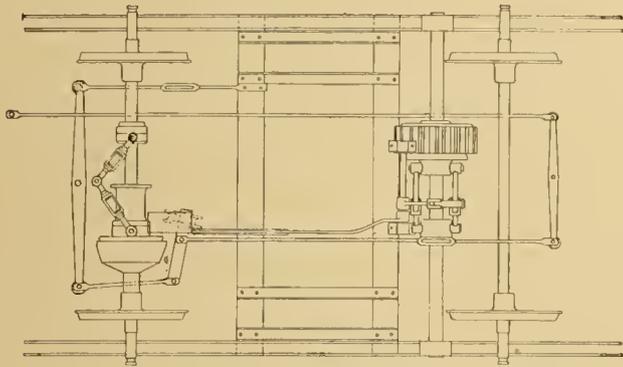

The rack, a section of which is illustrated, is in 3-foot 11½-inch sections, weighing 256 pounds each. It is 6 inches wide, with teeth 2¼ inches high and of 3 inches

ELEVATION OF RACK DEVICE.

pitch. A wooden liner surfaces the iron and wooden cushions between the rack and yoke taking off the shearing strain from the bolts which hold it to the yoke. The entrance to the rack is provided with a differential rack section supported at the entering end by a coiled spring, which allows the pinion to mesh with the rack, no matter at what speed the car may go. The pinion of each grip car will be carried high enough to clear any obstruction

on the street, and being on a separate axle, will be set to engage with the rack on entrance to the tunnel. A friction brake mounted on the pinion axle is to be powerful enough to stop the car in any distance desired. The pinions weigh 150 pounds each, or an equal to the weight of two passengers. The conclusion of the matter and tests will be watched with interest.

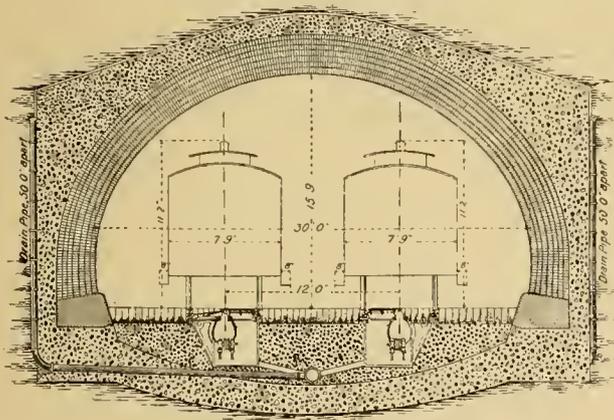

PLAN OF RACK DEVICE.

The device is the invention of S. Potis, the company's chief engineer, and is working very satisfactorily indeed.

The tunnel in completion presents an elegant appearance. It is lighted thoroughly by the Nutting arc lamp, made by Bartholemew, Stow & Co., Chicago. The lamps are 50 in number, of 2,000 candle power each and are run at 110 volts from a Waddell-Entz machine. The lighting plant is owned by the West Chicago Company.

On April 21, the first train formally opened the great

ORDINARY SECTION OF TUNNEL.

undertaking and six decorated cars carried a distinguished crowd of street railway men of the city, contractors and engineers of the undertaking and city officials, around the loop, through the tunnel and back to the Van Buren street power house where an elegant collation awaited the guests. Mr. Yerkes was master of ceremonies and in his happiest manner bade the guests welcome and called upon several prominent west side residents, who responded in words of praise for the man and the undertaking.

Thus the end crowned the work.

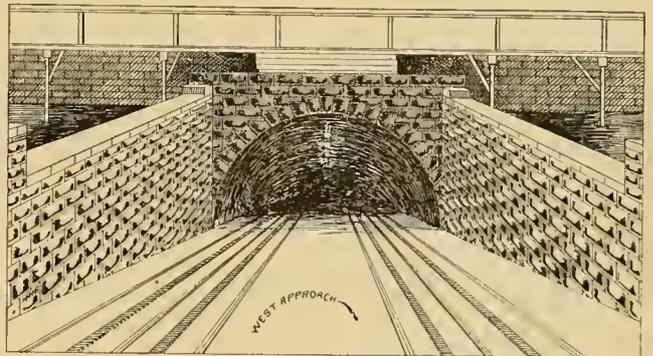

THE Sandusky, Milan & Huron Street Railway Company began hauling American Express in a special car, April 1.

PETROLEUM BRICK FUEL.

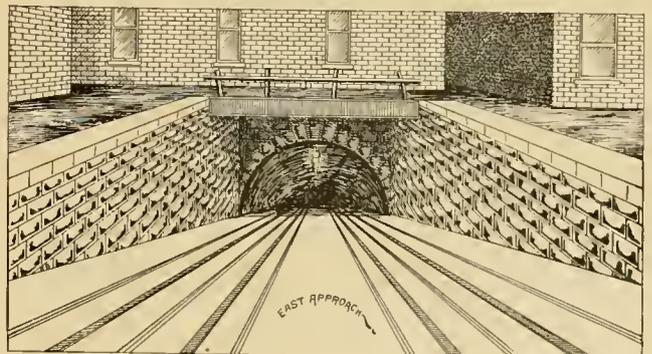

The method of manufacturing petroleum bricks for fuel, as followed by Maestracci of Havre, France, is attracting considerable attention abroad.

The receipt is this: Mix one litre (1.05 quarts) of petroleum, 150 grams (5.29 ounces) of triturated soap, 10 per cent of resin, and 333 grams (11.75 ounces) of caustic soda. Heat and stir until solidification begins, say 40 minutes. If the mixture tends to boil over, pour in a few drops of caustic soda. Pour the semifluid mass into moulds, and place in a hot or drying room for 10 or 15 minutes. Then remove and cool. M. Maestracci recommends the addition of 20 per cent of sawdust and 20 per cent of clay or sand to the original mixture. Trials of these bricks are said to have developed three times as much heat as ordinary coal brick and leave no ashes. With some change in furnaces, it is expected that the bricks will develop four times the heating power of coal, and specially adapted to street car heating.

THE Oakland, California, Consolidated Electric Railway Company has concluded to do away entirely with the pass system, and no more will be granted.

THE Remscheid (Germany) tramways, finished in 1893, have been in successful commission since. It is an overhead, single track, side pole system.

DON ALBERTO PALACIO, an engineer, has been granted a concession at San Sebastian, Spain, for operating an electric tramway. Traction, in Spain has made little progress, and it is hoped that the San Sebastian road may be the forerunner of many others.

## NEW YORK NEWSBOYS.

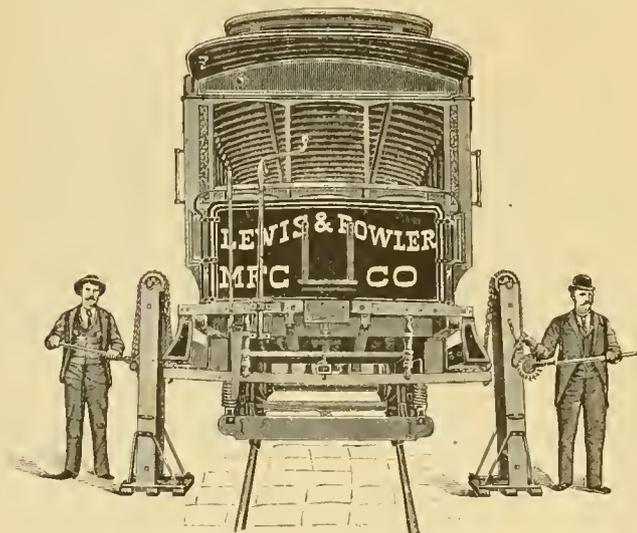

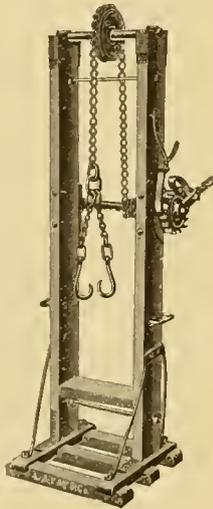

ON April 23, newsboys were interdicted from riding on the principal street car lines in New York City. The introduction of rapid transit has made the rule imperative. This cause was added to by the complaints of patrons whose feet and clothes suffered from the youngsters' rush through the cars. The

Metropolitan began the action, which is general on all its lines in New Jersey, Philadelphia and elsewhere.

## THE ACME CAR JACK.

The numerous occasions, both in the barn or shop and on the road, for lifting a car body, or car and truck, require more than the brute force and awkwardness of the few employes and numerous willing bystanders. In fact, a reliable, portable and competent car jack has become an absolute necessity in this time of heavy cars and trucks. A car jack will pay for itself on the first occasion of its use.

The Lewis & Fowler Manufacturing Company, of Brooklyn, N. Y., keeping up with the demand for a good jack, has put upon the market the "Acme," represented in our engraving. The Acme Jack is sufficiently powerful to lift the heaviest car, yet is portable and easily handled. Two men can raise a car with it quickly and safely, and hold it in position for any length of time. Its con-

struction is simple, and it is strongly built so that both for shop work and line emergencies, it is reliable and efficient.

## MAINTENANCE OF ROLLING STOCK.

## IV.

The Wilmington, N. C., Street Railway owns the following rolling stock: Six 8-seat open cars, with two 15-horse-power S. R. G. motors. Two 16-foot closed cars with a like equipment. Four 16-foot closed cars with two 15-horse-power Sprague number 6 motors each. In the winter season six, and in the summer twelve cars, are in regular use. The Thomson-Houston part of the equipment is two years old. The age of the Sprague motors is so great as to have become an unknown quantity. The barn force consists of one inspector, an apprentice, a general workman who cleans cars, oils switches and helps wherever needed, and a night watchman, who looks over and cleans cars and motors. Motormen report every night any faults discovered. If the night watchman cannot fix them the car is kept in. Cars are brought in when general repairs are needed, or oftener if work is slack in the sheds. Motormen make their daily reports on the back of conductor's daily report, and also make a note of repairs needed on a car, for the use of the night man. Armature and field winding, light blacksmithing and painting, and varnishing are done in the barns.

The cost of repair parts for the electrical apparatus on the cars is .151 cents per car mile. The cost of repair parts for cars exclusive of electrical equipment is .344 cents per car mile. The cost per car mile of repair and inspection labor, including the man who does the cleaning and general work, is .668 cents per car mile.

The total cost of car maintenance is therefore 1.163 per mile. The company has never lost a field coil or armature section, wound in its shop. There is not enough work to support a machinist, but the company contemplates employing one, and taking in enough outside work to fill up his time. John H. Barnard, vice-president and general manager, says of the system: "We can recommend to small roads the system employed on this road of accomplishing our repairs and instructing our men at one and the same time. All candidates for the position of motormen or conductor, must serve a period of probation and apprenticeship in our car shed. When a man is accepted, he becomes the junior of usually six men, and works assisting the inspector or foreman (whichever he might be termed) in all work about the shed. They are entitled in order of seniority to filling the place of any conductor or motorman, who may be sick or off for the day, and to vacancies, as they occur, among the regular men by resignation or discharge. The only pay they get during this period is the time lost by regular men or extra runs, and 12½c per hour when extra cars or trailers are needed. It usually happens that the senior one makes quite as much as a regular man, as lost time is charged against regular men at a higher rate than their pay, and this goes to the extra man or men doing the work.

The instruction they gain in assisting in repairs gives them a very fair understanding of the machinery they

are to handle as motormen, and greatly lessens the mismanagement of the equipment. They are also quick to notice troubles, which if not corrected at once would lead to more serious trouble. While forbidden to attempt the correction of troubles, they do not understand they have often displayed much ingenuity in repairing slight troubles which would have stopped their car. Inefficient men are quickly weeded out in the shed. Men who have secured a regular run appreciate it more for the apprenticeship it has cost them. We get a great deal of repair work for nothing; have always a half dozen extra men to call on in an emergency; better class of motormen; and when needed any conductor can serve as motorman. Bright men are taught armature winding, etc., and are given extra pay when so employed. Four men brought up in this way have become foremen on other roads; one a superintendent."

THE UNITED ELECTRIC RAILWAY, NASHVILLE,

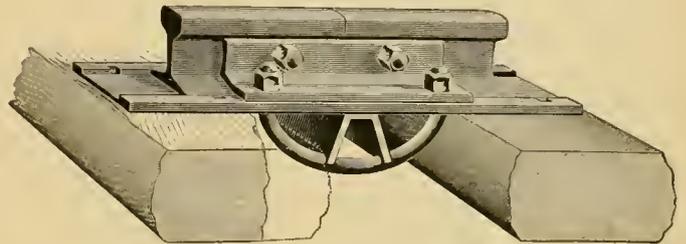

has 66 double motor cars consisting of thirty-eight, F-30' twenty Sprague number 6, and eight Westinghouse double reduction number 1. Forty-eight are in daily use. To keep them in operation a force of fourteen men is employed. There are two foremen,—one for each barn,—four day men, four night inspectors, and eight night car cleaners. The motors, being inspected every night, are overhauled only when necessary. A system of repair blanks is used. All repair work is done in the shop. The pay roll of this department is \$28.50 per day. The cost per car mile of cleaning repairs, and labor on bodies, trucks and motors is 2.96.

E. G. Connette, general manager, contributes the following valuable suggestions: "Our cars are all equipped with an obsolete type of motor which makes the expense of maintenance very high. Furthermore, we are limited in equipment, so that the cars we have are required to do harder service than they should, which makes the expense higher than it would be, if we had an ample equipment, enabling us to keep the cars in better condition. The manner of cleaning, oiling, inspecting and repairing cars and motors, should be governed to a great extent by the manner in which the cars run, and the number of extra cars to be used for substitutes. Where the equipment is limited to only enough cars to fill up the lines, with a sufficient number of extra cars to substitute for disabled ones, the work of cleaning, oiling and inspecting should be done at night. When a car comes in at night, it should be cleaned and the motors wiped off and oiled; the motors should then be thoroughly inspected to see if all connections are intact, brush holders tight, brushes making good contact. If necessary put in new brushes, inspect the gears and pinions; examine the light circuit, and test it to see if the circuit is all right; examine the trolley and oil the wheel; but the most important part of the inspection is the brakes; they should be very carefully inspected every night, and put in good condition and tested before the car is allowed to go out. We employ one man whose only duty is to inspect and work on the brakes at night. Where a road has a sufficient number

of extra cars and it is convenient, it would probably be better to do this work in daylight. If the motors are properly inspected and receive proper attention at night, the cars should run all day without coming into the shed for repairs or trouble of any character. Overhauling and repairing, as far as possible, should be done in daylight by mechanics employed for that purpose, in order that the work may be done properly."

THE TRUSS RAIL JOINT.

This is one of the most simple and at the same time most successful attempts to make a rail joint that will keep the gray hairs out of the young railway manager's head. A base plate is used and the bolts of the truss serve to hold the rail ends firmly to the base plate. The

angle plates have nothing to do with supporting the rail ends and act only to keep the heads in line. As long as the truss bolts hold firmly, the rail ends must stay in surface. The joint is well adapted to street railway service and is specially valuable in pulling joints back to line after they have become low. It has been successfully used on large steam roads for four years and is made by the Truss Rail Joint Company, of 1111 Monadnock building, Chicago.

ONE OF MANY.

The editor of the De Kalb (Ill.) Review, is a rose-colored optimist. He wants an electric railway in De Kalb, whether it will pay or not. After pleading for the usefulness of street cars, ye editor saith:

"There is nothing like looking on the bright side of things. That's the side your humble servant looked on when he tried to publish a daily paper in DeKalb with all out-go and no in-come as the base of operations. The fact that the daily didn't pay was a mere trifle. It was a source of pleasure for the people, and the right thing for the publisher to do was to publish it as long as bright side held out. We like to encourage worthy enterprises of all descriptions. Street cars might not pay in a strict sense of the term, but they would be awful handy to ride on, and the name of having them would outweigh all other considerations. Welcome, street cars to our order."

Won't somebody, please, buy the editor an electric railway.

THE Budapest Tramways carried 12,500,000 passengers in 1893, 11,000,000 in 1892 and 8,500,000 in 1891.

### PERFORMANCE OF THE LIVERPOOL OVERHEAD RAILWAY.

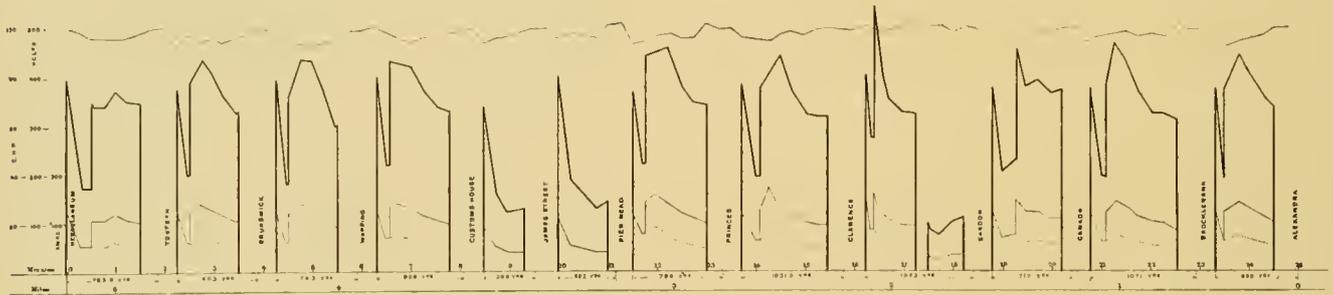

In our issue of March, 1893, we gave a description of the plant installed for working the above road. We are now able to give figures as to its performance, and it is gratifying to note that they are very favorable to the use of electricity. A very full account of the line and its working was recently given before the Institution of Civil Engineers, by J. H. Greathead, Francis Fox, and Thomas Parker. It is from these papers that the following figures are taken.

The road was operated during 1893 by the Electric Construction Company, of Wolverhampton, which company built the road and agreed to operate it for two years, at a cost of eight cents per train mile. The trains consist of two cars, and seat 114 persons. The average actual working expenses per train mile for the three months, from July to September, are as follows:

Time standing at stations, 4 minutes, 40 seconds.  
Average speed while running, 16.1 miles per hour.  
Average speed, including stops, 13 miles per hour.  
Electrical horse-power, while running, 59.1  
Electrical horse-power, including stops, 46.

The curves of the station output show the influence the number of trains on the line has on the current variation. When seven trains are on the road, the average output is 430 amperes, and the maximum 860, or 123 amperes per train. With twelve trains in use, the maximum current is 1,200 amperes, or about 1½ times the average current. The coal per train mile varies from twenty-five to seventeen pounds, according to the number of trains in service. The latter figure was made when the traffic was lightest.

The trains consist of two double truck cars, having one gearless motor each. These motors are controlled with a series-parallel controller. An inspection of the curves reproduced here shows that the most current is required, not at starting, but when the motors are thrown

MOTOR CURRENT CURVES.

Supervision.....	\$.32 cents
Generating station wages.....	1.224 "
Drivers' wages.....	2.118 "
Coal.....	1.690 "
Oil, waste and grease.....	.272 "
Water.....	.024 "
Stores and sundries.....	.178 "
Cleaning and repairs to carriages, switches, etc.....	1.692 "

8.030 cents

This includes the cost of current for lighting stations, working signals, and driving tools in the repair shop. Owing to the colliers' strike, the cost of coal is considerably higher than it would be under normal conditions. During July the cost was only 1.178 cents per train mile, which rose to 1.23 cents in September. Coal rose from six shillings to seventeen and a half per ton. The showing during 1893 was so good that the railway company decided to relieve the construction company of its two years' contract and take over the road. This has been done, and the railway is saving money by it. During the three months previously mentioned, the watt hours per train mile were 2,800. The coal burned was 17.44 pounds per train mile. The coal used was slack, having 70.08 per cent of fixed carbon, 16.47 per cent of volatile hydrocarbon, and 8.51 per cent of ash.

A test made with a fully loaded train, weighing in all thirty-nine tons, gave the following results:

Distance run, 5.125 miles.

Number of stops, 12.

Time on journey, 23 minutes, 47 seconds.

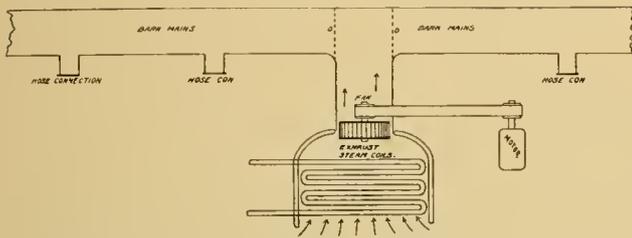

from series to parallel. This has been also observed on certain forms of series-parallel controllers in use in this country.

The authors compare the relative economy of steam and electricity, and as their estimates are based on actual facts, they are of great value. Comparison is made with the Ninth Avenue Elevated, of New York, the two roads being nearly the same length. The cost of electrical equipment on the Liverpool Overhead is about 5 per cent of that which was estimated for the Ninth Avenue line, after the unfortunate electric locomotive trials on the latter road some years ago. With a train mileage equal to that of the Ninth Avenue road, the operating expenses at Liverpool would be six cents a train mile. The actual average consumption of coal at Liverpool is 16 pounds a train mile, for trains weighing 38 tons, seating 114 passengers, and averaging 12 miles an hour, as against 54 pounds, in New York, for trains weighing, with locomotive, 92 tons, and making the same time and same number of stops. The coal used at Liverpool is bituminous slack, and that at New York anthracite. Electric traction is really the cheapest, allowing for difference in conditions, and when the electric line mileage increases, the comparison becomes still more favorable to electricity.

The construction and operation of the Liverpool road has been under the direction of Thomas Parker, of the Electric Construction Company, and he certainly has cause for satisfaction in its unqualified success.

**THE HOT AIR SYSTEM IN THE CALUMET BARN.**

The main barn of the Calumet electric road of this city is fitted with a system of hot air piping that may prove useful to a great many roads in northern cities. The rear of the barn is of brick and is used as a repair shop. This part is heated by exhaust steam, from the power house, 150 feet distant, in the ordinary manner. The main or front part of the barn is used for shelter and storage principally. It is a corrugated iron structure, and no attempt is made to heat it as it would be almost an impossibility. However, it is extremely convenient to be able to thaw off parts that come in covered with ice and snow, without being obliged to take the car into the repair shop. To do this the following inexpensive

HOT BLAST SYSTEM, CALUMET BARN.

system was installed. Referring to the engraving, air is drawn through a bank of steam coils by a fan blower, driven by an electric motor. From the fan it is forced into a main pipe of galvanized sheet iron, running the length of the barn and carried on the roof trusses. These mains are about two feet in diameter, and have dampers, D D, to cut off the air from parts not being used. When hot air is wanted under a car a large hose is attached to one of the outlets made for the purpose, and which are located every few feet along the main. These outlets are covered by a simple sheet iron lid when not in use. The hose being attached and the fan started, hot air can be turned onto any part of a car or truck and in a few minutes it is clean and dry.

Although in this barn such an arrangement is specially needed, because the barn is not heated, it may prove a very valuable method in barns that are heated, because the thawing off of ice and snow is so much more rapid. Besides this, there is the drying effect of the stream of hot air which is worth a great deal in handling motors, especially the old styles. A stream of hot air will dry off a motor as nothing else can, as it penetrates into the cracks and corners. The most expensive part of the outfit is the motor, but on old roads, that most need this apparatus, a good enough motor for this service can generally be found in the scrap heap.

A PARKERSBURG, Va., maniac, after attempting a carbolic acid suicide, took possession of a street car and forbade any passenger to leave at the peril of his life. Finally the police were called in and the fellow secured, after compelling the conductor and driver to make two round trips.

**TIE PLATES AND TRACK REPAIRS.**

At the Association of Railroad Superintendents held at Buffalo, April 19, Benjamin Reece read a paper on the "Value of Tie Plates in Track Repairs." The chief value of tie plates, he says, is in the ease of track maintenance. Too much importance is sometimes attached to the area of the plate. A large plate must be a heavy plate to stand the strain, and a heavy plate is undesirable both in first cost and wear on rails. One of the most important offices of the tie plate is to prevent canting of the rail outward. When rails so canted are straightened up there is a great increase in the power necessary to move trains. When tie plates are used the rails are kept straight and the wheels and rails wear normally. Deterioration of track is due to the yielding and abrasion of parts, and the principal office of tie plates is to prevent this.

**THE ELECTRICAL STUDENT'S A B C.**

- A is the Amp. that went into the Arc.
- B is the Brush, sometimes seen with a spark.
- C is the Copper, most handy for mains.
- D is the Dynamo, driven without reins.
- E is the Science we study and pass in.
- F is the Field, with more iron than grass in.
- G is the Galvo., which "shorts" can foretell.
- H Hysteresis, heats iron like — (anything).
- I is Induction, much blessed and cursed, too.
- J is the Joule, set in carbon and cu.
- K is the Kathode, who lives in a bath.
- L is the Line, cut by wires in its path.
- M is the Motor, which torques as it works.
- N Non-conductor, which carrying shirks.
- O is the Ohm, found in wire as in brick.
- P is the Pole, which to iron wood stick.
- Q the Quickbreak on a high-voltage circ.
- R the Rheostat, which 'eats when at work.
- S is the Switch, like the ones used with trams.
- T is the Telephone; earns many bad — (words).
- U is the Unit, at fourpence a blessing.
- V is the Volt, who is always most pressing.
- W the Watt; E. C., when you know it.
- X the Xpense. House installers should blow it.
- Y is the Yoke, which in magnets is grey.

And the  
Z inc has connection with bells every day.  
J. H. C. B., in London Electrical Engineer.

**CHEAP EXCURSIONS TO THE WEST.**

An exceptionally favorable opportunity for visiting the richest and most productive sections of the west and northwest will be afforded by the Home-Seekers' low-rate excursions which have been arranged by the North-Western Line. Tickets for these excursions will be sold on May 8th and 29th to points in northwestern Iowa, western Minnesota, North Dakota, South Dakota, Manitoba, Nebraska, Colorado, Wyoming, Utah, Montana and Idaho, and will be good for return passage within thirty days from date of sale. Stop-over privileges will be allowed on going trip in territory to which the tickets are sold. For further information, call on or address Ticket Agents of connecting lines. Circulars giving rates and detailed information will be mailed, free, upon application to W. A. Thrall, General Passenger and Ticket Agent, [Chicago & Northwestern Railway, Chicago.

## THE BRISTOL, ENGLAND, TRAMWAYS.

In ye moste ancient and honorable citie of Bristol, England, ye folke travell by tramcar in ye most approved style. Hence this story.

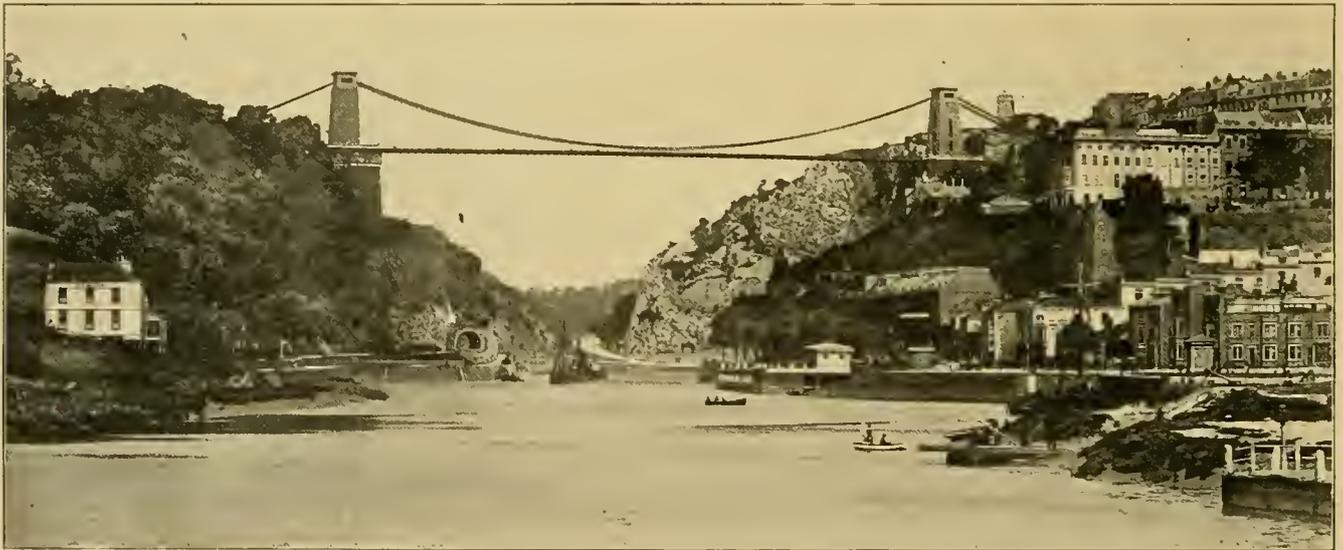

Bristol was not built up in a day, and the interesting old place, 108 miles west of London, on the sea coast, has a most valuable collection of mediæval architecture, supplemented by modern houses and villas and surrounded by historic villages and hamlets.

To no other one interest do the people of Bristol owe more comfort and convenience than to the Bristol Tramways & Carriage Company, the lines of which radiate from the town center to all the main points of interest or industry. The route map is reproduced on this page. A copy of the map is placed in each car, and the management says it considerably increases traffic. Beneath the map is a list of fares which range from one to two pence, (two to

hours. Some of the aldermen are already awakened to the necessity of rapid transit and an effort to educate the public up to modernism is being made.

The plan of the proposed trolley line is that followed in all particulars by the Staffordshire system, as introduced by General Manager A. Dickinson.

As it is, the public has a kindly feeling toward the tramway and particularly for the employes. One manifestation of this spirit is the annual dinner, which is given by the *public*, (think of it!) as represented by a committee of which a clergyman is the chairman, to the drivers, conductors and other employes. At this dinner the management shows its appreciation by attendance. At the last dinner, held March 22, the substantial menu and hearty toasts were divided by music furnished by tramway talent. Among the latter, the competent and progressive manager of the traffic department, C. Challenger, was called upon for several violin solos, besides acting as

CLIFTON SUSPENSION BRIDGE, BRISTOL, ENG.

four cents) according to the distance. The law relating to payment of tram fares is also appended. At various places in the down town districts the map is reproduced with a black background, on a board five feet square, for the benefit of the traveler about to be.

Traffic on the lines is very good, as tram riding goes in Great Britain, with a noticeable increase year by year.

On Easter Sunday, 1893, the lines carried 60,139 passengers, in 1894, the same occasion brought out 73,828 passengers. Thirteen million people are carried annually on the system and a dividend of six per cent is paid.

The system is, of course operated by horses, and comprehends 13 miles of street, double tracked in the populous districts and single tracked in the suburbs. The company owns 800 horses, and runs 70 cars and busses.

A bill now in parliament provides for three miles of extension and the electrifying of the Kingswood-St. George line. The average day's work of the employes is 11 hours for trainmen. The cars are on duty 14½

vice-chairman of the meeting. The toast of the evening, "Success to the Bristol Tramways and Carriage Company," shows the spirit of the public toward the tramway.

One of the features of the tram traffic is a new double decked car, built by the Bristol Tramways & Carriage Company, and reproduced herewith in an engraving. It is called number 2, and carries 32 passengers, 16 inside and 16 out. It weighs 5,824 pounds, including the renumeration if not elegant advertising boards, and cost \$600. This car has extended platforms and steps, and doors of double the ordinary width, four feet instead of two. The simple spring fender in front of the wheels is another new feature, the invention of Mr. Challenger. This car has been adopted as the standard for the tramways, and will be built in the best style, and of the best procureable material. Mr. Challenger was the principal designer and superintendent of construction.

The various lines of the Bristol tramways lead to many places of historic interest. One of these takes the visitor to the world renowned Clifton suspension bridge, an

engraving of which we show, surrounded by romantic scenery, the objective point of all travelers, whether commercially or pleasure bent. The bridge is said to be one of the highest in the world, and offers numerous advantages for prospective suicides. In fact one of the principal duties of the bridge watchmen, is to keep a close eye on all wild looking people of suicidal symptoms. A curious instance lately, was that of a tired-of-life-and-crossed-in-love young woman, who jumped for death, but her skirts filled up with air, a la parachute, and she was landed gently in the mud, from whence she was hauled unhurt, but, wiser and sadder, to answer a charge of attempted suicide. The bridge is 32 years old, and weighs 1,500 tons. It will support a burden of 7,000. The single span is 702 feet 3 inches, and its height from the low water 287 feet. There are 4,200 links in its chain,

C. CHALLENGER.

each 24 feet long and seven inches wide. They pass gracefully over the 70-foot towers, and are anchored 70 feet into the solid rock.

The management of the Bristol Tramway & Carriage Company, consists of President W. Butler, J. P., and directors, Messrs. Gardner, Low & Wethered. Of General Manager C. Challenger we reproduce a portrait.

**DISTRIBUTION OF ELECTRIC POWER IN EUROPE.**

The town of St. Etienne, France, seems to be rapidly arriving at the point of ideal electrical development in the way of distribution of electric power to small shops and factories. In the consular reports for May, Charles W. Whitley, Jr., describes the conditions of affairs there. St. Etienne is a workmen's town of 133,000 inhabitants, of which 30,000 of the most intelligent are weavers. Of the 18,000 looms in the city, the majority are owned by the individual weavers. They have until recently been worked by hand, but the weavers are beginning to find that with electric motive power they

can increase their output, and electric motors are accordingly coming into extensive use in the small shops. The power is furnished by the Edison Electric Company, from a 900-horse-power water-power plant on the river Loire. There is also a ribbon factory using electric motors in place of the usual shafting and belting, thereby adding another to the list of modern factories using this advanced method.

**MUST BURY THE WIRES.**

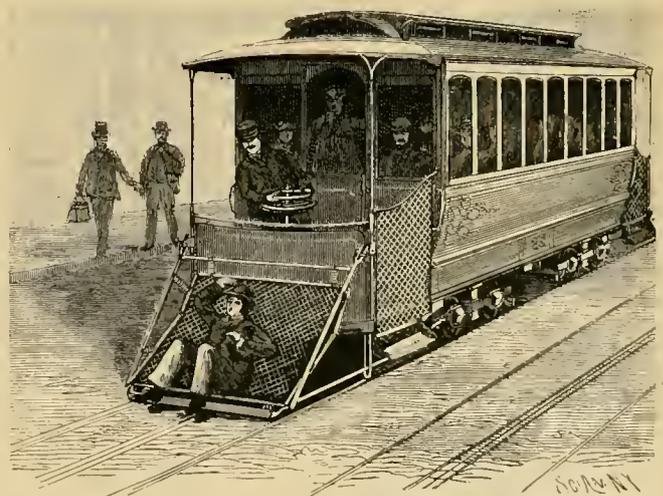

The Board of Aldermen of Boston has ordered the removal of all overhead feeders and returns of the West End Street Railway, and give until November 15 to put them underground. The telegraph and telephone companies and electric light companies must also obey this rule. The down town and crowded portions of the city are alone specified.

**STREET RAILWAY EARNINGS IN ST. LOUIS.**

The decrease in passenger traffic of the late "hard times" is well illustrated by the last quarterly report of the St. Louis street railways. The total trips were 1,313,949, against 1,469,513 for the first quarter of '93, and the passengers were 20,953,841 in '94, against 21,485,054 in '93. The Lindell railway increased its traffic over 1,000,000 in spite of the depression.

**THOMAS' LIFE FENDER.**

The fender illustrated herewith is the invention of Charles F. Thomas, Buckeystown, Md. It is in the form of a catch net with a frame which bends inward as a heavy body falls into it. The frame is carried on the truck frame or on a supplemental frame as necessity

requires. The striking edge may be padded. As the person is struck and falls upon the net the helical springs of which it is composed close him as in a purse or bag and prevent further injury from falling again on the track as might be the case if the springs were less flexible. This fender is open to the objection that obtains in all flexible fenders, namely, lack of strength.

## HALF FARES.

Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.

THE South Chicago and Calumet lines of this city are making preparations to burn oil as a fuel.

THE Buffalo & Williamsville has utilized a newly-discovered gas well by piping the product to its boilers for fuel.

JESSE SELIGMAN, of the great New York banking house, is dead. He was a large holder of street railway securities.

THE Brazilian war is at an end, and the tramway lines in Rio no longer have use for the sign, "Take this car to the naval battle."

CONSIDERABLE idle talk of a strike of Chicago street railway employes was the main topic of the sensational evening sheets during the month of April.

H. R. BILL 6724, authorizing the extension of the Columbia Railway of the District of Columbia, is under the consideration of District commissioners.

A VERY fleshy woman fell in front of a Broadway (N. Y.) cable car the other day, but her corpulency saved her life. She was too fat to get under the wheels.

THE Brooklyn goat is the latest victim of the d--ly tr--y. He very frequently tries to eat the loaded end of a trolley wire and the consequences are heart-rending.

THE Windsor Beach Electric Railway, near Rochester, N. Y., will be opened April 20, and the pleasure resort business begun in earnest. A new pavilion is being built.

THE Ridge avenue line of the Philadelphia Traction Company was put into commission April 18. President Widener, W. L. Elkins and distinguished guests made the trip.

THE Ohio vestibule case, which was fought by the Springfield Railway Company, was prepared and conducted by Oscar T. Martin, a leading attorney of central Ohio.

THE Fort Meade, Fla., Street Railway is one of the successful Southern roads, having paid an 8 per cent dividend for the past two years. J. G. Carter is general manager.

FREIGHT hauling is the greatest question now under the consideration of the electric railway managers in Jersey City, Newark, the Oranges and that section of New Jersey.

MOUNTED policemen in New York City will hereafter be provided with nickle mounted lanterns with half green half white lights. The idea is taken from the cable car warning lights.

AN old colored woman in New York, on her first attempt to cross the cable tracks, was so frightened that she gave up in despair and walked around the loop rather than cross.

BALTIMORE is boiling over, that is in the pro bono publico columns of the papers, concerning the high-step evil of the rapid transit car. It is said to be particularly injurious to the ladies.

THE bill in the Ohio legislature, allowing municipal corporations to buy, construct and own street railways, and upon a two-thirds vote to issue bonds to pay for same, was defeated in the Senate.

A HARMLESS little garter snake recently got loose in a New York horse car and stampeded everybody except one man who had several drinks aboard and said he never gave way to his imagination.

THE city council of Philadelphia has established a standing committee on "street passenger railways." It consists of twelve members of each chamber, but the chairman must be a member of the select chamber.

THE Chicago, Burlington & Quincy Railroad Company and the West Chicago Street Railroad Company had an interesting altercation over a grade crossing recently, in which the street railway hosts came out victorious.

PROFESSOR BEMIS has decided that all street railway, gas and electric light plants should be owned by the municipalities. This is not a new thing, professor, and the street railways go on owning themselves just the same.

THE Atlantic Avenue Railway Company of Brooklyn has bought three of the electric cars used on the Intramural for use on its Coney Island and 39th street ferry line. If successful there they will be used in the city also.

THE report generally circulated that the Canadian Pacific Railway had decided to adopt electricity on one of its heavy grades on its Rocky Mountain Division is, we are informed by Assistant General Manager Tait, incorrect. It was considered, but cost was too great to warrant.

THE life fender in use on the Springfield Avenue Street Railway line, of Newark, N. J., the invention of Foreman Smith, of the Irvington line, recently distinguished itself by picking up a big Newfoundland dog. When the car was stopped Mr. Dog jumped out and ran away, without so much as a wag of thanks.

THE Brooklyn, Queens County & Suburban Railway Company has awarded contracts for twenty-five miles of 90-pound girder rail to the Johnson Company, and for fifty cars to the Lewis & Fowler Manufacturing Company.

RICHARD C. BEGGS, ex-secretary of the Oakland Consolidated, who was sent to the penitentiary for absconding with \$10,000, has been released. The release gives general satisfaction, as Beggs has fully expiated his crime.

PRESIDENT VREELAND, of the New York Metropolitan Traction Company, writes us they have received about 3,000 applications for the \$50,000 prize. When it comes to novel transit, Coxey's army isn't in it with the Metropolitan contest.

THE Mohawk & Illion Horse Railway, of Illion, N. Y., reports for the quarter ending March 31: Gross earnings, \$1,715; operating expenses, \$1,144; net income, \$511. The net income for the first quarter of 1893 was \$502.

L. R. SHELLENBERGER, Atlanta, Ga., chairman of the local committee on exhibits, for the October convention of the American Street Railway Association, is the assistant engineer of the Johnson Company, of which Wm. W. Kingston is the Southern agent.

WHEN the John Stephenson Car Company of New York City ships a car to a foreign port, the vehicle is boxed complete, knocked down. The total weight of the usual car for South America is 6,500 pounds with the box, and the package measures 27 feet by 8 by 4 feet.

JUDGE PARKER, of Kingston, N. Y., has granted a new trial in a damage suit brought by a woman who gained \$2,500 damages from the Troy City Railway. The company now is prepared, it is claimed, to show that the damages resulted from an abortion. The company alleges blackmail. It will prove an interesting case.

THE relative amount of securities of the two great electrical concerns is given as follows:

Westinghouse.	General Electric.
\$ 692,000.....bonds .....	\$10,000,000
3,600,000.....preferred stock.....	4,000,000
5,400,000.....common stock.....	30,000,000
9,692,000.....total .....	44,000,000

A NEW YORK saleswoman has been arrested on the charge of blackmailing a street railway company. She received a \$6,000 judgment against a street railway company some time ago on account of an alleged broken ankle. A detective has discovered that her ankle was otherwise broken and a scheme concocted to bleed the company.

It takes presence of mind to be a successful electric car conductor. For instance, the other day in a neighboring town a car ran away down hill, jumped the track

and stopped before the very door of a "prominent citizen." When the startled p. c. rushed out to find the reason of so much tumult, there stood Mr. Conductor, cap in hand, saying, "Did you order a car, sir?"

THE change in the management of the Niagara Falls Park and River Railway, places C. R. McKenzie, well-known as connected with the Montreal road in the general management. Mr. McKenzie's ability as shown in his previous connection has, in this relation, ample opportunity to display itself. W. A. Grant, ex-manager, returns to steam railroading on the Canadian Pacific.

THE enterprising Parisian newspaper, the Petit Journal, has offered a prize of \$2,000, a second prize of \$500 and a third of \$400, for the three most deserving self-contained "horseless carriages" for roads. Vehicle must carry at least two persons, and run at least six miles an hour. The competition closed April 30, but to date no awards have been published. The Journal staff were the judges.

PROFESSOR SHEPARDSON, in one of his recent interesting "talks" in the American Mechanic, says: "The writer has heard of one conceited 'electrician' in a small town, who found great pleasure in telling his visitors that when his plant was put in by the company it required 110 volts and 80 amperes, but he had improved it so that he had done away with volts entirely and did not use them any more."

WE are in receipt of \$2.00 in stamps enclosed in an envelope postmarked San Francisco, with one of our subscription blanks, but which bears no name whatever. As our San Francisco list of subscribers is very large it is impossible for us to know to whom to credit this amount, and if this item should reach the eye of the remitter we should be glad to have him advise us so that the amount may be passed to his credit.

THE Rabbinowitz family has a large sized crow to pick with the Kansas City Cable Company. Harry R. wanted \$2,000 for an alleged broken rib. Bertha R. wanted \$5,000 for bruises and wounded feelings. Frank R., the latter's husband, wanted \$2,000 for the loss of his wife's society and service. The first two were given \$200 each by the benevolent jury, and a big sigh of relief will be properly heaved by the company when the Rabbinowitzes are disposed of.

THE Terre Haute, Ind., city council has passed a "hitching-on" ordinance that rejoices the heart of the conductors and the Street Railway Company of Terre Haute. It makes it unlawful for any one to mount a street car unless with the intention of becoming a bona fide passenger, and prohibits the hitching-on of any person under 16 years of age in any manner whatsoever. The person or child violating this ordinance may be fined in any sum not exceeding \$25, on conviction before the mayor.

## FOREIGN FACTS.

WORK will be begun on the Mandelay, India, tramways this summer.

THE Creusot Works will exhibit an alternating current street railway system at the Lyons, France, exposition.

THE long eared portion of the citizens of Bristol, England, is organizing against the introduction of electric cars.

ON March 30 the Hamburg, Germany, Electric Railway was commissioned. It has  $21\frac{3}{4}$  miles of line and 42 cars.

A SYDNEY, Australia, capitalist wants to put in a cable railway between the terminus of the present Perth, Scotland, tramway and Mount Magnet.

THE Paris Chief of Police forbids the carrying in public conveyance of any dirty, overlarge or ill-smelling package. It is an idea worthy of imitation.

ON the Austrian state railroads recent disasters from explosion of gas and oil have been so numerous that there is a strong probability that electric lighting will be made compulsory.

THE success of the overhead electric railway of Liverpool has tempted the company to build an extension to the Seaforth Sands Station. The total line will then measure  $6\frac{1}{4}$  miles.

THE London Tramways Company is running a car on its line in which storage battery, incandescent lamps are placed. One lamp is placed upon an iron frame six feet above the car roof, for the use of "outside" passengers.

A STATION indicating device is in use on the Albert Dock railway, London, gives satisfaction. At a certain place just before arriving at a station a lever is struck by a raised block between the track. The name of the station is brought into view.

THE new Isle of Man Tramways & Electric Company, England, has a capital stock of \$75,000 and will consolidate the Douglas Bay Tramway and the Isle of Man electric. Extensions will be made and the entirety of the Manx country will be traversed by the motor car.

THE Anglo-Argentine Tramways Company, a London corporation working the street railway lines of Buenos Ayres, reports a dividend of 43 cents a share and \$10,000 credited to the reserve fund for the year 1893. The running expenses were \$604,690, the receipts \$799,970.

J. H. WOODWARD, the prominent English electrical engineer, whose name is so intimately connected with the installation of the Liverpool Overhead railway, has severed his connection with the electrical construction company (Elwell-Parker) and has opened offices at No. 6 Brighton Terrace, Merridale Road, Wolverhampton, England. He is now absent on a six weeks trip on the continent.

THE British police raid a tram car that is supposed to be "overload," that is, carrying more than it can seat. On such an occasion recently the excited conductor pulled off his cap, badge and register and sat down among the passengers, hoping thus to escape detection. His ruse was of no avail, as his excitement betrayed him.

THOMAS PARKER, head of the extensive electrical works of the Electrical Construction Company, Wolverhampton, England, retires from the concern the last of this month, taking with him five members of the staff. Mr. Parker was the founder of the Elwell-Parker Company. His address will be Telkenhall, Wolverhampton.

THE International Tramway Union has changed its date of meeting from the 25th of August to the 18th of the same month. The meeting will last five days and include an extensive trip, visiting the more prominent German electric railway plants. The meeting proper will be held at Cologne. The dinners each day will be prominent parts of the proceedings.

IN 1885 the thirty-two miles of the Buenos Ayres, South America, tramways, carried 12,725,000 passengers, while in 1893, with two miles more of track, 25,583,000 people were carried. In 1888 the dividend paid was 10 per cent. The present dividend is  $3\frac{3}{4}$ . The fares were raised last year 25 per cent, but the increase in labor and price of forage counterbalanced the rise. Better try electricity, brethren!

AN English engineer, the inventor of a radial truck, recently suspended himself in a hammock underneath a car equipped with his device and attached to an express train. To his horror after a few miles he saw that the swing of the hammock had worn through one of the attaching ropes. Luckily, however, the train soon approached a station and the engineer crawled out with all the data he cared for.

DURING the past year an electric railway has been constructed and commissioned at Genoa, Italy. The feeders are carried on brackets attached to the houses and the trolley wires are 23 feet above the ground and strung in the same manner. The station capacity is 450 horsepower, and Siemens-Halske electrical equipment is used. A wire frame is used instead of a trolley wheel. Twenty-four cars are in use, each equipped with two 18-horsepower motors. The Electric & Cable Railway Company of Kerns, Switzerland, built and owns the road.

THE KHEDIVAL GOVERNMENT, through the minister of public works, announces an extension of six months for receiving bids for the proposed concession for the construction of a street railway line in Egypt. This makes the last date August 1, 1894. The concession is a monopoly of street traction and is attracting considerable attention. The American consul-general is Frederick C. Penfield, Cairo, Egypt. American capital might here find an excellent opening. Investigation shows good reason to believe the venture will be successful.

**THE SANDUSKY, MILAN & NORWALK  
ELECTRIC RAILWAY.**

Longest Interurban in the Country—Built During the Panic by  
Local Investors—Passengers, Freight, Express and Mail  
Combine to Furnish a Splendid Business.

The projection of this interurban road and its successful completion in the face of the financial disasters which spread over the country during its construction, is one of the most gratifying results in electric railroading it has been our pleasure to chronicle, and a short sketch of its history will certainly be of interest to those who contemplate similar enterprises. It comprises nineteen miles of track, which is the longest road of its kind on record, and Sanduskians may well feel proud that they have in their midst an element of enterprise such as has been displayed by the projectors in the building of a line of such proportions. Sandusky is situated on Lake Erie, midway between Cleveland and Toledo, and has a population of about twenty thousand. There are already two electric roads within the corporate limits of the city, both of which were built by the projectors of the present line. In the summer season excursionists come into Sandusky from all directions to visit the Ohio State Soldiers Home or to take the steamboats plying between Sandusky and the islands of Lake Erie. Cedar Point, another celebrated summer resort, draws thousands to the city, and both roads are kept busy. The Sandusky, Milan & Norwalk interurban line commences at the State Soldiers Home, where it connects with the city lines, over one of which The Peoples Electric Railway, a traffic arrangement, has been made, and the Sandusky, Milan & Norwalk cars are thus enabled to bring their passengers to

a source of income for the road. There is a slight curve in the road at this point which, when turned, opens up to view a straight piece of track extending across a prairie for a distance of five miles. Substantial farm houses and prosperous looking farms extend along on both sides of the track. After crossing the prairie a turn is made and the first 6 per cent grade is encountered, this grade being also on a curve. About one mile from here the road crosses the Nickel Plate at Avery, crossing it at grade

DEPOT AT SOLDIER'S HOME,

and close up to the station platform, which makes it convenient for transferring passengers and express matter. From Avery a straight run of two miles is made through a rich farming section, where large quantities of strawberries and other small fruits are raised, and which when in season will be a source of revenue to the freight and express department of the road. The next five miles of the line run through a very broken country, and it is over this latter portion of the line that the projectors showed their backbone in overcoming the obstacles which stood in the way. The power house was located in this valley on account of the proximity of water, coal-ing facilities of the Wheeling & Lake Erie Railway, and nearness to the heaviest grades on the road.

From North Milan Hill the valley below is reached by a maximum grade of 8 per cent, although the highway has a grade of over 20 per cent, but by cutting down the summit and trestling, the foot is reached with the grade mentioned above. The river is crossed over an iron truss bridge 165 feet long, and after making a severe curve crosses the Wheeling & Lake Erie steam road at grade and then winds up on a side hill, making a climb of 65 feet in less than 800, all of which grade is on a reverse curve. This is the most difficult grade encountered along the whole line, but the heavy cars with their double equipments and heavy loads have no difficulty in making the climb. At the top of this grade we enter the village of Milan, a picturesque little town of about 1,500. There are many fine residences to be found here and the inhabitants would not part with their electric railroad for a good deal. They are all good patrons of the road, and it cannot but prove a benefit to Milan in many ways. Leaving the village of Milan the road continues south to the city of Norwalk, a distance of five miles more, pass-

ON THE BEACH, CEDAR POINT.

the heart of the city and direct to depots and boat landings, thus avoiding the transfer of passengers.

From the Soldiers Home the line extends south on the west side of the highway, the franchise from the county commissioners stipulating that the track shall not encroach nearer the center of highway than fifteen feet. About one mile south the first trestle 300 feet long and 10 feet high is crossed. Still further south, about one a half miles, a picnic ground and pleasure garden has been opened up and bids fair to become a popular resort and

FIVE MILES ACROSS THE PRAIRIE.

STEAMBOAT LANDING, SANDUSKY.

PAVILION AT CEDAR POINT.

ing over some very wide and deep ravines, all of which have been trestled. The longest is 800 feet and the highest 30 feet. The line enters Norwalk from the east end and extends down the main street to a point opposite the court house, a distance of about two miles. It is the intention to extend the line about two miles further, taking in the entire length of Main street. Norwalk is a thriving city of 10,000 people and is the county seat of Huron county. It is intended to put on a local service in Norwalk when the extension is completed, and as business may warrant it other extensions will be made.

The construction of the railway was commenced in December, 1892. The estimates were made by Thomas Wood, the present manager, and were \$155,000, covering the entire line construction, real estate, buildings, machinery, cars and electrical equipment. This amount was to be realized by the sale of \$80,000 stock and \$75,000 of bonds.

The entire construction was placed in the hands of Mr. Wood, who has already constructed other lines, and the road to-day speaks for itself as to the success or failure of his efforts. Grading of the roadbed began in December, 1892, and was completed to Milan in fifteen days. Operations were suspended for the winter, but poles and ties were distributed along the lines with sleds. A locomotive and four flat cars were purchased for use in construction and they proved a good investment. In March construction began again, although the snow was three feet deep, and track was laid on top of it. Several

miles were built before the snow melted enough to let the track down to the ballast. All went well till June came, and the projectors learned that the parties who were to take the bonds could not carry out their agreement. This came as a stunning blow, for \$80,000 had been spent and as much more was contracted for. However, with personal loans and with the receipts of one car running between Milan and Sandusky, construction work was kept up a while longer. Finally it was thought best to appoint a receiver until such time as the bonds should be negotiated, and Col. J. C. Gilchrist was given that office. It was an impossibility to place a bond of any kind with any bank, and the promoters realizing this did not try to do so, but sold them in lots of one and two in the country through which the road is built. The entire amount was placed within thirty days at par; a very gratifying result, and one that showed the local faith in the enterprise. The opening of the entire line occurred August 28, seven weeks after the date set, and although those seven weeks would have been most profitable ones, the stockholders felt that they had cause to congratulate themselves that affairs turned out as well as they did, after the very discouraging aspect of two months before. The receiver was discharged after sixty days service, and all creditors have been paid in full.

The rail is principally 48-pound T, with some 45-pound girder. The ties are cedar except on curves and trestles, where oak is used. The trestles have been well tested with car loads of stone, but it is the intention to

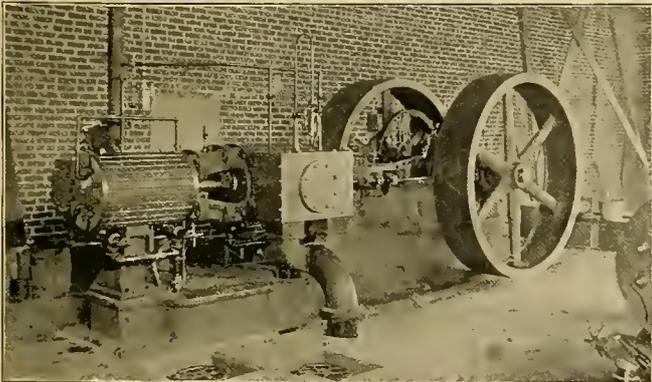

fill them up. The poles are all set in six feet of concrete. The power house at Milan contains two 150-horse-power Babcock & Wilcox boilers, two 150-horse-power McIntosh & Seymour compound engines and two Westinghouse multipolar generators of a like capacity. All the electrical apparatus is of Westinghouse make, this being the third road built by these projectors employing Westinghouse machinery. The equipment at present consists of three closed coaches 40 feet in length having double trucks; three open coaches of the same length and one 16 foot vestibuled car for service in Norwalk. One of the coaches is a combination passenger and express. All the cars are upholstered with plush and all windows are beveled French plate. The trucks are all from the McGuire Manufacturing Company of Chicago, and are doing good service. Each car has two 30 horse-power Westinghouse motors under it, and a speed of 25 miles is attained on level track. The road was opened for through traffic August 28, 1893, and from that time to the present the cars have been well filled and the prospects for the road are very promising. The coming summer will in all probability tax the capacity of the road to its full extent, and the stockholders are to be congratulated on the outcome of the efforts of the projectors and active members of the enterprise.

The road has a contract for carrying the United States mails to six post offices twice a day. A five years contract has been made with the American Express Company for carrying its business. The company has realized quite a revenue from carrying freight since opening the

line, and it is growing daily, so that it will soon necessitate regular freight cars.

A ride of 42 miles for 50 cents, is certainly an inducement for travelers to take the Sandusky, Milan & Norwalk Electric Railway. Arrangements have been made by which the Sandusky, Milan & Norwalk sells tickets at its offices to points east and west over the Nickel Plate, and mileage tickets of several roads are honored by the conductors of the Sandusky, Milan & Norwalk. This makes it very convenient for traveling men, and they are not slow in appreciating it. We look upon this project as being one of the most enterprising ones yet entered into by electric railroad men, and the fact of the project being, as it is, an assured success will undoubtedly lead to the building of many more similar lines. The present management consists of Geo. H. DeWitt, president; Thomas Wood, secretary and manager, and A. W. Prout, treasurer.

Ohio seems to be one of the favorite states for interurban projects, and it is well suited for them, combining prosperous farms with numerous large towns. The report of the Ohio Road Commission to the last legislature of that state showed a full recognition of the important part to be played by this class of roads in the future. This commission, of which Martin Dodge is the chairman, and leading spirit recommended that no money be spent in expensive road improvements as electric railways furnish a much cheaper means of transportation at a less outlay of capital. It was shown that \$1.25 would haul a ton five miles by horse-power on a wagon road, twenty-five

700-FOOT CURVED TRESTLE.  
MCINTOSH SEYMOUR ENGINE.

IRON BRIDGE OVER HURON RIVER.  
GRADE AT RATTLESNAKE CREEK.

miles on an electric railway, and 250 miles on a steam railroad. The majority of the commission reported in favor of masterly inactivity on the part of the legislature, thus leaving the field open to the electric road built by private enterprise. The minority report went farther

G. H. DE WITT,  
President.

and pointed out that it was by the free use of the highways that such cheap rates are made possible on electric roads, so that "public aid though not public money has

THOS. WOOD,  
General Manager.

A. W. PROUT,  
Treasurer.

been given, and properly given to cheapen transportation by that means." Thus the state has helped in a great improvement without straining itself financially or parting with any rights previously enjoyed.

THE report that Henry M. Whitney is to resume the presidency of the Boston West End is branded as false by Mr. Whitney.

## STANDPIPE ACCIDENT AT PEORIA.

The Water Company Tries to Evade Responsibility by Crying Electrolysis.

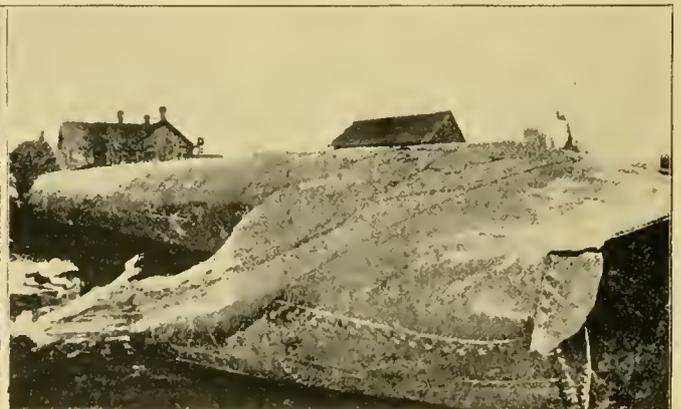

On March 30, last, the steel and wrought iron standpipe, 25 by 120 feet, at Peoria, Ill., was broken close to the foundations, and falling, occasioned several deaths. A high wind, fully thirty miles an hour, prevailed at the time. Expert examination, under the direction of the coroner and others interested, revealed the fact that the interior of the sheets forming the pipe were corroded in the form of blisters or excrescences, composed of layers of brown and black oxide. Beneath the second coating the plates were pitted in some cases to a depth of one-eighth of an inch, but on removal revealed a clean metallic surface. These blisters extend all the way to the top, and are observed, also, in the other tower on the east bluff.

The water company, in its anxiety to shift the responsibility for the accident on other shoulders, have asserted that the accident was caused by electrolysis, as the Ft. Clark electric line passes in close proximity to the tower, and one of the water mains leading out, is laid in the same street with the road for a half mile. The Peoria Journal prints an open letter, dated April 6, from the water to the railway company, as follows:

GENTLEMEN:—You are hereby notified that the Peoria Water Company for a long time past has been, and is now, daily suffering and sustaining great injury and damage to its lead and iron pipes, and other underground property in the streets and alleys of Peoria. That it is put to great labor, expense and trouble in making and keeping up repairs on its said pipes, by reason of the improper and wrongful use by you of the ground as a return conductor for electrical currents; and by the illegal, careless and improper use of electrical currents generated by you.

You are also notified that by reason of such improper, wrongful and illegal use of electrical currents by you, the Peoria Water Company is not only suffering great loss and expense in connection with its lead and iron pipes and other underground property, but it is greatly hindered, delayed and injured in the conduct of its business, the furnishing of water to the city and citizens of Peoria, Ill.; and if such improper, illegal and wrongful use of electricity and electrical currents is continued by you, it is only a question of a short time when this company will, by reason thereof, be so injured, delayed and hindered in its business as to be prevented from conducting and carrying on its said business.

We are informed that you are about to undertake the extension of tracks and the use of electricity in the streets of the City of Peoria beyond the present limits of your street railway lines; and that the construction of the extension and the use of electricity will be the same as is now in use by you; and we wish to protest against all such extensions,

THE STANDPIPE ACCIDENT, AT PEORIA.

and request that you not only do not make such extensions and further use of electricity in the manner above specified, but that you immediately cease and desist from the improper, illegal and wrongful use of electricity and electrical currents as herein before specified.

You are therefore notified that this company and its receiver will hold you responsible for loss, injury and expense suffered, or that may be suffered, by it, through the wrongful, improper and illegal use of electricity and electrical currents by you.

Yours truly,  
 DABNEY H. MAURY, JR.,  
 Supt. for the Receiver.

The answer of the railway people was promptly made, under date of April 10, and sets forth the policy of the road in the matter.

DEAR SIR:—Your favor of April 6th, to the Fort Clark Street Railway Company, has been forwarded to me for consideration.

I was not aware of the fact that the Peoria Water Company had the exclusive use of the earth within the City of Peoria; if we had known such was the fact, we would have applied to you for the franchise, instead of to the common council.

We have been led to believe that the law of the street was plain, and that they were devoted to the public for the purpose of conveying passengers by different methods.

It is our intention and purpose to use the rails of our railway for conveying the return circuit, and I may call your attention to the fact that when the late franchise was granted to the Fort Clark Street Railway Company, the Peoria Water Works Company's representative did all in his power to prevent having the ordinance passed, so that we could not use the rails.

In regard to the extension we propose to make, we would refer you to the common council, who require us to make that extension; the rails at the present time are on the ground; the poles are erected, and we hereby notify you that we shall comply with our ordinance unless restrained by the courts.

From the recent accounts in the papers we would assume that your trouble was more above the ground than under it. If you are not able to build a satisfactory standing pipe that is above ground, it certainly would look as if you would not properly put in any underneath the ground that would stand ordinary wear and tear.

It would seem that the trouble with your water works plant is general debility, resulting from other causes than that of the electrical current that is used in propulsion of cars within the city of Peoria.

Yours respectfully,  
 F. W. HORNE, President.

The claim that electrolysis had anything to do with the accident is absurd, and furnishes a mighty thin defense, which cannot hope to stand, but will fall to the ground in shorter time than the ill fated tower. The fact that the oxidation, on which so much stress is laid, extends all the way to the top, and many feet above the high water mark, should alone wipe the electrolysis story from the slate.

Our illustration is reproduced from Engineering News.

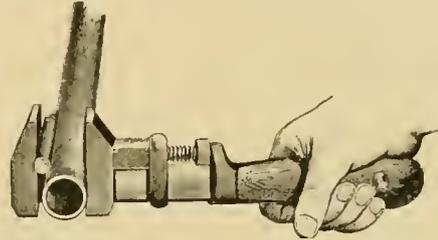

THE construction of fifty new motor cars and fifty trailers has been commenced in the Toronto Railway Company's shops. From these shops 180 cars have been turned out. These cars are in use in Montreal, Winnipeg, and elsewhere.

THE London authorities have decided that an electric van or omnibus is a locomotive within the meaning of the law.

THE Lake Street Elevated Company, of Chicago, has taken the road out of the hands of Underwood & Green, the contractors, and assumes entire control of the road.

A HOME MADE PIPE WRENCH.

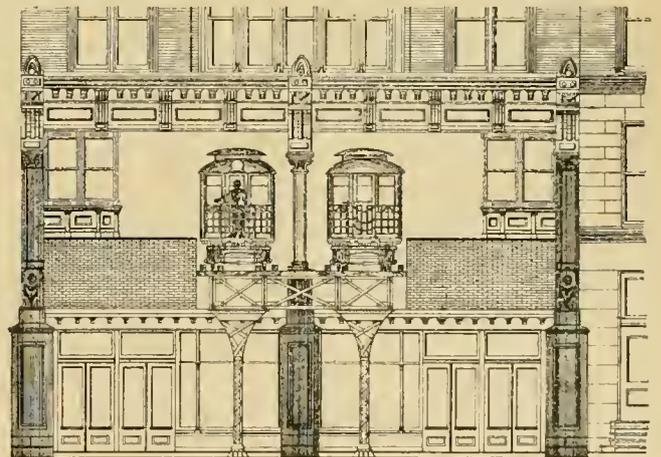

Necessity that is the mother of invention and the opportunity of the good mechanic, was the occasion of the use of the ingenious pipe wrench shown in our engraving. The Scientific American recently saw a mechanic who desiring to unscrew a pipe, and not having the requisite tool improvised an effective implement by taking a

round file and fitting it in the jaws of an ordinary wrench as shown, loosening the pipe without difficulty. The rough file prevented slipping, and the wrench did the rest. It has been said by a prominent professor of mechanics that a well equipped laboratory was often more hindrance than help, as the student would depend on what was afforded rather than use his brain.

THE NORTHWESTERN L.

The franchise obtained by the Northwestern L, some months ago, from the Chicago city council, is about to be acted upon by the promoters of the enterprise. It has been decided to condemn a strip 40 feet wide through the business houses on its right of way from the river south to the alley just north of the First National bank, and then east to Wabash avenue. As now proposed, the line will go through the second floor of the buildings, a la arcade.

The Columbian Construction Company, with offices on the fifth floor of the Rookery, will build the line, and right of way is now being gained, and such men as P. D. Armour, C. T. Yerkes, John J. Mitchell, Marshall Field and L. Z. Leiter, are said to be intimately connected with the enterprise. D. H. Louderbeck is the formal head of the enterprise. Our illustrations show proposed method of tunneling buildings.

## SOME FOREIGN TICKETS.

The case of foreign street car tickets which many will remember as a part of the STREET RAILWAY REVIEW'S World's Fair exhibit, was a most interesting assemblage of these "common carrier's exchange."

We represent here a few of the most interesting of the number and begin with the most difficult, at first sight, printed in the musical Russian tongue. The one marked 88041 will give the passenger one ride on the Nevskii Prospect, the world renowned thoroughfare of the capital of all the Russias. It is worth five kopeks or 2½ cents.

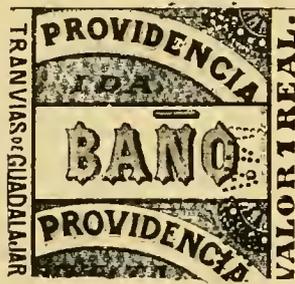

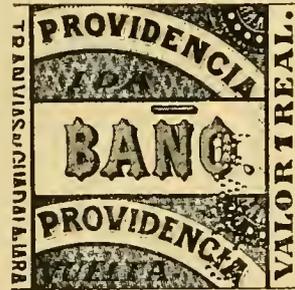

the months are noted by letter and the route by the double row of names. It is worth 20 pfennigs or about five cents. It is only good for a continuous ride in the direction in which the passenger set forth and in the next available car. The conductor's number is stated and the ticket must be shown to the inspector on demand. Berlin's contribution is numbered 09545 and is worth 2½ cents to travel on the circular or belt line to Georgplatz, Bremen. The horse-shoe ticket from Bremen is a receipt in full for 15 pfennigs, which must be kept during the journey and shown when required.

From old Barcelona comes the one headed vale 15

It must, like all European tickets, be shown on demand to the conductor or inspector. Number 97,127 is like unto the former, but of a different route. Number 67,993 comes from Moscow and will permit the bearer to travel on Great Garden street, the great boulevard of the city of the Kremlin. Translated it reads P. T. G. A. (name of line); five kopeks; ticket for going; must be shown on demand of conductor; Bolshaya Sadovaya (great garden street).

Number 1557 is a transfer ticket from Dresden, Germany, on the Dresden Street Railway. The Roman numerals show the hour of the day; the date is in arabic;

cents. It is a suburban ticket and must be shown on demand of the employees of the line.

Mexican tickets, of which there is a large number of various denominations, make up the rest shown herewith. The City of Mexico uses generally a plain printed slip bearing the legend "Bueno por un pasaje," etc., which means, "Good for one passage from the Plaza Hidalgo to the National Station," with the same repeated in English. The three classes are represented in the suburban tickets which need no explanation, while the ornate affair from Guadalajara and the simple one passage, un pasaje, of Guanajuato close the list and this story.

## MUNICIPAL PURCHASE OF TRAMWAYS.

The Court of Appeal, London, England, has heard the appeal of the London county council in the case of the Council vs. the London Street Tramway Company in re the award of the arbitrator for the sale of the undertaking to the city. The lower court sent back the award to the arbitrator ordering him to take into account in framing his award the past profits of the undertaking, with a view of arriving at the rental value of the parts of the tramway to be bought. The arbitrator refused to do this and the appeal was taken and upheld by the Court of Appeal. The Company held that the valuation should be based upon the purchase of profits, which would have made the price \$750,000. The Council held that the price should be the cost of construction less the depreciation, making the sum \$320,000.

This rule was adopted by the arbitrator "because he could arrive at the value in no other way." It is claimed by the council that no hardship is worked to the tramway

will run from 6 a. m. to 12:30 midnight. The trip will be made in 38 minutes including stops. Twenty centimes will be charged for any distance. The stations will be in the form of Kiosks and foot bridges will connect arriving and departing trains.

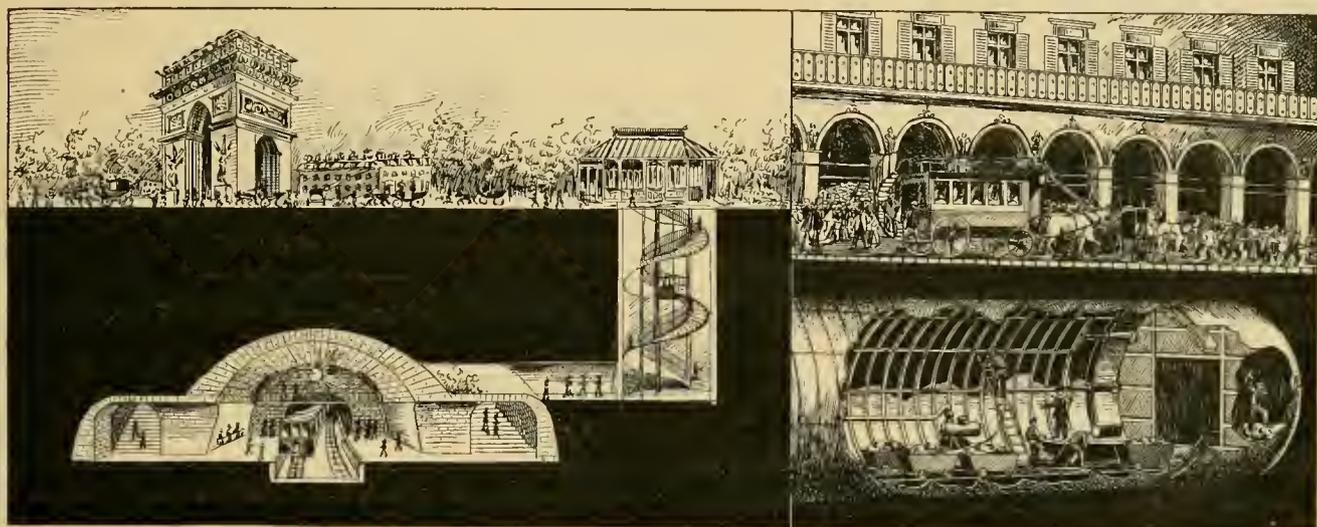

Our illustration shows the station de L'Etoile the foot bridge and details of the ascent and descent.

## A NEW METHOD OF CREATING TRAVEL.

A western bank president has a habit of taking an airing each evening on the front end of a street car, absorbing ozone and throwing off the cares of business, while chatting with the motorman. The other night he met a genius, and his match.

After the usual exchange of courtesies the motorman said:

"Mr. Blank, you consider yourself a financier, I suppose?"

PROPOSED UNDERGROUND ROAD IN PARIS.

company because they paid nothing for the privilege, and the judges seem to think that the increase in value was an "unearned increment."

## THE PARIS UNDERGROUND RAILROAD.

For the first city of the world, Paris is woefully deficient in the comforts of rapid transit. It is M. Berlier's plan however to obviate this difficulty of urban transportation and give Parisians an underground, tubular railroad from the Bois de Vincennes to the Bois de Boulogne. Seventeen stations will be placed on the route touching all the points at which "men most do congregate." The distance is  $6\frac{3}{4}$  miles, and the route almost parallels the Seine. Our engraving shows the idea. The tunnel will be of metal, 16 feet in diameter with air shafts every 55 feet. The stations, cars and platforms will be lighted electrically, and the cars will be driven by electric motors. The trains will be made up of from one to four cars and

"Yes," replied the banker, "I guess I am, or I could not hold my job."

"Well, you don't know anything about financiering," the motorman made bold to state. "But my 'boss' (referring to the president of the street car company) is a first-class financier, he is. Why, do you know that every Sunday he advertises for a servant, and Monday twenty or thirty girls ride out to his house, near the end of the line, to get the place, but find madam can't see them; so they ride back, and repeat the journey several times, before they are finally told that the old girl has decided to stay a while. Now, that's financiering. Fifty cents paid out for advertisements, and \$8 or \$9 taken in for car fares, to swell the annual dividends of the boss' company."

THE report of funeral cars on the South Covington & Cincinnati Street Railway Company is denied by T. M. Jenkins, the superintendent.

### TOLEDO STRIKERS SENTENCED.

During the recent labor troubles on the Robinson lines at Toledo, O., a few of the strikers exceeded their prerogative to quit work, and harrassed the company by maliciously destroying property and grounding the trolley wire. They were arrested and brought before the grand jury which indicted three of them, namely: Oscar Austin, William Garber and Edward Scott. The first answered a charge of malicious mischief and the other two a charge of grounding the wires. The Robinsons generously refused to push the case and the men were thus saved a severe penalty.

Judge Pugsley said in passing sentence: "You look like men of intelligence and out of place here. However, you are guilty of grievous offenses. Perhaps you have acted in ignorance of the law. Still, you have done things you had no right to do. You had no right as a citizen, employee or anything else to ground the Robinson Company's wires. The prosecuting attorney has generously withdrawn these latter charges, or else you would surely have gone to the penitentiary. It is hard in this case for the court to be lenient, for you have committed a serious offense and it must be stopped in the future. An example must be made. As I said, it is hard for the court to be lenient, but if you promise not to repeat your actions in the future I will inflict as small a penalty as I consistently can, in the interest of public peace and order.

"Oscar Austin is sentenced to five days' imprisonment in the county jail and to pay a fine of \$25 and costs, to stand committed until paid.

"Wm. Garber ten days in jail and \$50 and costs.

"Ed. L. Scott ten days and \$50 and costs."

### KOHLER BROTHERS, THE NEW WESTERN AGENTS FOR THE WALKER COMPANY.

The result of the visit of Vice-President Billings and Professor S. H. Short of the Walker Manufacturing Company of Cleveland, Ohio, to Chicago, has been declared in the appointment of the Kohler Brothers to the western states agency of the Walker Manufacturing Company business. Since the death of the late J. L. Barclay, the Walker Company has been casting about to find a competent successor with the result above noted. The connection of the Kohler Brothers with the Eddy Electric

F. W. KOHLER.

Company will continue unchanged, and their offices will still be in the Monadnock building. The territory

assigned the new sales agents comprises the following states: The western part of Michigan and Indiana, Northern Illinois, with the entirety of Wisconsin, Minnesota, Iowa, Missouri, Kansas, Nebraska, South Dakota, North Dakota, Montana, Wyoming and Colorado.

The Kohler Brothers, Franklin W. and G. A. E. Kohler, have for two years represented the Eddy Company in the west with continued and deserved success. G. A. E. Kohler is a thorough street railway man, having been graduated from the offices of the North Chicago Railroad Company. Upon this was laid a considerable electrical training, in which may be included the formation of the firm of Kohler Brothers & Green. Franklin W. Kohler began his career in Philadelphia, but followed his brother to Chicago as above noted. Both gentlemen are well known in the electrical field and are genial and cordial in every business and social relation, and their friends will confidently expect continued and enlarged success commensurate with their increased field.

G. A. E. KOHLER.

### I. H. FARNHAM ON ELECTROLYSIS.

The paper presented by I. H. Farnham before the Institute of Electrical Engineers at New York, April 18, and at Chicago, April 25, was of interest as coming from the man who was the first to meet the trouble from electrolysis and who has studied the conditions as few others have. Mr. Farnham's personal experience was with lead telephone cables in Boston. Figures were given from voltage readings taken between cable coverings, pipes and rails, and it was made apparent that a very small difference of potential would cause considerable action. The first trouble discovered in Boston was in the summer of 1891, on telephone cable. The two suggestions that together were most helpful in curing troubles were: first, to connect the positive pole to the trolley, thereby restricting electrolysis to districts near the power house; second, to run copper feeders from the grounded pole of the station along the cables and connect it frequently to the cables. The two conclusions of most practical importance, drawn by the author are, that it is advisable to connect the positive pole of the dynamo to the trolley lines, and that a large conductor extending from the grounded side of the generator entirely through the danger district and connected at every few hundred feet to such pipes as are in danger will usually insure their protection. The author omitted to state, however, that this "large conductor" might as well be a well bonded track as anything else.

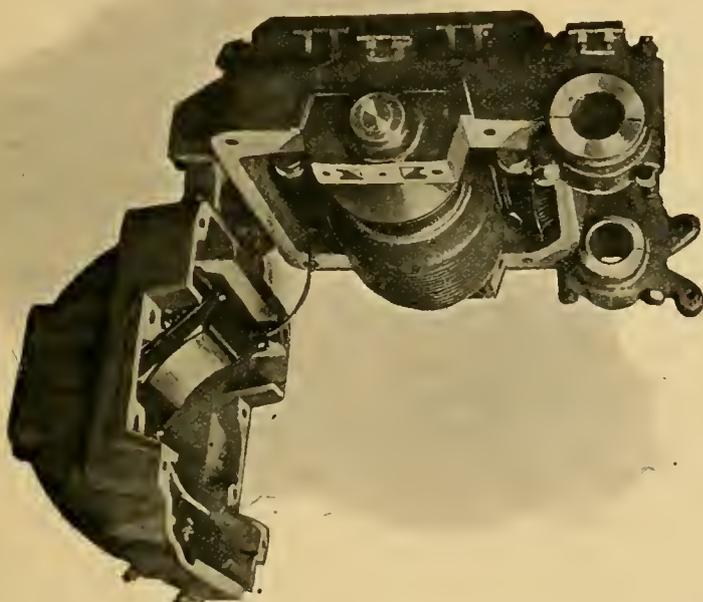

## THE NEW WESTINGHOUSE MOTOR.

The year, ending with our present issue, has been marked by the introduction of new railway motors by the three large companies engaged in this line of work. All these motors, while not radically different from the types previously manufactured, represent a distinct step in advance. They are mainly refinements of the forms manufactured by those companies for two or three years past. Such refinements are a part of the evolution of the machinery of any large industry. There are three improvements which are common to the new forms. The weight has been reduced, the motor entirely enclosed, and the dead weight on the axle partly taken off and supported by the truck springs. The original type of Westinghouse single reduction motor has been on the

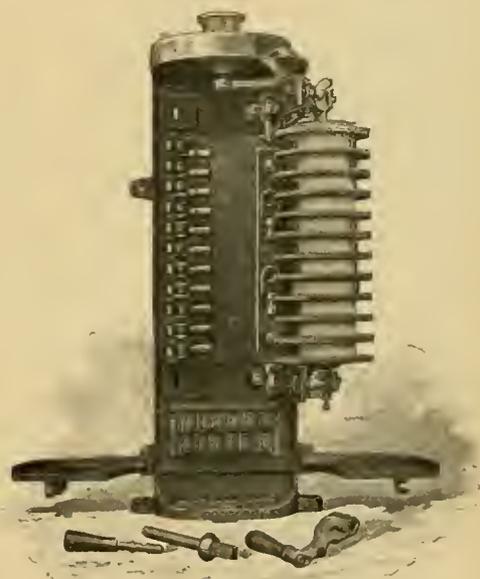

the wire in each path is under the two upper field poles, there can be no unbalancing of the armature caused by wear of the bearings.

The form of the field castings and methods of opening the motor can be clearly understood from the engravings, as can also the spring suspension. The lower half only is hinged. The upper half is cast solid with the side frames which were a feature of the old motor. The top casing has one opening, which is above the commutator. The bottom casing has three openings, one at each end and one below the commutator. The motor is suspended entirely from the top.

The blocks holding the armature bearings are bolted to both upper and lower halves, so that the armature can be either left in the upper part or swung down with the lower. By this construction and arrangement of parts,

SINGLE REDUCTION RAILWAY MOTOR, OPEN WITH ARMATURE IN UPPER FIELD.

SERIES MULTIPLE CONTROLLER, OPEN.

market over three years without change, a remarkable record considering that the motor was at the time of its introduction the pioneer of enclosed street railway motors, and its designers had not the benefit of experience with this form of motor. The old Westinghouse No. 3 motors will continue to do good service on the roads where they are now running for many years to come, but the company now offers something still better, embodying the improvements previously mentioned as being common to the latest types.

The armature of the new machine differs but little from the old. It is a grooved drum, having lathe wound coils connected as a two-circuit winding. In this method of winding the active wire on the long sides of each coil is placed in armature slots 90 degrees apart, and the two ends of each coil connected to segments, 180 degrees apart. By this arrangement only two brushes are needed for a multipolar machine. Furthermore, as there are only two paths for the armature current, and one half of

all repairs can easily be made from the pit, and consequently the grease and dirt accompanying repair work is not introduced within the car. These motors are known as Numbers 10 and 12. Number 10 is made for 40 and 50-horse-power, and Number 12 for 20, 25 and 30-horse-power.

In connection with the new motor, an improved series-multiple controller is offered. In outward appearance and in movements of the handle it is the same as its predecessor, "type G."

The main improvement in construction is that of making the contact drum so that it can be swung back away from the contact tips. The case has a double back in which the wires and connections are concealed. The electrical combinations of the motors made by the new controller are improved over those of the earlier type, in that the motors divide the work equally, and the car starts more easily and attains its maximum speed more smoothly.

Among other things worthy of note in the Westinghouse car equipment are the Wurts non-arcng lightning arrester, which is entirely enclosed in an iron case and contains no moveable parts; and the fuse box with which it is impossible to touch live contacts while renewing a fuse.

The first road to use the new motors was the Terre Haute Street Railway, and President Russell B. Harrison says they have given satisfaction.

### KANSAS CITY CONSOLIDATION.

The consolidation of the Kansas City Cable Railway Company, the Grand Avenue Railway Company, and the Kansas City & Independence Rapid Transit Company, all of Kansas City, Mo., is the largest combination of the year. The name of the new company is the Kansas City Railway Company, and the combined capital stock is \$4,300,000. Immediately upon completion of the arrangements Walton H. Holmes was elected president; Victor H. Buck, vice-president; William B. Clarke, treasurer; D. B. Holmes, secretary, and Conway F. Holmes, general manager. Besides these,

CONWAY F. HOLMES,  
General Manager.

the board of directors will consist of W. A. Bunker, John Long, Hugh C. Ward, R. W. Hocker, G. W. Clawson, and L. C. Krauthon.

The man who engineered the plan of merging the lines was Robert Fleming, of London, England, who interested capital and originated the idea. Walton H. Holmes attended to the Kansas City part of the deal. Mr. Holmes acquired an option on the Kansas City Cable Railway from President William J. Smith at a good round figure, and surprised that gentleman by closing the option. This retires Mr. Smith from Kansas City street railways, in which he has been interested for many years. He is a man of great executive ability.

The new company has executed a \$5,000,000 blanket mortgage to the Central Trust Company, of New York. The total amount of the assumed obligations is \$4,980,000. The company now owns sixty miles of cable and electric, with valuable extension franchises.

Walton H. Holmes, the president of the new company, formerly president of the Grand Avenue Company, is 32 years of age. He, with his younger brother, Conway F. Holmes, succeeded to the interest of their father, Nehemiah Holmes, in the Grand avenue line, the pioneer line of the city. Conway F. Holmes, the present manager of the Consolidated, is a thorough street railway man, risen from the ranks of mule car drivers. He knows thoroughly every detail of the business, from oats to volts.

The Vose Spring Company, of New York, has moved its offices to 39 Cortlandt street.

### THE PRESENT UTILITY OF ELECTRIC MOTORS ON RAILROADS.

The above was the title of a paper recently read before the Western Railway Club, by David L. Barnes, of Chicago. Although rather elementary in its treatment of the subject of electrical apparatus, as was necessary in a paper read before steam railroad men, there were a number of points brought out that have not been extensively touched on before. Figure 1 shows the speed and acceleration of an elevated train in regular service, as taken by a Boyer speed recorder and presented in the above paper. Figure 2 was presented by the author as representing the amount of energy put into a train by the engine and taken out again by the brake shoes. The area, A, B, C, D, represents the energy put in by the locomotive, and C, E, F, the energy taken out by the brake shoes. The areas, a a and b b, show the small amount of power necessary to keep the train in motion continuously without starts and stops.

In comparing the cost of fuel for locomotive and electric motors, he says; "If the same fuel is used on the steam locomotive as in the stationary boilers, and the fuel is assumed to be fair bituminous coal, then each pound of fuel will evaporate into steam about about 6 pounds of water in the best steam locomotives, and 8½ pounds in a good stationary boiler. The steam locomotive will generate a horse-power for about 25 pounds of steam an hour when the locomotive is of the best type, hence, on this basis, a comparison of the economies of the two systems in the indicated horse-power in the steam cylinders of both systems is 1.8 pounds of coal per horse-power per hour in the stationary engines and 4.2 pounds of coal per horse-power for the steam locomotive. The steam locomotive uses the power directly and there is no further

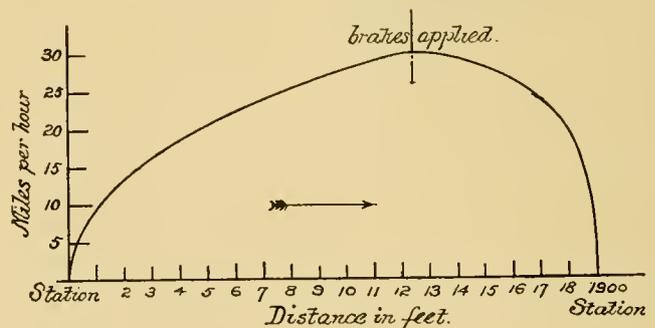

FIG. 1.

loss that need be considered with this general comparison, but with the electric system there is a further loss of 15 per cent in the dynamo and connections, 10 per cent in the line and 50 per cent in the motors for switching suburban and elevated work, or 20 per cent in the motors for lines having about eight minutes between stations. The final result is an efficiency of about 38 per cent between the cylinders of the stationary engine and the draw bars of the motors for switching elevated and suburban railroad work and 61 per cent for the longer line assumed. The result in the fuel used will then be

4.7 pounds of coal an hour in the stationary engine to get one useful horse-power on the draw bar of the electric motor for short lines, which is practically the same as that required for the steam locomotive. \* \* \*  
 If conditions are such that a cheaper class of fuel can be used in the central station than on the steam locomotive, there may be a considerable saving in cost of fuel while there is no saving in weight of fuel. On the elevated railroads of Chicago where the fuel costs about \$7 a ton on the tenders and the fuel for a central station could be purchased for \$1.75, a saving in cost of fuel of 63 per cent is possible. In this case allowance should be made for the difference in quality of fuel, which would reduce the possible saving to about 50 per cent."

The failure of the electric locomotive on the Manhattan Elevated, in New York, several years ago, has been brought up by the opponents of electricity every time the adoption of electricity has been discussed. Mr. Barnes clears the matter up and it is to be hoped that this trial

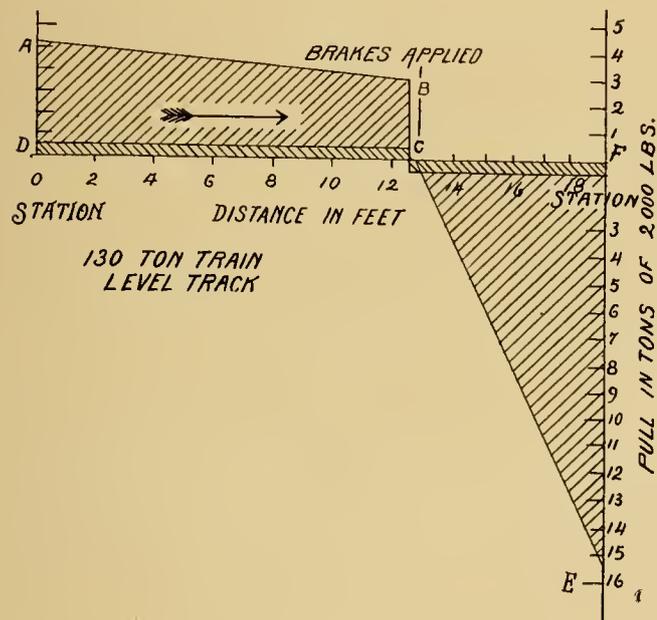

FIG. II.

will cease to be used as an argument. He says: "The first steam railroad of any importance to take up seriously an investigation of the plan to use electricity in place of steam was the Manhattan Elevated, in New York City. The motor (see Figure 3) was too small and not powerful enough, or at all adapted to compete with the steam locomotives then in use, and the design was also inefficient. The maximum draw bar pull was about 4,000 pounds. The failure was a certainty from the start, and although so evident at the time to those who were well informed in locomotive practice, yet this case of failure has been used unfairly ever since to show the impracticability of electric motors for railroad work. The trial was the result of a lack of appreciation of the real conditions, and to cite the results as showing anything useful, so far as power, cost or efficiency is concerned, is practically malicious."

The result of the tug of war at the World's Fair is thus commented on:

"The cause of the failure was a neglect to study conditions, and the results were so misleading as to need further mention here. The weight of this locomotive (the electric) on drivers is about 59,000 pounds. The weight of the steam locomotive, against which it was

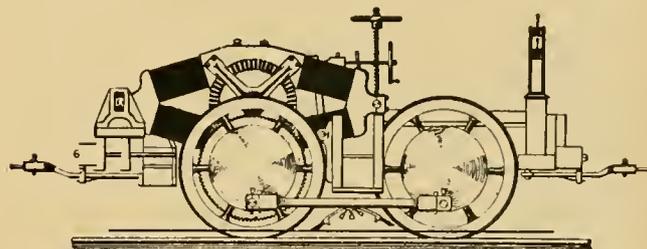

FIG. III.

tested, is about 62,000 pounds on drivers. The electric locomotive has a short wheel base, and the drawbar is above the center of the axle. When the pull came, the weight on one pair of wheels was reduced by the tipping tendency, and that pair slipped, and in slipping the motor on that axle revolved rapidly and acted like a dynamo, as has been before explained here, and shut most of the current off from the other pair of wheels, and the locomotive was practically without power. Had the motors been connected up so that the current divided and went through each separately, then the remaining motor on the other pair of wheels, after one had slipped, would have given a substantial pull but not enough to overcome the steam locomotive. If the wheels had been connected up with parallel rods the results would have been quite different, and if some heavy weights had been added to hold down the electric locomotive on the opposite end from the point of pulling, the electric locomotive would undoubtedly have pulled more than the steam locomotive,

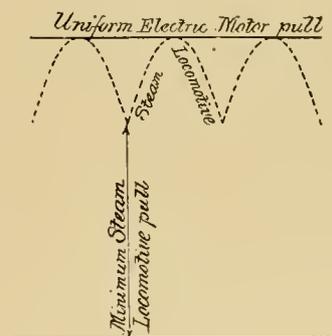

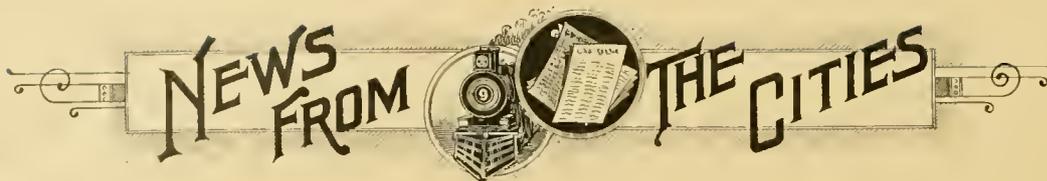

FIG. IV.

for the reason that the power of the electric motor is applied evenly, as shown by the full line in Figure 4, while the steam power is applied irregularly, as shown by the dotted lines."

CONEY'S army has been a drawing card at every large town where the commonweal has stopped. In one or two cases the street railway companies did a land office business in hauling the citizens to view the show.

### Alabama.

OPPELIKA, ALA.—John L. Cowan has about financed his Opelika-Auburn line.

### Arizona.

YUMA, ARIZ.—City council has granted Col. George A. Allen, franchise for electric light, telephone and water works systems. Will begin work immediately.

### Arkansas.

LITTLE ROCK, ARK.—The City Electric Railway has gained a 25-year franchise for a line to West End Park. Work will begin at once.

### California.

SAN DIEGO, CAL.—Electric Railway Company is granted franchise for extension on D street.

SAN DIEGO, CAL.—The electric railway will probably be extended out D street and operated with horses for a while.

SOUTH PASADENA, CAL.—The trustees have extended the electric railway franchise granted to the Los Angeles Consolidated. The road must be running by January next.

SAN FRANCISCO, CAL.—The California Street Cable Company has been granted its petition restraining the Ferries & Cliff House Company from discontinuing its steam car service making connections.

REDLANDS, CAL.—The Redlands Electric Light & Power Company expects to operate a street railway system by December. There will be seven miles of track, requiring 645 tons of rails and 275,000 feet of lumber, besides electric equipment. Bids are wanted for all supplies F. G. Ferraud, secretary.

LOS ANGELES, CAL.—Pasadena & Los Angeles Electric Railway Company is incorporated by P. M. Green, H. W. Magee, E. C. Webster, L. P. Hansen and Fritz E. Beach, of Pasadena; William Lacy and E. P. Clark, of Los Angeles. The capital stock is \$500,000, of which \$3,000 has been paid in. Road will be thirty miles long. Work has begun.

SAN FRANCISCO, CAL.—The Southern Pacific Railroad Company elects: President, Charles F. Crocker; vice-president, H. E. Huntington; second vice-president, J. E. Gates; treasurer, N. T. Smith; secretary, J. L. Willcutt; directors, Charles G. Lathrop and A. N. Towne, Mr. Lathrop succeeding Charles Mayne, who declined a reelection.

Geary street, Park and Ocean Railroad Company, President, Charles F. Crocker; vice-president, Adam Grant; treasurer, N. T. Smith; secretary, J. L. Willcutt.

### Canada

HULL, CANADA.—J. Viau wants to build an electric railway in Hull. Matter is before council.

QUEBEC, CAN.—M. Stephenson, formerly manager of the Upper Town Street Railway Company, died recently at Montreal, aged 57.

TORONTO, CAN.—The receipts of the Toronto Street Railway for March were \$72,850, an increase of \$372 over March of last year.

ST. JOHN, N. B., CANADA.—E. C. Jones, St. John, manager of the bank of Montreal, has bought the St. John street railway, which his company will electrify and extend.

HAMILTON, CAN.—After a hard fight the Hamilton Radial Electric Railway Company, has been incorporated at a large capital. It will inter-connect a number of surrounding towns. The steam roads opposed it.

### Chicago.

CHICAGO.—Commissioners of Public Works approve plans of the Northwestern L.

CHICAGO.—The North Chicago Street Railroad is building a one-story brick shop at 465 Sheffield avenue.

CHICAGO.—The West Chicago Street Railroad ran its first car around the Van Buren street loop, April 16.

CHICAGO.—Madison Maginn and H. Brandenburg are inventors of a new underground conduit system which, they claim, can be built for \$5,000 a mile.

CHICAGO.—Mr. Mason's bid of \$3,000 for the stock of the Railway Equipment Company was approved by the court. Terms some cash, rest on time.

CHICAGO.—Metropolitan L elects: Directors, John Worthy, R. P. H. Durkee, Robert E. Jenkins, John H. Glade, George Higginson, Jr.; President, John Worthy; Secretary and Treasurer, George Higginson, Jr.

CHICAGO.—The North and West Side trolley ordinance has been passed by the council, which accepts the mayor's amendments asking for more street lights. This gives Mr. Yerkes his wished for franchises on Lincoln and Milwaukee avenues.

CHICAGO.—The Englewood & Chicago Electric Railway Company will at first lease power but eventually build a plant of its own. The officers are: President W. H. Comstock; vice president, A. J. Whipple; secretary, F. E. Elder. The capital stock is \$1,000,000. William V. Jacobs, who built the Calumet system, was the promoter of the new enterprise. The franchise was granted last summer.

CHICAGO.—A deed of trust on first mortgage gold bonds for \$650,000 was filed to the Illinois Trust & Savings Bank by the Chicago North Shore Street Railway Company. The money will be used to build lines on the North Shore. The deed is signed by D. H. Louderback, president, and Howard Abel, secretary of the railway company, and W. H. Reid, third vice-president, and William H. Henkle, secretary of the Illinois Trust and Savings Bank.

### Colorado.

DENVER, COL.—The new Broadway bridge has been decided on, and it will be a handsome affair.

### Connecticut.

BRIDGEPORT, CONN.—The electric railway is to be extended to Ansonia. Work begun.

ANSONIA, CONN.—The electric railway applies for several extensions. It is a new and unexpected move.

NEW HAVEN, CONN.—A line of railway is to be built from Savin Rock to Merwin's point. It will be done by June 15 and cost \$30,000.

SOUTH NORWALK, CONN.—The South Norwalk-Winnepauk electric railway construction contract has been awarded to Milley & Pinney, of New York City.

LONGMEADOW, CONN.—The Enfield-Longmeadow Street Railway Company elects L. A. Upson, temporary treasurer, and George B. Fowler, temporary secretary.

NORWALK, CONN.—The Norwalk Horse Railway Company will change its name to Norwalk Street Railway Company. They will double track West avenue and electricity will be used on both their lines.

**NORWALK, CONN.**—The Norwalk Tramways elect Charles A. Johnson, of New York City, president, and George N. McKibben, vice-president. Richard H. Golden was elected a member of the board of directors.

It was voted that new stock be issued to the amount of \$60,000 to meet the expenses of the Roton Point extension.

## District of Columbia.

**WASHINGTON, D. C.**—A bill has passed extending time allowed the Metropolitan to put its wires underground. The original bill required the change in eight months.

**WASHINGTON, D. C.**—The Washington & Arlington Railroad Company's track, cars, leases and other property was sold April 14, for \$2,500, to C. S. Henchman, of Philadelphia. The power house was sold to H. P. Gilbert for \$1,000.

**WASHINGTON, D. C.**—A bill is introduced permitting construction of an elevated electric railway from Washington to New York. Introduced by Mr. Catchings, of Mississippi. The incorporators of the proposed railroad company are Messrs. Noah L. Jeffries, J. J. Reynolds, John J. Hemphill, S. M. Bryan, Hamilton Disston, A. M. Bliss, George R. Tingle, L. A. Grant, H. F. Welles, Moses Sweetzer, Hiram Woods, V. D. Stockbridge, C. F. Kindred, H. S. Reeside, J. D. Hetzell, H. C. Turnbull and George F. Brott.

## Florida.

**TAMPA, FLA.**—T. C. Taliaferro sole the Tampa Street Railway at auction, May 7. Receiver's sale.

**JACKSONVILLE, FLA.**—Geo. O. Holmes, John Clark and A. D. Stevens apply for charter for terminal railway to use electricity or steam.

**JACKSONVILLE, FLA.**—The Savannah Electrical Construction Company has received the contract for electrical equipment of the street railway here.

**OPLIKA, FLA.**—The street railway stock subscription book has been opened for the line between Opelika and Auburn. Leading citizens are interested.

## Georgia.

**AUGUSTA, GA.**—The Georgia Iron Works wants a 100-ton hydraulic wheel press, second hand preferred.

**SAVANNAH, GA.**—The Brush Electric Light & Power Company will enlarge its plant at a cost of \$50,000.

**ATLANTA, GA.**—The Atlanta Consolidated will increase its power three and a half times and buy more rolling stock. New lines are scheduled. The company will also build an extensive repair shop, and do some manufacturing.

**ATLANTA, GA.**—Atlanta Traction Company's new board of directors consists of E. B. Rosser, president of the Exchange Bank; W. G. Rosser, G. V. Gress, president of the Gress Lumber Company; W. C. Hall and Dayton Hall of the State Savings Bank; W. L. Seddon, southern manager of the American Employes' Liability Company; J. W. Hines, attorney; T. B. Felder, Jr., attorney. They elected the following officers: Dayton Hall, president; W. C. Hall, vice president; W. L. Seddon, secretary.

## Illinois.

**GALESBURG, ILL.**—The street railway will be extended this season to the new fair grounds.

**BELLEVILLE, ILL.**—Local capitalists buy \$30,000 in bonds of the Belleville Electric Railway.

**PEORIA, ILL.**—John C. White asks franchise for electric railway along Mt. Hawley road. Referred to committee.

**QUINCY, ILL.**—E. J. Stone, superintendent of the street railway, will buy paving brick at Danville for paving along the track.

**ROODHOUSE, ILL.**—Greene County Electric Company organized at \$30,000, by E. M. Prindle, Hamden Kelsey and J. A. Blanrock.

**FREEMPORT, ILL.**—The formal change of the street railway is made, and the R. S. Brown syndicate, of Easton, Pa., goes into power.

**STREATOR, ILL.**—C. C. Barr is appointed manager of the Streator Railway Company, with full authority to buy material and sign checks. C. D. Haggerty is made superintendent, under Manager Barr.

**ALTON, ILL.**—Warren H. Loss, of New York, E. R. Gilman and W. P. Williams, of Chicago, propose to combine railway and light interests in a \$125,000 plant, citizens to subscribe \$40,000 in stock. A new line is to be constructed at once.

**FREEMPORT, ILL.**—R. S. Brown, of Easton, Pa., has bought the street railway here, in behalf of a syndicate composed of himself, Congressman Haines, of New York, and Congressmen Mutchier and Sibley, of Pennsylvania. They propose an electric.

**DIXON, ILL.**—J. S. Ticknor and H. B. Andrews, of Rockford, F. J. Jones, of Oregon, and J. B. Bartelot, met here to listen to the report of Chit. Wise, of Chicago, on the probable cost, earnings and running expenses of the proposed Rockford and Dixon line. It was decided to build at once from Oregon to Dixon.

## Indiana.

**GAS CITY, IND.**—The Marion, Ind., Street Railway Company has been granted a franchise here.

**BRAZIL, IND.**—The Brazil Rapid Transit Company has applied for extensions to the Stough cemetery.

**INDIANAPOLIS, IND.**—County commissioners grant the Citizen's Company right-of way over Michigan street for extension.

**MUNCIE, IND.**—The Citizen's Street Railway Company is in the market for a high speed engine. General Manager, W. C. Gotschall.

**VALPARAISO, IND.**—Edwin Tice and Elzer S. Noe, of Chicago, have been granted a franchise for twenty-one years to erect and maintain arc and incandescent light plant and telephone system. Must be running in six months.

**MICHIGAN CITY, IND.**—The city council virtually renew the unexpired franchise of the Lake Cities Electric Railway Company. John G. McNutt, of Terre Haute and Frank Riddle, of Chicago, in conference arranged for one years' extension.

**NEW ALBANY, IND.**—John McCloud, of Louisville, Ky., receiver of the New Albany Street Railway, is authorized to issue \$30,000 in receivers certificates. The present liabilities of the company are \$150,000 first mortgage bonds, \$50,000 new bonds, \$30,000 common stock and \$3,000 in lesser debts.

**SOUTH BEND, IND.**—General Power & Quick Transit Company, incorporates at \$100,000 to build electric railway from South Bend to Mishawaka. J. McM. Smith, of South Bend, is heaviest holder. Andrew Anderson, W. G. Croybill, W. L. Kizer and J. DuShane, all of South Bend, hold one share each.

## Iowa.

**CLINTON, IA.**—The Joyce Park line will be equipped electrically.

**MT. PLEASANT, IA.**—An electric railway is on the tapis for this place. Local capitalists interested.

**TIPTON, IA.**—Organized: The Tipton Electric Light Company, at \$12,000, by W. N. Treichler, J. H. Coulters, C. A. Garrett, et al.

**SIoux CITY, IA.**—Philadelphia parties have bought the Sioux City Street Railway in interests of bondholders. Will reorganize at once.

**KEOKUK, IA.**—The Commonwealth Street Railway & Light Company has presented its ordinance for a twenty-five year franchise. Alderman Le Baron brings it before the council.

**KEOKUK, IA.**—The Gate City Electric Street Railway Company was sold April 28 to satisfy a \$85,000 mortgage held by the American Trust Company of Boston. J. C. Hubinger, of Keokuk, bought it for \$10,000.

MT. PLEASANT, IA.—The incorporators of the proposed Mt. Pleasant Electric Railway are: Dr. G. E. Smith, president; J. N. Ross, vice-president; and J. C. McCoid, secretary. All are representative citizens of Mt. Pleasant, and claim that they mean business.

### Kansas.

KANSAS CITY, KAN.—The Consolidated will electrify the dummy line and improve other portions of the system.

LEAVENWORTH, KAN.—William Dill, local attorney for the electric railway, applies for right of way to the Home and the Muncie cemetery.

SALINA, KAN.—The Salina Electric Railway Company has reached the district court Phoenix Iron Works brings suit in replevin, presenting bill of \$5 500. Other liens and bills are to be presented also.

### Kentucky.

LOUISVILLE, KY.—The city council grants Ludlow street franchise to South Covington & Cincinnati

COVINGTON, KY.—The council has granted the Ludlow street car ordinance, allowing rapid transit in the West End.

NEWPORT, KY.—Another electric line is to be built to the new Rose-dale race course. The promoters have laid out the line.

OWENSBORO, KY.—J. N. Alsop and W. E. Whiteley have bought the remaining stock of the Owensboro Street Railway. This harmonizes the management of the road as the men named control it.

### Louisiana.

NEW ORLEANS, LA.—The Electric Traction Company has been reorganized. Jas. H. Maury, formerly of New Orleans, is president, and H. M. Littell will still be general manager. H. B. Hollins & Co., Manuel Lehmann, Peabody & Co. and other New York capitalists back the enterprise with \$4,000,000, and the contemplated electricity and extensions will now go forward.

### Maine.

LEWISTON, ME.—The Lewiston & Auburn Street Railway Company will be allowed to change to the trolley by the city council.

### Maryland.

CATONSVILLE, MD.—President Perrin, of the Baltimore City & Suburban Street Railway, asks right of way for the Frederick turnpike.

BALTIMORE, MD.—Wm. A. Bosley, of the Chestertown interurban, says that prospects for the line are very bright. The interurban will connect a number of towns with Baltimore.

BALTIMORE, MD.—R. C. Davidson, Oliver Middendorf & Company, J. S. Gittings et. al. are considering plans for an electric railway along the Eastern shore. All are prominent citizens.

BALTIMORE, MD.—The incorporators of the Frederick and Middletown Electric Railroad have effected an organization and elected the following officers: President, G. W. Smith; vice-president, D. E. Kefauver; secretary, W. A. Sharets; treasurer, Hermon L. Routzahn; attorney, C. V. S. Lery.

BALTIMORE, MD.—The Baltimore, Canton & Point Breeze Railway Company asks for rights to lay track. Former rights having expired by limitation.

The City Passenger Railway will soon begin to build long extensions to Lauraville.

BALTIMORE, MD.—The Pikesville-Reistertown electric railway will probably be built. It is to be 10½ miles long, with power house at Owings' Mills. The company will issue \$250,000 5 per cent 40-year bonds. Henry A. Parr is president and Middledorf, Oliver & Co. financial agents.

BALTIMORE, MD.—The Legislature, having authorized city councils to pass fender ordinance, the committee of the Baltimore council has prepared ordinance requiring fenders and has appointed commission to recommend a fender. The approved fender must be adopted by all railways in the city.

### Massachusetts.

BOSTON, MASS.—Rapid Transit Commission favors the Meigs elevated system against the subway.

BOSTON, MASS.—The bill authorizing street railways to carry express has been reported upon favorably by committee.

SOMERVILLE, MASS.—Malden, Medford, & Stoneham Railway Company, has been granted authority to extend its line to this place.

BOSTON, MASS.—Lynn & Boston officials deny sensational reports of removal of General Manager Foster, Treasurer Williams and other officials.

BOSTON, MASS.—The special committee of the city council reports in favor of putting all feeders for the West End Street Railway Company under ground.

BOSTON, MASS.—The West End Street Railway Company will be compelled to put all feeders under ground. Telephone and telegraph companies must also bury wires. Time given until November 1.

ATHOL (Worcester County), MASS.—The Athol & Orange Street Railway Company is getting right of way and receiving bids. W. B. Ferguson, of Malden, and Sumner Myrick, of Boston, are at the head of the enterprise. L. B. Caswell will furnish specifications.

BOSTON, MASS.—N. Thayer, F. Bartlett, Arthur Hunnewell, et al., issue circulars calling for deposits of shares of the Kansas City Railway Company, and the Grand Avenue Cable Company, of Kansas City, Mo., for the purpose of fighting the consolidation of the lines.

### Michigan.

JACKSON, MICH.—The Francis street line will be extended to Vandercook's Lake.

MONROE, MICH.—The Toledo, Monroe & Detroit Electric Railway gets its franchises here.

DETROIT, MICH.—Mayor Pingree's erratic fancy has now taken to the conduit electric system.

BATTLE CREEK, MICH.—The street railway company has paid its employes in full—total sum \$800.

KALAMAZOO, MICH.—A scheme is on foot to transmit power here from the Buchanan water power plant.

DETROIT, MICH.—The Detroit Citizens Railway elects: D. M. Ferry, president; W. C. Colburn, vice-president; John R. Stirling, secretary; Geo. H. Russell, treasurer; J. D. Hawks, general manager; J. H. Fry, superintendent.

ADRIAN, MICH.—The Adrian street railway has suspended operations because the electric light company has shut off the current, claiming unpaid bill. The railway also owes its employes, and has a bonded debt of \$36,000. A receiver is talked of.

NEGAUNEE, MICH.—Negaunee & Ishpeming Street Railway & Electric Company elects officers as follows: President, Samuel Mitchell; vice-president, F. Braastad; secretary and treasurer, A. B. Miner. Following are the directors: Samuel Mitchell, F. Braastad, C. H. Hall, Alexander Maitland, Charles Merryweather, J. B. Maas and H. O. Young.

### Minnesota.

DULUTH, MINN.—Col. Harris is again before the city council asking for a franchise. Petition referred to committee.

STILLWATER, MINN.—May 7 the street railway will be sold at sheriff's sale. A local company is being organized to buy it. The line is bonded for \$60,000.

### Missouri.

ST. LOUIS, MO.—Report that the Peoples' Railway will consolidate with the Lindell is denied by President Green of the Peoples.

KANSAS CITY, MO.—The county court has granted franchise to the Westport & Waldo electric railway. Must be running within one year.

**KANSAS CITY, Mo.**—Minority stockholders of the Grand Avenue Street Railway are trying to break up the consolidation. They are Boston and New York men.

**ST. LOUIS, Mo.**—William Biddle and H. C. Frint, of the American Railway & Light Company, of New York City, are conferring with street railway men here in regard to a new system of electric railway.

**ST. LOUIS, Mo.**—"Work will begin in a week on the new power house of the Grand Avenue Electric Railway," says Secretary E. H. Comrades. D. C. Bartlett is in charge of the construction work of the line.

The St. Louis Car Company has increased its capital stock from \$150,000 to \$500,000.

## Nebraska.

**OMAHA, NEB.**—Sheriff levies on the cars of the Omaha Horse Railway Company to satisfy judgment for damages of \$5,000. The cars have been stopped. Temporary embarrassment only.

## New Hampshire.

**MANCHESTER, N. H.**—General Williams says that his street railway company intends to build the line here. Plans and specifications are being prepared by J. H. Bickford, of Salem, Mass., and others.

## New Jersey.

**NEWARK, N. J.**—The Consolidated Traction Company, has gained franchise to operate all city lines by electricity.

**NEWARK, N. J.**—The Consolidated has gained a franchise in Clinton township. Manager Young promises a first-class road.

**NEWARK, N. J.**—William Henderson of Bloomfield has been appointed superintendent of the Suburban Traction Company, vice J. C. Cotton, resigned.

**TRENTON, N. J.**—Incorporated, the New Jersey Traction Company, at \$150,000, by Jephtha H. Baldwin, of Orange; John H. Tingley, of Rahway, and George G. Crosby, of New York City. The following officers have been elected to control the company:—Frank A. Magowan, of Trenton, president; E. W. Hine, of Orange, vice-president; J. H. Baldwin, of Orange, secretary; J. H. Darrah, of Trenton, treasurer; George G. Crosby, of New York, John H. Tingley, of Rahway, and John C. McNaughton, of Philadelphia, directors. This is to carry out the plan of an interurban to Philadelphia. Right of way has practically been secured and construction will begin at an early date.

## New York.

**GENEVA, N. Y.**—The street railway will be running by May 15.

**SYRACUSE, N. Y.**—There is a scheme to build an electric line to Long Branch.

**ELMIRA, N. Y.**—The West Side Railway Company will build an extension.

**ITHACA, N. Y.**—The Ithaca Street Railway Company has been granted an extension.

**BUFFALO, N. Y.**—George Chambers, ex-police superintendent, has been appointed general manager of the Steinway, L. I., railway lines.

**MIDDLETOWN, N. Y.**—George Hess, of Scranton, Pa., has been appointed engineer of the power house of the M. & G. Electric Railway.

**MOHAWK, N. Y.**—The Mohawk & Ilion Street Railway is about to buy new cars. R. M. Devendorf, of New York City, is arranging the matter.

**LYONS, N. Y.**—O. F. Thomas, of the Manhattan Silver Plate Factory, is interested in a scheme to build a street railway from the village to the New York Central.

**NEW YORK CITY.**—Thomas Miller, formerly superintendent of motive power of the New York & Northern, is made master mechanic of the Metropolitan Traction Company.

**ITHACA, N. Y.**—The Cayuga Lake Electric Railway has elected Herman Bergholtz president and William Hand secretary and treasurer. The line will be operated June 1.

**BUFFALO, N. Y.**—Buffalo Woodworking Machine Company has furnished the Street Railway Company a complete repair shop outfit. The railway will build some of its own cars.

**BROOKLYN, N. Y.**—The annual meeting of the Brooklyn City & Newtown Railroad Company elected directors as follows: Louis Fitzgerald, Henry B. Hyde, John N. Partridge, John L. Heins, Thomas Ennis, Alfred Wagstaff and Edward L. Montgomery.

**SCHENECTADY, N. Y.**—The General Electric Company elected the following directors April 10: Oliver Ames, C. A. Coffin, T. Jefferson Coolidge, Jr., C. H. Coster, Thomas Edison, Eugene Griffin, E. S. Hastings, H. L. Higginson, D. O. Mills, J. Pierpont Morgan and H. McK. Twombly. Two more are to be elected and the annual meeting will be held May 8.

**NEW YORK CITY.**—On April 24 the Atlantic Avenue Railroad Company, of Brooklyn, elected the following directors: Newberry H. Frost, Benjamin F. Tracey, William J. Richardson, William F. Redmond, William H. Wallace, William A. Reed, Henry Seligman, John P. Hsley, Benjamin Norton, E. W. Clark, Jr., Silas B. Dutcher, William Mertens and Frederick Strauss.

**NEW YORK CITY.**—The subsidiary company of the Cataract Constructing Company, called the Erie Canal Traction Company, is organized at \$4,000,000 to furnish electric or other power for canal traffic. Among the directors are George C. Haven, 24 East Thirty-fifth street, New York; Thomas C. Platt, Owego, Tioga county, N. Y.; Adrian Iselin, 56 Wall street, New York; C. T. Lewis, 32 Nassau street, New York.

## North Carolina.

**RALEIGH, N. C.**—Raleigh Electric Railway Company sold for \$4,000 to Dr. J. H. McAden, of Charlotte, as trustee for several parties, including the general electric company. The buyers will re-equip and operate in connection with light plant.

## Ohio.

**FREMONT, O.**—The Electric Railway will be running in a week.

**LIMA, O.**—A. E. Townsend, of Pittsburg, is elected president of the Lima street railway.

**DAYTON, O.**—City Railway Company awards contract for new power house to O. L. Bouck of this city.

**NORWALK, O.**—The road to Fairfield is an assured thing. It will be an extension of the Sandusky, Milan & Huron.

**TOLEDO, O.**—Hon. John Kunler says the new Maumee line is progressing well, and that financial backing is all ready.

**ASHLAND, O.**—A line of electric railway is talked of from here to New London. H. A. Thomas, of Ashland, is the prime mover.

**YOUNGSTOWN, O.**—The Youngstown Street Railway Company has adopted the Ramsey-Smith signal system. D. E. Zinn, of Pittsburg, will install it.

**CINCINNATI, O.**—The legislature authorizes the city to condemn and buy right-of-way to Spring Grove Cemetery, two miles. This means extension for the Consolidated.

**COLUMBUS, O.**—Citizens of Rome, Alton, West Jefferson and other towns want electric railway line to Columbus. G. B. Holtsberry, of Columbus, says county commissioners favor the enterprise.

**MANSFIELD, O.**—S. N. Ford & Co. are making the bodies of some cars for which the Fulton Truck and Foundry Company will build trucks and the Card Electric Company, both of this place, add electric appliances.

**DAYTON, O.**—The Dayton-Cincinnati electric line men are named as follows: Directors—Judge Dwyer of Dayton, Attorney O. B. Brown, William A. Mays, secretary of the Ohio Paper Company; Frederick Reibald, president Teutonia National Bank; Oscar M. Gottschalk, attorney; William Huffman, Walter Smith, vice-president of the Smith-Vaile & Stillwell Bierce Co.

**TIFFIN, O.**—Meschek Frost, Amardus Betts and N. W. Miller have sold their stock in the Tiffin Consolidated Street Railway and will begin shortly the construction of an electric railway from Tiffin to Melmore. The Consolidated will elect officers to take the places of those retiring. Rollo W. Brown has bought the interest sold. President Brown will make some improvements and extensions. A general manager is to be elected.

### Pennsylvania.

**PITTSBURG, PA.**—The Pleasure Railway Company will build a pavilion and pleasure resort at Schenley Park.

**READING, PA.**—The Birdsboro Electric Railway Company wants a franchise here. It is to connect with the Pottstown road.

**HUMMELSTOWN, PA.**—Gettysburg Electric Railway Company elects: President, E. M. Hoffer; secretary, H. G. Walmer; treasurer, George P. Hoffer, all of Hummelstown.

**PHILADELPHIA, PA.**—The Thirteenth & Fifteenth Streets Passenger Railway Company ratified the issue of \$500,000 new bonds. The Traction Company has begun work on its power house.

**PITTSBURG, PA.**—Kensington Rapid Transit Company, of Pittsburg, is chartered at \$20,000 by Samuel E. Moore, Bernard Rafferty, Joseph P. Cappean, Curtis C. Hussey and G. Kaufman, of Pittsburg.

**HOUTZDALE, PA.**—Officers of the Houtzdale & Suburban are: President, A. Markle, Hazleton; directors, John A. Seely, Brooklyn, N. Y.; Charles A. Bragg, Philadelphia; E. S. Dond, J. Edwin Giles, Hazleton.

**CARBON (Lawrence County), PA.**—The Carbon Street Railway Company is incorporated at \$20,000 by James M. Bailey, Allegheny; John G. Robinson and Rawdon Evans, Pittsburg. To build two miles of line.

**ALLEGHENY, PA.**—The Etna & Glenshaw Electric Railway enterprise is headed by F. Gwinner, Jr., Edward W. Gwinner and William B. Rhodes, of Allegheny; Charles K. Hill, of Ross township, and William I. Mustin, of Pittsburg.

**BRADFORD, PA.**—The Bradford Electric Street Railway has gained its franchise. The new company is composed of Bradford people—L. Emery, Jr., C. P. Collins, F. D. Wood, T. N. Barnsdall, L. E. Hamsher, W. R. Weaver and C. C. Melvin.

**PITTSBURG, PA.**—J. M. Guffey, D. P. Reighard and W. B. Lupton have bought the rights and titles of the Mt. Washington Street Railway and intend to push the scheme to completion. It is said that they have plenty of money.

**LANCASTER, PA.**—Chartered: The Lancaster & Lilitz Electric Railway Company and the New Holland Railway Company. John S. Graybill, of Lancaster, is president of both, and the directors of both are J. S. Graybill, S. H. Reynolds, Dr. Henry Yeagley, C. F. Espenshade, et al.

At a meeting of the Lancaster & Philadelphia Electric Railway Company the following were elected board of directors: John S. Graybill, president; J. J. Patterson, Jr., Dr. L. Banks, W. S. North and Carl F. Espenshade.

### Rhode Island.

**WOONSOCKET, R. I.**—Curtis D. Shepard is made electrician of the street railway company by Superintendent H. M. Young.

**WOONSOCKET, R. I.**—The Woonsocket Street Railway Company elects: President, James P. Ray; secretary, Willard Kent; treasurer, Walter Whittlesey; superintendent, Herbert M. Young. Office of general manager was abolished. It was voted to apply for franchises for extensions in Cumberland, North Smithfield and Lincoln. Mr. Young succeeds Harry Ross as Superintendent.

**PROVIDENCE, R. I.**—The mortgagee's sale of the Attleboro, North Attleboro & Wrentham Street Railway took place May 10. The North Attleboro Steam & Electric Company, which was bought by the Interstate road, it is said, will furnish power for both lines. The property of the North Attleboro Steam & Electric Company was purchased by William H. Haskell, of Pawtucket, "for the bondholders." The principal bondholders are Mr. Haskell, Homer M. Daggett, Jr., president of the Interstate Railway Company; William A. Walton, of Providence, and T. P. I. Smith, of North Attleboro.

### South Dakota.

**HOT SPRINGS, S. D.**—J. M. Metcalf et al., of Omaha, Neb., gain franchise for electric railway in Hot Springs.

### Tennessee.

**NASHVILLE, TENN.**—The Citizens Rapid Transit Company, file amendment to charter asking extension. The incorporators are Charles Flisher, J. K. Spicer, W. E. Steger, Norman Farrell and E. L. More.

**NASHVILLE, TENN.**—Nathaniel Baxter, Jr., bought the United Railway, April 18, at receivers' sale. He represents the bond holders and paid \$138,500. There are \$1,516,000 in underlying bonds which are assumed by purchasers. Forty-six miles of road are operated.

**KNOXVILLE, TENN.**—Advices from Receiver J. C. Duncan, of the Knoxville Electric Railway Company, deny the report that he is about to be relieved of his duties. He says that the first mortgage bondholders are well pleased with his management, and that the road is in the best condition possible. He will remain until the mortgage is foreclosed by the court.

### Texas.

**DALLAS, TEX.**—Mr. Seibert, of St. Louis, is taking data for the equipment of the Oak Cliff Street Railway with electricity.

**DALLAS, TEX.**—Incorporated, the Dallas & Oak Cliff Electric Railway Company at \$200,000, by John N. Simpson, C. F. Carter, T. H. West, et al.

**FT. WORTH, TEX.**—The North Side Street Railway has been sold out as follows: Fifteen cars and equipments, to the Brownell Car Company, for \$5,000; electrical plant to the Thomson-Houston Company, at \$15,000; Thomas Worthington, of England, bought the track franchises, etc., for \$11,750. Liabilities of the road, \$300,000. Sale will be passed on by the judge in ten days.

### Vermont.

**BURLINGTON, VT.**—The electric railway people contemplate an extension to Queen City Park.

**BURLINGTON, VT.**—Burlington & Winooski Street Railway Company, increased capital \$150,000 and will build long extensions.

### Virginia.

**SUFFOLK, VA.**—G. W. Nurney has leased the Suffolk Street Railway and will resume operation of line which had been abandoned.

**ROANOKE, VA.**—The Roanoke Street Railway Company elects: President, S. W. Jamison; vice-president and treasurer, Joseph T. Engleby; secretary, George C. McCahan.

**PORTSMOUTH, VA.**—The Portsmouth Street Railway Company has elected officers as follows: Judge L. R. Watts, president; H. L. Page, vice-president; J. L. Watson, secretary; L. C. W. Page, superintendent. The company has bought the line and will buy new cars, horses, and lay new track.

### Washington.

**EVERETT, WASH.**—An electric railway franchise has been granted to A. H. Ganel.

### Wisconsin.

**PORT HURON, WIS.**—The City Electric Railway Company will build the Lapeer avenue line as soon as paving is finished.

**APPLETON, WIS.**—Mr. Maxwell, of Cleveland, O., representing Toledo capital, has been before the county board asking rights for a line from Neenah to Kaukauna.

**GREEN BAY, WIS.**—Incorporated: The Fox River Electric Railway Company, of Green Bay, to build in Green Bay, Ft. Howard and De Pere. Stock, \$100,000; incorporators, James H. Elmore, Adam Spahler and Frank A. Hollman.

**MILWAUKEE, WIS.**—It is stated that the management of the street railway has averted the strike by signing an agreement of wages at 19 cents an hour until May, '95.

THE Wright and Adams Company, Quincy, Ill., is building engines for electric work.

THE Johnson Company, of Johnstown, Pa., reports a good business from the Chicago office.

THE J. G. Brill Company, of Philadelphia, has removed its Western office to 1038 Monadnock Building.

THE Page Belting Company, of Concord, New Hampshire, suffered a severe loss by fire early in April.

THE American Car Company, St. Louis, was represented in the East by President Wm. Sutton, during April.

W. S. DAVIS & SONS, of Concord, N. H., meet with success in the marketing of their new design of tower wagon.

DAY'S Kerite, in the West, is persistently pushed by Cushing & Morse, 225 Dearborn street, with good results.

THE Dorner & Dutton Manufacturing Company, Cleveland, O., has taken several orders for trucks within the month.

L. K. HIRSCH, of Chicago, has bought the Pier movable sidewalk at the World's Fair grounds and will sell the wreckage.

THE Shultz Belting Company has secured commodious offices for its New York agent, A. B. Lawrence, at 113 Liberty street.

I. H. RANDALL, of Boston, has brought suit against the West End Street Railway for building and using his advertising rack.

THE Falls Rivet & Machine Company's western branch finds inquiries more numerous and prospects, as well as orders, good.

A. GROETZINGER & SONS, Allegheny, Pa., have taken several large southern and Western orders recently for dermaglutine pinions.

THE Stever Rail Joint Company, 407 Chamber of Commerce, is meeting with deserved success with its well-known rail joint.

THE Electric Car Supply Company, of 84-88 Mechanic street, Newark, N. J., makes a specialty of bearings and boxes for electric motor cars.

GEORGE B. MERRILL, corner of Washington and Clinton streets, reports that enquiries are numerous and trade as well as can be expected.

THE Brown Electric Company, Boston, has considerable railway business in sight and looks for a large increase in business very shortly.

THE Phenix Iron Works, Cleveland, are well stocked with orders which will carry them into July, and are now working both a day and night shift.

THE SIOUX CITY ENGINE & MACHINE WORKS has sold a 400-horse-power Corliss to L. M. Erb, for the Leavenworth Street Railway Company.

WELLS GOODHUE, well-known to Chicago electricians, has been appointed Chicago agent for the Wagner Electric Manufacturing Company of St. Louis.

THE McGuire Manufacturing Company, of Chicago, has closed a large number of truck contracts lately. New England business has been unusually brisk.

THE Eastern management of the Bass Foundry & Machine Works has been given to F. R. Baldwin, with offices at 39-41 Cortlandt street, New York City.

THE Laclede Car Company, St. Louis, through E. J. Robinson, has closed a contract for twenty-five cars, for the Consolidated Traction Company, of New Jersey.

H. R. KEITHLEY is distributing a neat paper weight, consisting of a section of rail web containing a "Chicago" rail bond, and showing plainly the perfect contact made.

THE Ames Register Company, Boston, makers of the well known Ames combined portable and stationary register, has closed a number of orders for this appliance.

SARGENT & LUNDY, 13 Monadnock Building, Chicago, report a new line of fans and motors of the Crocker-Wheeler pattern, and find a fair spring business in other lines.

THE Charles E. Gregory Company, of Chicago, has bought the entire stock of Carpenter heating apparatus and construction tools of the late Ansonia Electric Company.

B. W. PAYNE & SON, the well-known engine builders of Elmira, N. Y., have sold several engines lately for direct connection to General Electric incandescent light machines.

C. M. GIDDINGS, for many years in charge of the engineering department of Russell & Co., and well known as a designer and inventor, has returned to Ohio, and has sold to Brownell & Co. the exclusive right to manufacture under his patents. Mr. Giddings will have charge of the engineering department.

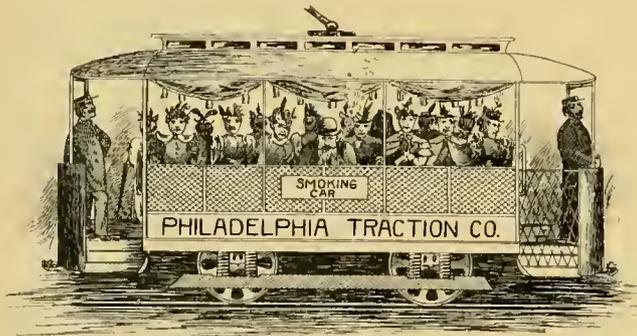

THE Chicago office of the Babcock & Wilcox Company finds reason for encouragement during these days and looks for a large amount of work in various lines of power using.

THE Hoppes Manufacturing Company, of Springfield, O., has the contract for supplying seven 300-horse-power purifiers to the municipal electric lighting plant, of Detroit, Mich.

THE Munson Belting Company, Chicago, is very busy. The present trade in saw-mill belting is unusually satisfactory, and Manager Groetzinger keeps things moving to ship orders on time.

THE Mosher Arc Lamp Company is in receipt of many new orders and a large number of inquiries. The St. Louis & Suburban Street Railway is one of the largest recent purchasers.

THE DAVIS CAR SHADE COMPANY, of Portland, Me., has received an order for 1,500 of the well-known Davis automatic shades from the Buffalo Street Railway Company of Buffalo, N. Y.

WOMAN'S LATEST VICTORY.  
To be seen any day on the Trolley Lines.  
—Phila. Times.

C. C. PECK, of Rochester, N. Y., will equip the Detroit, Mich., Municipal Electric Light plant with the well-known Peck boiler. Seven boilers of 300-horse-power each are required.

THE Sunbeam Lamp Manufacturing Company, of Chicago, is now located in its new offices at Room 304, 100 Washington street. F. S. Terry is manager and his telephone is 1273, main.

THE JOHN STEPHENSON CAR COMPANY, of New York, is still keeping up its reputation as an exporter. Several recent orders from South America have been shipped since the cessation of hostilities.

THE Wallace Electric Company is now located in its new quarters, No. 307 Dearborn street, Chicago. A large stock of improved railway devices and standard electrical goods will be carried. With increased shipping facilities, the company is now in a position to attend to the wants of the trade without delay.

THE Phoenix Bridge Company, of Phoenixville, Pa., has been meeting with great success in marketing its steel street railway, light and telephone poles. The Chicago office is at 931 Rookery.

THE 2,000-horse-power Allis engine exhibited in machinery hall during the late World's Fair is doing duty in the Jersey City-Newark line power house of the Consolidated Traction Company.

ARTHUR PARTRIDGE, the well-known St. Louis supplyman, has sold the iron center pole equipment to be used on the Milwaukee and Lincoln avenue lines of the North Chicago Street Railroad Company.

WESTINGHOUSE, CHURCH, KERR & COMPANY have removed their Chicago office from the corner of Lake and LaSalle streets to the New York Life building, corner of LaSalle and Monroe streets.

THE NEW JERSEY ZINC & IRON COMPANY, of Newark, N. J., has placed an order for iron roofs, one 50 by 400, and the other 60 by 187 feet, with the Berlin Iron Bridge Company, of East Berlin Conn.

THE East India mica sold by A. O. Schoonmaker, of 158 William street, New York City, is meeting with a warm reception. It is sold in the solid sheet as it is mined and splits even with a smooth cleavage.

THE Schoen Brake Shoe Company has moved its western office from 1023 to 519 Monadnock Building, Chicago. Jas. T. Milner, the western agent, reports trade good with prospects of improvement.

THE HAMILTON CORLISS engines, made by Hooven, Owens & Rentschler, of Hamilton, O., have reached a high-water mark, and the record now reads, 1,000 in daily use and 150 in street railway service.

S. N. FORD & Co., Mansfield, O., made their first shipment of street cars of their own manufacture, last month. The cars were two in number, ready equipped for service on the Fremont, O., street railway tracks.

THE Stirling Boiler, has received the text of its award made to it at the World's Fair. The points awarded were, simplicity, low cost of construction, economy and adaptability to situations requiring impure feed water.

J. JONES & SONS, 39 Vesey street, New York City, are introducing Anti-Thunderbolt insulating paper, for resisting heat, oil, water, chemicals and gases. It is especially adapted for street railway generators and stationary motor armatures.

C. E. LOSS & Co., Pullman building, Chicago, have the contract for 5½ miles of construction and equipment for the Hammond, Whiting & East Chicago Street Railway. The reliability of this firm is well known, and the business will be completed on time.

THE Stanwood Manufacturing Company, Chicago, has been doing a good business in repair lines during the past month. A certificate is attached to each job sent out, so that the customer may know its requirements and capabilities.

THE new buyers of the United Electric Railway of Nashville, Tenn., have begun well. They have bought 18 new open cars from the Lewis & Fowler Car Company of Brooklyn, N. Y. They will be commissioned June 1.

THE International Register Company, 197 S. Canal street, Chicago, is doing a good business. A recent order equips the Toledo Consolidated Street Railway with International registers. The whole number will be 135.

BARTHOLOMEW, STOW & Co., have removed from 57 Michigan avenue, Chicago, to 19 North Clinton street, where the factory and store rooms are combined. Their lamp, the Nutting arc lamp, is meeting with great success.

THE Charles Munson Belting Company reports a decidedly better trade, orders being nearly up to the old time mark for the past few weeks. Seven large saw mills have been fully equipped with Munson belt within the last two weeks.

THE demand for the car lamp and headlight specialties of "Smith of New York" has become so great that Manager Charles G. Smith has been compelled to put on an extra force of men and work his factory day and night to supply the incoming orders.

A. L. IDE & SON, of Springfield, Ill., report a flourishing business, with a goodly number of orders from electric concerns. The new power transmitter is becoming very popular, and 24 engines, ranging from 8 by 10 to 12 by 20, have been sold within the month.

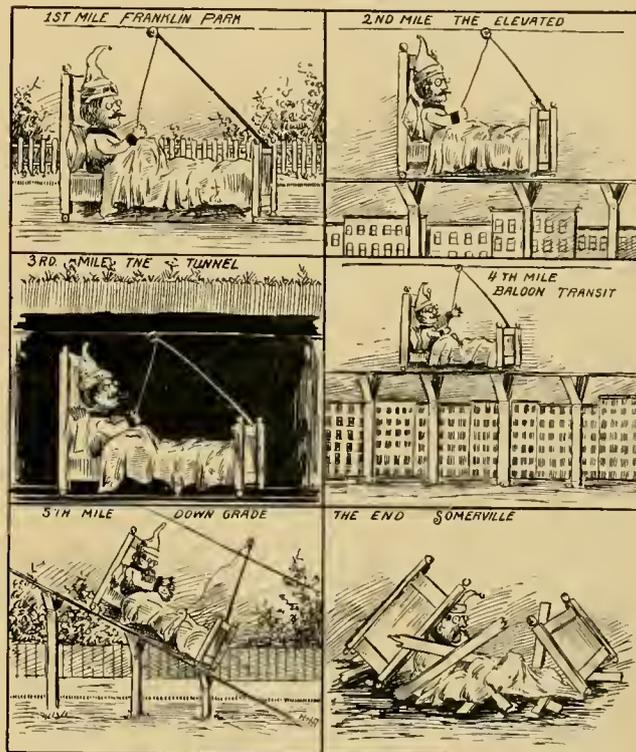

THE Manhattan General Construction Company, 50 Broadway, New York, and 753 Monadnock Building, Chicago, has taken the sales agency of the woven wire gauze dynamo brush invented by W. H. Fleming, late of the International Trading & Electric Company.

THE R. D. Nuttall Company, of Allegheny, Pa., will be represented in Philadelphia by Chas. J. Mayer, at the Betz building. Mr. Mayer will also represent the W. T. C. Macallan insulating material, and his long experience and genial personality are guarantees of his success.

THE Babcock & Wilcox Company, New York, has orders for a 1,500-horse-power plant for the Nassau Electric Railway, Brooklyn, N. Y.; a 1,500-horse-power plant for the Hestonville Passenger Street Railway, of Philadelphia, and a 2,675-horse-power plant for the Philadelphia Traction Company. The latter is a second order.

A. C. VOSBURGH, well-known to the trade as secretary of the New Process Rawhide Company of Syracuse, N. Y., has taken upon himself the duties of treasurer also. Mr. Vosburgh has a new process of his own which enables him to do the work of three ordinary men.

THE Westinghouse Electric & Manufacturing Company, through its southern agent, J. R. Gorden, has closed a contract with the Atlanta Consolidated Street Railway for two 400-horse-power generators, eight 30-horse-power motors, besides a 1,000-horse-power generator for the use of the new lines.

RAPID TRANSIT MATTHEW'S DREAM AND ITS RESULT.

—Boston Beacon.

W. J. COOK, of the McGuire Manufacturing Company, Chicago, has closed orders for the Eastern trade as follows: Norwalk Tramway Company, Norwalk, Conn.; Norwalk Street Railway Company, Norwalk, Conn.; Taunton Street Railway Company, Taunton, Mass.; Dartmouth & Westport Street Railway Company, Newbedford, Mass.

THE Buffalo, N. Y. office of the General Electric Company, T. H. Fearey, manager, reports a large spring business. The Buffalo Street Railway Company has ordered two 800-kilowatt direct coupled generators, to be run on Lake Erie upright engines. Eighty-four equipments of G. E. 800 motors are also ordered. Besides these, many smaller orders are reported from the West Side road, of Elmira, the Kingston City Railway, the Buffalo & Williamsville, the Seneca & Waterloo, and the Grand View Beach Railway. The Buffalo & Kenmore Electric Railway will install two M. P. 100 generators.

THE Safety Brake Shoe Company, of Boston, Mass., received a deserved compliment from B. J. Weeks, of the Quincy & Boston Street Railway Company, recently, at a meeting of the Massachusetts Street Railway Association. Mr. Weeks said that the Safety Brake Shoes lasted from four to five months each, giving the best of service to the last turn.

THE Genett Air Brake is being adapted for use on the grip car, and a Third avenue, New York car is being fitted up for that purpose. Only one controlling valve is used at the dash, doing away with the brake and grip levers, and handling all with the small air valve. Only one additional brake cylinder is used, the pumps and receivers supplying both.

ON account of another large order from the Brooklyn City Railway Company, together with other demands from the New Jersey Consolidated Traction Company, the North Hudson County Railway, and numerous smaller calls, the Peckham Motor Truck & Wheel Company began May 1 to work a double force of men and to run the factory night and day.

THE organization of the White-Crosby Company results in the presidency of Mr. J. G. White, with Mr. Crosby as chief engineer. The arrangement is a perfect one as all concede who know the relative abilities of the two gentlemen. Mr. Crosby's magnificent engineering experience and Mr. White's equal ability will make the White-Crosby a great power in the electrical world.

THE Chicago rail bond, the invention of H. R. Keithley, of Chicago, and manufactured by the Washburn & Moen Manufacturing Company, is meeting with large sales. Among the largest roads in and about New York, Philadelphia, Chicago and other cities, the bond is being extensively used and everywhere with great success. Mr. Keithley and the manufacturers have every reason to expect an increased trade, although the present sales are eminently satisfactory.

THE question of a standard size for catalogues and similar publications is brought up periodically, but thus far the Street Railway Association has never taken any action in the matter. The committee appointed at the last meeting of the Master Car Builders' Association has reported on the following sizes as the most desirable: Postal card circulars,  $3\frac{3}{4}$  inches by  $6\frac{1}{8}$  inches; pamphlet and trade catalogues,  $3\frac{1}{2}$  inches by 6 inches, 6 inches by 9 inches, and 9 inches by 12 inches.

SHORT lap belting, of which the Charles Munson Belting Company has so much to say, and in which every belt user is so deeply interested, is the subject of another recent circular from this company. The circular says:

"When ordering belting, see that you get a pure oak tanned 4 ft. 2 in. lap belt (including the lap). If you do not get it, we claim you get the poorest kind of a belt,

at a high price in the end; any piece of leather in a belt, longer than 4 ft. 2 in. contains shoulder stock, and that is a poor grade of leather."

The Munson people will be glad to give further information on the subject and guarantee all their belting to be "short lap."

THE Economy Heat, Light & Power Company, of Scranton, Pa., has contracted with the American District Steam Company, of Lockport, N. Y., for the construction of a steam heating and power plant, with underground mains (Holly system), to cost \$150,000. The officers of the company are William Connell, president, and I. H. Burns, secretary. Central station heating will become a considerable factor in street railway economy as managers awake to the advantages of it.

THE Sioux City Engine & Iron Works, Sioux City, Iowa, has elected W. M. Thompson, president and manager, and E. H. Bucknam, secretary. The Pech Manufacturing Company is consolidated with the old Sioux City Engine Works. All of the old engineering and constructing staff of the engine company, have been retained. Without doubt the new company with increased facilities will make an enviable record in the great West in this line of work. The capital is all paid in and the company begins with \$30,000 surplus.

THE Eureka Tempered Copper Company, of North East, Pa., has been enjoying a magnificent electrical trade in all departments of their extensive business. A new dry battery has recently been put on the market and called the "Eureka." Their brush holders for street car motors are also giving satisfaction, keeping an equal pressure at all times upon the carbon where it comes in contact with the commutator. The Eureka exhibit at the Columbian Exposition received an award of which the company is justly proud. The new woven wire brush is a successful device. The insulated wire trade is flourishing, and in fact the Eureka Company has nothing to complain of.

THE North Side Street Railway Company, which has extensive franchises along Lincoln avenue and other North Chicago streets, has let the following contracts for equipment: To the General Electric Company, twenty-five 25-horse-power G. E. 800 motors; to Brownell Car Company, twenty-five accelerator cars, mounted on Brownell trucks; to Siemens & Halske, of America, four 550 k. w. multipolar generators; to the Washburn-Moen Company, forty miles of bare wire, both trolley and bond; to the Johnson Company, twenty miles of 85-pound girder rail; the feed wire was sold by Arthur S. Partidge, of St. Louis, the well known head of the supply house of that name. This contract calls for thirty miles of wire, of which ten and a half miles are to be of 350,000 circular mils and the remainder of 250,000. The Garden City Construction Company will build the new lines, as D. H. Louderback says, in the highest style of the art.

STANLEY GREEN, the good natured western manager of the Fuel Economizer Company, at Matteawan, N. Y., dropped into the REVIEW office a few days ago, and upon being pressed, admitted his last trip was a fairly good one. This is the record: 300-horse-power to the Kingston, Ont., cotton mills; 1,000 to the Montreal cotton mills; 3,000 to the Montreal street railway; two 500's and a 300 to E. P. Allis for the sewerage plant, Boston. The Montreal order is a duplicate of the order given five months ago, and which takes water at 90° and delivers to the boiler at from 270 to 315 degrees. Recently, when the economizer was cut out of this service for three days for the first cleaning in five months, the fuel account was increased \$10 per day, which shows the record it is making in Montreal.

THE Metropolitan Electric Company, 186-188 Fifth avenue, Chicago, has now plenty of room, according to its strength, with two floors for storage, elegant offices and first class shipping facilities. A new department, under the care of W. F. Richardson, formerly of the Enterprise Electric Company, will be devoted to the street railway interests of the concern, and those who know Mr. Richardson's engaging personality and marked ability will feel assured of the success of any department under his charge. Already the company is prepared to supply the Gibbs trolley, the Hercules trolley clamp, the Knox circuit breaker, the famous P. & B. insulating products, and any number of miles of N. I. R. feeder wire. "The sales in all lines," said Secretary McKinlock, "have increased wonderfully since we have been in our new quarters."

## R. C. BROWN GOES TO MONTREAL.

R. C. Brown, electrical engineer of the West End Street Railway of Boston, has resigned that office to accept a similar position with the Montreal, Canada, Electric Railway.

Mr. Brown ever since 1889 has been in the West End's service, and by dint of effort and native ability raised himself to the position of electrical engineer. His first position of trust was as superintendent of motors and cars, quickly followed by the superintendency of electric power, which he has since held to the satisfaction both of the company and of his employes. The best wishes of his many friends follow Mr. Brown to his northern field, and a rousing ovation from 100 of his employes marked his departure.

R. C. BROWN.

E. A. BRADLEY, superintendent of the Waterbury, Conn., Traction Company, writes that his line will adopt electricity by July 1, using Sperry motors. A new inter-urban line to Naugatuck is now being built, and the street railway company will operate the electric light plant recently acquired.

## \$250 IN PRIZES.

This company, having the construction of a permanent plant in contemplation, invites outline drawings and general specifications of a model plant for the immediate use of twenty motor cars and twenty trail cars, with suitable construction to increase capacity to forty motor cars, as occasion may require. The lot will have a street frontage on the south of 450 feet, on the east an alley frontage of 550 feet, on the west a street frontage of 300 feet, on the north the diagonal frontage abuts a steam railway, from which a switch may be extended to any portion of the lot where convenience or economical operation may require. The street railway tracks may enter the lot at the northeast corner, and will also extend along the entire south frontage. Water can be extended from a city water main to any portion of the lot. The drawings must show the location of all necessary buildings, the position of Corliss engines, boilers, machinery, coal tracks, pits, and all other desirable features for a model plant. For the plan first selected \$100 will be paid, \$75 for the second, \$50 for the third, and \$25 for the fourth. The undersigned reserves the right to reject any and all plans, and shall be the sole judge of the merits of each. Said plans must be sent to the undersigned on or before the first of July, 1894. Each plan should be identified by the owner's mark, the name and address to be sent on separate paper.

Chicago General Street Railway Company, 1032 Lawndale avenue.  
C. L. BONNEY, vice-president.

## The Big Four Route Has the Best Terminal Facilities at Chicago.

All trains enter Chicago on the Illinois Central tracks along six miles of the Lake Front, through the most picturesque portion of the city, and land passengers in the magnificent new Central Station on Twelfth street and Lake Front. This station is convenient to the Auditorium, Richelieu, Victoria and Leland Hotels, and within two blocks of the State and Wabash street cable lines and the South Side Elevated Railway. Convenient stops are also made at Hyde Park, Thirtieth street and Twenty-second street stations.

Magnificent vestibuled trains, parlor cars, Wagner sleeping cars, private compartment buffet sleeping cars and superb dining cars. No transfer across Cincinnati to make connections.

Your ticket should read via the Big Four route to enjoy these privileges. E. O. McCormick, Passenger Traffic Manager; D. B. Martin, General Passenger and Ticket Agent, Big Four Route, Cincinnati, O.

THE C. & G. Cooper Western agency, under W. W. Nugent, reports business as good as can be expected during these times.

THOMAS H. McLEAN, general manager of the Citizens' Street Railway Company of Indianapolis, called upon the REVIEW recently.

THE HOPPE'S MANUFACTURING COMPANY, Springfield, Ohio, manufacturing the Hoppes Feed-Water Purifier, has received the contract for the purifiers to supply the boilers with pure feed water for the city electric light plant, now being built by the Public Lighting Commission of Detroit, Mich. After thorough investigation the Hoppes Purifiers were selected, and the order calls for seven 300-horse-power purifiers to carry 165 pounds of steam working pressure. Each purifier is required to heat and purify 9,000 pounds of boiler feed-water per hour.

### PERFORMANCE OF THE GLOBE STORAGE BATTERY IN CHICAGO.

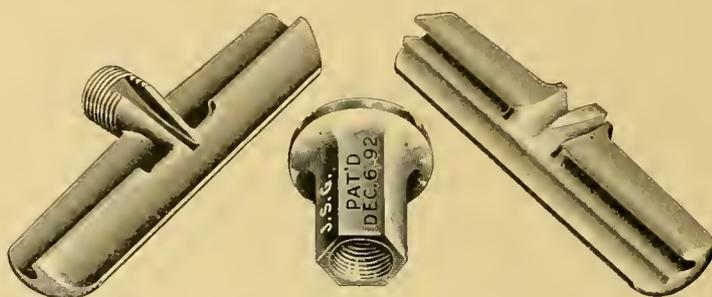

It will be remembered that the December, 1893, issue of the REVIEW contained an account of the Globe Storage Battery which was about that time put on the line of the Chicago General Street Railway, for trial. Although lacking proper facilities for storing, the car has been in use a portion of the time since November 26, 1893. The following facts and figures are obtained from a report made to the company by W. F. Brennan, superintendent of the road. They give a good idea of the actual performance of the car.

During the period from November 26 to April 21, the car made a total mileage of 1,780. The longest run made on one charge was 65.5 miles. The car was out on forty different days, so that the average run was 44.5 miles. In storing, the average energy consumed was 40 amperes, at 110 volts or 4,400 watts. In the period before mentioned, 281 hours were spent in storing, which, at the above rate, would give 1,236,400 watt-hours as the amount of energy spent in charging. This makes the watt hours per car mile run 638.6. On the day of the 65.5 mile run, the speed averaged 8.2 miles an hour, the amperes 40, and the voltage 85. Although it is difficult to come to definite results as to the actual amount of energy recovered from the battery, an approximation can be made by calculating the total amount of energy recovered from readings taken during short periods on the car. A test made April 15, gave the amount of energy taken to run the car as an average of 3,400 watts during the time it was on the road, or 400 watt-hours per car mile. This gives an apparent efficiency of 62 per cent, since the energy put into the battery was seen to be 638.6 watt-hours per car mile. This figure is, however, deceiving, as the car test was made with a very good track, while much of the balance of the time the track was in bad condition, and several days the car was run in snow storms. This would bring the actual efficiency much higher. The small amount of energy taken to run the car is surprising, but is explained by the fact that no energy is lost in starting. The batteries are connected through a series-parallel controller to give 50 volts in starting, which is afterwards gradually raised to 180. On April 26, one of the cells was opened by Mr. Brennan, in the presence of Mr. Rogers, of the Sperry Electric Railway Company, and Mr. Conrad, of the Globe Storage Battery Company. It was found to be in fair shape. From the figures in Mr. Brennan's report, it would seem that the battery in question comes nearer to a successful solution of the railway storage battery problem than any heretofore offered. Meanwhile more exhaustive and extended trials will be awaited with interest.

THE Western Telephone Construction Company has just completed the installation of a 50-subscriber exchange at Albert Lea, Minn., for F. B. Forbes. It gives perfect satisfaction to both owner and subscribers.

### HERCULES TROLLEY CLAMP.

The two objections—and there are only two—to trolley clamps have always been: That they will not hold the trolley wire as well as a soldered ear, and that when they do have any strength they have to encircle the wire almost completely, thereby causing the trolley wheel to jump and consequently arc. With these two objections constantly in mind, the makers of the Hercules trolley clamp set to work to make a trolley clamp that could be guaranteed to have as strong a hold on the wire as a soldered ear and yet not enclose at any point of its entire length but little more than half the trolley wire. As the result of their labor they now offer the Hercules trolley clamp. It consists of but three pieces, two of which grip the wire, and the third, namely, the nut, holds the others in engagement and also fastens it to the insulator. As the threaded shank is all one piece, it is readily seen that once the nut is screwed down to bear on the loose piece,

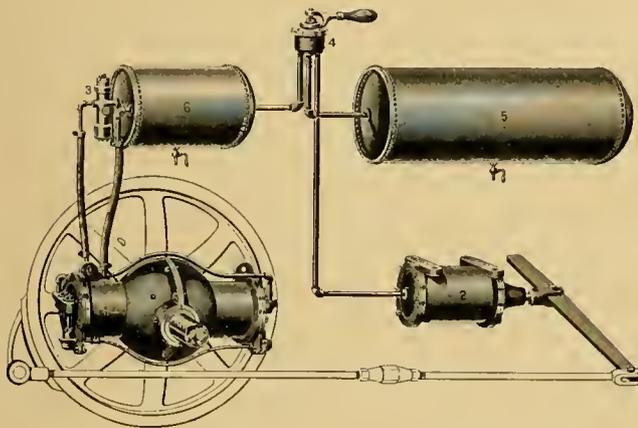

that the pressure on the nut is all on one side, which consequently locks the nut, and the clamp can not be jarred loose. When it is desired to adjust the clamp, it is not necessary to take the nut completely off, but simply unscrew it for three or four turns, when the clamp can be moved to the required point and refastened. A test was made recently by Robert W. Hunt & Co., of Chicago, on a Hercules trolley clamp and a 15-inch soldered ear. The Hercules clamp was subjected to a strain of 1000 pounds without being injured in any way whatsoever, while the soldered ear was distorted when subjected to a strain of only 500 pounds so that it could never be used again, and with an additional 180 pounds began to let go of the wire. In view of this test the makers of the Hercules clamp are certainly on the safe side when they guarantee their clamp to be as strong as a soldered ear. Gustin & Co., 84 Market street, Chicago, are at present making this clamp only for rigid hangers, but they are working on an attachment for flexible hangers, which will be ready very soon.

THE Chicago Electric Truck Company reports business very satisfactory. It is receiving many inquiries, and has placed one of its "B-2" trucks on the White Line, Dayton, Ohio, and also one under the new car of the Convertible Car Manufacturing Company, which is to operate on the Chicago City Railway. The company is now filling orders for their "A" trucks for the Jackson & Sharp Company, and the Fraser-Highland Company, for cars being built by them.

THE NEW GENETT AIR BRAKE.

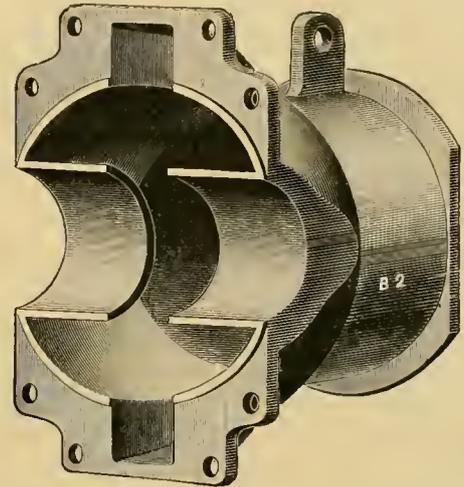

The evolution of the Genett air brake, has so far been very similar to that of the electric railway motor. This evolution has been in the direction of compactness and complete inclosure, to secure protection from dirt and water. The new duplex pump placed directly on the axle has its moving parts entirely enclosed. As will be seen from the section of this pump here shown, the pistons consist of two pieces bolted together so as to form practically one solid piece and slotted both horizontally and vertically to receive the car axle and the eccentric which works the pump. The wearing parts are limited to

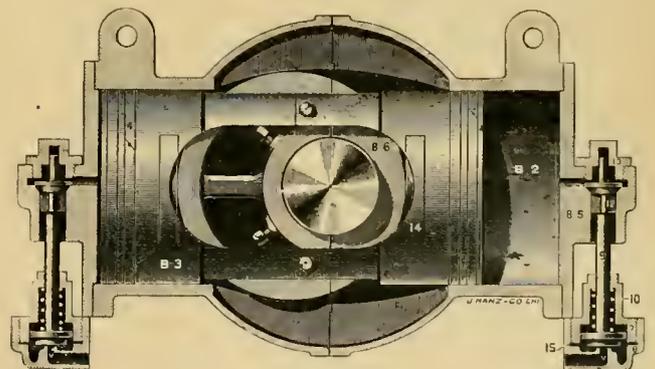

the eccentric plates and the bearings on the car axle. The space occupied on the axle by this device is only eight inches. It can be put on the same axle with nearly all the present makes of motors, though it is necessary sometimes to move the motor a little to one side or the other. The pump is oiled in the same way as a gear case by keeping it partly filled with oil.

An explanation of the principle of the Genett brake will be of interest to those who have not looked into the matter. The apparatus and piping required on a car can be seen by a glance at the engraving. In applying the brakes, air is admitted from the main reservoir 5, into the brake cylinder, and connection with the auxiliary reservoir 6, is closed. The regular running position of the brake handle opens the passage between the main and auxiliary reservoirs. The action of the pump is governed by the pressure in the auxiliary reservoir. When the pressure in it falls below thirty pounds, the pump begins to discharge into it. Normally the pump discharges into the open air against no resistance. When the motorman releases the brakes, he puts the handles on what is called the "starting point." This releases the air from the brake cylinder and closes the passages to both the reservoirs. After the car is under way, the handle is turned to the "off" position which opens a way between the reservoirs. The object of this is to prevent throwing the pump into action when the car is starting. Keeping the auxiliary reservoir pressure constant, by closing it when the air is drawn from the main reservoir to apply the brakes, prevents the pump from working until after the car starts, the pressure in the auxiliary is

reduced to make up the lost pressure in the main reservoir. Pressure is reduced three pounds by one application and should the pump fail to work, there is enough in the reservoirs for ten applications. A peculiarity of the controlling handle of this brake is that the "emergency stop" position is between the "service" and "off" positions. The idea of the makers is that the ordinary motor-

man will throw the handle to its extreme position in spite of all regulations, and that it is better to have the service stop there than to have the motorman using the emergency for service stops. The force of brake application is governed by the rapidity with which the handle is brought past the emergency point, as this is the point at which air is admitted to the brake cylinder. The Genett apparatus is made for hard practical service and the company proposes to do its work well or not at all.

On the roads now using the air brake it is giving an efficiency fully equal to that furnished by the air system on steam roads, and for high speeds is quite as essential; while on lines operating at low speeds, its prompt action and easy control make it in every way desirable. The eastern office is at 33 Wall street, New York city, while the works and western department are at 11 to 23 South Jefferson street, Chicago.

A NUMBER of Toronto, Canada, young men recently became so "funny" that they took down a stake and rider fence, and built it up again across the tracks of the Toronto & Scarboro Street Railway.

## PERSONALS.

W. H. BRENNER has resigned the electrical engineering of the Montreal, Canada, Street Railway Company.

E. P. ROBERTS, president of the Cleveland Correspondence School of Technology, was a visitor in Chicago recently.

J. W. COOPER, treasurer of the J. W. Fowler Car Company, has resigned, and F. L. Heidritter succeeds to his position.

D. H. GOODRICH, the long-headed secretary of the Omaha Street Railway, was a most welcome visitor at the REVIEW office.

F. A. MORRELL, of the Lewis & Fowler Manufacturing Company, of Brooklyn, N. Y., was an April visitor at the REVIEW office.

A. W. FIELD came into Chicago from the Boston office of the Peckham Motor Truck & Wheel Company to spend a few early May days in business.

PROFESSOR SIDNEY H. SHORT and Vice-President Billing, of the Walker Manufacturing Company, Cleveland, spent some days lately in Chicago.

FRANK DE HAAS ROBINSON, of Cleveland, will be pitted against his brother street railway magnate, Tom L. Johnson, for congressional honors at the next election.

ALEX. LEWIS, well-known as the Western manager of the Curtis Electric Company, has resigned, to locate in Cincinnati, O., where he will handle electric railway supplies.

ON April 25, Michael F. Burke, superintendent of the Terre Haute Street Railway Company, was married to Miss Margaret M. Toner, of Terre Haute, by the Rev. Father Schnell, at St. Patrick's Church. Two sons of the groom and two nephews of the bride were the acolytes.

J. R. CHAPMAN, general manager of the Grand Rapids Electric Railway, Grand Rapids, Mich., has been engaged by Mr. Yerkes as manager of the proposed and constructing lines of electrics on the North and West sides, Chicago. The duty is well placed, as Mr. Chapman is a competent manager as well as a first-class electrician.

FRANK C. PECK, has resigned from the Kansas City Cable Railway, where he has so ably filled the office of Assistant General Manager, and will engage in commercial business on his own account. Mr. Peck has had 14 years constant service under President Smith, and is one of the most practical and best informed railway men in the fraternity. We join with his numerous friends in the wish and expectation that he will achieve the same deserved success in his new venture, as has characterized his street railway experience. Thomas Barrett, succeeds Mr. Peck under Manager Holmes.

## THE ELLIS CAR COMPANY PLANT BURNS.

On April 26, the plant of the Ellis Car Company, at Amesbury, Mass., was totally destroyed by fire. The building was a two story frame, built six years ago by W. G. Ellis. The loss was \$50,000 and the insurance \$16,000. Besides the work under way, twenty-five finished cars and \$10,000 worth of wagons were lost. The fire is supposed to have originated in the paint shop.

## ST. PAUL PARK—A NEW PICNIC GROUND.

St. Paul Park is located at Morton, Ill., fourteen miles north of Chicago, on the Chicago, Milwaukee & St. Paul Railway. The grounds cover eighty acres on the North Branch River. One-half is a grove of large maples, the other half is a level meadow suited for baseball, tennis and all outdoor games, good boating on river, and in every way most attractive picnic ground in the vicinity of Chicago.

For further information, rates, etc., apply to H. E. Laing, City Passenger Agent, Chicago, Milwaukee & St. Paul Railway, 207 Clark street.

## OBITUARY.

BIRDSIL HOLLY, the inventor of the Holly waterworks system and the Holly district steam-heating system, died recently at the age of 72. He was an engineer of prominence, known both in Europe and America. His home was at Lockport, N. Y.

GEN. HENRY W. SLOCUM, president of the Brooklyn & Coney Island Railroad Company, died April 14, at the age of 66. His road was the first of the Brooklyn lines to adopt electricity.

## NEW PUBLICATIONS.

THE VULCANIZED FIBER COMPANY are sending out a neat little book giving uses, prices, and manufactured forms of vulcanized fiber.

"THE ECHO" is the name of a new paper about to be published weekly in the interests of the employes of the West End Street Railway system, of Boston. As there are over 5,000 employes, there would seem to be plenty of field for such a paper. It will embrace the whole range of matters of interest to the employes.

THE first number of "The Trade Press," the handsome monthly issued by H. J. Bohn, and devoted to the interests of publishers of technical and class papers, reflects much credit on its maker. It is neat, concise, full of suggestive ideas, and most welcome in every way. It is absolutely alone in its field, and proposes to wage ceaseless war on the house organ.

THE May 1 issue of the Pharmaceutical Era is called its moving day number, and celebrates the removal of that paper from Detroit to New York. It is a very elaborate issue, and the publication is a credit to its publishers. It contains an immense amount of information valuable to its trade.

R. C. CRAWFORD, formerly secretary of the West Chicago Street Railroad Company, has entered stock broking, with elegant offices on the first floor of the Stock Exchange building, Chicago.

FOREIGN SUBSCRIPTION, - - - 20 SHILLINGS.

Address all Communications and Remittances to THE STREET RAILWAY REVIEW,  
269 Dearborn Street, Chicago.

H. H. WINDSOR, Editor. F. S. KENFIELD, Business Manager.

#### CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,  
269 Dearborn Street, Chicago.

Eastern Office, Room 14, No. 128 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4. JUNE 15, 1894. NO. 6.

**Contributions.**—*Subscribers and others will materially assist us in making our news accurate and complete if they will send us early information of events which take place under their observation, such as changes in railroad officers, organizations and changes of companies in their management, particulars as to the business of the letting, progress and completion of contracts for new work or important improvements, experiments in construction and operation, and suggestions as to improvement. Discussions of subjects pertaining to ALL DEPARTMENTS of street railway business, by men practically acquainted with them, are especially desired. Officers will oblige us by forwarding early copies of notices of meetings, elections, appointments, and especially annual reports, some notice, of all of which will be published.*

THE Michigan Street Railway Association was organized at Grand Rapids on June 5, and adds one more strong association to the growing children of the paternal American association.

THE trolley is every day becoming more popular in Brooklyn, and as predicted in these columns, has proved a fast increasing competitor to the L lines. Another reduction in wages has just been made, and the reason ascribed is the loss of business, owing to the surface lines capturing the travel.

A BOSTON lawyer, Charles S. Rackman, thought he knew the law and refused to pay fare on a street car where no seat was furnished him. He was ejected and sued for his passage and ejection. He lost his case and the company received a verdict of the amount of the fare and two cents damages.

MAYOR SCHIEREN, of Brooklyn, proposes to call a meeting of trolley line presidents and managers, with a view to arranging a reduced schedule of speeds. We still hold to our former conviction that no manager is likely to permit a time table to continue which calls for a running time dangerous to the public, and that it is impracticable to make an inflexible rule.

THE Supreme Court of Pennsylvania has ruled that a company is guilty of contributory negligence, if, when in the exercise of ordinary prudence the conductor or driver of an electric car saw, or ought to have seen, a horse or team frightened by the movement of the car, and fails to slacken its speed or bring it to a stop. If the driver of a vehicle is placed in a state of peril by the negligence of those having charge of a car, the company is responsible for the consequences.

THE decline in iron and steel prices since January, 1893, has been from 26 to 10 per cent, according to the shape the material is in. A greater part of this fall has occurred since January, 1894. The fall of prices after the panic of 1873 was gradual as compared to this. Previous to 1893, prices had been steadily declining and it was thought the low water mark was reached, but with the panic came a reduction in every item of the cost of manufacture, and prices have gone down far below what was formerly the cost of production.

THAT a street railway has not only the right to make reasonable rules for the safe and convenient care of its passengers, but as well to enforce such regulations, is again plainly set forth in the ruling of the Appellate Court of this state. A passenger on the Ft. Clark road, in Peoria, persisted in standing on the rear platform when there was room inside the car. He allowed himself to be ejected without force, and in the lower court secured ninety dollars in damages. This was reversed in the Appellate, the court holding that "a street car company has the right to require a passenger to observe all reasonable rules tending to promote the safety and convenience of passengers, and the successful conduct of its business. So long as a passenger observes such rules the company is bound to carry him, but when he wantonly refuses to obey them, the company has the right at once to expel him, using no more force than may be necessary for that purpose."

THE Dodge bill giving electric railway companies the right of eminent domain has become a law in Ohio. It allows them to use the public highways in the country, and streets and alleys in villages and hamlets, with the consent of the public authorities in charge of the streets and with the consent of a majority, measured by the foot front, of the owners of property abutting on streets on the entire route. These companies are given the same powers to appropriate private property as is had by railroad companies. There is a suspicion that this bill means more than appears on the surface, particularly as these companies are given the right to consolidate

with street railroad companies. It is questioned whether the law will not be retroactive and allow steam lines to use city streets. Under the conditions of steam locomotion now in vogue it is doubtful if this will be the case, however, as the city steam road has long since been declared a public nuisance.

THE question of the proper temperature for open car service has again come up in Brooklyn, and a schedule agreed upon. Under 65 degrees the proportion of open to closed on the street decreases to none at all for cold weather. With the changeable climate of the Northern tier of states, particularly those along the great lakes, it is an extremely difficult matter to anticipate the proper car. In Chicago it is no infrequent thing during the hot weather in summer to have a sudden change in the wind cause a drop of twenty and even forty degrees in five or ten minutes; in which case it would be obviously impossible to call in several hundred opens, scattered out on 150 or 200 miles of track, and replace them with box cars. It is a task requiring several hours to run in one equipment and replace it with the other. Companies should do all in their power within reason to comfortably and suitably take care of their patrons, but unfortunately they cannot make the weather, and to put out box cars on a hot day is to invite a storm of popular wrath.

WE are still thinking of the future of the interurban—the link that is to bind the country to the city with a sort of electric weld, and make suburban life of isolated existences. A great deal is said these days about the overplus of city population, where a large proportion of able bodied men can only secure occasional work; and of the millions of broad, rich acres, patiently waiting for the touch of the husbandman.

The soil lies fallow, the woods grow rank,  
Yet idle the poor man stands;  
Oh, millions of hands want acres,  
And millions of acres want hands.

The great tide has for ten years surged toward the city, but it is doubtful if the ebb will carry many back. Unquestionably the individual and the nation would be infinitely better off if a few millions of city dwellers could be induced to take up farming. In Europe, a few acres, which would hardly make a respectable garden here, are sufficient to comfortably support large families. The construction of country electric lines will bring into the provision market the product of thousands of acres now devoted to general farming, and create new occupations. It is bound to come.

ON one of the surface lines in Brooklyn, a passenger was killed by striking a telegraph pole, as he was walking along the footboard of an open car while changing seats. It was one of those unfortunate cases, which, however much to be regretted, cannot be blamed upon the crew. However, the police promptly arrested both conductor and driver, who were taken to the station. As it was late Saturday night, no little difficulty was

experienced in sending for the railway officials and furnishing bail. The men were meanwhile held at the station and booked under a charge of homicide. No one on the car, or even the station officers, claimed the arrested men were in any manner to blame for the accident, but nevertheless the charge was entered, and the men treated accordingly. What was really wanted was to insure their presence at a coroner's jury as witnesses, and the injustice is apparent of resorting to such extreme measures to secure the desired result. Of all men, the driver and conductor of a street car can be readily located, as the starter's record always shows who are on every car, and the car number is usually painted in large plain figures, in from four to six places on each car. The same practice generally prevails in all large cities, and we submit it is unreasonable and unnecessary, and inflicts a wholly needless burden and to a certain extent ignominy on the men.

THE report of electrical fires in the United States during the first quarter of 1894, as made by W. H. Merrill, Jr., electrician of the Chicago Fire Underwriters' Association, does not show a very alarming percentage caused by the existence of a large trolley wire mileage. The report covers all the larger cities, so that it is safe to say that it includes all the fires caused by trolley wires, although it does not include all the fires caused by electricity. In considering the following figures it must be remembered that the number of electrical fires is considerably less than 1 per cent of the total number of fires. Out of the eighty-two electrical fires reported during the quarter mentioned, five were caused by the existence of the trolley wire in the streets. With one exception, these were the result of crosses between telegraph or telephone wires and the trolley. The losses were nominal, except in the case of a telephone exchange switchboard. This latter loss would have been avoided had proper fuse blocks been used on the telephone circuits. In fact, the failure of the telephone and telegraph companies appears to have been at the bottom of the three other smaller fires. Two very heavy losses, which were caused by defective wiring in poorly constructed and oil soaked car barns, should not be classed as fires caused by the trolley. They make the total number of fires from railway circuits seven. With but twenty to thirty fires a year in the United States caused by railway circuits, and the majority of them avoidable by insurance inspection, the outlook is certainly not very alarming.

IN many matters street railways have been guided by what has found to be good practice in steam road-ing. In the question of welded joints the street car people are taking the lead. On this point we might mention the fact that the welding on the Baden & St. Louis electric line, St. Louis, is astonishing doubtful managers at its strength and evenness. One president tells us he visited the work, and taking a heavy sledge pounded away on the "joint" as hard as he could. The result was a pair of lame arms next day, while the

welded joint remained unharmed. The tread of the rail is also smooth and shows no line of contact. The inclination toward rails of unusual lengths on steam roads shows the tendency toward a reduced number of joints. The Norfolk & Western has used 60-foot rails over a year and is now laying this length, paying a premium of two dollars per ton. This extra cost, however, they consider balanced by the saving in cost of joints. On one section tested a range of 125° temperature between winter and summer showed no difficulties in bulging or creeping. The Pennsylvania road has laid considerable 33-foot lengths; and it is understood that the report of the committee of the General Managers Association of this city will recommend that if any increase in length is made it be to 60 feet. Of course, what is good practice for steam roads is not necessarily such on electric and cable lines, but on the question of rails and joints the two sit together on a front seat on the mourner's bench.

A SHORT strike was made by the conductors and motormen of the Atlantic Avenue road, Brooklyn, and for what would appear to be a most insignificant and ridiculous issue. The company decided that its motormen should wear gray blouses this summer, instead of blue, which was the established color last year. The garments cost \$5.50 each, and last an entire season. That they do last the season is self evident, from the fact that one of the chief claims made by the men was that the blouses worn a year ago were still in good condition. The strike reflects no credit on either the good judgment or loyalty of the men. Not one of the strikers but lost more in wages than would have paid for the new garment, and few people who are at all familiar with the severe wear of clothes incident to car work, or who recognize the reasonableness of companies expecting their men to appear in suitable and uniform apparel, will question the wisdom of the company. Street car employes are well paid for the class of work performed and the short time necessary in which to become competent workmen, and it is eminently just and fair that they should appear neat and trim, especially as the arrangements made by the roads enable their men to secure the suits at a wholesale price, far below what the men, as individuals, could possibly purchase at. In Chicago, the garments are all made to order from individual measurement in each case, and of good and lasting materials, and are furnished the men at from \$12 to \$15 less per suit than they could duplicate the same garments anywhere but at the uniform tailor. The same is true in other cities. Again, we say, we consider the Brooklyn strike unbecoming the Atlantic Avenue men, as exhibiting poor judgment and lack of reason.

AND now it is the "deadly trolley" sure enough. For six years the trolley has gone up and down the streets and avenues, and stalked abroad in the land. It has carried in safety millions of people, young and old, the blind, the halt—even deadheads have been found among its living freight—and all this time it has been "the deadly trolley," according to the daily press. At first, blood-curdling

reports swarmed out of dangers *futurus esse*. These were followed by still more glaring recitals of horrors which would have made the Inquisition green with envy. It has been the province of the REVIEW to run down these reports, and in every case they were found to be false in whole or part, and never once has there been a bona fide case of death as a direct result of the 500-volt railway current. But now we find a case, and with the same fearless and unbiased investigation the REVIEW lays the particulars before its readers. The railway current has finally found a victim. Five long years, in 400 towns and cities, it has searched through storm and shine, in densely crowded business streets and along retired and shaded residence avenues, and always returned empty-handed. But now its perseverance is rewarded, and it can claim its first life. But what the circumstances? A young boy, who had worked in an electrical shop and gained a smattering of electrical knowledge, conceives the idea of "getting a shock." He takes a long piece of wire, one end he tightly winds about his left arm, making a dozen or more wraps. He then throws the other end over the trolley wire and seizes the end in his right hand. But no shock. He then winds the free end about his right hand, tightly and several times. And still the lightning refuses to be coaxed from its hiding place. Failing to receive any shock while standing on the pavement, the boy purposely walks to the rail and places his foot upon it. Then, and only then, is there any shock. He is stunned and falls across the rail, and the frightened children watching the event make no effort to remove him. When adult help arrives after several minutes, life is extinct, and the "deadly trolley" is at last vindicated. The unfortunate occurrence, however, is striking evidence of the fact that a case of this kind is practically impossible in the everyday walk of life, and as an exception proves the rule that the 500-volt railway current is not dangerous. Of course if people desire to electrocute themselves, as in this case, it can be done. So can people lie down and permit a street sprinkler, or a wagon loaded with several tons of iron, to pass over their prostrate bodies. An ordinary hat pin with which a lady fastens her bonnet is sufficient to pierce the heart and cause instant death; but no sensible or sane person has any excuse for perverting the good and proper use of any of these things. And so we leave the case in question to go down to history as a case of unintentional suicide, in which every precaution was taken to insure death, and not a case where an unsuspecting victim was laid low by a stab in the dark from behind.

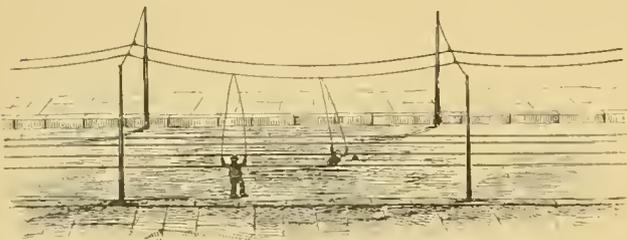

THE St. Louis Car Company, St. Louis, has its shops working at the top notch. The increase of the capital stock from \$100,000 to \$500,000 recently seems to have put vigor into affairs, both present and prospective. Besides a large number of orders from Eastern states, some nice local and Western orders are in hand. The cities represented are Brooklyn and New York City Philadelphia and St. Louis.

## AT LAST A VICTIM.

The "Deadly Trolley" Kills a Boy—But under the Most Unusual and Extraordinary Circumstances.—Millions Transported in Safety During the Last Six Years and this Exception Proves the Rule—Practically a Case of Unintentional Suicide.

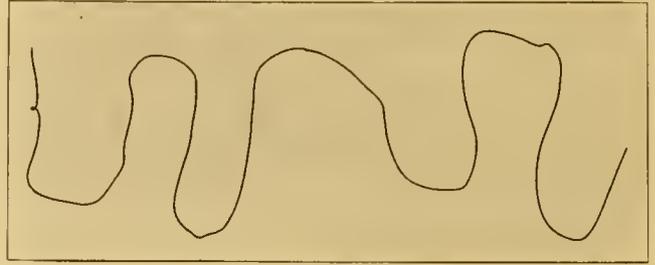

For four years the STREET RAILWAY REVIEW has investigated every supposed case of death from the shock of the 500-volt direct current, and in vain. Every instance of "the deadly trolley" that from time to time illuminated the columns of the lay press has been faithfully followed down only to find that death has not been the climax of the case. One man who received the full current, was very severely shocked at Auburn, N. Y., and went back to work the next day. His portrait was given, together with a history of the case from the pen of a physician who attended him, who also was associated with the electrocuting experiments at Sing-Sing prison, New York. Nil desperandum has been the "REVIEW's" motto, and patience has finally been rewarded by the finding of an authentic case of death by the trolley current. Although many millions of human beings have been transported by electricity without harm, it has been reserved for a boy and a St. Louis boy at that, to be distinguished as perhaps the first definite case on record of death by the 500 volt direct current.

Fred Burk, aged 16, was working in a cooper shop at 3007 South Seventh street, St. Louis. On May 9, at noon, while on his way home the lad decided upon some original researches in electricity. For this purpose he had procured a quantity of Number 29 wire, of soft iron, bright and clean, such as is used to fasten corks in beer bottles. This he threw across the trolley wire, and began to amuse his companions by showing them "how to get a shock." The lad had previously been at work in an electrical supply manufactory and knew, it is ascertained, something of the power and danger of the current. This "little knowledge" proved a very "dangerous thing." In his attempts "to get a shock" the boy was unsuccessful, until he stepped upon the car tracks and completed the circuit. In the meantime he had wrapped the wire several times around his hand and arm, as described in the report of the physician, which is appended.

Our sketch herewith shown gives the relative positions of the lad, showing him both on the pavement and lying upon the track. When the fatal connection was made he rolled over several times, thus winding the wire about his person, substantially as described by Dr. Faber.

It must be well understood that the boy had knowledge of electricity and its effects, and was unavailingly trying to get a shock until he stepped upon the track.

This engraving shows the exact size of the wire used by Freddie Burk, and is engraved from a piece now in possession of the REVIEW, and which was a portion of the wire wound about his body, and furnished us by Dr. Henry W. Faber, the attending physician.

When the circuit was completed the boy fell to the ground across the track, in an insensible or at least semi-conscious condition, incapable of motion. His companions were horror stricken and afraid to rescue him. An alarm was given to a passing pedestrian, who seized a wooden stick and broke the small wire. The boy's body was then pushed onto the pavement and away from the track, and carried to his home. So heavily was his body charged that the rescuer received a sensible shock. The body remained upon the track three or four minutes, and when removed was dead. Dr. Henry W. Faber was called immediately, but was unable to use any remedies or restoratives.

Dr. Faber says: "I saw him about five minutes after the accident. There is no doubt but that he was electrocuted. His skin had a blue waxy hue, but his appearance was otherwise normal. The left arm was burnt to the bones in the hands and fingers, and where the wire was wrapped around his arm it was cut with each wrap. The wire crossed his shoulder, then under the arm pit to the elbow and encircled the fore-arm five or six times, passing over the palm and through the fingers. His right hand and fingers were still more mutilated and burned to the bone. One finger was completely severed from his hand. In falling from the shock the wire fell across his breast, burning through the shirt immediately over the region of the heart, where a hole was burned in his body an inch in circumference and clear to the rib: To this injury his death is certainly attributable. All these wounds were made by the red-hot wire, which acted as an electric cautery and there was no bleeding from any of them. The body smelled strongly of burnt flesh."

The street railway company's superintendent writes that the accident happened substantially as related, and makes the natural enquiry if it is the first on record. The REVIEW is of the opinion that it is the first.

The only lesson is this: Let the daily papers, instead of raising the deadly trolley howl, teach the young idea that danger lies in familiarity with the trolley circuit only when undue liberties are taken, and that hydrogen gas, or cellar stairs are equally fatal. Any comment on the subject from surgeons or electricians will be received with consideration by the REVIEW.

## SPACE FOR EXHIBITS AT ATLANTA.

Space is now being taken for exhibits at the Atlanta convention. A large plat of the building will be found on page 190 of our March issue.

The side track at the west of the building will be a great convenience, but nevertheless it is deemed advisable to ship goods in due time. The hall is engaged for two weeks, beginning October 10, thus allowing ample time for placing and removal of goods. All exhibits must be placed and displayed on or before Tuesday evening, October 16. All counter shafting, pulleys, belts, switches, switch boards, etc., must be furnished by the exhibitors. Exhibitors must not circulate advertising matter or place signs outside their own space without consent of the secretary. Electric power will be furnished at the rate of 45 cents per rated K.W. of the machine actually using current. The minimum charge will be \$15. Applications for space received after June 15 will be allotted whatever space remains. Such allotments cannot be transferred without permission. The Association reserves the right to charge citizens of Atlanta admission fee if it sees fit.

N. W. L. Brown is chairman of the local committee on exhibits, and should be addressed Equitable building, Atlanta, Ga., for any particulars, or applications for space; or application may be made to W. J. Richardson, Secretary American Street Railway Association, 166 Montague street, Brooklyn, N. Y.

## LACONIA'S LOSS.

On the morning of June 3 the town of Laconia, N. H., suffered a loss by fire of \$125,000. Of this total \$75,000 worth of property belonged to the Laconia Car Company, the principal industry of the city. The fire is thought to have originated in the paint shop of the car factory and to have been of incendiary origin. From the paint shop the flames spread to the malleable iron foundry, an important branch of the works, and from that to the setting up shops. In the latter place were stored twenty electric cars for the Brooklyn, N. Y., Highland's street railway, and a number for the West End, of Boston. The setting up shops were two years old, 80 by 150 feet; the paint shop was 50 by 216 feet, and the malleable iron foundry 140 by 200. All were substantial buildings and insured in forty-two companies to the amount of \$47,000. The most serious loss was in the malleable iron department, where a large number of patterns were lost.

The company will begin immediately to rebuild and re-equip the destroyed shops, and the loss, although coming at a disadvantageous time, will not materially affect the progress of contracts in hand or the acceptance of new business.

Manager Putnam, the veteran car builder, says that the new buildings and equipments will be more commodious than the former, and that although Laconia is a little damaged it is still in the ring.

## A FAHRENHEIT SCHEDULE.

The sudden change of May weather, last month, caught a number of New York and Brooklyn citizens on open cars and of course gave them colds. In consequence, "Old Subscriber" and "Pro Bono Publico" rushed into print, and Smith and Jones and Brown rushed to the health commissioner's office to complain of the "fearful carelessness" of the railway officials, with the same acrimony observable in their remarks on the "stalling" closed car two days previous.

Health Commissioner Emery, however, called a council of Brooklyn street railway men to debate the question. There were present, Col. J. N. Partridge, of the De Kalb and Franklin avenue lines; W. A. H. Bogardus, of the Brooklyn City system, and Mr. Tobias, of the Atlantic avenue. No ill-feeling was displayed on the part of any one and an informal agreement was made upon certain rules. When the thermometer registers over 60 and under 65, it is settled that open and closed cars shall be run alternately. When the temperature is under 60 and the day is warm, two closed cars shall be run to every open one. When the thermometer approaches 70, the open cars shall be run at will, and below 60 degrees, closed cars are prescribed.

The New York line, the Dry Dock, East Broadway and Battery, notified the board of health that no open cars shall be run until the temperature reaches 70 degrees.

## TESTING SIGHT OF MOTORMEN.

Since the beginning of modern railroad practice, the care taken to obtain employes with perfect eyesight has resulted in special examinations of applicants for positions and the weeding out of those whose incompetency of eyesight might endanger life and property.

Since the wide use of mechanical traction on street railway lines no particular attention has been given to this important matter, although several accidents have been caused by near-sighted or color-blind motormen and gripmen. Recently, however, the matter has been attracting attention and all motormen on the Consolidated Traction Company, of Newark, N. J., have been ordered to present themselves to the company's physician to undergo an examination of eyesight. Without doubt the careful examination of the eyesight of gripmen and motormen would bring forth some very interesting data.

THE Western Electric Company are about to enter the street railway supply business and make it a speciality. They will carry a full stock of everything, including line material and repair parts for all systems, and be prepared to make quick and prompt shipments.

CINDER blocks for paving have been declared incompetent by the authorities at Philadelphia. Some of the blocks were hard and sound, but so many were soft that it was unsafe to use them. When soft the paving was as brittle as ordinary brick.

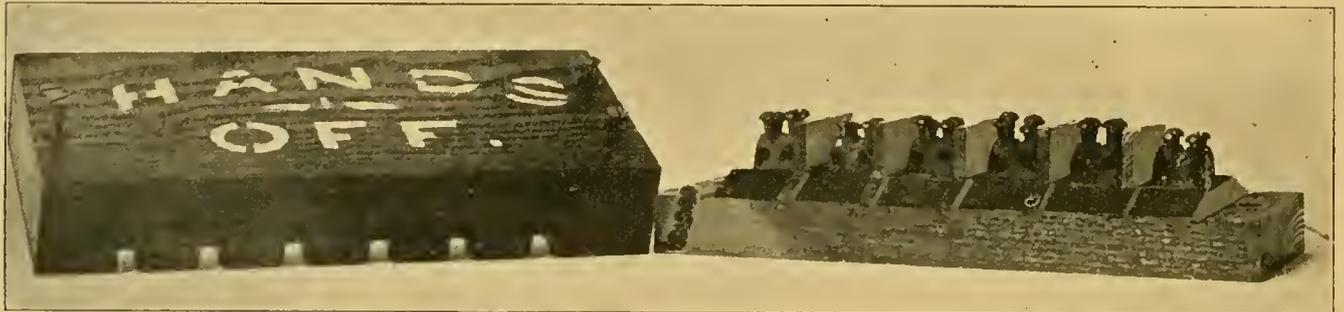

## MOTOR INSPECTION.

By William M. Ramsey, General Superintendent Federal Street and Pleasant Valley Passenger Railway, Pittsburg.

The inspection of motors, like many other subjects in our profession, is one upon which a variety of views has been expressed. All agree, however, that motor inspection of some nature is an imperative necessity. The differences of opinion are as to the frequency and to the method of inspection. As to the frequency of the inspection, it is the experience of the writer that managers operating nearly any of the older types of motors, Edison or Sprague No. 6, or any of the T.-H. double reduction types, will find it to their advantage to have a superficial inspection not less than three times each day, in addition to the more thorough nightly inspection. By superficial inspection, is meant an examination of each bearing, and of the brushes of the machines. The inspection of wires—field wires and brush terminals—is of so much importance that it had better be left undone than done in the manner which is almost universally practiced by thoughtless inspectors and shop-men. The usual method is to take hold of a wire and pull it more or less gently to see if it is loose at the terminal or broken under its insula-

screw, countersunk about a quarter of an inch, and shellac or sealing-wax poured over the head to indicate any removal of the cover by unauthorized parties. "Hands off" is painted in large letters upon the cover. It is found that by enforcing these rules that wires will last almost indefinitely, the effect of the oscillation of the car and motors not being enough to be noticeable even after a long time.

The nightly inspection should be most thorough. A point seldom thought of in the inspection of the new iron clad motors is the external cleaning of the fields and field magnets. Carbon dust and street dust accumulates about the field coils, and becoming mixed with grease, which creeps in from no one knows where, sooner or later destroys the field. It cannot be blown out with a bellows, but must be carefully wiped out with waste—the armature being removed for that purpose. Once a month, or every six weeks, is not too often to cleanse a motor in this manner. The usual nightly inspection of brasses or bearings is too often only superficial, especially as to the clearance of the armature between its pole pieces. It is not enough to see light between the armature and bottom pole-piece. The armature should be turned around and viewed from every position.

MOTOR BOARD.

tion. The obvious result of this is, that wires which might last for years if untouched, are worn out in a few months by such barbarous handling, and a constant wail of "broken field wire," or "another loose brush terminal," is heard from motormen and conductors. Motormen and conductors, themselves, soon learn to look for trouble first from broken wires, and like inspectors, pull and jerk the wires every time their car "bucks," and so matters grow worse, and will continue to grow worse until the manager makes it a punishable offense for any one, except the shop foreman, for instance, to pull a wire or to lay hands upon a motor wire. The writer has in use upon about one hundred and twenty motors of the Sprague No. 6 type, a "motor board," designed especially to obviate the trouble of loose wires. It has the usual six terminals or binding posts, separated by a partition of ash, one inch high. The placing of the cover on the board fastens each wire down to the board for a distance of about one inch and-a-half from its entrance to the binding post. This prevents the ordinary vibration of the wires from causing a break at the binding post. The cover of the board is fastened at each corner with a flat headed wood

In the inspection of controllers it is common practice to dress up the contact points with a file and allow the copper filings to fall where they will; this is frequently the cause of disastrous results. The cylinder should be removed occasionally, about once each month, and the back board thoroughly cleaned from copper and brass filings.

The every day inspection of grease cups, commutators, tightening of bolts, etc., need not be more than mentioned here, because all inspectors know that swift retribution follows any neglect of these common duties. As to the number of cars which it is advisable to place under each inspector's care, practice will vary; but from six to ten of the old double reduction to three times that number of single reduction, is a fair estimate. It can be set down as a maxim, that the annual cost of motor repairs varies inversely as the amount paid for inspection, and inversely as to the quantity of attention and intelligence displayed by inspectors.

A DAILY paper says that a street car has two currents on; one at each end.

PERSONALS.

O. T. CROSBY, of the White-Crosby Company, is in Europe.

A. J. PAINTER, inventor of the Painter Motor, of Pasadena, Cal., died recently.

T. M. SANTEE, director of the Safety Clutch Brake Company, Philadelphia, was a REVIEW caller of the month.

JOHN F. OSTROM, sales agent for the Pennsylvania Steel Company, Philadelphia, was a May caller at the REVIEW office.

F. C. RANDALL has assumed the duties of western manager for the J. G. Brill Company, with offices in the Monadnock block.

DANIEL J. DOWDNEY has opened up a New York office for the McGuire Manufacturing Company, of Chicago, at 171 Broadway.

MANAGER C. D. WYMAN, of the Milwaukee Street Railway Company, has removed his family from New York City to Milwaukee.

WILL H. THOMPSON, formerly superintendent of the Lima Electric Railway, was married recently. The bride was Miss Haller, of Lima.

R. BISSELL SCRYMGEOUR, traveling in the interests of the "Wells" light, that is so extensively used for night railroad construction work, made the REVIEW a recent call.

JOHN BROLLES, assistant secretary of the Third Avenue Cable Railway, New York City, read a paper before the Polytechnic School, May 17, on the "Third Avenue Cable Road."

H. H. ARCHER has retired from the general management of the Scranton Traction Company. His brother, Taylor Archer, master mechanic, also retired. Manager Archer is in ill health.

JOHN McCORMICK has severed his connection with the Heine Safety Boiler Company and will hereafter be identified with the Sterling Company, with offices at 126 Liberty street, New York.

EVERETT K. DAY, the well-known and competent superintendent of the Mousam River Electric Railway, of Sanford, Me., has resigned, and will spend the summer in rest at Hallowell, Me.

GOVERNOR FRANK BROWN, of Maryland, has accepted the presidency of the Baltimore Traction Company, vice T. Edward Hambleton, resigned. Governor Brown is the second state executive to be thus exalted. Ex-Governor Bowie has been president of the City Passenger Company for twenty years.

MALCOM D. PECKHAM, brother of Edgar Peckham, of the Peckham Motor, Truck & Wheel Company, died last month from injuries received from an assault made upon him by a former employe.

A. K. BAYLOR has been made assistant engineer of the railway department of the General Electric Company, with headquarters at 44 Broad street, New York. He has a deserved reputation as an engineer.

CONGRESSMAN TOM L. JOHNSON is a terror to bicycle makers. He weighs 250 pounds, and broke down three machines and nearly killed two attendants in learning to ride. Before the lesson was over, however, he rode with great ease.

LIEUTENANT BADT succeeds C. O. Daigh as general sales agent of the Siemens-Halske Company at Chicago. Lieutenant Badt is well known in his former connection with the General Electric Company, and will prove a valuable man.

CHAS. J. GUSTAFSEN, superintendent of the Chattanooga Street Railway Company, has resigned his position to go into business for himself. His headquarters will be at Chattanooga, and street railway specialties of his own invention his field.

CHAS. H. WILSON has been appointed general manager of the railway department of the General Electric Company, with headquarters at Schenectady. Mr. Wilson has been with the General Electric since the start, and is a thoroughly competent man.

THE Grand Rapids Eagle pays the following tribute to J. R. Chapman, on his retirement from the management of the street railway of that city:

Mr. Chapman's retirement from the management of the street railway system will be generally regretted in this city. He is a man of wonderful force of character, conservative but determined. He will leave behind him an enduring testimonial to his executive ability and matchless generalship in one of the best street railway systems in the world

THEO. P. BAILEY, of the Chicago office of the General Electric, has been made assistant western manager of this territory. The honors and duties of the position have been well placed, as Mr. Bailey's extensive knowledge of all details of the business as well as of the territory fit him for the incumbency. He has heretofore, it is needless to mention, been manager of the railway department.

MAY 18th, as Wm. W. Nugent, western manager of the C. & G. Cooper Co., was about to board a street car in Chicago, he was struck and run over by an express wagon. His head struck the pavement with such force that he was rendered unconscious for about four hours. No bones were broken, but he was severely bruised. He was taken to the Alexian Bros. Hospital, but was afterwards removed to his home, where he was confined to his bed for over two weeks.

## THE MICHIGAN STATE STREET RAILWAY ASSOCIATION.

The street railway men of Michigan have formed an association for mutual benefit, under the name of the Michigan Street Railway Association. The meeting was called at Grand Rapids, where the first annual convention will take place September 19, 1894.

The following officers were elected to serve until that time:

President, W. L. Jenks, City Electric Railway Company, Port Huron.

Vice-president, W. Worth Bean, St. Joseph & Benton Harbor Railway & Light Company, St. Joseph.

Secretary and treasurer, B. S. Hanchett, Jr., Consolidated Street Railway Company, Grand Rapids, Mich.

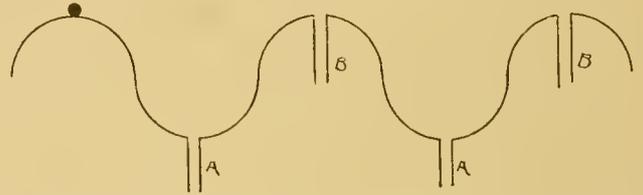

The executive committee consists of the officers and David H. Jerome, City of Saginaw Street Railway Company, Saginaw; Strathern Hendrie, Wyandotte & Detroit River Company, Detroit.

### A. J. WURTS ON LIGHTNING ARRESTERS.

The Chicago meeting of the American Institute of Electrical Engineers is becoming a more important event each month. At the May meeting the room in Armour Institute in which it was held was overcrowded, although it had a seating capacity of 140. The audience was distinguished by the large number of practical electricians present. The interest of the evening centered around the lecture on lightning protection by A. J. Wurts. It is not strange that the lecture proved a drawing card, as Mr. Wurts is undoubtedly the highest authority on lightning in the world. He has made it his life study, and being in charge of that branch of work for the Westinghouse Company, has every facility for the study of lightning discharges both in nature and in the laboratory. He has spent much time in regions where thunderstorms were frequent and violent.

The lecture began with the statement that electric lines are never struck by lightning in the sense in which the word is ordinarily used. That is the lines are never struck with a discharge which passes through many feet of air and shatters whatever comes in its way. The danger to electrical apparatus comes from static charges on the lines. It was pointed out that much present trouble is not so much with the arresters themselves as with the small number used and their unfavorable location and installation. The fact that there are nodal points along the line where discharges will at some critical times not take place, makes it impossible for one or two arresters to protect a line. The only safe way is to have a number of arresters scattered over the line and then some of them will be sure to take a discharge. To make plainer the nodal point principle, Mr. Wurts used a blackboard diagram which he said could not be considered as a mechanical analogy, but simply served to illustrate the point. In the accompanying diagram the curved line represents a trough in which a ball rolls.

At intervals along the trough are holes A, A, and B, B, through which the ball can drop. The ball in rolling will attain its greatest velocity at the low points A, A, and its least velocity will be at the crest of the curve. Consequently the ball will go over the holes A, A, without falling, but it will fall through the holes B, B, because its velocity at those points is so low. If it be imagined

now that the holes represent lightning arresters along the line, the necessity of having plenty of them to catch the nodal points is clearly seen. It is best if possible to have enough line arresters so that no station arresters are needed, as the station is a very bad place for them. They should be outside if possible. This was still more forcibly brought out by L. Gutmann in the discussion later in the evening. Mr. Gutmann advocated the use of the term lightning diverter instead of arrester. In one case, however, that had come under his notice he thought the term arrester was very appropriate. A certain station in the state of New York had an imposing array of lightning arresters artistically arranged. One day a thunderstorm came up and the aforesaid instruments "arrested" all the lightning so effectively that the station was partly burned down.

During the course of the evening practical demonstrations were given on the action of the Wurts arresters. The non-arcing metal arresters brought out several years ago are not suited to anything but alternating current circuits, as the direct current dynamo arc follows the discharge in these arresters. An arrester was finally evolved for direct current circuits, which consists simply of a discharge path made by charred grooves in a block of lignum vitae. This is the railway arrester now used. Some experiments were performed in which the two electrodes of the arrester were connected to the two sides of a 500-volt circuit. Discharges from a static machine were then made to pass across the arrester, momentarily short circuiting the dynamo, but the arc broke so quickly that a six ampere fuse was not melted.

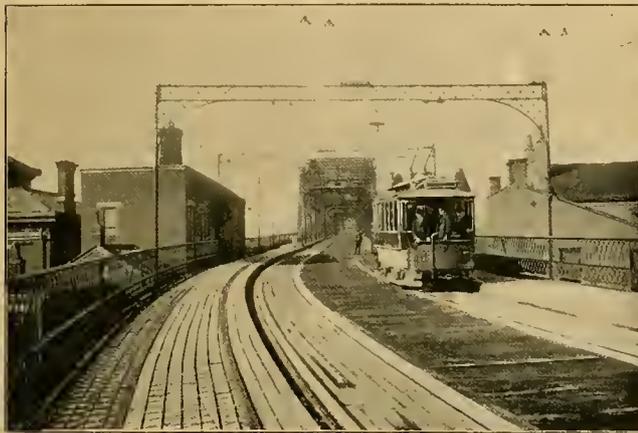

The subject of grounds was discussed at length. Mr. Wurts stated that since lightning arresters had been made so cheap, the main obstacle in the way of the use of a large number along the line is the cost of grounds. On railway circuits, however, grounds can generally be easily obtained by bonding to the track.

A MAN named Johnson was found not long ago in the vault of the cable conduit at Wells and Illinois streets, Chicago, with his head severed from his body by the rope. The unfortunate man had evidently, by accident or design, thrust his head between the rope and sheave. He was not an employe of the company, and of all suicidal methods, this would seem the most painful.

## AN INTER-STATE ELECTRIC RAILWAY.

The Complete and Modern System of the Cincinnati, Newport & Covington Railway.

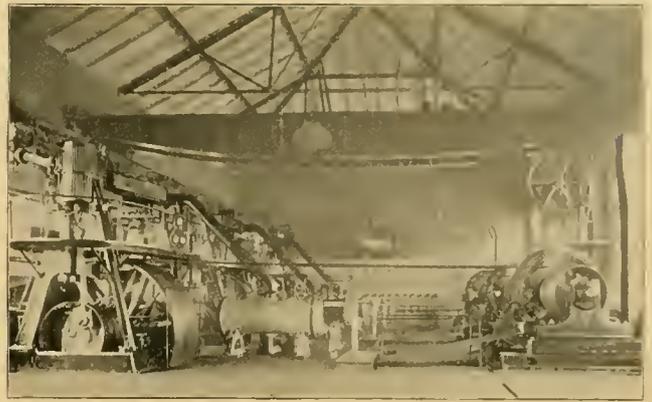

From Fountain Square, Cincinnati, O., to South Covington, Ky., is four miles as the crow flies and about five miles as the Cincinnati, Newport & Covington takes the passenger from one state to another. Besides this direct line which passes through the central portion of the city of Covington, other lines ply through West Covington, Central Covington, Newport, Bellevue, Dayton, Ludlow and Milldale, all suburbs of Covington, on blue grass soil and consequently within the metropolitan area of Cincinnati. From this extensive territory, all dependent to a greater or less extent upon the two main centers, Cincinnati and Covington, the Cincinnati, Newport & Covington Street Railway draws its traffic. Cincinnati has a population of 325,000, Newport, 30,000, and Covington, 45,000, with enough from the smaller villages to give a

NEWPORT END OF CENTRAL BRIDGE.

possible total riding population of 420,000. The system is a combination of previously existing horse lines (to be changed to electricity), lines now electrically operated and to be built and in process of construction. The rapidly developing manufacturing centers of Newport and Cincinnati will later on afford the system still further traffic, and the proposed resorts and pleasure grounds will make evening and holiday traffic as remunerative as the rush trips.

The road was organized July 1, 1892, and has now 55 miles of track in operation, of 5 feet 2½ inches gauge. Both T and girder rail is used, of 56 and 80 pound sections, respectively. It was rolled by the Pennsylvania Steel Company, Carnegie, the Maryland Steel Company and the Johnson Company. One hundred and twenty-five cars are now in commission. These came from the factories of the Brownell and the Laclede Company, St. Louis, and from Stephenson, of New York. Eighty of the cars are 30 feet over all and the rest 24 feet. Two Westinghouse 25-horse-power motors are attached to each car, and the trucks in use are made by Brownell and by Stephenson. The Bass Foundry, the Griffin Company and the Baltimore Wheel Company made the

POWER HOUSE AT NEWPORT.

wheels. Two power stations are required for the service, with nine engines, aggregating 3,000-horse-power. The engines were built by the Cleveland Shipbuilding Company, Lane & Bodley, McIntosh & Seymour and Armington & Sims. Ten boilers, with a total of 2,000-horse-power, are in use. They are of the well-known Babcock & Wilcox pattern, and the feed-water is rendered fit for use by the Warren Webster pattern of heaters and purifiers. Ten generators, made by Westinghouse, furnish 2,500-horse-power for the operation of the line. It will thus be seen that, mechanically, no pains have been spared to make the equipment complete and serviceable. As to station and line economics, the cost of repairs per car mile is \$.0040; cost of coal consumed per car mile, \$.0119 per mile, and the cost of motive power, including coal, is \$.0241, which showings speak volumes for the careful management and ought to rejoice the stockholders.

At the power station two crews are employed on twelve-hour shifts, and these in turn shift every two weeks from night to day. Each crew consists of one engineer, one oiler, one dynamo and switch-board tender, one fireman and one ash and coal heaver, making five men to the shift and ten men to the station.

The feeder system is complete in sections. Two-thirds of the line is single trolley and the remainder, that portion

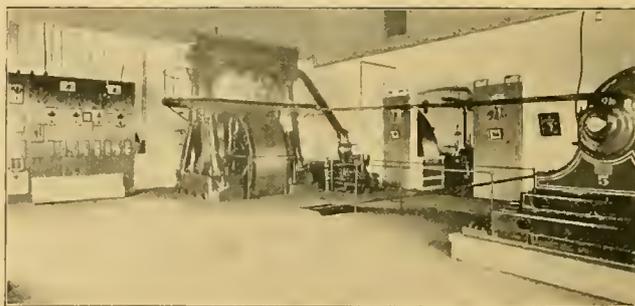

BOILER ROOM, NEWPORT POWER STATION.

which crosses the bridge and operates in Cincinnati, is double trollied. There are twelve ground returns from rail to the station, and one overhead return, besides ground plates placed every thousand feet. Lightning arresters are placed on poles every 1,200 feet. The type used is the Garton arrester, the performance of which is reported efficient. On the cars and on feeder lines entering the station, as well as on the switch-board, the Westinghouse arrester is used.

Several home-made devices are in operation, notably a track broom, which is so efficient that letters patent have been applied for it.

As to paving on the city streets, granite block, brick and asphalt is in use. On this portion of the line, 7-inch girder is laid. On suburban lines, T rail is preferred. In one instance, T rail is paved to with planks, and the superintendent is of the opinion, "that T rail paved to with brick will make the best road bed, both for the street railway and for the municipal authorities." Superintendent Jenkins, in relation to mutual fire insurance, remarks: "It has always been my opinion that a mutual fire insurance, or putting away of so much per year as an insurance fund, to provide against loss by fire, is what the street railways will have to do, as the present rate of insurance is a hardship that most of the companies cannot stand up under. With our arrangements of night and day foremen at the different car houses, and the number of hands in our employ, the arrangement of hydrants inside car houses and stations, with hose attached to plug and shelved on wall of build-

INTERIOR COVINGTON STATION.

ing, ready to have water turned on instantly in case of fire, we think we are free from all danger, except in case of lightning entering the barns or stations and so set them on fire, and even this possibility is almost precluded by our complete system of lightning arresters, both in the station and on the line."

The summer resort business of the Cincinnati, Newport & Covington is well provided for, and the bright and progressive management readily appreciates this feature of traffic. The following pleasure spots are noted: Latonia, at the end of the Milldale line; Carnival Park, at the State and Greenup street loop; Working Lake, a fishing resort; a half-mile trotting track at the Rosedale terminus; Clark's picnic ground and

FT. THOMAS.

rifle range, at the Dayton terminus; the Fort, at the end of the Fort Thomas line; Ludlow resort, to be opened this summer with a beautiful lake of eighty acres. This is the resort par excellence, and no expense will be spared to make it acceptable to all tastes, fads and conditions. Here will be established rifle ranges, launches, gondolas, merry-go-rounds, photograph galleries, toboggan slides and like excitement for hoi polloi. A portion of the 60-foot road way will be devoted to equestrians. This drive is two miles long. Here, too, a bathing pavilion will be established and a competent instructor will be engaged to teach the young idea how to paddle. It is the intention also to establish a laundry in connection with the bathing house, and while you bathe, your shirts will be laundried and your clothes pressed. This is not a fake, but really contemplated.

One of the features of the line that must be noted, is the suspension bridge, shown in our engraving, which crosses the Ohio river from Cincinnati to Covington. It is 2,252 feet long over all, 36 feet wide, and the main span runs 1,005 feet. The Central bridge, spanning the Ohio from Newport to Cincinnati, is 2,966 feet long, 38

COVINGTON APPROACH SUSPENSION BRIDGE.

feet wide, with two river arms, suspended spans 520 feet long, a cantilever arm at the Cincinnati end 252 feet long, and a similar span at the Newport end 250 feet in length. Its height above low water is 102 feet.

The average earnings per day of the system for the six months ending December 31, 1893, were \$1,232, an increase of \$310 a day over the previous year.

The officers and directors of this excellent system are: John J. Shipherd, president, Cleveland, O.; Chas. E. Orr, Pittsburgh, Pa., vice-president; Jas. H. Hoyt, Cleveland, secretary; Howard P. Eells, Cleveland, assistant secretary and treasurer, and J. B. Foraker and W. E. Hutton, Cincinnati.

#### A VETERAN STREET RAILWAY MANAGER.

W. J. Hart, general manager of the Union Street Railway, of Saginaw, Mich., has been a street railway superintendent for thirty years. Great as have been the changes in that time, Mr. Hart has not fallen back to the list of old timers who were in their glory in the day of

horse cars, but have now sunk into oblivion. He is, on the other hand, as wide awake, aggressive, and full of modern ideas as if recruited to the street railway ranks but recently, while his long experience is certainly not without value. He is now 47 years of age. He received a public school education and is a graduate of the Yates Polytechnic Institute,

W. J. HART.

Chittenango, N. Y. At eighteen he became superintendent of the Syracuse & Geddes Street Railway, an interurban from Geddes to Syracuse. He had continuous charge of that road for twenty-four years. In 1869 he took charge of another Syracuse road, the Genesee & Water Street Railway. He managed the two roads until 1890. During his service many extensions were built and good dividends paid. He was also one of the incorporators and directors of the Eastwood Heights Electric Railway, and was consulting engineer in organizing and building many street railroads throughout central New York. He was a charter member of the New York State Street Railway Association. In 1890 he became assistant manager of the consolidation of Syracuse roads. He remained with this corporation only a short time, however, before resigning and accepting the general management of the Saginaw Union Street Railway. This road, which has recently gone through a thorough reorganization, has twenty-four miles of track, all of which is this year being relayed with 60 pound groove and T rail. A fine new car barn and machine shop has just been erected for the accommodation of the forty-five cars in use. A beautiful pleasure resort will be opened up this season.

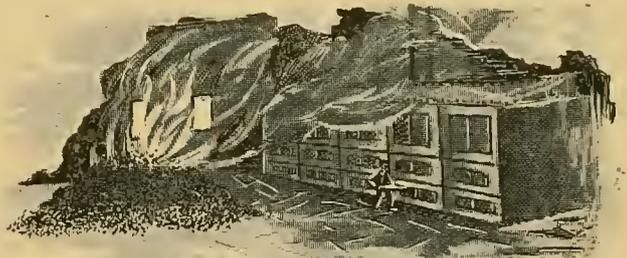

During his long street railway connection Mr. Hart has devised many improvements in the way of car trucks,

snow plows, etc., and is said to be the first man in the United States to put stoves in street cars. During his management in Syracuse his road transported over 25,000,000 passengers, without a death resulting from accident either to passengers or others.

The Saginaw Union road will be remembered as one of the first to encounter trouble from electrolysis. The poor return was in this case aggravated by the presence of a great deal of salt and sulphuric acid in the soil. Mr. Hart has made a careful study of the matter from the beginning, and has come to the conclusion reached by the majority of students of the problem, viz., that a reduction of the return resistance by heavy bonding is the first requisite in preventing this trouble.

#### SPONTANEOUS COMBUSTION AT QUINCY

The provident management of the Quincy, Ill., Street Railway Company, at the beginning of the miners' strike, laid in a big supply of coal. It was not of very good quality, but it would make steam. It was stored in the boiler room near the boilers and behaved admirably for a time, but finally ignited by spontaneous combustion. The fire got a good start during the night and simply roasted the iron roof off of the boiler house and burnt

down the walls of the room, which were 40 by 50 feet. The boilers were not damaged and steam was kept up by shoveling the coked and burning mess into the furnaces. It was a curious scene with just the bare boilers without roof or walls, and the stack sticking up lonely and forlorn. The loss was \$3,000, with no insurance, as the room was supposed to have been fire proof.

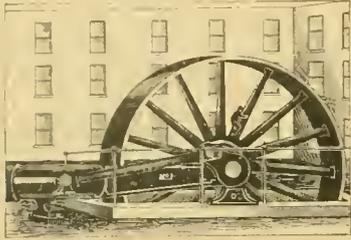

THE "Pennsylvania Traction Company Relief Association," is the title of the organization of the Columbia, Pa., street railway employes. The weekly dues are 12½ cents, and the sick benefits \$5 a week. Upon the death of a member, his nearest relative will receive \$75, and upon the death of a wife, the husband will receive \$50. At the death of a member the others are assessed \$1, and at the death of a wife of a member, each one is assessed 50 cents. The president is Samuel Charles and the secretary George Gardiner.

JAMES G. FLOYD, agent of the Barrows electric elevated system, proposes to build a line on the route of the Harrisonville, Randallstown & Granite Rapid Transit Company, near Baltimore, Md.

### RODE A MILE A MINUTE IN A WHEEL.

Young Harry Skidmore, of St. Louis, had an exciting experience last month. He is an oiler at the electric power house of the St. Louis & Suburban Street Railway Company, and while engaged in lubricating a journal was caught in a wheel and whirled around a number of times with frightful velocity. When the horrified employes regained their senses and stopped the engine,

Skidmore was rescued in a badly bruised condition, and his escape is little short of a miracle.

### MUSTN'T FLIRT.

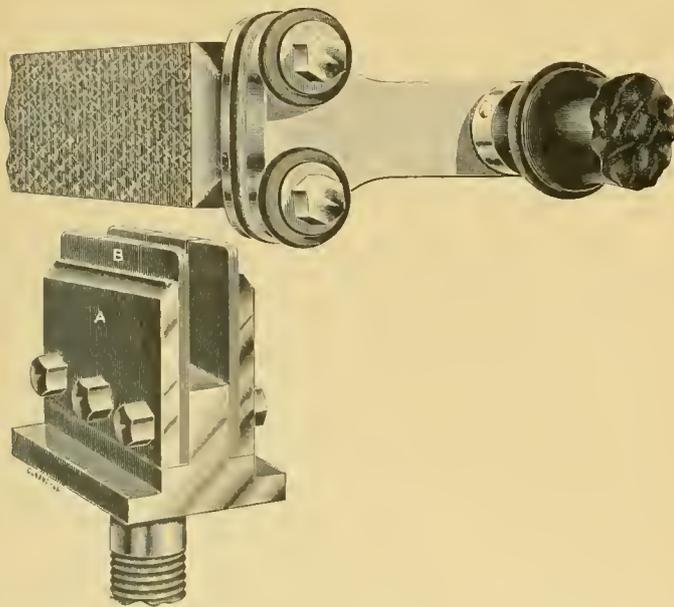

The manager of the Brooklyn Heights Street Railway, Brooklyn, N. Y., has posted this notice in the car barns:

CONDUCTORS AND MOTORMEN  
MUST STOP  
FLIRTING ALONG THE LINE.

The order arose from a petition of the women patrons, who asked that the employes be in some way restrained from the pernicious habit engendered by the prevailing and proverbial softness of the conductorial heart.

### THE NEW W. S. HILL SWITCH.

The W. S. Hill Electric Company, of Boston, has made several improvements in substantial switch con-

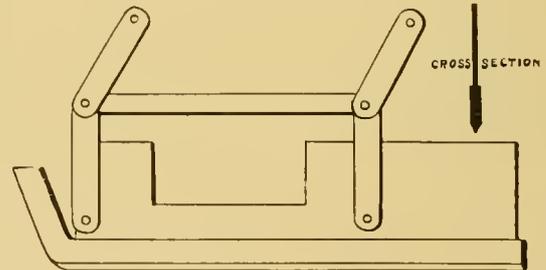

struction, which have recently been patented and which have been incorporated in the switches made by them.

The first improvement is in the method of securing the

blades to the yoke by two bolts instead of one. With one bolt the blades are liable to be twisted so that one breaks contact sooner than the other. To overcome this defect and produce a more mechanical and substantial device, the outer ends of the blade and yoke have been broadened to make room for two screws. The second improvement consists in backing up the regular flexible contacts B, by a reinforcing plate A. It has heretofore been the custom to use nothing but the copper strips B, and these of a necessity being flexible, were liable to spring apart by constant usage, thus impairing the contact. By the method shown the flexible contacts are kept in proper position.

### SAN FRANCISCO'S SLOT BRAKE.

The dangerous grades of San Francisco's streets are too well-known to require any particular mention. Suffice it to say that no city in the world has such a succession of grades to overcome by mechanical traction. The precipitous hill on Washington street, from Jones to Mason, was the scene of a hair-lifting runaway not long ago. Car 46 was the fated one and only the merest chance intervened in two instances between wreck and ruin of cars crossing the path of the wild train.

Eye-witnesses of the runaway stood spell-bound and the railway men were helpless, but their shouts brought the dazed gripman to his senses. He then applied the slot brake, which brought the car to a stop within 150 feet.

In taking a steep grade in San Francisco it is customary for the gripman to draw the grip as tightly as possible to bring the car to the rope speed. This the gripman had done, but the shank of the grip broke and before he realized what had happened had fallen into the slot and the car was shooting down grade. He mechanically applied the foot and hand brake, which are respectively track and wheel brakes, but to no effect. The track was slippery and down went the car gaining momentum with every second and with nothing to prevent it from leaving the track. The conductor twisted the rear brake until a shower of sparks fell from the shoe in fiery torrent. Then the slot brake was applied by the gripman and the car stopped.

The slot brake referred to is a wedge of steel 2 feet long, 6 inches wide and  $1\frac{1}{4}$  inches thick, tapering at the lower edge to a little less than the thickness of the slot. It is worked by a toggle joint and thrust into the slot by means of a lever. It is used only in the

greatest emergency and is driven into the slot by the momentum of the car. It usually has to be removed by cold chisels, as the great heat generated welds the steel of the slot and of the wedge together. Our engraving represents the brake and toggle joint.

It is the invention of an Australian, but was first used by Howard C. Holmes, of the Powell street line, San Francisco. On the San Francisco lines the grades are fearful, running frequently from 10 per cent to 19.8, as the case just mentioned. With these the slot brake is imperative, but since its adoption several years ago there has not been a serious runaway on the system.

A STATION OUTPUT RECORD.

The Cleveland Electric Railway has a graphic method of keeping its ammeter readings for each day, that is much easier and more available for future reference than any record kept by figures. It consists in having a book

CLEVELAND ELECTRIC RAILWAY CO.---ELECTRIC DEPARTMENT.

with pages 18 inches high by 16½ inches wide. Our engraving represents a piece torn from the top of one of the pages. On each page is plotted the ampere curve for a day, as taken from half-hour readings. Vertical space, represents amperes and horizontal distance time. At the bottom of the page are blank spaces for entering the condition of the weather, temperature, etc.

A SCALE OF ENERGY.

A story, says the Railway Review, is told by a gentleman in one of whose shops is a German mechanic who is something of a genius. Lying on this German's bench

a gentleman connected with the works saw a hammer, on the handle of which were figures corresponding to those in the little accompanying sketch.

“What is that for?” the man who was making the rounds asked.

“Vy, don’ you know vot dot’s for? Ef I got von tollar a tay I takes hold of him like dot,” and, suiting the action to the word, he grasped the hammer handle down over the dollar mark, and pounded away about as effectively as would a red headed woodpecker. “But ef I got tree dollar I takes hold of him like dot,” and he grasped the handle at its extreme end and swung the

hammer with a force that would have driven a cold chisel a quarter of an inch into steel at every blow. Anyone who has had much experience in handling men will readily see in the German mechanic’s hammer handle a very suggestive object lesson.

BRICK PAVING.

By J. D. Wardle, City Engineer, Cedar Rapids, Iowa.

Brick paving, while yet in its infancy, has passed the experimental period and is fast taking the place of all other pavements; and while it is not the object of this article to detract from or lessen the appreciation of other pavements, yet it is the belief of the writer that as brick, as a material for paving, becomes better known, and as the means to supply the demand are more and more developed, brick paving will be more called for and oftener specified, and that the time is not far distant when

the main streets in our smaller towns and the principal country roads will be paved with brick as well as the streets in larger cities and towns.

It is but a few years since brick paving was somewhat of an experiment, and the kind of brick required, the method of laying, and the nature and amount of foundation were questions upon which good engineers might differ, and the tyro was compelled to use his best judgment and learn by observation and results. And while results are now in no ways doubtful, yet we have by no means reached perfection, and the engineer, contractor or manufacturer, who has any desire to obtain the best pavement, must not stop experimenting or studying results.

Like all other pavements much depends on the foundation, and as we have had almost all kinds of foundations we ought to know something about what is best and most practical.

The early specifications called for foundations all the way from one with a six-inch “Telford” base and six inches of small macadam with two cushions of sand and a two-inch course of brick, to one where all the foundation called for was the natural soil to receive the four-inch wearing course of brick.

The kind and amount of foundation should be determined by the nature of the sub-soil and the cost of material. In a sandy sub-soil where brick suitable for lower course brick can be obtained cheaper than macadam, a two-course paving on sand with a sand cushion between courses is perhaps the best; but where the sub-soil is a loam, or clay, or refuse filling, a six-inch

macadam foundation thoroughly rolled and compacted will give the best results; on and into this should be placed enough sand to fill all interstices and leave a cushion of sand at least one inch and not more than two inches in depth.

Concrete as a foundation is specified in many places, but the places where and the conditions under which it is superior to macadam are few, and then oftentimes the additional expense is not warranted by the conditions or the necessities of the case.

Whatever foundation is used, it is essential that not only the foundation, but the sub-soil as well, be thoroughly compacted and settled. If the sub-soil be sand this can best be done by flooding and tamping. If loam, or clay, or refuse filling, a heavy roller is a necessity, and the best results can be obtained with a ten or twelve ton steam roller. A "macadam" or "concrete" foundation may and should be rolled with fully as heavy a roller as the sub-soil or natural foundation. In a two-course pavement, the under course should be rolled with a hand roller, to settle the brick firmly in the sand. Whatever the foundation, there should be a cushion of sand under the top course of brick, at least one inch and not more than two inches deep.

For a wearing surface, brick thoroughly burned and vitrified, when made of clay adapted to the manufacture of paving brick, have proven superior to any other known substance that can be used in street paving. Costing less than granite or asphaltum, it is less slippery and will out-wear either, is less noisy than granite and costs less for repair than asphaltum.

From a sanitary standpoint, brick pavement is the nearest perfect of any, it is easily kept clean, is impervious to water, and does not decay.

A paving cement or pitch is sometimes used to fill the joints between the brick. It costs about twenty cents per square yard, and the paving is not enough better to warrant the additional expense. About the only claim of superiority that is made in its favor is, that it makes a water-tight joint, and the same thing is obtained with a sand joint after the street has been worn a short time.

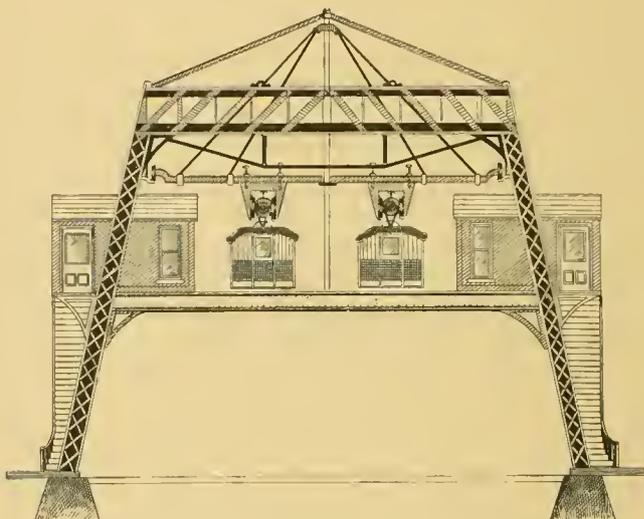

The quality of brick to be used is of the utmost importance. There are several makes of brick that have had actual wear enough in street paving to prove their reliability, but the brick manufacturing industry is growing and spreading so far and rapidly that the engineer will oftentimes be asked to accept brick that has not had the test of actual wear. Any manufacturer that expects to sell brick to be put into paving should also expect to guarantee such brick in the pavement. Many of the brick being used could be safely guaranteed to last fifty years or longer.

The usual tests for paving brick are the crushing test, the absorption test and the abrasion test. The poorest brick used should not crush under less than 6,000 pounds per square inch, should not absorb more than 2½ per cent of water in 24 hours, or lose more than 10 per cent in 5 hours in a rattler used to clean castings running 30 revolutions per minute with ten times its weight of castings put in the rattler at the same time.

If we persist in demanding better brick from the manufacturers, better work from the contractors, and inspection from the engineers, the future will see the same or greater progress in the line of better and more satisfactory pavements than the past.

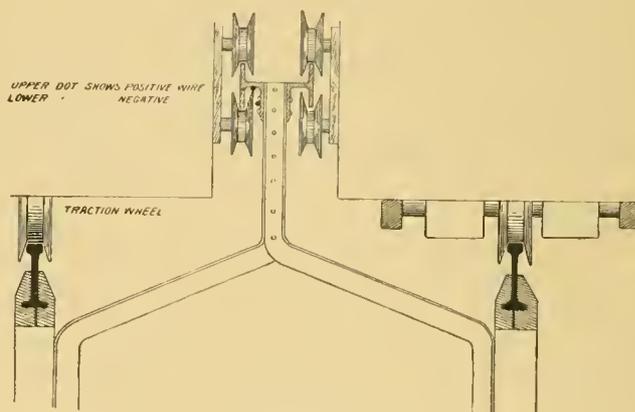

## TWO ELEVATED ELECTRIC RAILWAY SYSTEMS

The Johnson elevated railway system is shown in the accompanying engraving. It demands a series of suspended bents of 150 feet span on the suspension bridge style. At intervals, a heavy steel support connects

THE JOHNSON SYSTEM.

across the top by a truss on which the cables rest. The rails are held in position by means of heavy steel stirrups or yokes, with horizontal top bars and vertical arms hanging from each end of the bar. These arms turn in and up and upon them are set the rails for the car. The car

BROTT SYSTEM.

s suspended upon these rails. A motor is hung between the two pairs of wheels to a truck. The total weight of each span with two cables is 17 tons, with a strain of 8½ tons to the mile. The cable will be 3 inches in diameter, and the cost is estimated by the inventor to be \$80,000 a mile! Electricity is of course to be the power and unlimited speed is promised together with absolute safety as in all like affairs. It is a strong reminder of

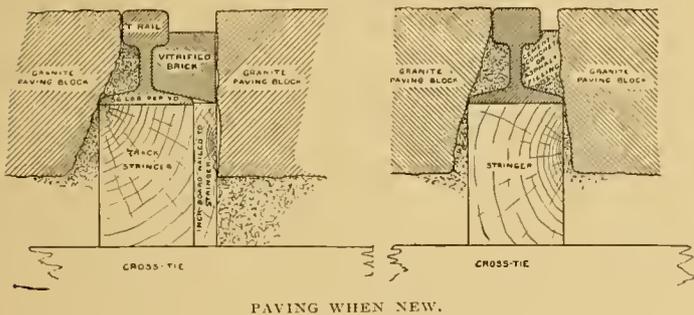

the St. John V. Day system, illustrated by the REVIEW two years ago.

THE BROTT SYSTEM

is an elevated electric, designed by G. F. Brott, McGill building, Washington, D. C., and furnishes the side rails shown in the engraving as a track for the steadying wheels of the car. The supporting track rail is held in position by the two cast iron pieces fitting on the top of the post. The side rails prevent oscillation when the car is at rest; while in motion the car balances on the supporting rail. The flanges on the running wheels are very deep. The side rails form also a conduit for the trolley wires. A motor on each side of the supporting wheels drives the vehicle. It is proposed to build a line on this principle from Washington City to the suburbs. To this end a charter has been applied for to congress, and the claims of unlimited speed and safety made.

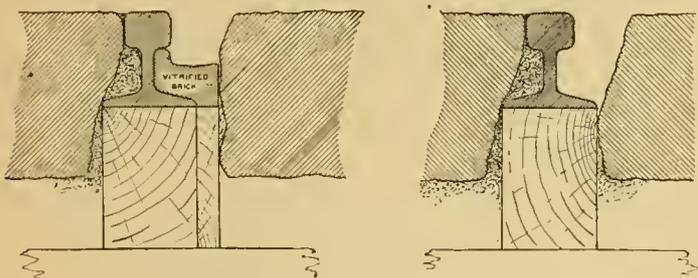

SPRINGFIELD PAVEMENT TO T RAIL.

W. L. Dickinson, superintendent of streets, Springfield, Mass., has an article in "Good Roads," on the effect of tracks on street repairs, in which the accompany-

PAVING WHEN NEW.

ing sketches are given of the two methods of brick paving to T rail, as practiced by the Springfield Street Railway Company. The moral is obvious. We might also remark that had there not been so much space left for the flanges of the car wheels the results in both cases would have been more favorable. As long as there is sufficient room next to the rail for vehicle wheels to enter, there

AFTER ONE YEAR.

will be excessive wear at that point. The common practice of paving close to the rail head, leaving only enough room for the flanges, is the correct one, as there is then not only the least jar when driving across the tracks, but there is no tendency for the vehicle wheels to get into the rut next to the rail and stay there. A large space next to the rail is hard on both vehicles and paving.

SOLAR CARBON AND METAL BRUSH.

The Solar Carbon Company, of Pittsburg, has secured the right to manufacture the combination carbon and wire gauze brush shown herewith. It is made of successive layers of carbon and wire gauze. The copper improves the conductivity of the brush, while the lubrication is practically as good as with a pure carbon brush. The product is already known to street railway managers and is giving good satisfaction.

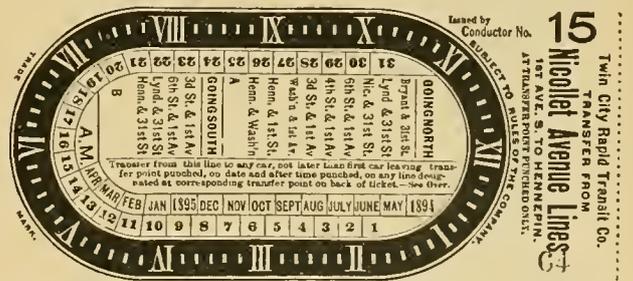

THE LATEST ON WORM GEARING.

Philip Dawson has been carrying on some experiments during the past year at Leeds, England, with some worm-gear street railway motors designed by the late Anthony Reckenzaun. These tests showed an efficiency higher than that usually ascribed to worm gearing. The trouble with worm gearing in the past seems to have been greatly aggravated by an improper understanding of the necessary qualities of such gearing. Mr. Dawson found an efficiency on the trucks in question of from 84 to 95 per cent. The worm was turned out of a solid piece of steel and was well polished. It is 6 inches in diameter, and has a treble thread of 6 inches pitch. The worm wheel is of phosphor bronze, 15 1/4 inches in diameter. The pitch of the threads is 45 degrees, the angle that gives the highest efficiency. Mr. Dawson concludes that to get the highest efficiency with worm gearing, there must be a high peripheral speed, a limited pressure between the teeth, a multiple thread, and a 45 degree angle between plane of thread and axis of worm.

THE MINNEAPOLIS TRANSFER.

On May 1, the Minneapolis Street Railway Company put in force its new transfer system for the city lines. There are 20 styles of the ticket in use for the 20 different points of transference. The engraving tells its own

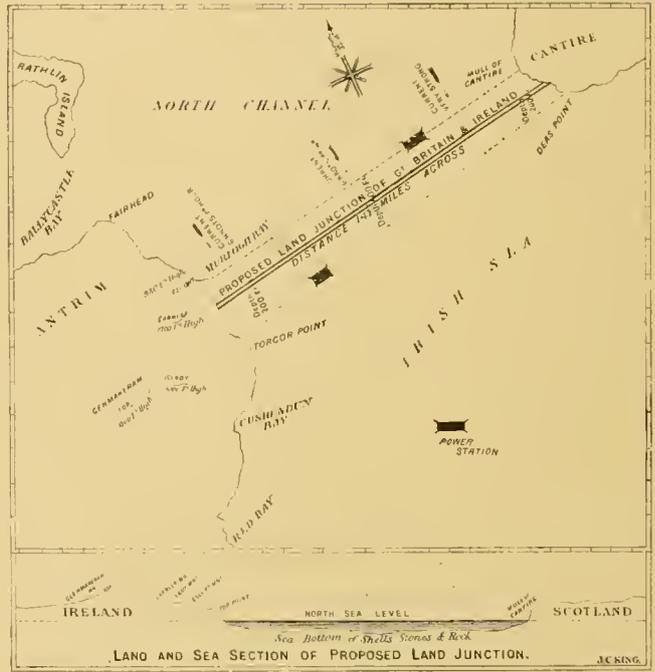

story of the hour, the line to and the line from which the change is made. Various colors of the ticket denote the routes. Manager Hield reports that the method is very successful so far. The transfer arrangement is the result of a special ordinance.

**SCHEME TO DAM THE NORTH CHANNEL.**

The most daring project for power production that has appeared recently is the one to build a dam across the North Channel, between Ireland and Scotland, for the purpose of utilizing the strong currents which now run through that channel. It is estimated that there is enough power going to waste to supply Ireland and Scotland for miles around with power for all purposes. Our map gives a good idea of the magnitude of the undertaking. The scheme includes among other things, the building of a double track street railway across the isthmus. A million acres of prime land would be recovered. Convict labor would be employed on the construction. The time required would be three years. This is the plan of the civil engineer and speculator J. C. King, who estimates the cost at \$15,000,000.

BALTIMORE street railways paid a license fee of \$5 a car as follows: City Passenger, 134; Traction Company, 132; City and Suburban, 95; Lake Roland, 38; Central, 30.

PRESIDENT KILGOUR, of the Cincinnati Consolidated after watching the pushing and hauling of a piece of his rolling stock by the train crew in a vain effort to get it on the track again, said mildly to the conductor, "Why don't you use your switch hook to guide it back to the rail?" The man turned sharply, saying, "What the devil do you know about it?" "Oh, nothing," said the president, "except that I'm an employe of the company." Shortly afterwards the man discovered Mr. Kilgour's identity. He is now civil on all occasions.

THE Brooklyn roundsmen, in a competitive examination for sergeancy, gave some queer answers to the questions. One of them who has been on the force for several years was asked what was homicide. "It is where a man is ran over by a trolley car and doesn't know it," was the reply which he gave in writing. Another one declared that it was a combination of arson and highway robbery. Still another insisted that it was assault where one man throws a bucket of water over another.

GRANITE AND STONE MATERIAL FOR BUILDING ISTHMUS.

PROPOSED SITE OF POWER HOUSE.

PROPOSED TERMINUS OF ELECTRIC RAILWAY.

## THE ELECTRIC RAILWAY AS A PHILANTHROPIST.

The Opinion of an Engineer, Manufacturer and Student of Social Problems.

While political economists and philanthropists are studying for means to obviate the evils consequent on the building of great cities and the crowding together of population, the electric railway is quietly going to work and solving the problem. We have pointed this out many times before, and prominent thinkers are beginning to realize this factor of modern city life. Thomas D. West, a prominent manufacturer of Sharpville, Pa., recently read a paper on "Suburban Homes for Workingmen," before the Civil Engineers' Club, of Cleveland, in which the subject was treated very thoroughly. The following is an abstract of the most important parts of the paper.

The greatest bulwark that can be thrown up to protect civilization is to make it possible for the working classes to feel and know the comforts of a home. How can we expect anything but ignorance and anarchism when our social system will permit and often compels men and women to be housed by the dozen in two or three foul rooms, and there live more like animals than human beings? Volumes have been written upon the subject of homes for the poor, and the best plans for model workingmen's tenement houses, etc., but their adoption in this country is only to be deprecated. Were there no available land adjoining our cities and towns we might sanction plans for pushing to dizzy heights or dragging out an existence in the damp excavations of the earth. But many years will have passed ere it will be impossible for man to find room for a comfortable home in a suburban lot near our business sections.

The writer's last three years' experience as a manager and manufacturer, moving from city to village life, has proven much to him in practically illustrating the desirability and advantages of a suburban home for the workman. We have in our employ men that two years ago came to us from city life, that could not save a penny had they thought of doing so, but the same men are now, with about the same wages, on the road to soon own a good house and small farming lot upon which they have found profitable employment during the many "shut downs" we have had during the last nine months. My observation during the business depression we are now recovering from, in comparing the unemployed of crowded cities with those of the small towns and villages, where conditions admit of the workman possessing a gardening allotment, goes to fully prove the desirability of the system this paper advocates.

The plan proposed is that of having a well paved road leading out from two to ten miles from the city. On or near these roads have elevated or other reliable rapid transit facilities with stations every quarter mile. This highway and its vicinity would be lined with workingmen's homes.

One aid to advance good suburban homes would be the selection by every city and town of some one popular country road, and have the land along it laid off in allotments of, say forty to fifty feet frontage by from three to four hundred feet deep. Such lots would give workmen, according to their needs, sufficient ground to cultivate about all the vegetables their families might require, and with farming sections not far from their homes, it can readily be seen how cheaply they could live and raise or procure stock to supply themselves with all the fresh products of a dairy farm.

An opportunity for such suburban homes would surpass all previous efforts to elevate the workman. Many would question whether the amount of suburban travel in some districts would be sufficient to pay the interest on capital necessary to build and operate an elevated road. Where there is good reason for such doubts then of course the ordinary electric street car plan could be used.

The running of rapid transit cars being very objectionable on some roadways, it is suggested that a space in the rear of the lots be devoted to this, and the highway crossings raised or lowered.

For the economical transportation of fuel or heavy products to and from the suburban resident or farmer, the rear allotment system for rapid car travel presents many advantages over the elevated road, as switches could be laid from the main line, on the ground, at almost any point and not interfere with teaming, foot or bicycle travel, or require truss or bridge work to transfer such delivery.

In connection with the rapid transit road, an elevated bicycle roadway is suggested, which would be a source of income to the company, and obviate the necessity of paved roadways in the newer districts.

The purport of the plans here presented in nowise means to advise all workmen fleeing from the heart of our towns and cities to locate themselves in outer thoroughfares, as such would be almost like lifting up a city and moving it to some other locality. The plan advocated might be said to be more of a safety valve to prevent dangerous or unnecessary pressure upon the inner circle of our crowded towns and cities, and commence the inauguration of a system whereby we could enjoy the privileges of city life and still be miles from them, and not be compelled to crowd into unhealthy hovels and dungeons that many are found existing in to-day in order to have cheap rent.

Some would at this point raise the question of economy of residing at great distances from points of trade and employment, and argue that car fare would more than overbalance any cheapness in rent that might accrue from living in a suburban home. The number of workmen existing in our cities to-day are in the minority that do not lay out just about as much for car fare in travel for themselves and families as they would were their homes five to ten miles further away from their places of employment.

4. Ascertain number of trips, headway and running time.

5. Arrange the trips in the time table so that the work will be equalized and the platform days' work will cover as few hours as possible.

6. Special passenger memoranda should be taken of the different holidays of the year."

The general rules are good for almost any line of any size, and coming from Mr. Jewell's ripe experience are worthy of close attention.

Thus it may be seen that an elastic time table is necessary. On the Chicago City Railway the trips are divided into straight runs, swings and trippers, according to conditions. On most lines a "fall back" of twenty minutes is allowed for meals, which is counted in the day's work. A platform day's work on the Chicago City is from nine to ten hours for train men running two cars and ten to twelve hours for single cars, "split" or consecutive.

The mechanical part of the method used by Mr. Jewell, is shown in our engraving of an excerpt from the Indiana avenue line which is worked by horse and connects with the Wabash avenue cable. The line is two and two-third miles long. The line is operated with one-third less drivers than conductors. The starting point is half a mile from the barn. When the table in full is shown, each driver can tell at a glance with which car he is to connect at Wabash avenue.

Schedules for train crews are hung in the different barns from which the crews obtain reporting time. The time table is made elastic by means of the laying time at the end of the route. This serves several purposes, but is particularly useful in case of blockade or sudden access of traffic, as an equalizer. A starter is placed at each terminus of main lines who is governed by time table except in case of blockade. Starters are also placed at branch points.

Extra cars may be cut in or out, as traffic demands, in such a manner as to equalize the increase or decrease of work among the regular crews. It was by this means that the dedication crowds of October, 1892, were handled with the regular train force, although double the amount of passengers was carried.

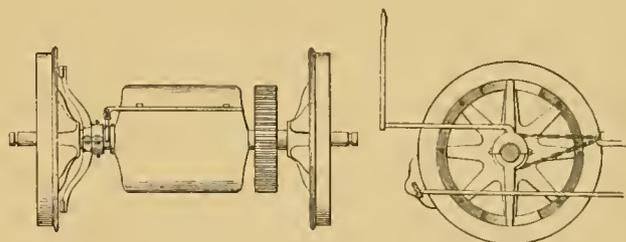

The Sunday traffic, pleasure traffic, theater traffic and, in fact, all unusual burdens are divided and carried upon the lines and by the plan set forth.

R. S. STIKEMAN, on retiring from the Milwaukee Street Railway Company's engineering staff, was presented with a gold watch by the employes of the construction department.

W. J. FAWCETT, of 846 Fifth avenue, Pittsburgh, Pa., having retired from active street railway management, offers his services as representative of supply companies for West Virginia, western Pennsylvania, western New York and Ohio. Mr. Fawcett's large acquaintance among street railway men will undoubtedly be effective in this line of work.

## THE WINTERS CAR BRAKE.

A new car brake applicable to any form of lever or ratchet movement has been devised by David Winters, a street railway employe of the Pueblo, Col., city railway lines. The plan is, in short, a friction clutch operating against a friction plate fastened inside the flange. The clutch is supported by the axle which revolves inside the sleeve of the clutch. This sleeve is kept constantly oiled. Two chains are bolted to the sleeve, one above and one below. The friction rim is fastened to the wheel and is a separate part of the device. When it is desired to brake the car the clutch is thrown in on the axle by means of the ordinary brake lever or ratchet handle and the arms of the clutch press against the friction rim. This immediately tightens up the chain and pulls the lever of the ordinary brake. The chain is attached to the brake beam, so that no change of the style in use need be made. The mechanism simply performs the work of applying the brake. The clutch is carried only a quarter of an inch from the friction plate on the wheel when the brake is off, so that very little exertion

on the part of the motorman sets the brake as tight as may be desired. When a gradual stop is wanted, a mere touch will begin to slacken the speed and this may be increased as much as is necessary. The chains do not wind around the axle sleeve but are bolted at the top and bottom, so that only a quarter of a wheel revolution is required to apply the brakes hard enough to slide the wheels. Our engraving shows this attachment of the chain and the means of connecting it with the brake beam. In the same figure the friction plate is seen. Figure 1 shows the clutch on the axle carrying a motor to illustrate the small amount of room necessary for the device.

As will be readily seen the idea is not to create a new brake but to make a new, positive clutch attachment for applying any style of brake. In short, the clutch performs the function of the brake cylinder on air brakes.

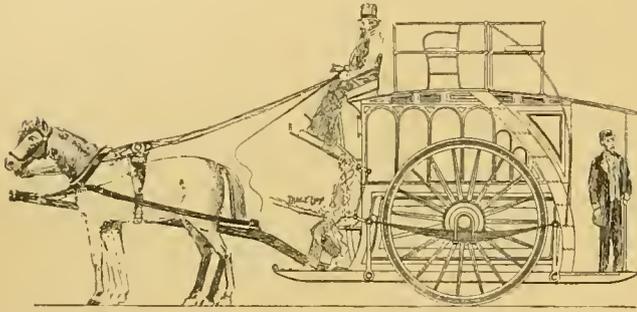

The Pueblo street railway has made tests of the appliance, and General Manager H. E. Chubbuck is greatly pleased with the mechanism and will apply it to all his cars.

ALEX. B. ALLAN, of Glasgow, Scotland, has resigned from the salesmanship of Geo. Cradock & Co., Wakefield, England, the great cable making firm. Mr. Allan will sell cables for a Glasgow firm.

## A CAB-OMNIBUS.

Of all the queer methods of transportation invented or devised by his Ubiquity, the rapid transit crank, is the "cab-omnibus" shown in our engraving and launched upon the public's notice by the Glasgow, Scotland, Evening Citizen.

The engraving explains the idea of a two-horse Hansom cab of gigantic size, capable of seating ten passen-

gers inside and eight outside, besides the driver and conductor and "trace boy" for using the extra horse on grades. Pneumatic tires, strong springs, and good workmanship are proposed, and the vehicle is to weigh 3500 pounds empty, and three tons with passengers. The main advantage claimed for the scheme is its adaptability and speed.

## LIKE LOTS OF OTHERS.

(We often wonder why the street railways proposed for Podunk and other large centers of from 200 to 500 population are not materialized. The following from a Brocton, N. Y., poet explains it in verse:)

Bold Owen P., he said, said he,  
"I'll form a combination  
And we will run a street car line  
Down to the railway station."

Then all the people laughed and said  
He'd better save his money;  
It wouldn't pay him one red cent,  
Which wouldn't be so funny.

But Owen said the thing he lacked  
Was just the right of way;  
If only this could be obtained  
He'd start the cars in May.

'Tis May, and cars run every day,  
With trailers on behind;  
You ask why you cannot see them—  
They're all in Owen's mind.

—PENNYSON.

RUSSELL HARRISON, of Terre Haute, Ind., recently fell afoul of the ministerial alliance of that city on account of keeping the street railway resort open to Sunday pleasure seekers. The alliance tried to stop the Sunday business, but the park commissioners and the populace stood by Mr. Harrison as did the daily papers. The consequence is that the park will be open Sundays.

## GEORGE K. WHEELER, E. E.

One of the oldest young men in the electrical field is George K. Wheeler, of the western department of the General Electric Company, whose services began with the earliest application of commercial electricity and the end is not yet.

Mr. Wheeler was born at Boston, Mass., July 21, 1861, and received his early education in that city. At the age of 18 he entered the telephone business, then in its infancy, and followed it to commercial success and the assistant chieftainship on the Boston Exchange and the management of the New England Exchange.

When the Thomson-Houston Company entered the railway field, Mr. Wheeler became associated with it as constructing engineer in the railway department. His first assignment was the Boston and Cambridge line, in which a difficult draw bridge was electrically and successfully equipped. After this, the South Side Street Railway, of Cleveland, was built by him for Tom L. Johnson. After these lines had proved successful, Mr. Wheeler constructed the lines at Newport, R. I., the West End, of Boston, and the Brooklyn & Coney Island, of Brooklyn, N. Y., besides other railways at Nashville, Tenn., and Utica and Rochester, N. Y.

GEO. K. WHEELER.

His distinguished success in these lines led to his appointment as chief engineer of the Railway Department of the Thomson-Houston Electric Company, at Chicago, embracing its entire western territory, and he has filled that position also

for the General Electric Company for the past four years. During that time, and under his personal supervision, there have been 3,059 electric cars equipped and put into operation over 1,912 miles of road, and he has also supervised the entire construction of a number of railways throughout the western territory. He is further known as manager in the following capacities: President of the Dubuque Light & Traction Company, Dubuque, Iowa; president of the South Side Railway, Kansas City, Mo.; general manager of the Citizens Street Railway Company, Kalamazoo, Mich., and general manager of the Ottawa Electric Railway, Ottawa, Ill.

Mr. Wheeler's remarkable record makes him not only a pioneer but a leader in the advancement of electric traction.

CITIZENS of Los Angeles, Cal., who own dogs, apply to the city council for an ordinance to compel the street railway company to carry the canines free. Heretofore fifty cents per dog has been the tariff.

**EXPRESS AND FREIGHT AT HORNELLSVILLE, N. Y.**

The progressive management of the Hornellsville, N. Y., Electric Railway Company, of which C. H. Wickham is the superintendent, finds freight and express business both profitable and convenient. The profits come from hauling goods for other people, and the convenience is found in using the freight car for road bed repair work.

FREIGHT GONDOLA.

be carried. It is called number 11. The railway company receives a percentage on all the express, and up to date the returns have been satisfactory.

The express carried, is that of the United States Express Company, between Hornellsville and Canisteo. It is billed out and received by the express company, so that no separate blanks or forms are in use by the railway company. A special car, however, is provided of which we shown an engraving. The car is a closed 16-foot trail car, with wide side doors for the admission of the goods to

BAGGAGE AND EXPRESS.

Car No. 20, is a gondola for heavy freight, such as brick or lumber. This car has hinged sides 12-inches high, so that it can be transformed into a flat. Doors in the bottom admit of its use for carrying and dumping ballast. The carrying of repairs for the road is no small convenience.

A special messenger is employed by the railway to collect for and solicit freight business, and the returns have been eminently satisfactory. The consignor and consignee, load and unload the goods.

THE Albany Street Railway Company, of Albany, N. Y., reports for the last quarter in 1893: Gross earnings, \$102,534; operating expenses, \$64,462; net income, \$17,945.

**DECLINED, WITH THANKS.**

We had occasion in a recent issue to make unfavorable comment on a device in which an impractical inventor is trying to interest street railway managers. We have just received what the writer evidently considers a flattering offer on his part, and which reads thus:

"If you will kindly reconsider your criticism, and make comment in a more favorable strain in our interest in your valuable magazine, and send me a marked copy, I will agree to subscribe for it."

**GAS MOTORS IN GERMANY.**

Gas motors are in regular service at Neufchatel, Switzerland and Dresden, Germany. At Neufchatel, there is an interurban line connecting with St. Blaise, a distance of three and a half miles. The estimates were made on the basis of one car each way every half hour. Each motor car carries twenty passengers, weighs, loaded, about six tons, and costs \$2,856. Gas is furnished from the city mains and compressed to 6 atmospheres. The gas costs \$1.09 per thousand, and the cost per car mile is 2.9 cents. At Dresden, Luhrig gas motors, built by the Gas Motor Fabrik, at Deutz, are used on a street railway three miles long. The Luhrig car seats six passengers, weighs seven and a half tons, and costs \$4,000. One charge of gas will run the car eleven miles. Gas supplied from the street mains is compressed by a stationary gas engine. The motor is capable of hauling one trailer.

**THEIR OWN FAULT.**

A Pittsburg clergyman preached a sensational sermon on people and corporations, and commenting on Stead's book, quoted liberally from the contents of many chapters, and indorsed with special force what was said on street railways. "Mr. Stead remarks," said the speaker, "that the overcrowded condition of the street cars reminded him of a scene in Dante's Inferno. We in Pittsburg can sympathize with what he says on this subject. It is disgraceful and unnecessary, and often so excessive that it is no unusual thing for modest women to be insulted under cover of the general push and scramble. I have heard of a number of cases where women have complained of the liberties that were thus taken with them.

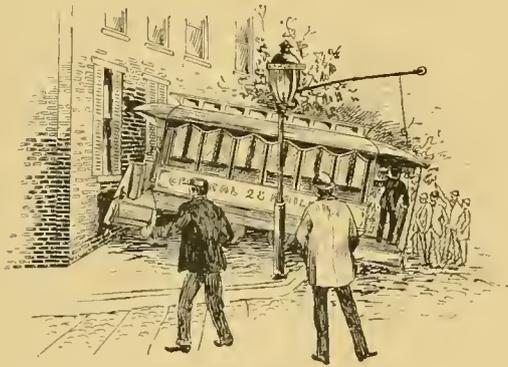

"We Americans are a good natured and long suffering people to stand these things as we do. They would cause no end of trouble in England, where the people are well versed in the art of grumbling. We who do not understand it should be glad that we can get an Englishman now and then to come over here and grumble for us."

All of which sounds very plausible, but what are the facts? The female contingent of street railway patrons, especially, seem to exercise no judgment whatever in using the cars. With great unanimity they insist on

crowding the first car that comes along, and squeeze in, regardless of the protestations of the conductor that another vehicle is close behind with plenty of room. We have seen this time and again, but the American public seem inoculated with an insane desire to "get there," and the one or two minutes delay, which would insure room, seats and comfort, are religiously disregarded.

### A BALTIMORE COLLISION.

Car Number 28 of the Central Electric line, Baltimore, is possessed of an evil spirit, or perhaps it was only hungry. As it was at the top of the Lanvale incline recently, the trolley wire broke, which in falling stunned the motorman. The unmanned car then started on the descent, and ended the swift journey by jumping the

track at the curve and crashing into a dwelling. The house was of brick, but the bumper of the car and the roof went through the walls, causing them to bulge out like a balloon. The family was at breakfast, which matutinal meal was measurably interrupted by the advent of the car. The damages claimed by the house owner amount to \$2,000, and the car suffered \$250 worth. The house owner had his suit filed by twelve o'clock the same day. Truly, the trolley is waking people up in Baltimore.

### NEWSBOY NUISANCE IN NEW YORK CITY.

The Broadway Company has at last been forced to do what many other large roads have already found inevitable, the forbidding newsboys to sell on the cars. The edict has gone forth, and thereupon the daily World enters a vigorous protest. The Recorder, however, replies in words of good common sense, as follows:

"If it be right to sell papers in the cars, if the companies were to permit their patrons to be annoyed by these little chaps, why not peddlers of candy, soap, shoe strings and bananas? Months prior to the promulgation of that order, public attention was time and again called to the abominable nuisance, not of an occasional newsboy, but of swarms of them. The Broadway cars in special, which are overcrowded, passengers outrageously incommoded at certain hours in the day, were the chief sufferers along that line. Repeatedly I have known thirty newsboys to jump on and off a crowded car between

City Hall Park and 21st street. Seven at least in every ten sold no newspaper, in spite of their pushing with great difficulty through the crowded passengers, stepping on toes and leaving odorific evidence of their passage at that. It is to be hoped, in the interest of the community in general, that the companies will adhere firmly to their rule."

### THE MIDDLETOWN & GOSHEN GOES.

The interurban electric railway connecting Middletown & Goshen, New York, was put into commission May 7, with great eclat. The initial trip was made with a distinguished party of city officials and street railway men on board the cars. The occasion was gracefully ended by a magnificent banquet with a number of speeches from the most distinguished guests. The line has every prospect of a good business and will soon be extended. The officers of the road are: James C. Hinchliffe, president; Merle J. Wightman, vice-president and electrical engineer; W. B. Rockwell, general manager; and E. G. Wightman, secretary.

### WATER PROOF COAT FOR WALLS.

The following process will, according to Architect and Building, make a water proof coating for walls. The process consists of covering first with a solution of Castile soap in water and then with a solution of alum and water, repeating the process until the walls are impervious to moisture. The solutions are,  $\frac{3}{4}$  pound soap to one gallon of water and  $\frac{1}{2}$  pound alum to four gallons of water. The walls should be clean and dry, and the surrounding temperature below 50° Fah. at the time of application. The soap wash should be applied boiling hot, and a froth formed on the wall. It should remain twenty-four hours before the alum wash is applied. The alum wash is put on cold. The alum and soap form an insoluble compound.

### AND THEY FOUND NO FLIES ON HIM.

The conductors on the Oakland, San Leandro & Haywards Electric Railway, of Oakland, California, have an unusual run. A number of different fares are collected on the line for various distances, and to facilitate collection a bell punch is used.

For some time past it had been suspected that some "knocking down" had been going on. The registers were found correct enough, although examined at the beginning and end of each day. Inspectors were put on the line, but the men "inspected" them before they inspected the men. It was finally concluded that the dishonest men among the conductors opened the punches and abstracted the tell tale slips. But how to catch them was the question. Finally, a bright detective hit upon the plan of imprisoning an able bodied house fly in the punch, so that if the case was opened during the day the fly would escape, and by its absence inform the company

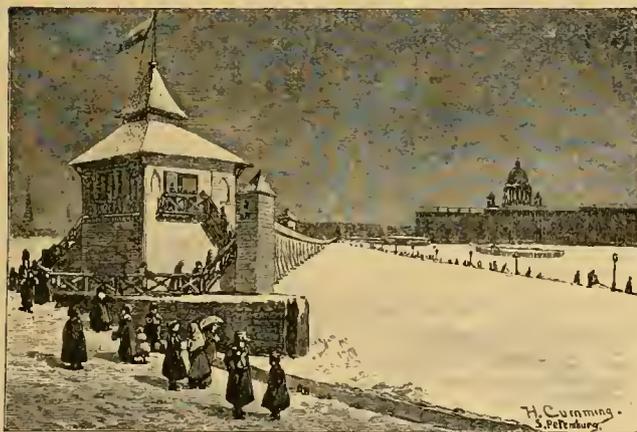

of the dishonesty. All the punches were, therefore, loaded with flies one morning and taken out by the men. And in the evening of the same day the punches were turned in, and in nine punches a fly was shy, and upon whomsoever no fly was found the same was given a vacation, the end of which is not yet.

A RECOMMENDATION.

An electric railway in New York state, about to be commissioned, was deluged with applicants for conductors. All sorts of recommendations were advanced by the would be fare takers, but the most unique was from a young man, who explained that he "had never been a conductor, but had often rode on the cars."

A RAILWAY ON THE ICE.

When the ice comes down the Neva River, at St. Petersburg, Russia, most of the bridges have to be removed. This is in the autumn, and when the ice gets thick enough, the bridge traffic is not resumed, but in its place is instituted an ice railway, as shown in our engraving. The Neva is at places four hundred yards wide, and an inclined plane furnishes the motive power and the cars are hauled back again by machinery. The trip requires fifty seconds and costs one cent. The cars run at 3-minute intervals,

RAILWAY ON THE ICE.

and are filled all day long by passengers whose necessity or pleasure takes them over the frozen stream.

Two laborers were repairing a natural gas main in Pittsburg, recently, and the product was escaping at a lively rate when an electric car came along and the flash from the wheels ignited the gas, burning the men seriously.

AN IOWA DECISION.

In the case Des Moines Street Railway Company vs. the City of Des Moines, Ia., the Supreme Court of the State reversed the decision of the lower court. The action grew out of an attempt of the city to compel the Street Railway Company to remove its tracks temporarily from the center to the side of the street in order to allow the city to put in a sewer. *Held*: That the compelling order was unlawful. The opinion continues: "It is well settled that a municipal ordinance 'must be reasonable, consonant with the general powers and purposes of the corporation, and not inconsistent with the laws or policy of the State,' and that the courts may declare void ordinances and by-laws which are not reasonable. An ordinance is unreasonable if it be partial, unfair or oppressive in its effects, as by imposing a serious burden without adequate cause." And such, the court decides, was the order to remove the tracks of the Des Moines Street Railway.

ELECTRICS IN ENGLAND.

Commenting on the Tramways Institute at Manchester, last month, the Electrical Engineer, of London, says editorially:

"Altering from horse to electric traction means the expenditure of additional capital, and the question at once arises, will the increased expenditure bring increased returns upon the total capital expenditure? If it does not, what is the advantage of the change? If it does, the advantage is at once seen, and conviction of tramway interests on this point will soon put the required capital in the hands of managers. If a line does not now pay, the question will be somewhat different, and assume the shape of, can it be made to pay by the alteration? The inability to pay dividends is generally from lack of passengers, and it is difficult to see how one form of traction will increase the number of passengers to any large extent. While, then, we regret the want of progress in electric traction in this country, we cannot be blind to the reasons which have made tramway managers cautious. From the humanitarian point of view, horseflesh in traction work should be abolished; but nowhere in the world's history have commercial undertakings been carried out from this point of view. No one who understands horses can for one moment ignore the fact that traction work is perhaps the most killing that horseflesh is subjected to, and would gladly see inanimate materials used in its place. Those, like us, who have advocated and do advocate the use of electric traction, advocate such use because from figures put before us, from our knowledge of the possibilities of electricity, we firmly believe that its use would in most cases where it is proposed lead to increased returns, the increase being proportional to or even greater than indicated by the increased capital outlay."

"It is difficult to see how one form of traction will increase the number of passengers to any large extent."

No such difficulty exists in this country, and a careful study of results here should quickly dispose of the "difficulty" elsewhere. Just as the superior advantages of steam cars makes possible a passenger business impossible to the stage coach; or the ocean greyhound induces travel unknown to slow sailing vessels, just so the electric and cable car create a business which can never come into existence with horse cars. The saving in time; the larger and better cars; the riding for pleasure only:—any one of these advantages insure increased revenue, as certain as day follows night. It would seem to us, at this distance, that the great bar to electrical progress is in the uncertainty as to how long a corporation may hope to own and operate its property, and that the Nemesis of a municipal purchase, which to some extent must necessarily prove a confiscation, more than all other causes combined, is what serves to make capital reluctant to take the risk of expensive installation.

### THE RIDING GALLERY AS A RESORT ATTRACTION.

The advantage of some cheap, constant and diverting amusement for summer resorts is acknowledged. But what amusement? There is one that seems never to lose its charm for children and young people, city or country, and that is the merry-go-round. To improve the primitive and make it hold its interest, the Armitage-

Herschell Company, North Tonawanda, N. Y., has put upon the market the steam riding gallery represented in our engraving. It has an outside diameter of 40 feet and is built in the strongest and most durable manner. A steel cable about the periphery in direct connection with a portable engine furnishes the motion. It is readily adjusted and strongly fastened in every particular. The horses represented have a galloping motion and other stationary seats are placed at intervals. No supporting rods are in the way of the riders. The manufacturers furnish an organ and a large strong tent. The riding gallery is undoubtedly one of the best and cheapest amusement within the reach of the manager of small or

medium sized pleasant resorts. The electric railway in particular has an advantage in such an arrangement, as an old motor may be pressed into service in place of the portable engine and the power derived from the railway circuit. Where nature has not afforded boating or other passive exercises, the riding gallery makes a substitute of infinite value. In connection with evening excursions and round trip pleasure rides, and in many other ways which circumstances may suggest to the thoughtful manager, this specialty of the Armitage-Herschell Company will be a valuable adjunct.

### DIDN'T WANT TO SOBER UP.

He boarded a Fort street car at the city hall, says the Detroit Free Press, and had to stand up and hang to a strap on account of the crowd. He didn't look like a man with much curiosity, but that's where they sized him up wrong. When the conductor came for his fare the man observed:

"Con-conductor, I'd like to talk with you for about half—for about half an hour."

"Fare, sir—no time for talking!" replied the official.

"But I want to talk to you on the sub—subject of 'lectricity. I want to know how the old thing works. F'r instance, what would——"

"Here's your change!" interrupted the conductor, as he passed out.

"No time to talk, eh?" mused the passenger. "Well, mebbe somebody else has. Shay, ole man, I want to ask you a question."

The "ole man" was a solid looking business man, who was reading a paper. He looked up in an annoyed way, and replied:

"Well, what is it?"

"This car runs by 'lectricity, don't it?"

"Yes, sir."

"Takes powerful current?"

"It does."

"Current sometimes slips off the wire?"

"Perhaps so."

"Well, shir, what I want to know is this: 'Spos'n the current would slip off the wire and hit me—what would be the effect?"

"It would sober you up in about two seconds!" was the placid reply.

"Honest Injun?"

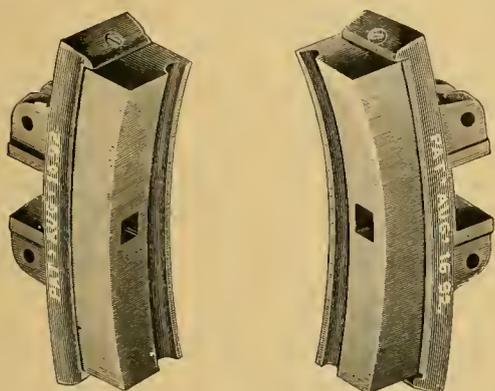

"Yes, sir."

"Much obliged. I allus kinder thought she was dangerous to fool with, and now I'm sure of it. Lemme git out! I don't want to sober up and I ain't goin' to be where the current can hit me if she slips off! Shtop 'er, conductor—shtop 'er back end of 'er car and let me drop off and walk! Shober me up! Not any! Cost me sixty cents to git zhis jag on and wouldn't shell it f'r a dollar bill!"

THE Charter Gas Engine Company, of Sterling, Ill., has a new 22-horse-power traction engine.

**WHARTON'S WOODEN FACED BRAKE SHOE.**

The engraving represents the idea of Wm. Wharton & Co., of Philadelphia, of a wooden faced brake shoe which they claim is cheaper and wears the wheel less than other forms of brake shoes. The wooden blocks, which are fitted into iron hangers, are made of oak cut across the grain, thus presenting the most durable and

effective surface for friction. The manufacturers carry patterns of these shoes for all standard trucks and have samples of the shoe which have run 6,000 miles. The use of wooden faced shoes is by no means a new idea, but in the former patterns the braking force was always with the grain instead of across. The simple method of attachment to the iron hanger and its capability of quick renewal will also be noted in its favor.

**BUFFALO'S BUSINESS.**

The report of the Buffalo Street Railway Company for the quarter ending April 1, shows: Gross earnings from operation, \$267,135; operating expenses, \$168,541; net earnings, \$98,193. For the same quarter last year there was a net loss of \$9,598. The Crosstown Street Railway, operated by the same company, shows: Net earnings, \$24,435; fixed charges, \$22,050; net income, \$2,868. For the same time last year there was a net deficit of \$7,890. President Watson and Manager Littell should rejoice.

**HAY PAVING BLOCKS.**

We have frequently seen pies that were better suited for manhole covers, and biscuits which would certainly have done faithful service as paving blocks, but it has remained for some ingenious crank to suggest the use of hay for paving purposes. Engineering News says: "Compressed hay for paving is reported to be under trial by the Amies Pavement Company of Philadelphia. Under heavy pressure in a Dederick hay press, the dry grass is pressed into cubes and then cut into paving blocks of convenient size. After being soaked in a drying oil it is claimed that the blocks become indestructible."

**THE SONG OF THE "GRIPMAN."**

" You may talk about your hermits' caves,  
Far off from human jars,  
But there's no place for a misanthrope  
Like the Broadway cable cars.  
Oh, with the folks a-standin' up  
I like to play my tricks.  
And see them knock each other down  
Just like a row of bricks,  
I'll start so quickly that they'll fall  
And butt against the door;  
While dignified old gentlemen  
Sit down upon the floor.  
And when they smash each other's hats,  
And scream, and swear, and groan,  
I'd not change places with the king  
Who sits upon the throne!"

—N. Y. World.

**BELTS AND BELT SPLICING.**

F. W. Salmon, writing on the above subject in Power, gives the formula for belt glue used in splicing: 1 pound pure water, 1 pound 2 ounces of clear white glue, 1 ounce of isinglass, to which when hot and thoroughly mixed is added 3½ ounces alcohol, ¼ ounce of white shellac, ¼ ounce sulphuric ether. Sometimes 1½ ounces of dry white lead, or 1 ounce powdered pumice stone, are added to give body to the mixture. This glue should be applied hot to the well scraped laps of the belt to be spliced. The joint is then well hammered with a wooden mallet and clamped firmly until the glue has set.

**BROOKLYN'S TROLLEYS AFFECT L ROAD'S REVENUE.**

When people must travel do they prefer a surface or elevated transit? Do the so-called "dangers" of rapid transit electric and cable cars deter the many from investing nickels in rides to and from business or pleasure? Is elevated transit with steps to climb and stops at stated intervals pleasing to the average citizen? The L roads of Brooklyn, with a sorrowful sigh, say No! The people of Brooklyn, with one accord, say no, and the proposition so stands. Not many months ago the REVIEW showed the falling off in receipts of the Brooklyn elevated lines. This deficit was directly attributable to the electric cars then new. The sequel is that Anthony Barrett, president of the L, has decided upon extensive retrenchments to make up for the loss "on account of the encroachments of the trolley lines." Wages of employes are consequently reduced and all the night platform men discharged. The New York Times says:

The trolley system commands the local transit situation. The increase in traffic on the electric lines surpasses the most extraordinary expectations of the management. The crowding of the cars is not confined to the so-called "rush" hours, when passengers are going to and from their business. It is particularly noticeable in the forenoon during the time set apart for shopping. Along Fulton street and Flatbush avenue, in the retail dry goods district, it is not unusual to see seventy or eighty cars so close together that they resemble a "solid" train. The demand for seats is so heavy that the rolling stock in use supplies it insufficiently. At the present rate of development the railroad companies will have to largely increase the number of cars.

### COL. SINCLAIR AS A BOND SELLER.

When Col. Wm. H. Sinclair sallies forth to do anything the usual custom is for him to succeed. It was thus with the floating of \$1,000,000 of bonds for the Galveston, Texas, Street Railway Company, of which Col. Sinclair is president. These bonds, which were sold to New York parties, will be used in retiring the company's outstanding obligations and in paying off the floating indebtedness. This will consume half of the money thus obtained, while the rest will be used in rehabilitating and reorganizing the service of the road by introducing electricity and rebuilding almost the entire line. Col. Sinclair has the utmost faith in Galveston's future, and he rarely makes a mistake. "With improved terminal facilities," says Mr. Sinclair, "Galveston will be the metropolis of the great southwest."

### THE SMALLEST STREET RAILWAY TOWN IN THE WORLD.

How many people does it take to support a street railway? Will the class in rapid transit please step forward? That is a delicate question.

Here comes an answer from North Carolina, not only from Carolina North, but from Carolina High, in fact from Hendersonville, 2,400 twelve-inch feet above the level of the Atlantic ocean. There the Hendersonville Street Railway Company has builded, to the best of our knowledge and belief, a street railway, in the smallest town supporting such a modern contrivance.

By reference to the directory of street railways at the beginning of this volume will be found the following:

**Hendersonville, N. C.**—Hendersonville St Ry  
Co. Pres Supt & Pur Agt S V Pickens, 1¼ m, 4-3¼  
g, 30 lb. steel T r, 2 c, 1 h, 2 m.

What it does not say is that Hendersonville has only 1,800 people within its borders, and that the one-and-a-half miles of track are at an elevation of 2,220 feet at the lowest point, and rise to 2,350 feet before the end of the mile and a half is reached. Nor does it say that S. V. Pickens, president, vice-president, superintendent and purchasing agent, is one of the most whole-souled men in the south, a lawyer, and a North Carolina prohibitionist. All of this is true, however from a to z.

Yea, and more.

The Hendersonville Street Railway has a franchise for 99 years! To be exact and truthful, Mr. Pickens does not conceal the fact that three of the ninety and nine have expired.

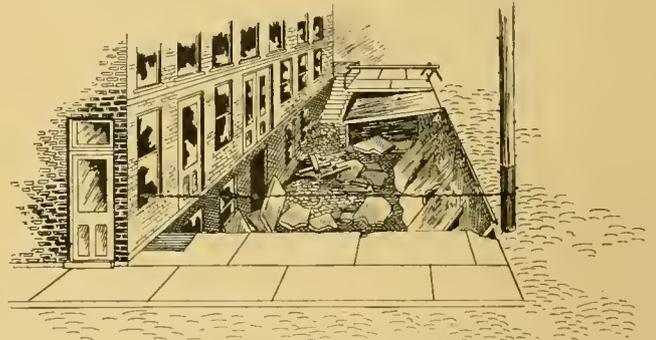

Asheville is twenty-two miles from Hendersonville, and may be reached by the Asheville and Spartanburg Railroad. Summer tourists are numerous throughout this region, and Hendersonville has the best of facilities for caring for the invalid and pleasure seeker. It is situated on a table land ten miles square, and where the town stands it is almost as level as most of Chicago. It seems surrounded by mountains of from 600 to 1,000 feet in height above the table. The town has its own water

works, made by building a reservoir, for a deliciously cold and clear mountain stream, and at the same time getting a natural head of 300 feet.

The street railway runs up the main street, passing all public buildings, theatre, churches, and the domiciles of seven-eighths of the inhabitants. The rolling stock is in first class condition, and the motive power is well cared for by the humane superintendent. Every visitor to North Carolina should not fail to ride up the Hendersonville street railroad, nor miss meeting the genial genius of the enterprise.

### AN EXPLOSION IN CHICAGO.

It will take several fares to repair the damage done to the stone sidewalk of the North Chicago Street Railway Company's offices by a terrific gas explosion on the night of May 16. Leaking gas caused the ruin, igniting from

SIDEWALK IN FRONT OF GENERAL OFFICES.

a workman's lantern. The huge flag stones were lifted clear of their foundations and plunged into the subway. No damage was done to the cable or cable conduit and no one was hurt. The damage to the buildings and pavements was \$5,000.

### FUEL OIL AT AURORA, ILL.

Pending the settlement of the miners' strike, and consequent coal famine in Illinois, the manager of the Aurora Street Railway Company, D. A. Belden, has begun the use of petroleum for steam making. No particular system of burning has been adopted, but two well known burners were purchased and connected up on a plan of Mr. Belden's. It consists in simply piping live steam to each burner with a pump, to maintain the pressure at twelve pounds. There is no tank for reserve supply, but the oil is taken directly from a tank car on a switch track in front of the boilers. Mr. Belden says that had he been using lump coal the oil would have given a distinct and appreciable saving. Streater screenings, at \$1.10 per ton delivered, was the fuel in use, however, with special grates, so that tests must be made to determine the relative economy of oil. Two men in the boiler room are dispensed with under the new plan. As a convenience during the coal strike the idea was commendable, and we await the outcome of the tests.

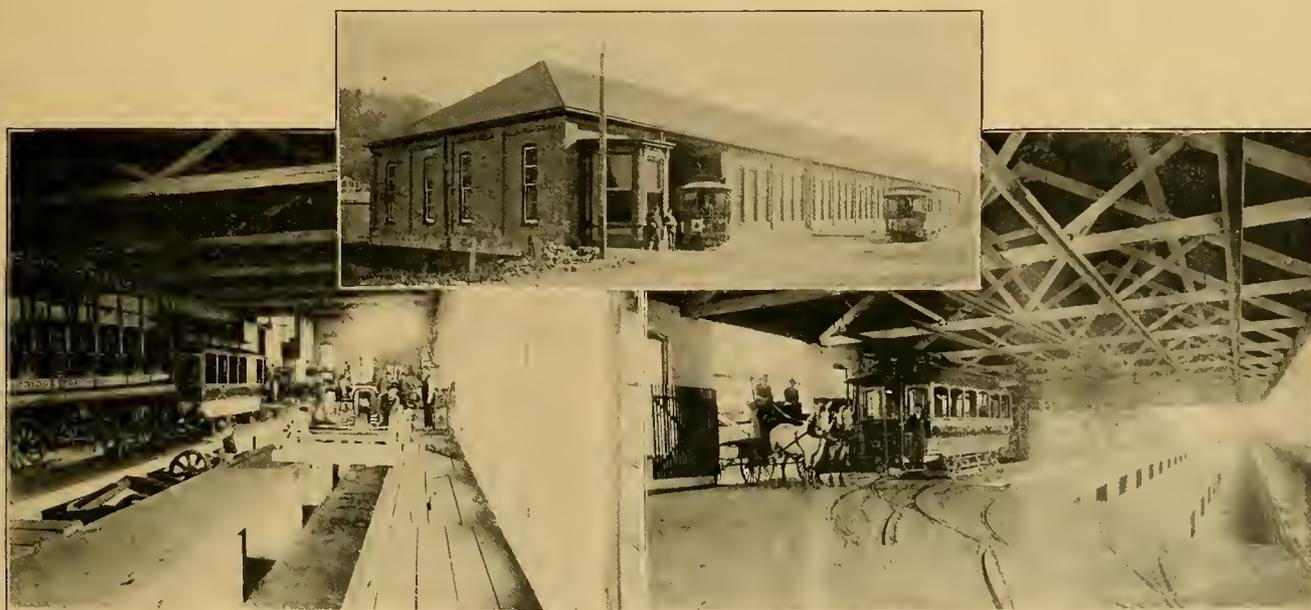

THE NATIONAL SCHOOL OF ELECTRICITY.

A national school of electricity has been organized recently in this city, the object being to form a class under a competent instructor, in every town in the country where the population will justify it. These classes will be held weekly and the course will be forty weeks. The plan if carried out ought to prove a benefit to street railway employes and indirectly to employers. The honorary faculty comprises thirteen prominent electricians. The officers of the corporation are J. P. Barrett, city electrician of Chicago, president; J. L. Little, vice-president; E. L. Powers, treasurer; J. Allan Hornsby, Monadnock building, Chicago, secretary.

C. T. SNEDERKOR, of the home office of Washburn & Moen, is on a few months trip through Europe.

THE WHEELING, W. VA., ELECTRIC LINES.

REVIEW readers will remember an interesting account of the Bellaire, Bridgeport and Martin's Ferry interurban which appeared in the December, 1893, issue of this magazine. It will not be without interest, therefore, to those who are watching the remarkable progress of interurban lines and the sure growth of trunk electric railroads to hear further of railway development in this growing section of the valley of the Ohio. Just across the Ohio river from the scene of our former story is the metropolis of the section, Wheeling, W. Va., a city of modern enterprise, historic worth and electric railway possibilities. Wheeling has now a population of 40,000, with seventeen miles of street railway whereon to ride. The Wheeling Railway Company, which operates the above-mentioned track, is the result of a history.

CAR HOUSE—WHEELING, W. VA.

THE TRUE INWARDNESS OF THINGS.

The Buffalo Times has evolved a wonderful idea and says:

“Strange that it has never been thought of until now! One of the latest inventions in steam power is that of making the grate bars of furnaces hollow, and fitting them with water pipes, so as to utilize for creating steam a great deal of heat which is wasted in the ordinary grate. Nothing strange, though. We have been trying to have the street railway companies have hollow rails made through which hot steam might be forced to do away with the snow nuisance, but they will not do it.”

Another equally good advance would be to make the trolley wires hollow through which the current can pass without exposure to the rain and snow.

THE weather during the past month has necessitated an almost daily change of equipment.

This is the history:

The Citizens' Street Railway Company was incorporated in 1863, and operated in 1867. Until 1887 it was run as a horse line, when the Wheeling Railway Company was organized, which, together with the Citizens' Railway Company, adopted the Vandepoele system of electric traction. It was thus one of the first four street railways to adopt electric traction.

In 1892, a Cleveland and Cincinnati syndicate purchased the line and the Citizens' Railway Company was leased by it. Since then the system has been operated as the Wheeling Railway Company, of which John J. Jacobs was president until his lamented death in November, 1893.

During the years 1892-93, the entire system was rebuilt and re-equipped from the double to the single trolley system. Seventeen miles of new rail also was laid, all 85 to 95-pound girder type.

The power station, a well-equipped and substantial

structure, contains three Abendroth & Root Manufacturing Company's boilers of 270-horse-power each; four General Electric dynamos of 100-horse-power each; one Westinghouse generator of 270-horse-power, and three Ball, cross-compound, high speed engines of 250-horse-power each. The arrangement of the machinery gives most efficient disposition of space and its condition speaks well for the management.

The car equipment consists of 25 St. Louis Car Company's cars and 15 of other make, each having two 15-horse-power General Electric motors. The cars are models of comfort and elegance and the motors give satisfaction.

The roadbed is carefully planned and substantially built, and the excellent service is rewarded by increased and increasing traffic.

The geography of the surroundings is best explained by reference to any good map. The distance from Wheeling to Benwood is four miles; Bellaire is directly across the Ohio; Bridgeport is one mile from Wheeling,

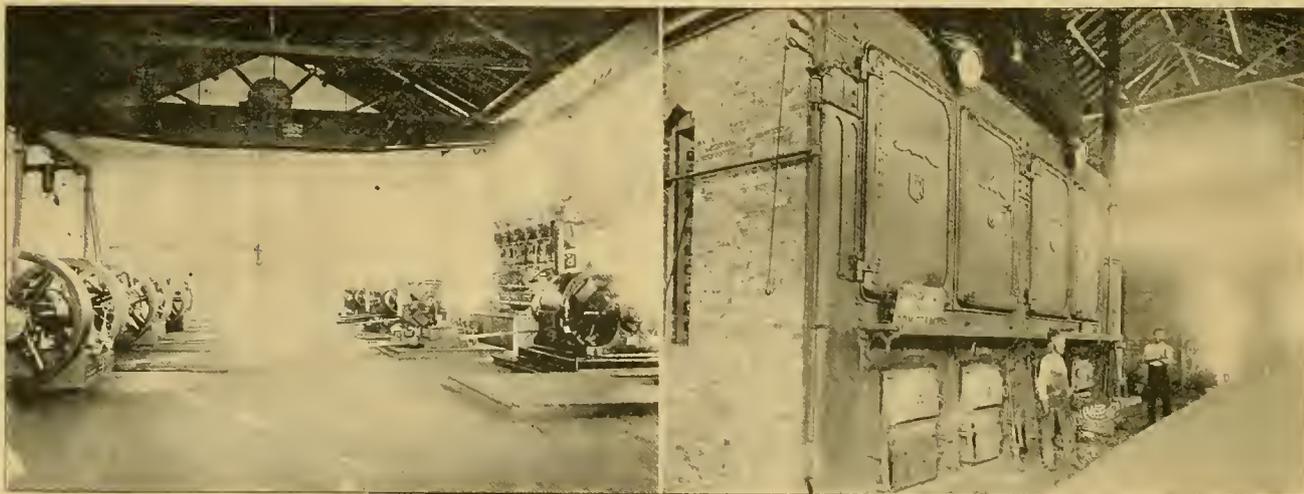

the Ohio river, one being a suspension bridge, and two bridges crossing the back channel. One of the bridges crossing the main channel and both of those crossing the back channel are used by the railway company. The one directly opposite, connecting Wheeling with Bridgeport, is extensively used, more so on account of the railways entering there, the upper bridge being used by the railway company in operating its cars to Aetnaville and Martin's Ferry.

The personnel of the company is: President, Hon. Wm. Erskine, a prominent Wheeling lawyer; C. F. Dickinson, B. S. Allison, J. C. Palmer, Jr., and W. R. Kimball, directors; W. A. Shirley, secretary and treasurer, A. M. Jolly, manager.

THE WHEELING POWER HOUSE.

THE Menominee Electric Light, Railway & Power Company, which was at one time considering the matter of putting in a storage battery as an auxiliary to its central station, has given up the plan and put in additional machinery instead. Battery makers seem to be unwilling to guarantee definite results.

INTERIOR VIEWS WHEELING POWER HOUSE.

Aetnaville two miles, and Martin's Ferry four miles. An island in the Ohio, opposite the city, has become a favorite residence spot and now has a population of 7,000. It is one and a half miles long by half a mile wide. The surrounding towns are feeders to the extent of the following population: Benwood, 10,000; Bellaire, O., 25,000; Bridgeport, O., 15,000, and Martin's Ferry, 15,000.

There are two bridges crossing the main channel of

CHICAGO conductors are noted for their honesty. Recently the West Side Street Railroad Company received from one of its conductors inclosed in an envelope a \$2 bill as a contribution to a conscience fund. A note accompanying it read: "My conscience hurts me. I failed to ring up some of the fares I collected. I could not sleep for thinking over it. I believe the inclosed \$2 will make us about square. May God bless you. May he guide me aright hereafter."

THE SAME EVERYWHERE.

The daily press of the country delights in constantly keeping the public in mind of fatalities which occur in connection with the operation of street cars, and of late years electric and cable cars particularly. As we have frequently shown, the great majority of these accidents are purely the result of no less than criminal carelessness on the part of the victim.

In London, where there are practically no street cars operating on the surface, one would naturally expect there would be scarcely an accident in the streets. The following from the Pall Mall Gazette therefore dispels the illusion and ranks the London cabbie as a more dangerous engine of destruction than the deadly trolley ever dreamed of being:

"A correspondent has called our attention to the alarming increase of human slaughter in the more crowded thoroughfares of London. He complains that there is no sort of supervision over drivers of public vehicles. Even a conspicuous badge is no longer insisted upon, and many of the drivers have no license to show. And he wants to know whose fault it is that the hackney carriages act is not enforced. We suppose it is the fault of the police, who have full power to exact competency and reasonable care from drivers. But at the same time we are bound to say that in our experience both cab drivers as a whole and the constables who regulate traffic are well enough up to their work. But that may be because we have never been slaughtered in the street ourselves."

WHERE CIRCULARS GO.

"Newspaper advertising is all right in its way," said a young business man recently, "but we new advertisers do not stand much show. When I give an advertisement to a trade journal, it is placed among others of its class, and is overshadowed in importance by those of older and better known firms. With circulars it is different. Each stands upon its own merit, and the best wins."

Not long after this conversation, says a writer in the Inland Printer, I stood in the postoffice of a busy country town, awaiting the distribution of the mail.

A man, who was afterward found to be the proprietor of one of the leading stores of the place, came in and opened a lock box. He took therefrom a goodly quantity of mail, piece by piece, and, after glancing at each, tossed a number unopened to the floor.

When asked for his reason for doing so, later in the day at his store, he said: "I have been in business twenty years, and have in that time received so much advertising matter through the mails that I can almost tell a circular by a glance at the envelope, whether sealed or not.

"What I am not sure I will be interested in I do not take time to open. I miss it sometimes, you will observe," with a glance at a partly filled waste basket, "but not often."

This incident was an actual occurrence, and it shows

that, while good results may be obtained from a judicious use of circulars, they can hardly be regarded as being sufficient unto themselves.

GRANDMA'S POEM.

(At a public meeting at Brecksville, O., to encourage the electric line to Cleveland, the following "poem" was read. It may be said to contain more truth than poetry).

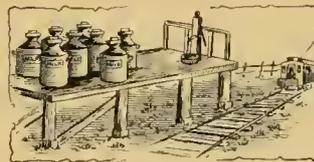

Don't you hear the street car coming!  
 Don't you hear the "ting-a-ling"  
 Over the hills and through the valley;  
 That's the bell; just hear it ring.  
 Horse cars do not suit our times,  
 sir—  
 We know of a better steed;  
 Don't mark us as "hayseed fogies,"  
 We will ride at lightning speed.

And our produce for the market,  
 We will send it every day;  
 Berries that are just delicious  
 We will grow, for it will pay.  
 Berries fresh with dews of morning  
 We will to our cousins take,  
 Ere they eat their early breakfast  
 In the city by the lake.

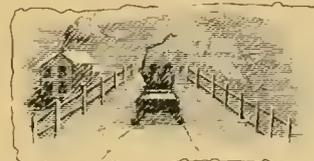

Cows will now be worth the keeping;  
 Jersey cream and butter fine  
 We will send to you in town, sirs,  
 Send it by the motor line.  
 Four quarts of milk will make a gallon,  
 As it did long time ago;  
 And we'll send our friends in Cleveland  
 Milk on which the cream will grow.

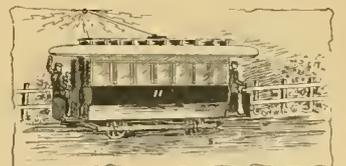

Futile all our plans were proven,  
 If we thought to ride to town;  
 Horse and buggy both were ready  
 But the rain came pouring down  
 Then the roadway was so muddy  
 We perforce must paddle through  
 If this day we reach the city;  
 I don't like it, friends, do you?

And again the icy snow storm  
 Oft prevents the ride to town,  
 And the thought of play or lecture  
 Leaves on many a face a frown.  
 But the street cars now are coming;  
 That's the bell, just hear it ring;  
 O'er the hills, and in the valleys,  
 Listen to the "ting-a-ling"

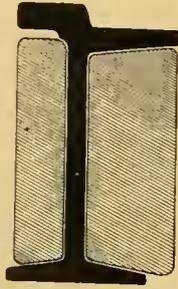

Step aboard now, and be sheltered  
 From the rain and winter's cold,  
 And from fervid heats of summer;  
 There is room for young and old  
 Horses are too slow to suit us,  
 Lightning must obey our will;  
 We are traveling with the times,  
 sir,  
 Don't think we are mossbacks still.

**BRUNER'S BRICK FILLER.**

For the purpose of paving to any type of rail, H. C. Bruner, of Pontiac, Ill., has devised a series of molds for brick, to be made in such shape that they may be used with any pavement. The idea is very simple, as the engraving shows, namely, that of a brick molded to fit a girder rail. It may be made also to fit a T or center bearing rail as well. The idea is a good one, and no doubt will materially decrease the expense of wood fillers along street railway track.

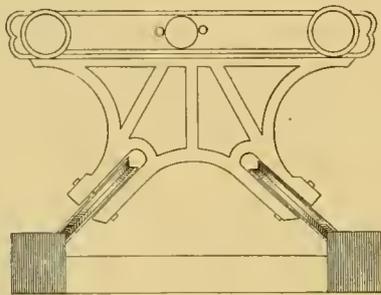

**DA MONK ESCAPED.**

The Allentown & Bethlehem Traction Company, of Pennsylvania, has an unique summer resort of which a feature is a menagerie. Recently a carload of new animals was brought in. Among them was a long tailed monkey. This interesting beast squeezed through the bars of his cage and went for the tallest tree in the grove. The entire force of the street railway, assisted by the population of Manhattan village, rushed to the task of capture, and finally lodged Mr. Monkey where he belonged, but not before more than one pair of trousers had suffered at his paws.

**REINCARNATION OF ELEVATED BICYCLE RAILWAYS.**

The bright, new ideas that inhabit the inventive mind frequently have prototypes in your Uncle Samuel's patent office that throw a shadow of suspicion on the said bright, new ideas. This is especially true of radical

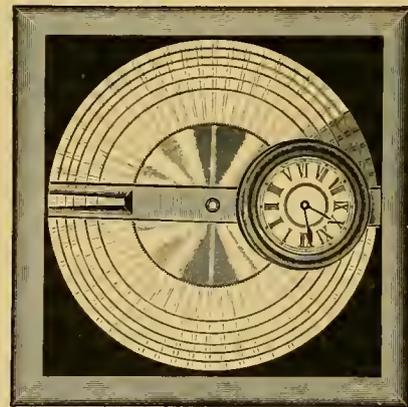

departures so often floated through the daily lay press as panaceas for the rapid transit evils (?) of our parlous times.

In the Scientific American for December 25, 1845, nearly half a century ago, there appeared the plan for an elevated bicycle railway as sketched in the engraving. The inventor claimed that the scheme was particularly adapted for wooden rails "thus saving the great cost of iron." The two wheels seen in the engraving are set at an angle of 45 degrees and act only as guides, the car wheels being flat rollers and running on the square wooden rails also shown. The account of the invention

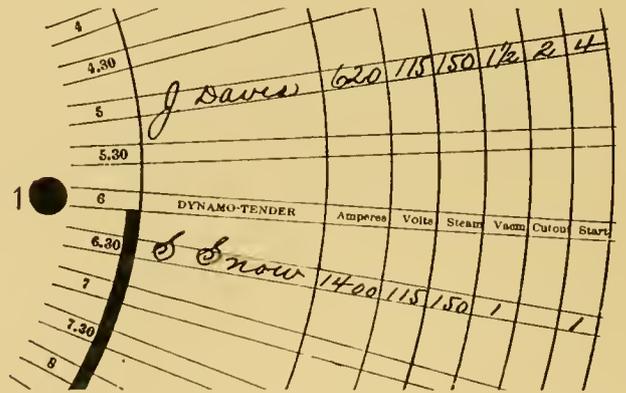

says that a system of this order was in process of building at Wimbleton Common, England, and the American remarks, "If the invention succeeds, and we see no reason why it should not, it will lead to the introduction of wooden rails on many short railway lines from village to village or to manufacturing establishments." The Meigs elevated railway plan shows several points which seem to parallel this ancient plan. Perhaps the perusal of old patent reports by inventors of our day would be productive of a number of other "new ideas."

**THE AUTOGRAPH RECORDER FOR POWER STATIONS.**

Quite a novelty in the way of a station recording instrument is being introduced by the New National Time Recorder Company, of Milwaukee. Figure 1

represents the device, which is 17 inches square. A small section of the dial is shown in Figure 2. The dial is 15 inches in diameter and when in operation is covered by plate glass with the exception of an opening through which the engineer or dynamo tender can write his signature and also the record desired. By referring to Figure 2 it will be seen that the record dial is divided by parallel radial lines into 30 minute spaces, so that a record

can be made every half hour of the amperes, volts, steam pressure, vacuum, dynamos cut out and dynamos started, which records are separated by concentric lines. The heavy black line is the night line and represents the time from 6 p. m. to 6 a. m. Figure 2 shows a record made

at 5 p. m. by J. Davis, the day man, and a record made at 6:30 by S. Snow, the night man. The dials are made to cover a space of 30 hours, so that in case whoever keeps the records does not always change the dials at a certain hour each day, there will be six hours lee way. In using this recorder it is absolutely necessary that the employe should make his record at stated intervals, otherwise that portion of the dial where the record should have been made will have passed away from the slot and will be unaccessible. It can be fastened on the wall or laid on a desk, as preferred, and it will keep good time in either position. It is readily adapted to other business by simply changing the printing of the dials.

**A PURELY ARTIFICIAL PLEASURE RESORT.**

Although we have, in a previous issue, fully described the resort built by the Urbana & Champaign Electric Railway Company,

we can not refrain from again calling attention to the success of an undertaking which seemed so unpromising at first. With nothing but a corn field to start with, and the public ridiculing the idea of making a pleasure resort in a country, treeless, riverless and as level as a floor, the company began late last spring to get the corn field in shape, and in spite of the fact that last year the park bore a very crude and unfinished appearance, the public patronized it to such an extent as to nearly swamp the street railway. This year a professional amusement manager and two theatrical assistants are employed. Admission to the park is free. Theater seats are 10, 15 and 20 cents. The success of this undertaking should be a lesson to those who are

without natural parks in the vicinity. The accompanying actual size reproduction of one of the numerous advertisements sent out gives a good idea of the attractions at the park and is suggestive as to what others can do along the same line.

**THE STILWELL RAILROAD JACK.**

The Stilwell-Bierce & Smith-Vaile Company, of Dayton, Ohio, has put upon the market the car jack shown herewith. The frame is very stiff and of malleable iron, the rack and pawls of forged steel, and the bearings of

machinery steel. The load may be carried either on the foot at the base or on the upper end of the bar. The load, by the arrangement of the pawls, may be raised half or full notch, but is absolutely still during the downward movement. The jack is strong, rigid and reliable.

**THE GIANT SAFETY COLLARS.**

These collars, which are made by the Gouverneur Machine Company, of Gouverneur, N. Y., are manufactured in both solid and split forms. They are chambered to avoid unnecessary weight upon the shaft, but in such manner as to preserve full bearing surface at each end.

SOLID

SPLIT OPEN

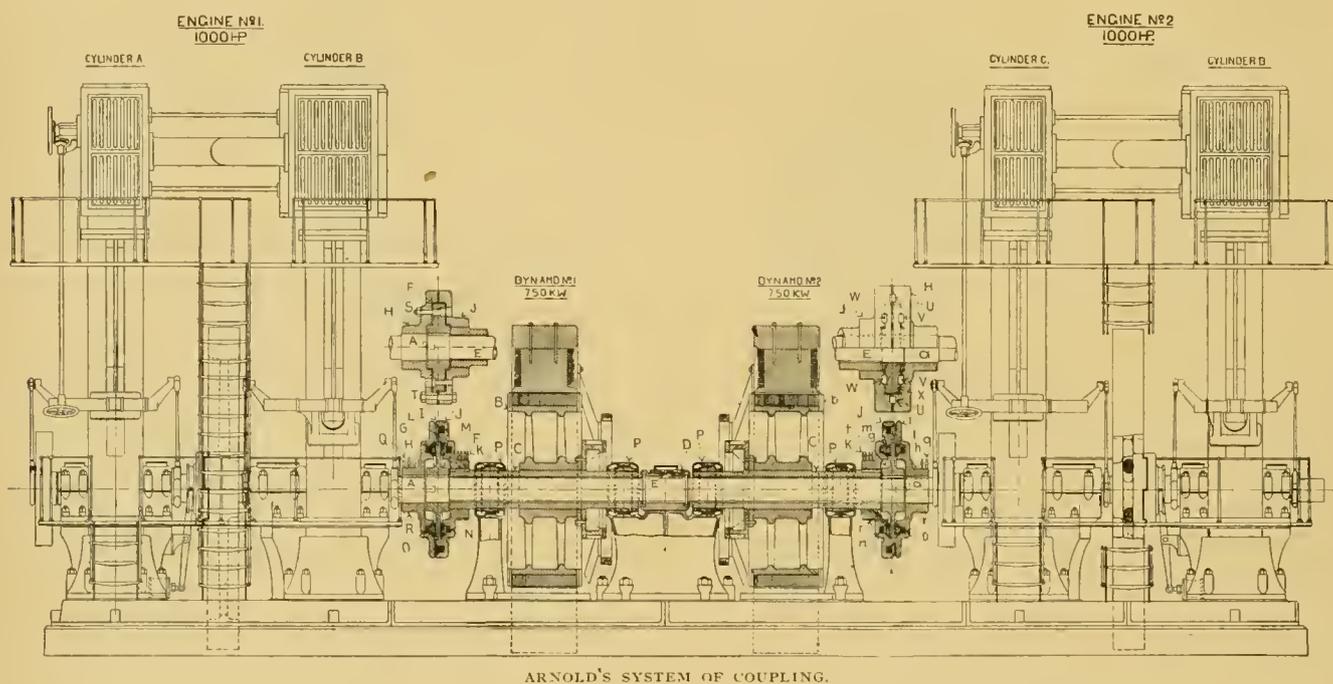

SPLIT CLOSED

The split collars have a hinge joint and may be put upon the shaft in a space equal to their length. When in place the set screw that holds the collar together also secures it in position on the shaft. No bolts are used, and the set screw heads do not project above the surface. They are attractive in appearance, and contain sufficient material to give necessary strength where required, useless weight being avoided.

### THE ARNOLD SYSTEM OF ENGINE AND GENERATOR COUPLING.

The well-known street railway and electrical engineer of Chicago, B. J. Arnold, has designed a system of engine and generator connection which offers a saving both in real estate and first cost over the approved method of plant construction at present. It is now generally considered that a plant, to have the highest efficiency consistent with reliability, must consist of three units, two of which are sufficient to carry the maximum load, while the third is held in reserve. Thus one-third of the plant is lying idle constantly. The Arnold system gives a part of the reliability of three units with but two. As the system of clutches necessary to do this costs something, the saving in investment is not equal to the cost of the third unit,

shaft. The hollow shaft is then coupled to generator Number 1 by energizing the coil N. Thus both generators are run from one engine. The low pressure cylinder of the engine is run as a high pressure in order to give the necessary power to run the two generators. This is, of course, an uneconomical and temporary arrangement, but is only necessary when repairs are being made. In case the magnetic clutch is not used, a mechanical one will serve the purpose, although it can not of course be changed over so readily. A possible form of mechanical clutch is shown above the magnetic clutch in the engraving. The station can be enlarged indefinitely by adding on units at one end or the other of the two already installed, thereby increasing the reliability of the station, in that one engine can be connected to four generators.

but the inventor estimates the saving over the three unit plant at about 20 per cent. The plan is to have the two generators mounted side by side with their shafts in line and with the engines at each end. The generator shafts are hollow and are independent of each other and of the engines. They revolve in the bearings P, p. Through these hollow shafts runs another shaft, not touching the generator shaft in any way, but supported by the bearing E in the center and kept in line by the cone points at each end. In the disks, which are on the ends of the generator shafts, there are magnetizing coils M, m, which, when energized, attract the wedges I, i, on the corresponding engine disks and form a clutch coupling so that each engine drives the generator nearest it. Meanwhile the inner shaft is idle and there is no more friction or wear than in any direct coupled plant. Suppose now, engine Number 1 breaks down. The coil o of the disc on the shaft of engine Number 2 is energized, which has the effect of coupling engine Number 2 to the hollow

### ROBINS FENDER TEST.

The Robins fender has been tested in Philadelphia recently on a car of the Electric Traction Company. Men and boys sat down gracefully in it with the car going seven or eight miles an hour when it struck them, and finally it became so that the "children cried for it," and begged for a chance to be picked up by the device. If the accounts of the test are correct, the fender seemed to answer the requirements of such a device, as far as saving of life is concerned.

THE Patton motor has reappeared in Chicago and a car of this type has been plying for several days on 67th street, between Cottage Grove and Stony Island avenues. W. H. Patton, the inventor, says that a company to be known as the Patton Independent Motor Company, with offices in the Old Colony building, will put it on the market.

### BEAVER'S BALL PARK.

The enterprising management of the Beaver Valley Traction Company, of Beaver Falls, Pa., realizes the value of induced traffic to the extent of arranging at the expense of money, time and trouble, two beautiful popular pleasure grounds, known as Junction Park and Grand View Park.

The site selected for the former was midway on the line of the Traction Company and a mile and a half above the confluence of Beaver River and the Ohio. It contains twenty-six acres of level ground, and what nature and history has not accorded the Traction Company has added to its interests. Within the enclosure of Junction Park is laid out a base ball diamond, a foot ball field and a tennis court. A bicycle course is also prepared and a half mile driving track is arranged for next season. For the accommodation of the patrons of the park a grand stand has been erected. This will seat 1,000, and six tiers of "bleachers" have been placed for the comfort and convenience of a thousand more. Dressing rooms for the participants in the

H. P. BROWN.

It will be mainly a picnic ground, and the excellent natural advantages, coupled with the care bestowed upon it by the Traction Company, make it an ideal place for families and schools as well as for small parties to spend a bright summer day amid the handiwork of nature. Beaver Falls in itself is a worthy object of visit, redolent with the early history of the great commonwealth of Pennsylvania and the Indian wars. Here, too, was the basis of the treasonable operations of Aaron Burr, whose overweening ambition to found an empire in the Southwest territory resulted in his fall and flight.

The officers of the Beaver Valley Traction Company are John M. Buchanan, president; Theodore P. Simpson, vice-president; Stephen P. Stone, treasurer, and Hartford P. Brown, secretary and general manager, whose foresight and earnest efforts have resulted in the increased traffic of the system and to whom we are indebted for the material of this sketch.

### AN ANCIENT PNEUMATIC CONDUIT RAILROAD.

In the Practical Engineer of England, G. A. Sekon tells of a six mile pneumatic railroad, built in 1845 between Forest Hill and Croydon. It was worked by a piston in a cylinder or conduit between the rails. The air was

BEAVER FALL'S PARK.

games and tournaments, refreshment stands and ticket offices, are also provided.

The actual opening of the park was arranged for April 25 and a "combined show" brought out a crowd of 4,000. The formal opening was May 12 with a ball game. Since then, base ball has been the attraction, and the dates are closed until far into the season. The business of the line has been so good that next season more extensive preparations will be made for public entertainment.

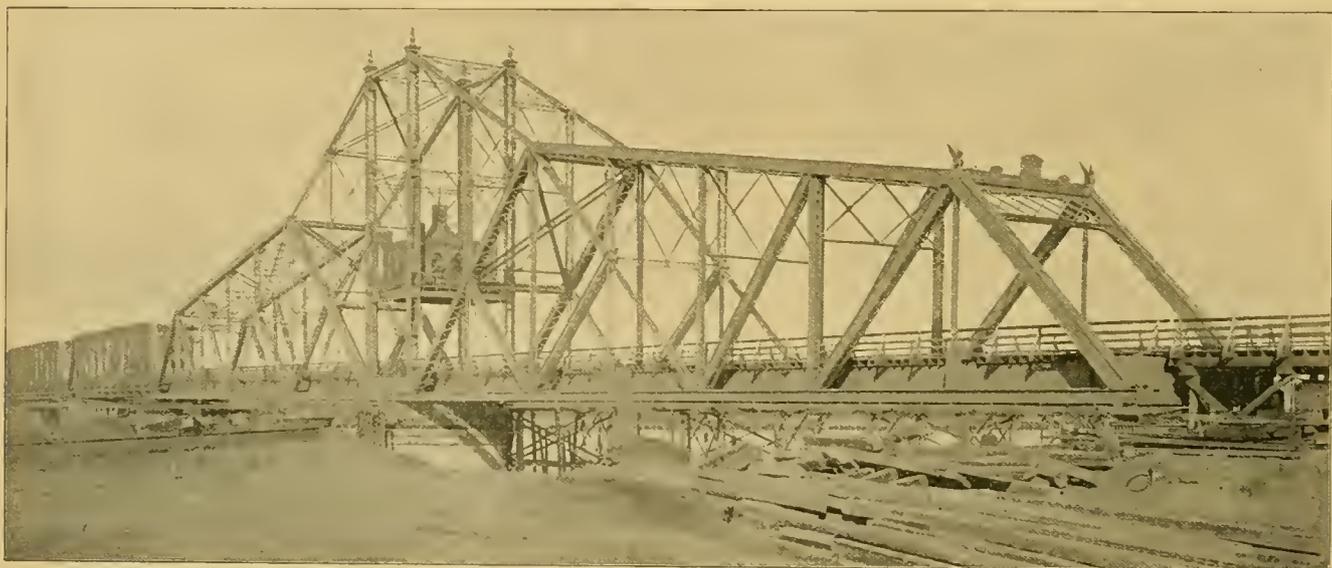

Grand View Park, at the Northern terminus of the line, is now open for the reception of pleasure seekers. The site has many natural advantages, such as caverns, springs, towering rocks, shady groves and lovers' lanes.

exhausted in the conduit in front of the piston. A slot in the conduit which was self closing enabled connection to be made between the car and piston. As impracticable as the scheme appears on its face, the fact remains that the road was run and a speed of seventy miles an hour attained. The conduit slot had leather edges and these were sealed behind the car by an apparatus which fed a sealing composition onto the slot. It would seem impossible to maintain a vacuum with several miles of such a joint, but this was done (for a time at least) by dividing the line into two sections of three miles. In 1847 the South Devon railway opened up a fifteen mile section of this kind of road. The cause of failure of this, as of the others, was the deterioration of the leather of the slot.

### THE LONGEST SWING BRIDGE IN THE WORLD.

The Omaha Bridge & Terminal Company has the honor of being the possessor of the longest draw bridge in the world. The company was incorporated three years ago for the purpose of building a second bridge across the Missouri river at Omaha, and operating steam and street railways in connection therewith. The bridge, which was completed last winter, extends from East Omaha to Council Bluffs. The East Omaha Street Railway will use it to reach Council Bluffs. The span is 520 feet and is swung by electric motors. At present there is only a double track railway on the bridge, but the trusses are provided with places for brackets to carry roadways and sidewalks. It was built by the Phoenix Bridge Company, which does a large amount of this kind of work, and has reason to feel proud of having in this case broken the record for length of draw span. A. C. Sites, the Rookery, is Chicago representative of the Phoenix Bridge Company.

connection will be made with the water pipes at convenient stop valve and fire plug boxes with a small copper plate of known weight, and placed in the moist earth close to the water pipe and allowed to remain there for a definite time, its percentage of gain or loss in weight will be a measure of the current passing to or from the pipe through the plate and into the earth at that place. As a check, a similar test piece of copper, not connected to the pipe, will be buried close to the other in such a way that it will be subject to the same conditions from action of soil and moisture on the copper which may take place independent of the electric current from the water pipe. The proper corrections are to be applied on account of the action that may be set up between the iron and the copper independent of the earth return currents under consideration. I am led to believe that by continuing experiments of this kind and keeping proper record thereof, the affected territory can be definitely circumscribed. The determination of the direction of the street railway return currents must be by volt meter and ampere meter methods.

LONGEST SWING BRIDGE IN THE WORLD.

### EXPERIMENT WITH ELECTROLYSIS AT ST. LOUIS.

The supervisor of city lighting at St. Louis, A. J. O'Reilly, has recently made the following report to the Board of Public Improvements in regard to an experiment that will be tried in that city to determine the extent of electrolytic action on the water pipes.

"It being desirable to make records of the electrolysis at various places along the water pipe system of the city that comparison may be made of the relative extent to which the electrolysis is going on during a definite time in various parts of the city, and, as this cannot be done with any degree of accuracy with the instruments available for the purpose, without a great increase in the number of observers, the following method has been determined upon by the water commissioner and myself. A

### HAVE YOU HAD ELECTRIC MUMPS?

Everything is fast becoming electric, at least in name, but the very latest and decidedly original idea was developed in the courts in Louisville, where the case of Samuel H. Isaacs, administrator, vs. the Louisville Railway Company and the Ohio Valley Telephone Company was on trial.

This was a very peculiar case. Isaacs died in May, 1893, with an attack of mumps. By some means, some active attorney of the bar found out that about six months previous to the time of his taking down with the mumps that he had had a shock from an electric wire, and at once, thinking it a good excuse for a law suit, filed one against the said companies for \$10,000 damages.

After hearing the evidence the same was thrown out

of court; the administrator failed to receive any damages whatever, as it was well established that the said Isaacs safely recovered from the slight shock he had received, and it was a genuine case of the mumps that he died with.

**BRICK PAVING AT LOUISVILLE, KY.**

The city council of Louisville, Ky., has recently passed a complete series of ordinances specifying the manner in which all paving shall be laid, and the quality thereof. As regards brick paving, the ordinance is complete in all details.

It provides that the street surface shall be worked to grade, and that the crown of the subgrade shall be twelve inches below the top of the curbing when set to grade.

ORDINARY SECTION.

After being thoroughly rolled and cleaned and the material approved, a six-inch bed of hydraulic cement concrete shall be laid. The formula for the cement is: One measure of cement and two of clean, sharp sand, thoroughly mixed dry, and then made into mortar with the least possible amount of water; broken stone or hard brick cleaned, drenched with water, but containing no loose water in the heap, to be incorporated with the mortar so as to give a surplus of mortar. This mixture is to be spread and rammed. On the foundation thus prepared, a bed of clean, sharp sand shall be spread two inches deep, and upon this bed the paving brick is to be laid, on edge, at right angles with the street, except at street intersections, where the board of public works may make special orders. Brick must be laid as com-

whole pavement rolled or rammed to the true section. After the rolling and ramming is completed, the joints shall be filled with paving cement, obtained from the residum of distillation of asphalt or coal tar. Then the whole shall be covered with half an inch of sand.

Footway crossings are built three inches higher than the street. When a street railway track is laid in the street, the rails, ties and stringers shall be put in place by the company before the paving is laid, or if afterwards at the expense of the company, as shown in the engravings. Street intersections and curves shall be laid as shown in the plan. A granite liner between the brick and the rail is provided. The space between the track and directly outside is to be filled with concrete.

**NEW ORLEANS' WEST END FIRE.**

Early Wednesday morning, May 23, New Orleans citizens were aroused to witness the most destructive fire of many years—a loss of \$100,000. The West End, a famous pleasure resort, consisting of the West End hotel, bar, wharf, restaurant, promenades, park, band stand and minor appurtenances thereto, was destroyed. It was the property of the New Orleans City & Lake Street Railway Company, of which H. M. Littell is manager. The establishment was well insured in twenty different home

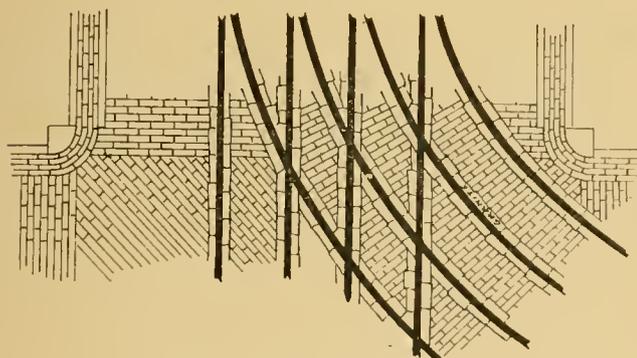

WEST END RESORT.

and foreign companies, and the enterprising manager did not allow the total destruction of the property to interfere with the traffic, but rigged up a band stand and made the smoking ruins "the attraction."

Before the fire the place was a most popular pleasure ground, standing on the shore of Lake Pontchartrain. The hotel, with its broad verandas always in the sweep of the breeze, had a large capacity, and a magnificent view of Spanish Fort and Milnburg. Seats on the beach for hundreds of people and ample band stand room induced a large evening traffic. A new arrangement will be made by the company for next season.

THE coal famine in Ohio has led the Mineral Ridge & Niles Electric Company to adopt a clever method to secure coal. The company has had built a regulation flat car which they can attach to a motor car and haul coal from the Ridge mines to Niles. A similar plan has been adopted by the Trumbull Company.

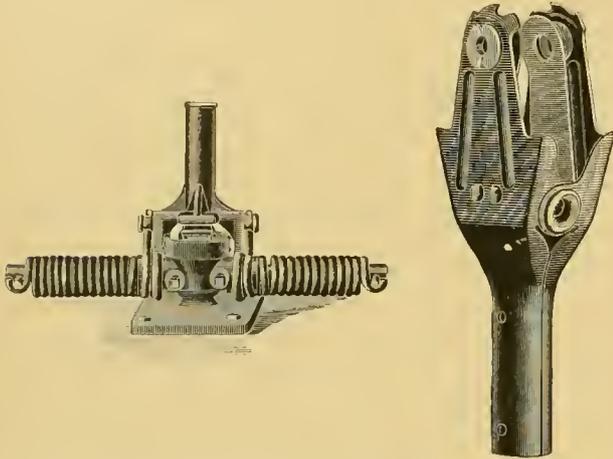

PLAN OF STREET INTERSECTION.

pactly together as possible, and all joints are broken by a lap of at least two inches. The brick must be hard burned, for paving especially, of uniform size and free from flaws. Nothing less than a half brick may be used to break joints. The brick must be burned throughout to vitrification. When the brick has been laid for a distance of sixty feet, the first fifty must be covered with clean, sharp, dry sand, which must be swept in and the

### THE INDEPENDENT TROLLEY.

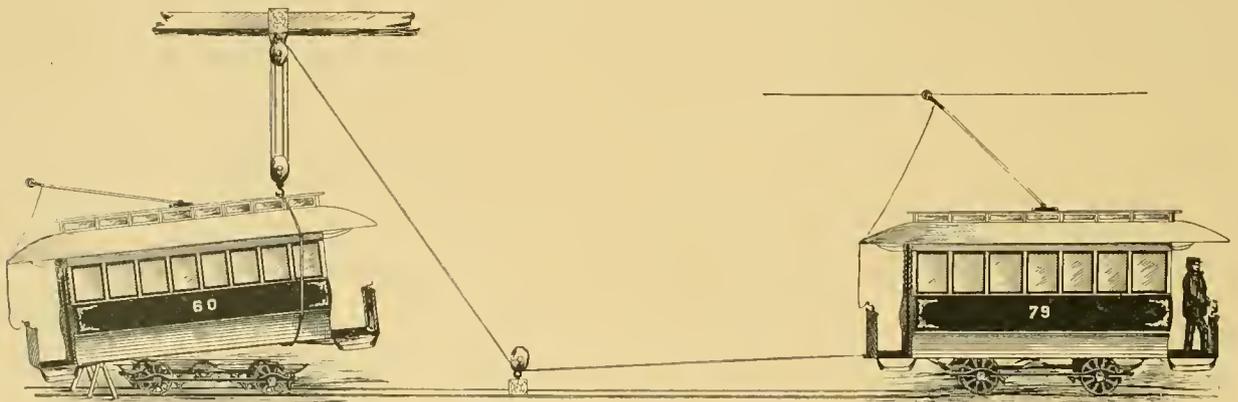

The first noteworthy point about this trolley is that it has a flexible pole of seamless steel tubing. This tube is tapered from  $1\frac{1}{2}$  inches to  $\frac{1}{8}$  inches. The object of this is to relieve the hammering on the overhead construction. The weight of a 13-foot pole is 13 pounds 2 ounces. Another peculiar feature is the roller bearing swivel base. While at first this seems like an unnecessary refinement,

it must be remembered that the strain on the swivel bearing is enormous. The roller bearing used is similar to that used for years on grindstone axles. Torsional springs are used on the base, for the reason that they give nearly a uniform pull throughout their entire range. This is shown in the case of clock springs. This, together with the fact that gravity counteracts the effect of the spring when the pole is bent very low, goes to make the pressure almost even on the wire. The harp is pressed from thin sheet steel, and will receive any type of trolley wheel. The wheel has a hard copper hub with graphite bushing. The harp has flat phosphor bronze springs pressing on each side of the wheel. The weight of the trolley complete is 112 pounds 2 ounces. It is handled by F. Wayland Brown, Cleveland.

### LIFTING CAR BODIES.

Superintendent I. B. Walker, of the Sioux City Street Railway, has a very simple method of lifting car bodies

NOVEL METHOD OF LIFTING CAR BODIES.

off of trucks that is far ahead of the use of car jacks both in rapidity and first cost. It is operated on the principle of a steam railroad wrecking derrick, the motive power being furnished by a motor car running on one of the barn tracks. One end of the car to be lifted has a horse placed under it. Over the other end a large set of pulley blocks are suspended from a beam overhead. The loose end of the rope from the blocks runs through a snatch block attached to the bottom of a post at one side of the track and finally attached to the drawbar of a motor car on the same track as the car to be lifted. All connections between the body and truck are removed, the pulley blocks attached, the motor car started, and up comes the car body. When the body has been lifted enough, the brakes are set on the motor car until the car body is to be let down again. Mr. Walker says that with this arrangement a pair of wheels can be changed in a few minutes. A box car can be brought off the road and have its truck put under a summer car in two hours. The only investment required is for the pulley blocks.

### CIRCLE TO THE RIGHT.

The "belt" of the Underground Railway of London, and the "compartment" cars are responsible for the following dialogue in which an elderly woman and a young man were actors.

She:—Might I ask you, sir, to help me out at the next station?

He:—I should be most delighted, madam.

She:—I would not ask the favor, but you see I'm old and stout and lame, so I have to get out backward, and, every time, just as I get my foot upon the platform, the guard comes along and thinks I'm trying to get in, and before I can stop him he shoves me in and slams the door to, and cries out "Right away," and I've been around the circle three times!

A. W. FIELD, who resigned from the vice-presidency and directory of the Peckham Motor Truck & Wheel Company, has accepted the managership of the Boston office for the same company, a position which he held in conjunction with his former duties.

## STREET RAILWAY LAW.

EDITED BY FRANK HUMBOLDT CLARK, ATTORNEY AT LAW, CHICAGO.

*Expelling Passenger for Failure to Comply with Rules.*

Where a street car company has adopted a rule against passengers riding on the platform, a request by the conductor that persons violating the rule shall come inside the car, in observance of the rule should be complied with, whether the person had notice of the rule or not; but when he wantonly refuses to obey, the Company has the right, at once, to expel him, using no more force than may be necessary for that purpose.

This is an action in case, brought by the appellee to recover damages for being ejected from one of appellant's street cars, after he had taken passage thereon. A trial resulted in a verdict and judgment for ninety dollars.

The evidence shows that appellee took passage on one of appellant's electric cars at a time when all the seats inside the car were occupied, but when there was plenty of standing room within, and the aisle was clear. He, with three others, took position on the rear platform, when they were requested by the conductor to go inside. It was against the rules of the company to allow passengers to ride on the rear platform. The others pressed in, but appellee refused. He was several times so requested by the conductor, but each time refused, and persisted in standing on the platform. At length the conductor told him he must either go in the car or get off, and refused to go further with the car until appellee should comply. Appellee then left the car, no violence being used toward him. The conductor did not lay his hands upon, nor offer to do so.

It is difficult for us to understand upon what theory the plaintiff is entitled to damages. The rule which he refused to comply with, and because of the enforcement of which he was denied passage on the car, was established for the safety of passengers, and the convenience of employes operating the car. It was a reasonable and proper rule. He saw fit to stand out in defiance of it, evidently from sheer stubbornness, or to invite an assault from the conductor. A street car company has the right to require a passenger to observe all reasonable rules tending to promote the safety and convenience of passengers, and the successful conduct of its business. So long as a passenger observes such rules, the company is bound to carry him; but when he wantonly refuses to obey them, the company has the right at once to expel him, using no more force than may be necessary for that purpose.

Appellee contends that he had not sufficient notice of the rule. We do not think it was necessary for the conductor to have exhibited the rule, or told appellee in terms that the company had adopted such a one.

The request of the conductor was reasonable, made in observance of the rule, and it was the duty of appellee to comply, instead of standing out against it with childish obstinacy, as he did. The conductor should have control of his car, with the right to enforce all needed regulations, and all reasonable requests made by him with that end in view should be obeyed by passengers.

The judgment will be reversed, and, inasmuch as we find that the facts are such that the plaintiff has no cause of action, the cause will not be remanded.

(Illinois Appellate Court. Fort Clark Street Railroad vs. Ebaugh. 49 Ills. App. Rep. 582.)  
*Consolidation of Street Railway Companies—Original Charter—Obligation of Contract.*

Certain street railway corporations, organized before the adoption of the Tennessee Constitution in 1870, consolidated their property and franchises after the adoption of said constitution. Nothing in the constitution or subsequent acts of the legislature indicated any intention to deprive such consolidating companies of any privileges or franchises exercised under their old charters. The said constitution required all corporations to be formed in pursuance of the general laws, whereas the said consolidating companies had been organized under special charters. *Held*, that under the rule that the presumption must be that the consolidated company preserves its original charter rights and burdens intact, unless the contrary is expressed, the said corporations did not, by the act of consolidation, subject the irrevocable rights granted by the original charters to the dominion of the state; and neither the state nor a city thereof could take away from the consolidated company the right to use a certain street under a right granted by the original charter to operate a street railway "on all or any of the streets in the city."

(United States Circuit Court, Western District, Tennessee. Citizens' Street R. Co. vs. City of Memphis. 63 Federal Rep. 736.)

*Motive Power—Stringing Trolley Wires—Injunction.*

The mere fact that a charter granted to a railway company contains some provisions usually contained in special charters granted to railroad companies, such as condemnation of land, and the taking of the railroad by the state, does not require the charter to be construed so as to prevent the construction and operation of a street railway within a city, where the charter expressly confers upon the company the right to construct its railroad from some point within the city to a point without, as well as along any street of the said city.

In an ordinance of a city, consenting to the construction and operation of a railroad within the city, the words "horse railroad track or tracks," must be taken as descriptive of the railroad to be constructed, and not of the motive power to be used, when the terms "horse railroad" and "street surface railroad" have come to be convertible.

An act entitled "An act providing for the placing of electrical conductors under ground in cities of this state, and for the creation of a board of commissioners of electrical subways," provides that no electrical wire or cable shall be constructed along, across or above the surface of

any street or avenue in any city without authority from the board created by the act. *Held*, that while the general object of the law is to require electric wires occupying the streets of a city to be placed underground, the commission is authorized to permit wires to be strung in cities until such time as the overhead stringing of wires can be terminated without hardship.

Where the authority of a street railway company to string its trolley wires without the consent of the said commissioners is doubtful, the company is not entitled to an injunction restraining an abutting owner from cutting down the wires which it has placed above the walk in front of such owner's lot.

(New Jersey Chancery Court. *Patterson R. Co. vs. Grundy*. 56 American and English Railroad Cases, 486.)

*Reorganization of Street Railway Company — Assignment of Contract Rights — Using Track of other Company.*

Two corporations organized under the general laws of the state, each holding assignable street railway franchises, entered into a contract (each acting for itself, its successors and assigns) by which the first agreed to pay the second, as a consideration for authorizing it to run its cars over its track, four cents per mile for each and every mile traveled by each and every car run over its tracks; said agreement to last during the term of the charters granted to the said respective corporations, or of any extension of said charters, provided that, in case the first company shall cease to use the privileges granted to it in the contract, then, and in that case, the agreement shall be ended. *Held*, that where the first company is in undisturbed possession of the right, exercising and enjoying it every day, it cannot release itself from its contract obligations on the claim that the agreement was *ultra vires* of the powers of its officers; that where under such a contract the second company conveys all its rights, property, and franchises, specially including therein its rights under the agreement mentioned, to a third company, which assumes all the obligations of the former under the agreement, there is nothing in the assignment of which the first company can complain; the said third company having been organized by the stockholders of the second company, and for the express purpose of acquiring all the rights, property and franchises of the old company, and assuming all its obligations, and the old company having postponed its dissolution until after such transfer and *assumpsit* should have been made, the new company, for the purpose of the contract declared on in this case, was merely the old company organized under a new name.

(Supreme Court of Louisiana. *Canal & Claiborne R. Co. vs. St. Charles Street R. Co.* 44 La. Ann. 1096.)

*Injury to Child — Obstruction in Street — Construction Company — Who liable for Injury.*

In an action against a street railway company for the death of a child, it was not claimed that the city had any active agency in causing the accident, further than giving

the construction company a contract to build a sewer, and its ordinances required the construction company to so place the excavated material as not to interfere with travel on the streets or incommode occupants of adjoining property, and to observe all ordinances in relation to obstructing streets, etc. *Held*, that if the city were liable at all, it was for negligence in permitting the construction company to violate its ordinances by creating and maintaining a nuisance.

A construction company, under a contract with a city to build a sewer, made a temporary wall of the pavement blocks which had been torn from the street, leaving an aperture through which people might pass upon a foot-path five feet wide along the side of the street railway. Travelers had been accustomed to use this pathway, and did not usually cross the street railway at this point. It seems that the construction company had left the aperture in the wall for the purpose of accommodating travelers, and to avoid obstructing the street. A child, in attempting to cross the railroad, after having passed through the small aperture, was killed by a passing car. *Held*, that the construction company was not a joint *tortfeasor* with the railroad company, because it could not logically nor reasonably be maintained that there was any necessary connection between the death of the child and the work of the construction company.

(Supreme Court of Missouri. *Stanley vs. Union Depot R. Co.* 56 American and English Railroad Cases, 561.)

*Negligence of Car Driver in Frightening Team — Contributory Negligence.*

In an action against a street car company for injury to plaintiff's horses, caused by collision with defendant's car, it was held that the plaintiff was not guilty of contributory negligence in selecting the street upon which the injury occurred, when he might have gone another route, although the space between the tracks and retaining wall was narrow, and an electric railway causing noise calculated to frighten horses was being operated on that track.

The conductor on the street car was guilty of negligence in not stopping or slowing up his car, which was running at a high rate of speed, where, as soon as he came in sight of the plaintiff's horses, they began to rear and jump, and the conductor saw, or ought to have seen, in the exercise of ordinary prudence, the team, and that they were frightened.

If the driver of a wagon was placed in a state of peril by the negligence of the motorman of the street car, the company is responsible for the consequences which ensued, though the peril might have been increased by an effort made to avoid it, or might have been lessened or escaped in the exercise of unusual courage and self-possession, provided the driver used the care of an ordinarily prudent man, under all the circumstances.

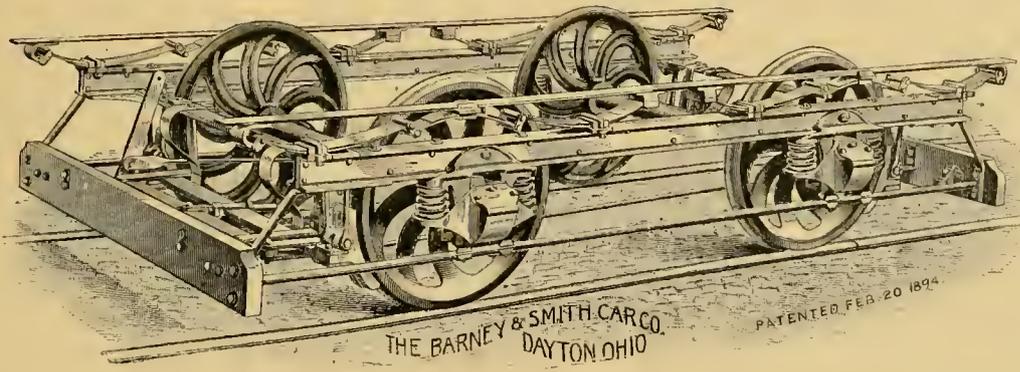

If the driver of a vehicle is placed in a state of peril by the negligence of those having charge of a car, the company is responsible for the consequences, since

“a defendant cannot impute a want of vigilance to one injured by his act, as negligence, if that very want of vigilance were the consequence of an omission of duty on his part.”

(Supreme Court of Pennsylvania. Gibbons vs. Wilkesbarre & Suburban St. R. Co. 155 Pennsylvania State Reports, 279.)

**BARNEY & SMITH TRUCK.**

The new car truck manufactured by the Barney & Smith Company, of Dayton, O., is giving much satisfaction on the lines where it is being used. Oscillation is eliminated by a very liberal use and favorable combination of springs. Two kinds of springs are used. The elliptics are between the car body and frame and the spirals between the frame and car axles. Of the latter there are four sets of three springs each, one set over each journal. These springs are so proportioned and connected on the cantilever principle that a load applied at any one of the points of support is felt equally by the

whole set, and is thus distributed over a considerable distance on both car body and truck frame. The truck frame is thoroughly cushioned from destructive vibrations. The spring base is ample to properly support the car body, being 13 feet for a 6½ foot wheel base. To hold up the ends of long open cars the truck is built to receive a set of braces which are not shown in the engraving. The frame is strong and simple. The side frames are continuous and straight. The latter feature will be appreciated by those who are familiar with some forms of built up frames. No gray iron casting enters into the construction of the frame, it being composed entirely of steel, wrought iron and malleable iron. The brakes are very powerful, with wrought iron beams and levers, and the breaking of hangers will not let the parts drop on the track nor hinder its working. The failure of one of the chains or either of the connecting rods disables the apparatus only so far that it can be applied from but one end of the car, but from that end, however, with maximum power.

THE Neville Island & Coraopolis electric railway of Pittsburg has introduced a freight service for hauling garden produce to the city.

**THE SARGENT SHOE.**

Modeled after the M. C. B. Association pattern, the Sargent Company, formerly the Congdon Brake Shoe Company, of Chicago, has produced the Standard brake shoe and head for street railway service. The standard measurements for the head are determined for the face which fits the shoe alone, as the back must be made to fit any particular kind of beam used by the railway. The measurements are almost identical with the standard adopted by the Master Car Builders' Association after long study. The advantage of standard measurement to the store keeper and to the repair shop are so obvious that no mention of it need be made here. The Sargent Company will mail blue prints, with full dimensions, to any manager interested.

THE West End Street Railway Company of Boston is declared to have a soul, by the daily press. Recently a number of its employes were burned out of their homes

by a South Boston fire. The Company immediately established the unfortunates in a new tenement, and purchased all their housekeeping requisites, besides two week's supply of groceries. Eighteen families were thus assisted.

**The Big Four Route Has the Best Terminal Facilities at Chicago.**

All trains enter Chicago on the Illinois Central tracks along six miles of the Lake Front, through the most picturesque portion of the city, and land passengers in the magnificent new Central Station on Twelfth street and Lake Front. This station is convenient to the Auditorium, Richelieu, Victoria and Leland Hotels, and within two blocks of the State and Wabash street cable lines and the South Side Elevated Railway. Convenient stops are also made at Hyde Park, Thirty-ninth street and Twenty-second street stations.

Magnificent vestibuled trains, parlor cars, Wagner sleeping cars, private compartment buffet sleeping cars and superb dining cars. No transfer across Cincinnati to make connections.

Your ticket should read via the Big Four route to enjoy these privileges. E. O. McCormick, Passenger Traffic Manager; D. B. Martin, General Passenger and Ticket Agent, Big Four Route, Cincinnati, O.

### THE SORROWS OF THE OLD MAN.

It was a summer day in Chicago. The sun was behind the clouds somewhere getting up a new meteorological disturbance, and three men had just been into the superintendent's office to offer advice on the question of open cars.

It was inventors' day.

The seventh inventor came in and turned down the fur collar of a rather battered coat. Six of his kind had run the gauntlet of the private secretary and had made their painful way into the superintendent's presence.

Fifteen others had gone away dragging their hearts along the floor, where they had fallen with an obtuse concussion of low temperature, when the young man, whose business it was to head off inventors, had informed them that this office is not an asylum for cranks or a rendezvous for experimenters. Three had been killed and thrown into the cellar in order to make their presence more seldom.

The seventh was now before a frown, for the best natured superintendent cannot hold in check the frowning propensities of his face at the sight of a model or an inventor's blue print.

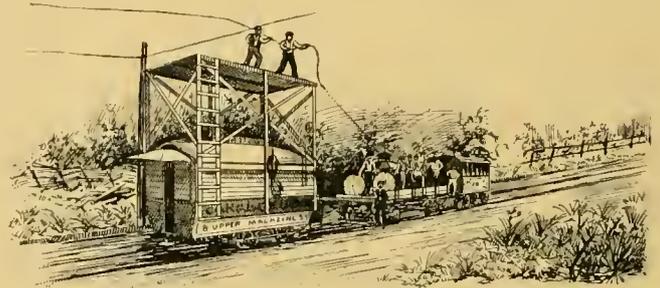

"Are you the superintendent?" asked the inventor. "I am," was the reply, less stern than the frown betokened. Thus encouraged, the inventor unrolled his drawing and continued, "For years I have been greatly distressed over the great loss of life on our street railways, and it has led me out of my regular business to do what I could to allay this destruction of life. I have solved the problem, and now offer you the result of my thoughts and labor. It is a fender for your cars which will do its work perfectly in every case—the only practical, common sense fender ever gotten up."

The curiosity of the superintendent was fully aroused. Four of the preceding six who had succeeded in getting before him, had exhibited also the only perfect fender. He glanced at the drawing and it took but a moment to see that it was all the inventor claimed for it. It would do its work perfectly and absolutely. To provide against any contingency, in case the first blow did not kill, the contrivance picked the victim up bodily, pitched him several feet high and more than that broad, where, if the fall did not finish him, he was left to the mercy of heavy trucks and hurrying vehicles. "You have never been in the street railway business, I believe," said the superintendent. "No," the inventor replied, "I am an undertaker, but my experience——" and while the private secretary and the elevator boy tried to resuscitate the nerveless form of their superior the inventor drifted into the henceness and reappeared a few hours later at the office of the STREET RAILWAY REVIEW, where the religious editor listened patiently for an hour to a detailed description of the "wonder."

THE first horse-car in Buffalo, N. Y., was run in the "middle thirties," and the president and general manager was also conductor and driver.

### THE NEW ORLEANS TOWER WAGON.

The New Orleans Traction Company has designed for its overhead work a simple and efficient tower wagon, a representation of which is shown herewith. It was made by taking an old horse car and erecting above it a substantial platform, properly girded, with a ladder at one end as shown. It was moved by an old dummy engine, also a relic of pre-electric days. It is safe, convenient and cheap. The car is used as a storage for tools and wires.

stantial platform, properly girded, with a ladder at one end as shown. It was moved by an old dummy engine, also a relic of pre-electric days. It is safe, convenient and cheap. The car is used as a storage for tools and wires.

### FREE RIDES FOR THE UNFORTUNATE.

The generosity of the management of the West End Street Railway, of Boston, is becoming proverbial. In another place we mention the kind treatment of certain of its employes' families that suffered a total loss of household goods by a fire and here we take occasion to mention that the company distributes 70,000 tickets per annum to various well known and reputable charities, such as hospitals, infirmaries and the like, for redistribution to worthy persons who may need an outing on the street cars. The tickets are not good on Saturday and Sunday, and only during the hot weather. On the reverse is this legend: "The person riding on this ticket waives all claims against the company for any accident growing out or incident to such ride."

The mayor and board of aldermen are made almoners of this interesting and generous charity. This method of gaining public approval might be followed to advantage in many other places.

### DECORATION CROWDS IN CHICAGO.

On Memorial Day the North Chicago Street Railroad Company enjoyed several advantages over the other city roads. The cemeteries of Calvary, Graceland and Rose Hill are reached by the north lines, and the bicycle road races began and ended at Lincoln Park. The receipts were between \$8,000 and \$9,000, and about 150,000 passengers were carried. The increase over ordinary traffic of the post-Columbian year was very satisfactory. The South and West Side street railways also did a good business.

JOHN FOX, for thirty-five years an employe of the Brooklyn City Railway Company, died recently at the age of 57.

## STREET RAILWAY FREIGHT LINES.

The Beginning of an Industry that Will Still Further Supplant Horses—Inauguration of a Slow but Sure Change in Our Cities.

The electric railway freight service began with the long interurban road. It gives promise at present of not only seriously interfering with the business of the farm and stage horse but entering our cities and relieving the city truck horse of some of his work.

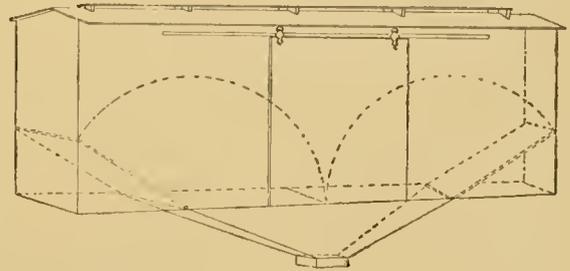

Like other innovations it will meet with bitter opposition on the part of teamsters and the kicking public, but in places where it will pay it is bound to come. The only question in most cases is as to what extent the street railway would be able to compete with teams. In large cities, where there are many large commercial houses depending on teams, freight haulage by street railways would undoubtedly be the cheaper. In very large cities the business would have to be done principally at night.

A very important move in this direction has been made in the city of

## SPOKANE, WASHINGTON,

where the various street railway properties are controlled by the Washington Water Power Company, which concern, besides owning the water power in the city, operates a large flouring mill there. This mill was built several years ago, and owing to various causes trackage facilities by steam railways have not been extended to it and to a number of other similar industries, and so far the output of these industries has been handled by means of teams. Within the last two months the subject of reaching these industries and handling their incoming and outgoing freight by electric cars has absorbed the attention of the local property owners, and after a more or less bitter battle a franchise has been granted the Spokane Street Railway Company, authorizing the company to make connection with the steam transfer track of the Northern Pacific Railroad and to operate an electric freight car along Front avenue over the tracks on which it now runs passenger cars, terminating at the C. & C. mills, with branches from the main line reaching other mills not yet reached by side tracks, and the depots of the Spokane Falls & Northern Railway, the Union Pacific Railway and Great Northern Railway, thus giving the electric system complete connection with all the depots and railways centering in the city. As the ordinary tracks of the electric railways are used for this freight car, it was not deemed advisable to move steam cars on the tracks, especially as the curvature of the streets would have been a serious obstacle, and necessity therefore compelled the design of electric freight cars specially arranged for the cheap handling of the freight. As a result a very ingenious car was designed by the manager of the company, and was built in the company's car shop the details of which are sufficiently novel to justify full description. All grain is taken to the mills in bulk. It is brought in from the country in box cars and has to be handled into the electric cars. Temporarily this is being done by hand, but a small elevator is nearly completed, and the grain will then be moved out of the steam cars

by an electric power shovel and dumped into the boot of the elevator, which, running also by electricity, will lift the grain to a bin, from which it will flow by gravity into the freight car. The car itself is 16 feet long and 7 feet wide in the clear. It is an ordinary box car, mounted on Brill No. 13 trucks, with 6½ foot wheel base, and is equipped with two No. 8 Edison motors, which have been rebuilt in the shops, so that the maximum speed with 30-inch wheels is now six miles an hour. In outward appearance the car is like an ordinary freight

car, except that there is a hopper under the middle. In the center of the floor over the hopper are two trap doors, opening up from the center and swinging back against the ends of the car. When the traps are down the car has a level floor. When they are up the car is transformed into a huge hopper, of which the hopper under the car forms only the lower part. The principle is easily seen from a glance at the accompanying sketch. At the spout of the hopper is a steel gate. When the car is loaded it is run down to the mill, where it passes over the mill sink, the hopper spout of the car coming, when the car stops, immediately over the aperture of the sink. The steel gate is then drawn, and in less than a minute the contents of the car gravitates into the mill sink, and from thence finds its way into the mill elevators for grinding. The hinge floor of the car is thrown down to the center and the load of flour dropped into the car ready for transfer to the steam cars, by which it is shipped to China or Japan. The car at present used in the work carries about 250 bushels of wheat in a trip and a similar quantity of flour out. A larger car of the same design is now being built to carry 10 tons at a load. In the month of February the car handled in 230 hours, running between the dry kilns and the mill, some 64,000 bushels of wheat. This work was performed by one man, and a boy acting as trolley boy. The car has been on the road now for three months, and has never been to the shops for repair. In handling the output of the mills there is a piece of line of 900 feet of 5 per cent grade and a 55 degree curve with 4½ per cent grade, and the car travels up these curves smoothly and rapidly. The car has been found exceedingly convenient for delivering macadam along the road between the rails. Macadam is loaded into the hopper portion of the car, and when its distribution is required the steel gate is drawn, the current is thrown on, and the car delivers its macadam evenly on the track to be surfaced.

Under the franchise granted the company is compelled to handle freight at 15 cents per ton each way, and to

accord any mill owning its own car current and right-of-way over the tracks to any depot reached, at a charge for the service of a sum not exceeding \$2.50 per car per day. With one car such as that in use the wheat in and the flour out of a 1,000-barrel mill can be handled in fifteen round trips, or in one day's work. The route selected is on a street, the property on which is suitable for wholesaling purposes, and already some of the property owners are agitating the question of putting spur tracks into their property, so that freight can not only be handled in but handled out in less than carload lots, thus doing away with the cost of drayage between the wholesale establishments and the depots.

The last two months of operation has demonstrated that even with the convenience now perfected, the mill product can be handled at a less charge per steam freight

ELECTRIC FREIGHT SERVICE IN MAINE.

car than the switching charges prevailing in the city, viz., \$2.50 per car, and while it involves extra handling, the cost of this handling is exceedingly small. The development of the plan started in Spokane will no doubt be watched with a good deal of interest by the electrical fraternity, and the use of the car tracks in the city for freight purposes may prove to be a considerable source of revenue to the companies, to say nothing of the revolutionizing changes it suggests in city freight hauling methods. W. S. Norman, manager of the company, has handled the matter in a very creditable manner, and we feel sure that if others would show the same ability that Mr. Norman has shown in this direction, freight hauling would soon be a common thing in many other cities.

#### ANOTHER MAINE FREIGHT LINE.

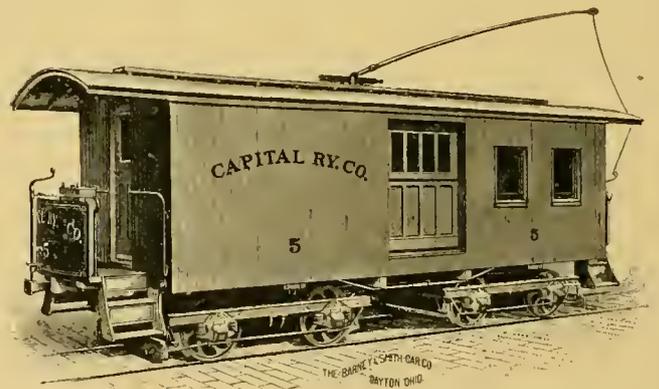

In our issue of January last we described the Mousam River Railroad, which was one of the first to enter the freight hauling business with a locomotive. We now have the pleasure of showing the freight locomotive used by the Rockland, Thomaston & Camden Street Railway for a similar service. In this case it is a combination box car and locomotive. Each of the four axles is provided with a 25-horse-power W. P. motor. There is an additional freight equipment of two flat and one box car, used as trailers. The track connects with the Maine Central Railroad at Rockland, so that cars can be run into the freight depot of the latter road. From this depot all the through freight is taken. The local freight, which is the

greater part of the business at present, is delivered to the car. At Camden, the northern terminus, eight miles north of Rockland, the street railway has a freight depot at which goods are left under the same conditions as on steam roads.

The rates are \$1.50 a ton, except in the case of large shippers, who get a rate of \$1.25. Freight is billed to all points on the Maine Central and connecting railroads. It is usual to transfer all freight from the steam to the street railway cars at Rockland, but in several cases standard freight cars heavily loaded with machinery have been hauled the eight miles to Camden. There are some very sharp curves and steep grades (in one place  $8\frac{1}{2}$  per cent on a curve) but as yet everything has been hauled that the attempt was made to handle.

#### FRANKFORT, KY.,

is the scene of other profitable operations in the way of street railway freight. The Capital Railway Company, with its  $5\frac{1}{2}$  miles of electric line, of which Pat McDonald is president, and John T. Buckley, secretary and general manager, has inaugurated a transfer service

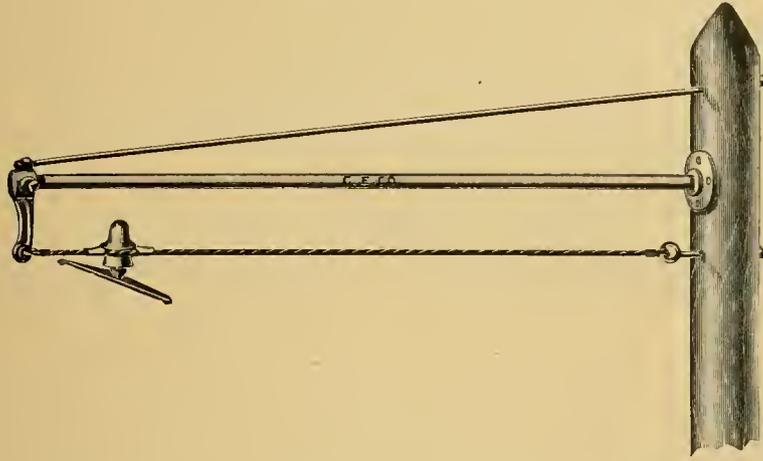

CAPITAL CITY FREIGHT CAR.

by which it carries freight in car load or broken lots over its road from the trunk roads entering the city, to manufacturing establishments. The motive power for this work is furnished by a combination freight and passenger motor car. This car, with its trucks, was built by the Barney & Smith Manufacturing Company, of Dayton, O. Its length over all is 28 feet. The wheel base of the two trucks is 5 feet. There is a 25-horse-power General Electric motor on each axle, and these motors are controlled by a special series-parallel controller. They are thrown with gradual changes from four in series to four in parallel. There is thus a very great range in speed and draw bar pull. By putting all four in series an enormous load can be pulled at a slow speed with economy. It will pull from one to three loaded freight cars up a six per cent grade and around sharp curves.

No small part of the freight business comes from the world renowned distilleries of this region, to which switch lines run. They, of course, use a large amount of freight. Strange to say, the road has to have a power plant. It would be thought that with so much 40-rd lightning on tap, this would not be necessary. However,

as the power station seemed to be one of the orthodox things to have in connection with an electric road, one was installed, with a 175-horse-power Dick & Church engine and two 80-horse-power Jenney dynamos. The scattered nature of the town and factories helps to make

has been found a very useful car during severe winter weather in breaking roads. By placing it behind a snow plow it will go through nearly every drift ever encountered. Besides using the locomotive for handling freight and snow, it is used in the busy summer season to haul two open trail cars afternoon and evening. "In fact," says M. H. Mero, "we have no more useful car on the road than our locomotive."

CREAGHEAD BRACKET.

the passenger and freight business in conjunction very profitable. The freight trains are run between the regular passenger cars.

The overhead work is notable as being that designed recently by the Creaghead Engineering Company. In the suburbs, bracket construction is the order. The Creaghead Company has not only reduced the cost of bracket work with the accompanying design, but has reduced the cost of maintenance due to insulators on rigid supports.

Fifty-six pound T rails are spiked to 6 by 8 inch white oak ties two feet between centers. The country is very hilly, necessitating many cuts and fills.

The electric equipment throughout was superintended by The Creaghead Engineering Company. Superintendent John T. Beckley will gladly answer all communications from those engaged in similar projects.

The freight business has been running something over a year, but has only recently been put in good working order. Owing to the cut-throat competition of teams, there has been very little money in the venture so far, but the teamsters are beginning to realize that they can not keep up such competition much longer and are going out of the business.

Mr. Mero says: "Everything considered, we are well pleased with the freight business and have no doubt but that the ensuing year will show a success financially for it."

#### THE HACKMENS' COMBINE DOWNED.

Judge Dallas, of the United States Circuit court, at Philadelphia, has handed down a decision denying the petition of the United States Government for an injunction restraining the Gettysburg Electric Railway from building its line across the battlefield. The operation of the road will now proceed. The only sorrowful ones are the hackmen, who have been reaping a golden harvest for twenty-five years from the visitors to the field. The route of this now famous line was illustrated by the REVIEW last year.

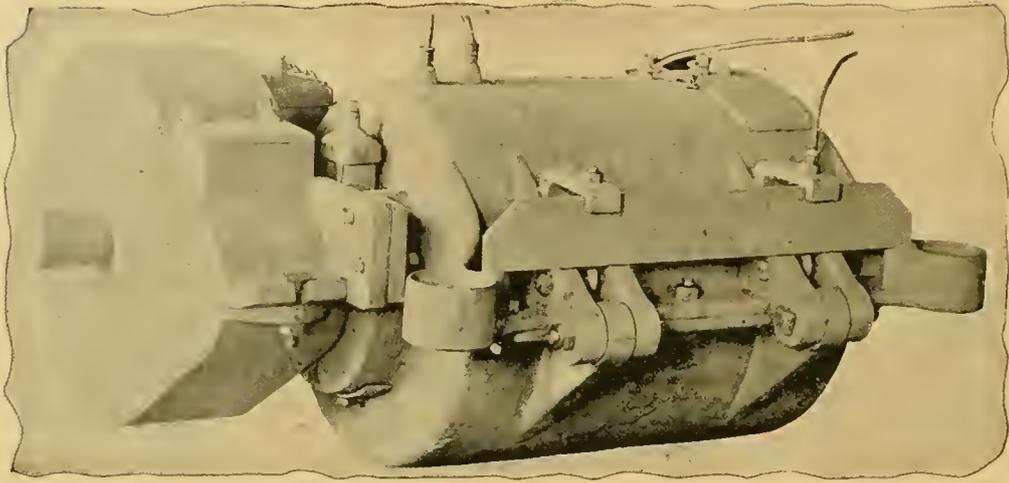

A MERRY T rail war has been waged at West Chester, Pa., with the victory for the T people.

ELECTRIC FREIGHT TRAIN—CAPITAL CITY RAILWAY.

At present only one round trip is made per day. The labor is performed by a conductor, who is the freight agent, and a motorman, who helps handle freight. In addition to the freight earnings of this locomotive it

It is rumored that the occasional complaints that the trolley cars in Brooklyn run too fast are instigated by the elevated competitors who greatly suffer in consequence.

THE CARD STREET RAILWAY MOTOR.

It is our pleasure this month to welcome another company to the field of street railway motor manufacture. The recruit is the Card Electric Company, of Mansfield, O. The motor now offered by this company is a very compact and rigid arrangement of steel castings, and is entirely enclosed as are all modern motors. As will be seen from the engravings the motor is opened by swinging down the lower half. The hinge is on the end of the motor away from the car axle. Liberal contact is provided for the joints in the magnetic circuit at the point where the upper and lower halves of the motor frame come apart. The frame itself is very rigid. In the rear view is shown the steel bar for strengthening the cast extensions which form the spring supports. It equalizes the strain so that it does not all come at the corners. To lower the bottom half which holds the armature bearings a small chain block is fastened to a beam of the car body and to the extension made for the purpose on the lower half of the motor case. The armature and lower field can then be swung down by one man. The bearings on the car axle are not interfered with in this operation. The armature is the slotted drum type. The commutator is so constructed that by standing the armature com-

mutator end up, any segment can be renewed without interfering with the others. Thus a commutator with a soft segment may be saved to a long and useful life. It often happens that the life of a commutator is very short, simply because there is a soft segment and frequent turning down is necessary. When the armature is on end in the manner stated the segments are held in place by the angle at which the segments fit in the recesses. Special provision is made against oil creeping along the shaft and getting into the commutator and armature. This is done by placing a rubber ring between the hubs of the end plates.

The controller is neat and strong and of a rather novel design. Instead of having a number of sliding contacts the contacts are made and broken by eight automatic quick break switches actuated by an equal number of cams on the shaft of the controller. Every contact is thus broken in a quick and positive manner, and there can be no continued arcing. All the switches and cams are exactly alike, and there is only one size of wood screw and one size of machine screw in the whole controller.

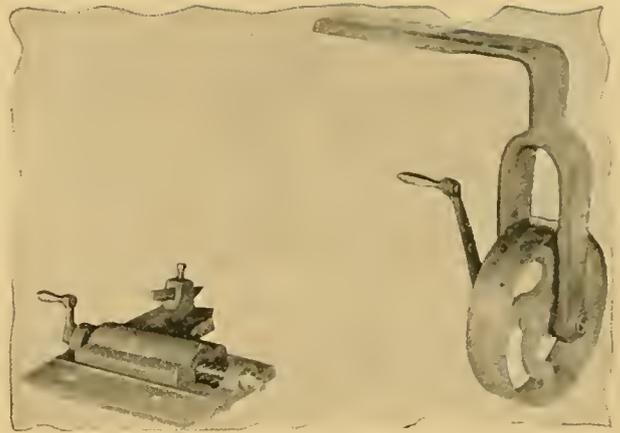

Another feature of the equipment that will be appre-

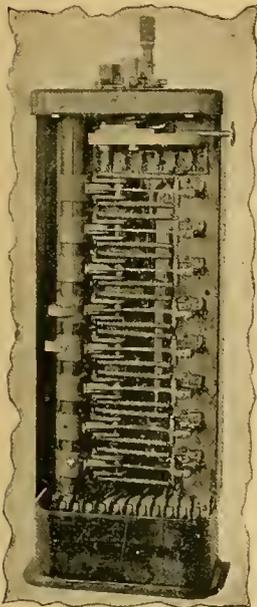

REAR VIEW OF MOTOR.

ciated is the provision made for turning down the commutator without taking the armature out of its bearings. Not only is it a great saving of labor to be able to do this, but it does away with the danger that the shaft centers will be thrown out by careless workmen when putting the armature in the lathe. When the latter happens the commutator will run eccentric to the shaft. With the armature in its bearings this can not happen. To turn down commutators two simple attachments are bolted to the open frame of the motor. One of these is the tool holder. The other is a crank and pulley, over which a leather belt is run to the pinion. This is a very simple outfit as compared to a sixteen inch swing lathe with the necessary provisions for driving.

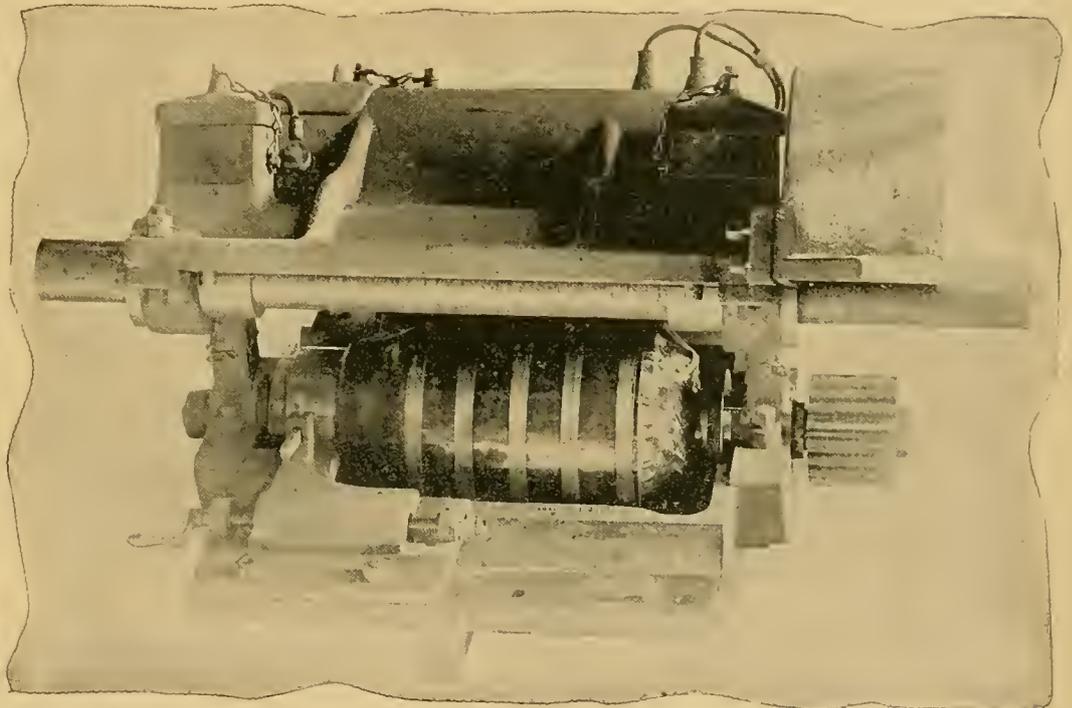

The Card Electric Company advocates the use of single motor cars for the majority of street railways now

OUTFIT FOR TURNING DOWN COMMUTATOR.

CONTROLLER.

CARD MOTOR—OPEN.

operating, and has built its motors with this end in view. For very heavy service it does not deny the advisability of two motors on a car, but it claims that there are few places where a properly designed single motor would not do better; the first cost and expense of maintenance being so much less for the single motor. In proof of its proposition it offers the experience of the road at Mansfield, where "a double motor equipment was never on the line and is not needed." It is a hilly road with grades as high as  $7\frac{1}{2}$  per cent.

J. Holt Gates, the well known and successful sales agent, whose offices are in the Monadnock building, Chicago, will represent the Card interest in this city, and will bring to his new work a large and valuable acquaintance, among the street railway fraternity.

THE "no spitting" signs in Brooklyn cars are backed by the conductors. One was recently asked how he did it. "O," he replied, "when I see anybody about to spit I grab him by the throat, stop the car, and send for a cuspidor!"

A STREET car jaunt was recently taken by Winfield S. Nevins, of the Boston Herald, who started one morning from Oldtown, on a sixty mile ride on electric cars, which brought him back to Salem the same day in the evening. From Oldtown he went through Newburyport, Amesbury and Haverhill to Lawrence, thence skipping the ten miles between Lawrence and Wakefield, from the latter town to Boston, and then from Boston to Lynn, Salem and Wenham.

## OPERATING EXPENSE OF THE INTRAMURAL ELECTRIC ELEVATED RAILWAY.

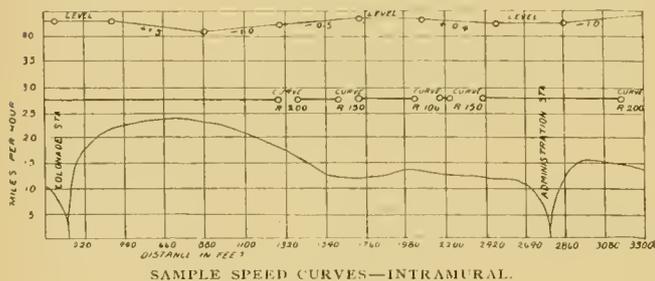

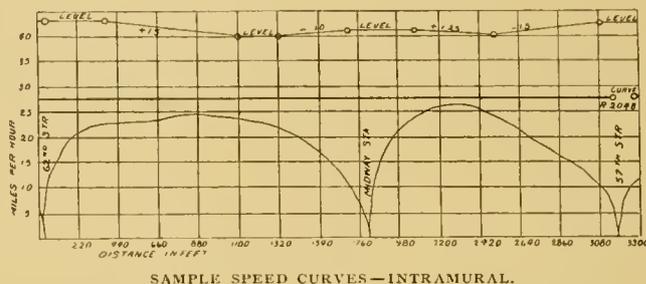

The question of applying electricity in the operation of elevated railways is perhaps the one problem most prominent before the minds of engineers at present, since the decision of the Metropolitan of Chicago to use transmitted power.

The REVIEW for May contained a complete statement of the operating expenses of the Liverpool elevated, and the present number, by the kindness of General Manager W. E. Baker, is able to set forth in detail the results of the six months' operation of the Intramural railway at the time of its commission and use, and the public has since evinced a lively interest in its commercial history.

The line has been previously described in this magazine in detail, both as to its construction, its power plant and its cars, so that a brief resume is all that is necessary to bring to mind the premises of the present argu-

nothing of elevated cars, and yet, with these odds, not a single accident occurred in the handling of 5,803,895 passengers.

To each motor car were attached four G. E. 2,000 motors weighing 3,800 pounds each, including gears. Weight of motor car total, 44,600 pounds; weight of trail car, 27,000 pounds; one motor and three trailers to each train, making total weight of train of 62½ tons. Horse-power of each motor, 133. The highest speed run was 32 miles an hour; average speed, 10 miles.

Actual operation required 42-horse-power per train or a total of 500 horse-power for twelve trains. On Chicago day 125,476 passengers were handled on fourteen trains, with a mileage of 1,000 or 125 passengers per train mile.

During August, accidents from all causes necessitating stoppage of system made a total of 28 minutes in all; 20 minutes of this was from steam troubles.

The total earnings, expenses and net per train mile of the system for the term may be seen in the following table. May is eliminated, as the Fair had hardly opened and the system just being tested:

|           | PER TRAIN MILE. |           |        |
|-----------|-----------------|-----------|--------|
|           | Earnings.       | Expenses. | Net.   |
| June      | \$2.82          | \$0.81    | \$2.01 |
| July      | 2.44            | .70       | 1.74   |
| August    | 3.08            | .63       | 2.45   |
| September | 4.40            | .67       | 3.73   |
| October   | 5.12            | .71       | 4.41   |

The cost per passenger for the whole term, including the month of May, was \$0.021

The average current per train is indicated in the accompanying table of tests.

|                      | K. W. HOURS. | NO. TRAINS. | AVERAGE K. W. HOURS. |
|----------------------|--------------|-------------|----------------------|
| August 2, . . .      | 1,752 min.   | 12          | 24.4                 |
| August 30, . . .     | 2,690 max.   | 12          | 32.0                 |
| Average (totals) .   | 671.4        |             |                      |
| September 2, . . .   | 2,528 min.   | 12          | 30.3                 |
| September 18, . .    | 3,396 max.   | 12          | 40.4                 |
| Average (totals) . . | 744.4        |             |                      |

The average for August and September gives 31.4 k. w. per train = 42.0 horse-power.

For the month of August the following is an exhibit of cost of the various departments of service:

ment. The Intramural consisted of a wooden elevated structure of a sufficiently strong character, but temporary enough to be wrecked at the end of the period without too great waste. The columns were of wood, carrying wooden stringers and girders, surmounted by double tracks and four extra "third" rails for the current. The total length was three and a quarter miles of double track, looping at either end. The power house was a temporary structure also, but, although laboring under this difficulty, was well founded and amply sufficient for far greater output than was found necessary at any time during the exposition, with the exception of one occasion. Twelve trains during September and October was the maximum number of trains in use, with less numbers during the first of the exposition period. The month of May with its disappointingly small crowds has considerably affected the expense account in the total, and in strict justice to the management should be eliminated in a judgment of success or non-success of the project. The fact, too, that absolutely no data or precedent was available, made another difficulty which can be appreciated only by those who have gone through a similar experience. The road, of necessity, abounded in curves, varying from 200 feet to 90 feet in radius and 22 in number. Stations were 1590 feet apart, and the most of the passengers were totally unused to any trains, to say

## EXPENSES FOR AUGUST.

### POWER HOUSE.

Fuel \$1,379.17 (oil burned); labor \$1,348.18 (30 per cent of which was Exposition labor, which, strictly speaking, should not be counted); lubricants and waste, \$134.14; train miles run, 32,058; ton miles (empty trains), 2,042,094; passengers carried, 1,000,672; operation of power house per ton mile; fuel, 0.00067 cents; other expenses, 0.00072 cents; total, 0.00139 cents; total kilowatt hours developed in August, measured by Watt meter, 133,049.

### OPERATING EXPENSES.

|                               | TOTAL.      | PER TRAIN MILE. |
|-------------------------------|-------------|-----------------|
| General expenses, . . .       | \$ 4,763.89 | \$0.1486        |
| Transportation expense, . . . | 12,716.78   | 0.3966          |
| Maintenance way and bldgs     | 1,209.38    | 0.0377          |
| Maintenance equipment, . . .  | 1,393.15    | 0.0434          |
| Total, . . . . .              | \$20,083.20 | \$0.6263        |

The cost of operating per train mile then was \$0.626 and the cost of fuel \$0.043.

The exhibit in the accompanying table is self-explanatory. It gives the expenses both of operating and for motive power for each month of the term.

The men employed on the pay-roll during the term for operating the system were as follows: Train service, 110; power house, 51; repair shops, 132; station service, 151; general offices, 23. This number was, of course, large in a few departments, resulting from a new system, but the handling of 5,000,000 in six months, with a train service of 110 men, deserves attention.

The repair shops employed 133 men because a large part of this work was really construction. Men competent to do the work were difficult to obtain, and more numerous changes were made in this department than any other. On August 15th the total number employed, including time keepers, inspectors, etc., was 25.

The total repairs for the period were \$5,916.35, of which electrical equipment counted \$4,047.28; electric power plant, \$38.91.

### TWO COMPARISONS.

The lessons to be drawn from the above statements are many, and we refrain from further detail except as regards comparison with steam elevated roads. The Manhattan Elevated, of New York city is chosen, and the cost per train mile shown. It must be borne in mind, however, that the Manhattan is a long established line. Its expenses have been worked down to a minimum with

## GENERAL EXPENSES.

|   | MAY.        | JUNE.       | JULY.       | AUGUST.     | SEPT'BER.   | OCTOBER.    | AVERAGE.    |
|---|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Pay rolls.....                                    | \$ 7,150.95 | \$14,673.52 | \$19,259.00 | \$19,904.80 | \$14,466.71 | \$14,774.26 | \$14,204.87 |
| Cost, per train mile, all items.....              | 1.69        | .81         | .70         | .63         | .67         | .71         | .87         |
| Oil, per train mile, (gallons).....               | 8.99        | 2.88        | 3.44        | 2.19        | 3.56        | 4.36        | 4.28        |
| Cost of fuel, per train mile, (cents).....        | 15.54       | 4.97        | 5.95        | 4.30        | 6.15        | 7.54        | 7.408       |
| Operation of power house, per train mile, (cents) | 15.46       | 5.61        | 6.15        | 4.21        | 4.08        | 4.20        | 6.618       |
| Wages motormen, per train mile, (cents).....      | 8.42        | 6.74        | 6.38        | 6.09        | 6.09        | 6.53        | 6.708       |
| Oil, per passenger.....                           | .38         | .10         | .14         | .08         | .08         | .08         | .172        |
| Passengers, per train mile.....                   | 23.75       | 28.31       | 24.46       | 30.97       | 44.29       | 51.32       | 33.85       |

## MOTIVE POWER EXPENSE—(CENTS.)

|                | Repairs, Equipment. | Fuel. | Lubrication Car. | Power house Wages. | Motormen's Wages. | Lubrication, Power house. | Repairs. | Total. | No. Motors. |
|----------------|---------------------|-------|------------------|--------------------|-------------------|---------------------------|----------|--------|-------------|
| JUNE.....      | 3.26                | 4.97  | 0.47             | 5.61               | 6.74              | 0.28                      | .06      | 21.39  | 8           |
| JULY.....      | 3.13                | 5.95  | 0.32             | 6.15               | 6.38              | 0.79                      | 0.29     | 23.01  | 12          |
| AUGUST.....    | 3.04                | 4.30  | 0.40             | 4.21               | 6.09              | 0.38                      | 0.42     | 18.84  | 12          |
| SEPTEMBER..... | 5.09                | 6.15  | 0.23             | 4.08               | 6.09              | 0.77                      | 0.28     | 22.70  | 13          |
| OCTOBER.....   | 6.12                | 7.54  | 0.42             | 4.20               | 6.53              | 0.70                      | 0.57     | 26.08  | 11          |

The second comparison shows that:

|                               |                         |              |  |    |                       |
|-------------------------------|-------------------------|--------------|--|----|-----------------------|
| In 1887 the Manhattan carried | 158,963,232 passengers, | at a cost of | \$4,498,462 <sup>79</sup> / <sub>100</sub> | or | \$.028 per passenger. |
| In 1889 " " "                 | 179,497,433             | " "          | 4,858,703 <sup>89</sup> / <sub>100</sub>   | or | .027 " "              |
| In 1890 " " "                 | 185,833,632             | " "          | 4,854,202 <sup>86</sup> / <sub>100</sub>   | or | .026 " "              |
| In 1891 " " "                 | 196,714,199             | " "          | 4,975,141 <sup>07</sup> / <sub>100</sub>   | or | .025 " "              |
| In 1893 " Intramural          | 5,803,895               | " "          | 121,848 <sup>02</sup> / <sub>100</sub>     | or | .021 " "              |

If the rate per passenger on the Manhattan, in 1891, had been 2.1 cents instead of 2.5 cents, the saving resulting, would have been, \$786,856<sup>80</sup>/<sub>100</sub>, to the Manhattan system.

the precedent of many years to draw lessons from. With the Intramural, the conditions were exactly antipodal. A new system, no precedent, temporary construction, vicious curves, short stops, and an immense num-

ber of passengers. The first comparison is of the cost per train mile on the Manhattan and the Intramural.

|                               | Manhattan. | Intramural. |
|-------------------------------|------------|-------------|
| General expenses .....        | 6          | 16          |
| Transportation expenses ..... | 44         | 44          |
| Maintenance ways .....        | 6          | 3           |
| Maintenance equipment .....   | 8          | 7           |
| Total.....                    | 64         | 70          |

The Overhead Electric Railway at Liverpool, England, shows an operating cost of 8.030 cents per train mile.

The value of comparisons of the three systems of elevated railways now most in evidence may not be of very great moment, as the conditions of each system are so radically at variance. The Intramural had, without doubt, the most to contend against, both as to practice and surroundings—a short time for proving its efficiency and a most trying roadway as to curves. The Liverpool Elevated, on the other hand, has a good straight route, plenty of time for construction, the very lowest priced labor, and cheap fuel convenient to the power house. The Manhattan Elevated has had years of trial in which to prune off too luxurious expense accounts, and a tried and tested system of locomotion, worked down to the last analysis of mechanical ingenuity and economical practice.

The basis upon which to compare, without giving tedious explanation, may therefore be stated as follows: 1, Generating station wages; 2, drivers' wages; 3, oil and waste; 4, repairs; 5, coal or fuel. Supervision is matter entirely governed by local necessity, magnitude of the undertaking and like environment.

The statement of the three systems is tabulated thus:

| Item.             | Liverpool  |                       |
|-------------------|------------|-----------------------|
|                   | Manhattan. | Overhead. Intramural. |
| Power house wages |            | 1.224 4.85            |
| Drivers' wages    | 8.93       | 2.118 6.36            |
| Coal or fuel oil  | 8.92       | 1.690 5.78            |
| Oil and waste     | .25        | .272 .95              |
| Repairs           | 2.41       | .178 4.13             |

This statement is, of course, "cents per train mile," and totals are withheld in justice to each of the systems as it is not right to compare the totals where the components are, in a great measure, results of local conditions.

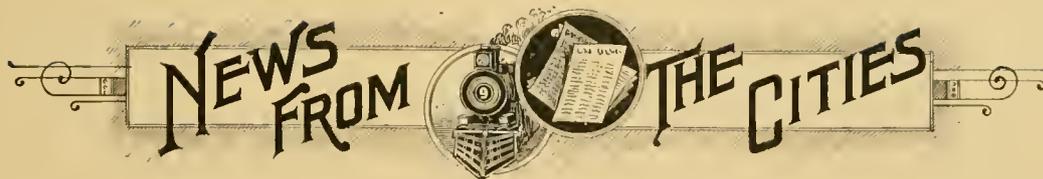

### THE CRADOCK ROPE RECORD.

Our readers will remember the engraving in our January issue, of a section of rope made by Geo. Cradock & Co., of Wakefield, England, which had run 98 days in the tunnel loop of the North Chicago Street Railroad. In the April issue of a certain street railway publication, an individual signing himself an "American Manufacturer," disgraces both himself and the publication by a very mean and insinuating letter, in which it is intimated that the section of rope in question was not representative of the condition of the whole or was possibly a piece of new cable prepared on an emery wheel. He says: "The beautiful illustration makes one feel real sorry for the cable railway which threw away so perfect a cable pre-

maturely. It may be, however, that portions of the cable were in a very bad condition; would it not have been better to have shown samples of worn cable, as it is easy to find plenty of good samples carefully prepared on an emery wheel."

It is perhaps a sufficient answer to this to state the fact that the 98-day rope was not "thrown away," but has since run over twenty-eight days on Clark street, and is still running at this writing. It was certainly not strange that the rope was taken out of the tunnel loop long before it was worn out, as the loop is the key to the whole North Side system, and a stop on the loop means a blockade for the whole system. On any of the other lines a breakdown affects only the line on which it happens. Further on he refers to the 98-day run as a chance record, and one upon which no weight can be put as showing the quality of the cable. Such records are not made every day of course, but if the "American Manufacturer" had read through any of the articles which were published on the subject he would have seen the records of all the previous Cradock ropes used on the loop. We do not pose as an advocate of any English or American manufacturer although our sympathies are naturally on this side of the Atlantic, but we believe in calling a spade a spade, and if an English manufacturer turns out a rope that makes a remarkably good record in a certain place he ought to get the credit for it. We can say for ourselves and we think also for other technical papers that if an American cable should make either a good average or a high individual record in any place, it would be published with pleasure. There may be places where the Cradock rope would not show such good service, but the fact remains that it has made the highest average record in the North Side loop, and has very badly broken the record for length of life of an individual rope. A few days ago another one of these ropes was taken from the loop after an 88-day run. We have personally inspected the cable in its entire length, and it is in as good or better condition than the sample illustrated of the 98-day rope. It will also be put on another line, to be worn out. The shortest lived Cradock rope that has ever been taken out of the loop was one that was stranded by a gripman, at the age of seventy-eight days. The "American Manufacturer" says that "cables of the same manufacture, which lasted less than half the time of the good one in the same place, might have been mentioned in the article." Verily, they might have been mentioned, had we not been particular about telling the truth, but not otherwise.

INDIANLAND AND WONDERLAND is the title of a brochure published by the Northern Pacific Railroad, and sent to any address for six cents in stamps. It is different from the ordinary railroad publication, both in matter and artistically, and is well worth reading for the instruction and entertainment it contains, and should be in the hands of every tourist.

### Arkansas.

**PIKE BLUFFS, ARK.**—The Citizens Street Railway Company reorganizes. The officers now are: J. M. Taylor, president; John O'Connell, treasurer; Arthur Murray, secretary; H. P. Bradford, manager of the Cincinnati Incline Railway, general manager. The line will be changed to electric this summer.

**LITTLE ROCK, ARK.**—Case of the St. Louis Trust Company against the Capital City Street Railway Company has consolidated with the similar case of the Atlantic Trust Company vs. the same. These companies hold \$600,000 bonds of the Little Rock Electric Railway and ask foreclosure.

### Arizona.

**PHOENIX, ARIZ.**—The Electric Railway will extend a mile on Third avenue.

### California.

**SAN FRANCISCO, CAL.**—The San Francisco & San Mateo Electric Railway is granted an extension of time on its franchise.

**OAKLAND, CAL.**—T. C. Johnson, of San Francisco, is made receiver of the Vandercook line. Road will be kept in operation.

**SAN FRANCISCO, CAL.**—Secretary H. N. A. Foster, of the Presidio & Ferries Street Railway, applies for use of electricity on that line.

**LOS ANGELES, CAL.**—The Main Street & Agricultural Park Street Railway is reported favorably upon by the committee of the board of public works.

**SAN FRANCISCO, CAL.**—Adolph Sutro asks for a street railway franchise to Sutro Heights. He has the unqualified backing of all the property owners en route.

**LOS ANGELES, CAL.**—E. P. Clark, manager of the Consolidated, has returned from San Francisco and says the Pasadena road will be pushed to completion immediately.

**OAKLAND, CAL.**—G. Y. Loring resigns as superintendent of the Oakland Cable Railway and the Oakland Electric Railway Company. G. A. Loring, assistant, will also resign.

**OAKLAND, CAL.**—S. B. Lenagan, until recently superintendent of the Twelfth street electric road in Oakland, has been appointed superintendent of the San Francisco and San Mateo Railway.

**SAN FRANCISCO, CAL.**—The Market Street Cable Railway Company has begun the reconstruction of a number of its lines, putting in electricity. The road bed of a number of horse lines is being changed preparatory to electrifying.

**LOS ANGELES, CAL.**—Incorporated: Los Angeles, Pasadena & Altadena Railway, by G. G. Green, Pasadena's multi-millionaire; Senator Geo. H. Barker, of Philadelphia; Andrew McNally, of Chicago. Line will be completed in six months.

**SAN FRANCISCO, CAL.**—Sandford Bennett, secretary of the Dunham Carrigan & Hayden Company, has been appointed receiver of the San Francisco & San Mateo Electric Railway Company, at suit of the California Title Insurance Trust Company.

**SAN FRANCISCO, CAL.**—It is rumored that the Market street cable combine will consolidate with the Metropolitan Electric Railway and the San Francisco & San Mateo line. Several new franchises will be sought if the proposition carries through.

**PACIFIC GROVE, MONTEREY COUNTY, CAL.**—The stables of the Monterey & Pacific Grove Street Railway Company burned with six cars. An electric system will take its place next fall and in the meantime second-hand cars are wanted to resume service.

**OAKLAND, CAL.**—Twenty-third Avenue Electric Railway and the Oakland, San Leandro & Haywards file articles of consolidation. It will be known as the Oakland, San Leandro & Haywards Electric Railway, capital \$1,000,000. The five directors appointed for the first year are: Horry W. Meek and W. E. Meek of San Lorenzo, William J. Landers of San Leandro, Egbert B. Stone, of Elmhurst.

### Canada

**MONTREAL, CANADA.**—A strenuous fight will be made against the Montreal Island Belt Line Railway by residents of the proposed route.

**ST. JOHNS, N. B., CANADA.**—F. W. Warren is superintendent of construction on the improvements and extensions of the line. He is from Montreal.

**QUEBEC, CANADA.**—Le Compagnie de Tramways Electriques de Quebec is formed, to build elevated or surface tramways. Incorporators are: Messrs. J. B. Laliberte, J. U. Gregory, B. Leonard, P. B. Dumoulin, J. F. Guay, and F. M. W. Pampalon, all of this city.

### Chicago.

**CHICAGO.**—The city council grants rights to the North Chicago Electric Railway to trolley Armitage and Fullerton avenues.

**CHICAGO, ILL.**—The West & South Towns Street Railway dissolve injunction and will build between May and Johnson streets on 22nd street.

**CHICAGO.**—Incorporated: Chicago Suburban Electric Company, Chicago; capital stock, \$1,000,000. Incorporators—Ralph R. Bradley, Harriet M. Gibbs and Phillip S. Post, Jr. Bradley's address is 863 Rookery.

**CHICAGO.**—J. J. Burns, manager of the Cosmo Soap Company, 185-187 Wabash avenue, is manager of the Goshen-Elkhart Electric Railway, and wants prices on motor equipment, cars, trucks. Two miles of line ready.

**CHICAGO.**—Organized: The Arnold-McArthur Company, at \$100,000, to push the patents of Bion J. Arnold, by A. F. McArthur, B. J. Arnold and Henry W. Magee.

Ajax Feed Water Heater & Purifier Company, at \$3,000, by Wm. H. Smith, Leslie A. Gilmore and George Segume.

**CHICAGO.**—The city council has granted Mr. Yerkes right to trolley Lake street under the L. Right was also granted the North Chicago Street Railway to build a line on Southport avenue.

The Alley L, the Lake Street L and the Metropolitan are making an effort again to form a down town loop. The matter will be laid before the stockholders this week.

**CHICAGO.**—The West Side Construction Company, of New York, now building the Metropolitan Elevated Railway, Chicago, elects: R. Somers Hayes, Frederick P. Olcott, Samuel Thorne, Henry L. Higginson, Charles F. Dietrick, A. F. Wolcott and George C. Clark, trustees; Messrs. Thorne, Olcott and Dietrick being elected to fill vacancies. R. Somers Hayes was elected president of the company and George C. Clark, vice-president.

**CHICAGO.**—Lysander Johnson is the inventor of a suspended-car elevated electric system. He is president of the exploiting company; G. I. Ladd, secretary; L. Johnson, general manager, and J. M. Munn, assistant.

Incorporated: Co-Operative Electric Railway Company, Chicago; capital stock, \$1,000,000; operate electric railway, manufacture and deal in electric equipment, etc.; incorporators: Morris S. Evinger, Charles E. Burnap, and Isaac T. Dyer.

**Colorado.**

CRIPPLE CREEK, COL.—An electric railway is proposed to build from here to Victor. D. W. Diggs, of St. Louis, is behind the scheme.

**Connecticut.**

NEW BRITAIN, CONN.—F. G. Platt says that the electric railway will be running by September 1.

HARTFORD, CONN.—The Johns-Pratt Company, of this city, gets contract for overhead work of the Hartford Street Railway Company.

BRIDGEPORT, CONN.—Watts-Campbell Company of Newark, N. J., get contract for engines for Bridgeport Traction Company. Thos. Murray, of New York, will build track and overhead construction.

NEW HAVEN, CONN.—Clay, Moore & Co., of Philadelphia, have bought the Centerville Street Railway for \$225,000. It will be electrified.

NEW HAVEN, CONN.—The New Haven & Westerville Street Railway will build a line from the Grand avenue terminus to the village of Montowese.

HARTFORD, CONN.—The Hartford Street Railway Company buys the site and buildings of the Woodruff & Beach Company and will build a power station and repair shop.

BRIDGEPORT, CONN.—The construction of the Bridgeport Electric Railway began May 14. C. J. Field, of New York, is consulting engineer. Contracts let for power plant and rails.

HARTFORD, CONN.—Hartford Street Railway Company awards power house building to the Berlin Iron Bridge Company; poles to Morris & Tasker, Philadelphia; Roelblings' Sons get the wire contract.

BRIDGEPORT, CONN.—The Bridgeport Electric Railway contracts are as follows: Generators and motors, to the General Electric; rails divided between Johnson and Wharton; trucks to Brill; car bodies to Stephenson and Barney & Smith.

**Delaware.**

WILMINGTON, DEL.—Front & Union Street Railway Company elects: President, W. W. Pussey; vice-president, Preston Lea; secretary and treasurer, F. L. Kurtz; directors, George W. Bush, Edward Bringham, Jr., Dr. J. P. Pyle, Willard Salusbury, Alexander J. Hart.

**District of Columbia.**

WASHINGTON, D. C.—Washington, Alexandria & Mt. Vernon Electric Railway has gained entrance to the city.

WASHINGTON, D. C.—Dr. Wm. T. Barnard, past-president of the Alley L of Chicago, is dead, at the age of forty-five.

WASHINGTON, D. C.—Brott Electric Rapid Transit Bicycle Company elects directors at Alexandria, Va., as follows: E. S. Parker, John J. Hemphill, Bushrod Robinson, Joseph J. Reynolds, Virgil D. Stockbridge, Chas. A. McEuen, Charles M. Shelly, Peter P. Little and Geo. F. Brott.

**Florida.**

OCOLA, FLA.—H. H. Birdsey wants bids on complete telephone equipment.

INTERLACHEN, FLA.—A tramway line is to be built from the Francis packing house to the depot.

**Georgia.**

ATLANTA, GA.—The Atlanta Traction Company goes into the hands of W. C. Haile, as temporary receiver, on petition of bondholders.

ROME, GA.—American Security & Trust Company of Washington, D. C., will sell the Rome, Ga., Street Railway at trustee's sale. C. J. Bell is president of the Security & Trust Company.

COLUMBUS, GA.—The Columbus Railroad Company elects: J. F. Flournoy, president; Mr. C. B. Grimes, secretary and treasurer; Mr. J. H. Henderson, superintendent, and Mr. L. E. Garrard, attorney.

ATLANTA, GA.—The Atlanta Traction Company's affairs have been placed in the hands of two receivers, viz: E. B. Rosser and W. C. Hale. Mr. Hale will control the finances and Mr. Rosser the operation of the road.

**Illinois.**

SOUTH CHICAGO, ILL.—The street railway employes' strike is averted.

ELGIN, ILL.—The Dundee Rapid Transit Company has bought a site for its power house.

OREGON, ILL.—F. G. Jones has been made manager of the Rock River Electric Railway.

BELLEVILLE, ILL.—The Belleville Electric Railway Company has gained entrance into St. Louis, and will build connections at once.

ALTON, ILL.—The new line of electric to North Alton is to be built at once. Bonds have been sold by H. M. Noel & Co., St. Louis, and A. K. Root, of Alton, is president.

EVANSTON, ILL.—Business men meet to consider the extension of the electric road. Committee consists of W. S. Lord, chairman, and R. F. Milne, secretary, and others. Wilmette and Winnetka will co-operate.

SPRINGFIELD, ILL.—The following officers are reelected by the Street Railway Company for the ensuing year: President, T. J. Minary; vice-president, Blanford Wilson; treasurer, C. K. Minary; secretary, Philip Barton Warren.

**Indiana.**

MUNCIE, IND.—Capt. J. W. Hilligross is appointed manager of the Street Railway Company.

FORT WAYNE, IND.—C. L. Centlivre will double-track his street railway, extend and put in a new electrical equipment complete. It will cost \$60,000.

HAMMOND, IND.—The street railway offices have been removed to the East Chicago power house. A. M. Turner is made superintendent, vice Mr. Ward, resigned.

GOSHEN, IND.—C. E. Bickel, of Elkhart, and Judge Wanner, of this place, are busy getting the electric railway on its feet. Arrangements will be closed shortly.

TERRE HAUTE, IND.—The Terre Haute & Brazil Electric Railway is again securing right of way. Max Joseph and Robt. Smith, of Terre Haute, are behind the scheme.

GOSHEN, IND.—The Goshen Street Railway Company has filed articles signed by J. J. Burns, J. H. McIlhenny and K. G. Ripley, of Chicago; W. L. Stonex and E. A. Dausman, of Goshen. Capital stock, \$25,000, under the name of the Indiana Electric Railway Company, to connect Goshen, Elkhart and New Paris. The Cosmo Buttermilk Soap Company, of Chicago, is backing the enterprise.

**Iowa.**

PORT HURON, WIS.—Col. William Nichols, of New York, and E. H. Brennan ask \$20,000 bonus of Port Huron to begin construction of the electric road this summer.

## THE ACCIDENT BLANKS OF THE VICTORIA ELECTRIC RAILWAY & LIGHTING COMPANY.

The Victoria, B. C., Electric Railway, under the superintendency of F. W. McCrady, has a few features in the system of printed blanks in use that are worthy of special consideration. One of the neatest plans for keeping accident reports that has recently come to our notice is the little four page book used for this purpose by this company. Each conductor carries with him a number of these books, which are 8¾ by 3¾ inches, a size convenient for carrying in the pocket and for filing. Each book is intended to contain the conductor's complete report of one accident. They have tough tag board covers, and contain four pages for the conductor's entries. The conductor's reports are thus made in a neat, permanent form, and they can be properly filed away. The front cover contains the following blanks, which are filled out by the superintendent and accountant, who receive and put on record the report.

Accident No.....  
 Injury to.....  
 Of No..... Street.  
 At.....  
 Car No.....  
 Conductor.....  
 Motorneer.....  
 Report received..... M..... 189.....  
 ..... Supt.  
 Report filed..... M..... 189.....  
 ..... Accountant.

On the inside of the front cover follow the company's rules in regard to accidents.

No. 8—ACCIDENTS. The conductors will use every possible precaution to avoid accidents. If an accident should occur they will

1st—Stop the car immediately, ascertain the name, residence and business address of the injured person, render all possible assistance, if necessary taking them to a drug store, if one is near, or summon a physician.

2nd—In case the accident is at all serious, conductor will telephone immediately to Superintendent's office—telephone 486—stating place and nature of accident.

3d—They will ascertain name, residence, and business address of all passengers in the car, and of all persons who witnessed the accident, and at end of trip make out a written report and send same at once to Superintendent, giving full and detailed report of the occurrence.

4th—Conductors will refrain from conversation or giving any information of any accident to any person other than the proper officers of the Company. You will not accompany injured party home or call upon same, without consent of Superintendent.

NOTE.—The above rules regarding accidents are of the utmost importance and must be observed, no matter how slight the accident to person or property.

For example: If a person falls in stepping from your car, even when your car is at a standstill and the accident is due entirely to passenger's own carelessness, and passenger insists that he or she is not hurt, the name and address of such person, with witnesses, must be taken and reported to the Superintendent. This is absolutely necessary for the protection of both Company and conductor. Accident reports must be handed to proper officer of the Company at the first opportunity.

AVOIDING ACCIDENTS.—Ring the gong when approaching intersecting streets, street corners, alleys, curves, etc. Make yourself familiar with rules on pages 11, 12 and 13.

When approaching bridges, viaducts, poles or other objects near to track, conductors will warn all persons standing on footboard of open cars, or on rear platforms of closed cars.

F. W. MCCRADY,  
Superintendent.

In the remaining four pages the conductor enters his report in the blanks left for the purpose. The lines run the long way of the book. The blank items are shown here on a slightly reduced scale and with some of the blank lines omitted.

(Page 1)

To..... Supt. .... 188.....

Dear Sir: An accident occurred in connection with my car this day, the circumstances of which are as follows:

Car No..... Conductor..... Motorneer.....

Exact place..... Exact time..... hrs. <sup>A. M.</sup><sub>P. M.</sub>..... min.

Car going..... Speed.....

### INJURY TO PERSONS.

| NAME. | RESIDENCE. | BUSINESS ADDRESS. | NATURE OF INJURY. |
|-------|------------|-------------------|-------------------|
| ..... | .....      | .....             | .....             |
| ..... | .....      | .....             | .....             |

(Page 2)

### DAMAGE TO PROPERTY.

(Pages 3 and 4.)

### HOW ACCIDENT OCCURRED.

.....

Motorneer. .... Conductor

When an armature is taken out it must have a tag attached to it with the following items:

1. Armature No.....
2. Extent of damage.....
3. Date damaged.....
4. Cause of damage.....
5. From car No.....
6. Motorman.....
7. Repaired by.....
8. Time consumed.....hours.
9. Placed in car No.....
10. Date same was replaced.....

Remarks.....  
Foreman.

The first six lines are filled out by the foreman, the seventh and eighth by the armature winder. The last two are filled by the foreman when the armature has been put on a car, and the tag is then returned to the superintendent. A record is thus kept on all repair work. Report blanks are all on tough manilla board or paper, which fact has a great influence on the neatness with which they can be kept. The whole system of blanks is a credit to the management and will bear imitation.

GOOD, IF NOT TRUE.

“Good, if not true,” like the Spanish story, is the tale that comes from the North Shore Electric Railway, Chicago. It seems that on that electric line the insulation of one of the iron poles was broken and as the pole was set in cement it was nearly insulated. The consequence was that the iron was pretty well charged. About this time an elongated greyhound, belonging to an Evanston citizen, came along and with the well-known fondness of canines for all such objects, investigated the pole. The result is said to have been fatal. This, however, did not deter a fine fat poodle and a shaggy spaniel from meeting a similar fate, and by the time the line men arrived six dogs had yielded up their lives to the ravages of civilized life.

WEST END TRANSFERS.

The West End Street Railway of Boston, in response to inquiries from the Rapid Transit committee, showed the number of transfers issued during the year ending September 30, 1893. Free transfers issued numbered 11,716,557, of which 10,823,201 were collected; 4-cent and 4½-cent checks issued and collected were found to be 11,652,843. The free transfer system cost last year \$18,067 for wages, \$3,928 for printing and \$1,612 for rent of waiting rooms, a total of \$25,608.

On May 3 the lower section of the Broadway, New York, cable was put into commission. The rope is 5,000 feet long and runs to South Ferry. The officers of the road made the initial trip.

STREET RAILWAY PATENTS.

ISSUED MAY 8, 1894.

- Contact device for electric railways. David F. Graham, Springfield, O., and William P. Allen, Chicago, Ill., assignors of one third to Oliver S. Kelly, Springfield, Ill. ....519,328
- Switch for overhead trolley tracks. Charles G. Schmidt, Cincinnati, O. ....519,351
- Conduit electric railway. James F. Cook, Mansfield, O. ....519,380
- Life guard for street cars. James Campbell, Brooklyn, N. Y. ....519,402
- Trolley wire hanger. Albert B. Crouse and Charles A. Rutlige, Passaic, N. J. ....519,446
- Electro hydraulic car motor. Charles E. Emery, Brooklyn, N. Y. ....519,462
- Fender for cars. Arthur H. Jelly, Cambridge, Mass. ....519,472
- Trolley wire crossing. Edward H. Allen, Cramers Hill, N. J. ....519,519
- Overhead cable traction. Walter G. Berg, New York, N. Y. ....519,561
- Cable replacer. John Z. Murphy, Chicago, assignor one-half to Frank W. Hudson, same place. ....519,586
- Electrical water wheel governor. Earl P. Wetmore, Helena, Mont. ....519,597
- Trolley wire hanger. Charles F. Strasburg, Lincoln, Neb. ....519,621
- Safety car fender. George C. Schmidt, Baltimore, Md., assignor of one-half to Abraham Harman, same place. ....519,648
- Electrical propulsion of railway cars. Jean J. Heilmann, Belfort, France. ....519,674

STREET RAILWAY PATENTS, ISSUED MAY 15, 1894.

- Switch for city railway, Joseph Shutt, East New York, N. Y. ....519,741
- Substructure for railway rails. James M. Price, Philadelphia, Pa., assignor to the Price Railway Appliance Company, of Pennsylvania. ....519,772
- Fender for street railway cars. John B. Bailey, Baltimore, Md. ....519,803
- Trolley wheel. Van Dyke Crusier, Flatbush, N. Y. ....519,837
- Contrivance for diminishing the danger to foot passengers from street railways. John Jernetz and Ferdinand Jeniczek, Vienna, Austria-Hungary. ....519,911

STREET RAILWAY PATENTS, ISSUED MAY 22, 1894.

- Electric railway trolley. Thomas M. Brown, Cleveland, O. ....520,156
- Trolley wire hanger. Thomas J. McTighe and Sumner W. Childs, New York, N. Y. ....520,213
- Railway car fender. John W. T. Gilliam, Baltimore, Md. ....520,230
- Safety attachment for street cars. Henry A. Howe, Albion, assignor to himself and Joseph Norwood, Brooklyn, N. Y. ....520,233
- Safety car fender. Frank I. Clark, Baltimore, Md. ....520,255
- Grip mechanism for cable railways. Charles I. Earll, New York, N. Y. ....520,259
- Electric railway. Ernst W. Von Siemens, Berlin, Germany, assignor to Siemens & Halske, same place. ....520,274
- Conduit electric railway. William R. De Voe, Shreveport, La. ....520,304
- Block system for trolley railways. Willard F. Lewis, Swampscott, Mass. ....520,323
- Electric traction apparatus. Paul Schoop, Zurich, Switzerland. ....520,340
- Conduit electric railway. Guarantee Trust and Safe Deposit Company, administrator of Charles Wm. Siemens, deceased, Philadelphia, Pa. ....520,356
- Transferring cable cars at intersecting points. John Kratz, Baltimore, Md., assignor one half to Joseph H. Pfister, same place. ....520,364
- Car brake. Thomas H. Allen, Toronto, Can. ....520,384

ISSUED MAY 29.

- Electric railway turntable. Rudolph M. Hunter, Philadelphia, Pa. ....520,527
- Trolley wire support. Budd J. Jones, Sioux City, Ia. ....520,737
- Conduit railway trolley. William Lawrence, New York, N. Y. ....520,758

MONTREAL conductors must be able to speak both English and French and must be 5 feet 5 inches tall at least.

Playing Cards.

You can obtain a pack of best quality playing cards by sending fifteen cents in postage to P. S. Eustis, Gen'l Pass. Agent, C. B. & Q. R. R., Chicago, Ill.

THE American Electrical Works, Providence, R. I., is very busy with line work.

THE Schuttler Manufacturing Company, Chicago, has gone into the hands of a receiver.

THE Ellis Car Company, Amesburg, Mass., still continues the manufacture of its well known snow plows.

THE Eastern Electric Cable Company, of Hamshire street, Boston, is meeting with a good sale of "Clark" wire.

THE Lane & Bodley Company, of Cincinnati, finds inquiries very numerous with excellent prospects for sales later on.

A. GROETZINGER & SONS, Allegheny, Pa., report orders plenty and customers well pleased with Dermaglutine pinions.

THE Pittsburg Steel Hollowware Company, of Pittsburg, Pa., finds business improving, with more enquiries and increased sales.

P. M. McLAREN, general agent of the Abendroth & Root Manufacturing Company, New York, spent a few May days in Chicago.

THE LaCledde Car Company, St. Louis, has captured a 50-car order from the Cincinnati, Covington & Newport Street Railway.

RIES & SCOTT, of Baltimore, have published a description of their alternating current motor, which they announced some time ago.

THE Clonbrock Steam Boiler Works have received many flattering testimonials of the working of their Morrin climax steam generator.

THE Sandusky, Milan & Norwalk Electric Railway of Ohio will put in a private telephone line for train dispatching and similar business.

THE Barney & Smith Car Company, of Dayton, O., will make 50 cars for the Cincinnati, Covington & Newport Street Railway Company.

THE Wallace Electric Company, Chicago, has been very busy of late filling orders for its promising material and the W. & W. lightning arrester.

WILLIAM H. WHILDEY has taken charge of the Schuylkill Electric Railway Company, of Pottsville, Pa., in place W. H. Conrad, the former superintendent.

ALBERT & J. M. ANDERSON, of Boston, are very busy getting out orders for their well-known overhead equipment. The works are running full time and full force.

THE Bates Machine Company, Joliet, Ill., is doing a first-rate business. The award of the judges of the World's Fair gives a first-class judgment on its Corliss engine.

THE first electric car across the Mississippi river at Davenport, ran over the Tri-City line May 4. This is the third line of street railway to cross the Father of Waters.

CHAS. A. SCHIEREN & Co., 47 Perry street, New York City, report an order from the Brooklyn City Railroad Company for an extra belt 91 feet long and 60 inches wide.

THE PITTSBURG BRIDGE COMPANY has an order for a 60-foot plate girder span to be erected on the Sharpsburg extension of the Allegheny Traction Company's electric railway.

THE Walker Manufacturing Company, by Kohler Brothers, western agents at Chicago, has sold ten equipments of its motors to the Green Bay, Wis., Street Railway Company.

THE Buckeye Engine Company, Salem, O., has established a St. Louis agency for its excellent engine in the Security building. The Southwest is a large user of Buckeye engines.

THE Brownell Car Company, St. Louis, is holding its own with the accelerator. Recent orders come from Chicago, where the accelerator was winner in a race with a lot of entries.

THE General Electric Company has closed the contract for the Poughkeepsie & Waffingers Falls Railway, of Poughkeepsie, N. Y., covering two 200 K. W. direct connected generators, 40 G. E. 800 motors and type K controllers.

F. W. WEBSTER & R. H. Beach, as Webster & Beach, 44 Broad street, New York, have gone into the supply business for street railways. Both are well known in the electrical field and will furnish all kinds of supplies except generators.

J. M. Denniston, the western salesman of the Davis Car Shade Company, of Portland, Oregon, has sold 380 of the Davis Shades to the Chicago General Street Railway Company. This means the equipment of twenty-five cars with the popular Davis Shade.

THE Sperry Electric Company has sold 20 equipments for the Price Hill lines of Cincinnati. The first installment of 125 motors for the People's Traction Company, Philadelphia, has been delivered, and 17 equipments for the Waterbury, Conn., line have been placed.

THE 88-day loop rope of the North Chicago Street Railroad Company, which was made by George Cradock & Co., of Wakefield, England, will be used on another line, still being in good condition. Ropes made by other firms for this loop lasted 31 and 39 days respectively.

J. HOLT GATES has been appointed western agent for the Card Electric Company's street railway motors, made at Mansfield, O. Mr. Gates still retains his relations with the Mather Company, and will prosecute the good work for both concerns with his usual ability and success.

THE McGuire Manufacturing Company, of Chicago, has purchased the controlling interest in the Columbian car heater, and will add it to its list of specialties. If the judgment of the company is as good in the stove matter as it has proved to be in its other specialties, it will soon be known throughout the land.

THE Burton Electric Heating Company has been organized as a subsidiary organization to the Electric Forging Company. It will operate the company's

senting a fund of valuable facts regarding water tube boilers in general, and the Improved Root Water Tube Boiler in particular. Write for their "Information Pamphlet No. 3."

WM. R. RONEY, inventor of the mechanical stoker and head of the mechanical draft department of Westinghouse, Church, Kerr & Company, was in the city on business recently. The mechanical draft of this company, which consists in placing a fan in the stack in connection with Green or other fuel economizers, is coming into extensive use and favorable reputation.

THE Sterling Supply & Manufacturing Company, New York City, is doing a good business. The Sterling register appears prominently, the following orders being an excerpt from the list of lines now using them: Atlanta Traction Company, White Line, Dayton, O., Poughkeepsie & Wappinger Falls, Citizens Street Railway, Indianapolis and many others. The sand box specialty is in use on the Consolidated Traction Company, Jersey City, N. J., the City & Suburban, Baltimore, and many others.

patents in New England. The new company is officered by Geo. D. Burton, president; F. J. Hutchinson, treasurer, and the factories will be at Woburn, Mass.

THE W. S. Hill Electric Company, of Boston, Mass., has shipped during the present month to one company, two orders for switches that weighed over eleven tons, and notwithstanding the hard times the gross sales for the past nine months average nearly 75 per cent more than for the corresponding months of a year ago.

THE Creaghead Engineering Company of Cincinnati is finding the demand for its flexible pole bracket much greater than was anticipated. This bracket has a wire stretched from its extremity to the pole on which to put the trolley hanger. This gives flexibility, while at the same time reducing the cost of bracket construction.

THE Abendroth & Root Manufacturing Company, 28 Cliff street, New York City, has issued for gratuitous distribution some finely illustrated trade literature, pre-

T. A. WIGHAM, of the Greiner Economical Cupola Company, 714 Bort Building, 17 Quincy street, Chicago, has been made the United States agent for George Cradock & Co.'s celebrated cable, which is in use on so many cable roads in this country. The factories at Wakefield, England, are full of work, and the Lang patent rope is not the least of the business.

Electric car  
Big hurry,  
Team on track  
Causes worry,  
Motorman,  
Great yell,  
Big foot,  
Broken bell.

THE Brown Electric Company, Boston, has closed the following orders during one week in May, calling for complete overhead equipment: Six miles for the North Weymouth Street Railway; 5 miles for an extension of the Quincy & Boston, and 10 miles for the Norwalk,

Conn., Street Railway Company. The Brown equipment is making a splendid record and the trade is growing in every department as is shown by the seven days' sales just noted.

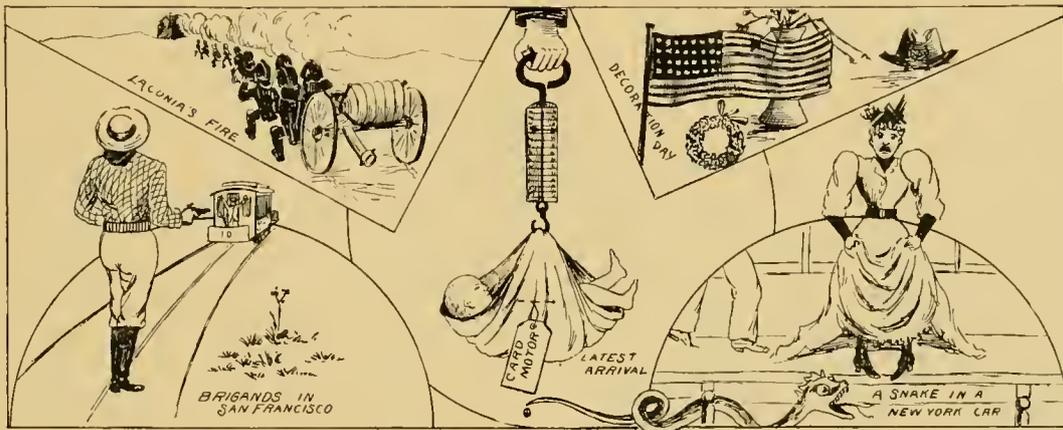

THE Lewis & Fowler Manufacturing Company, of Brooklyn, is still doing its accustomed large business. Its specialties in the line of trimmings have long been well known, while fare registers, sweepers and headlights are turned out at a surprising rate for these hard times. The L. & F. specialties have long been known and will be longer known as the foremost in the country.

THE Wallace Electric Company has placed on our desk a handsome model of Wood's improved combination pole bracket, which is intended to furnish a flexible suspension for trolley hangers with bracket construction. The hanger is placed on a short piece of span wire stretched across an oval frame at the extremity of the bracket. It is a very neat and strong device.

building plant. The company has five 10-bench open cars with closed ends and one 25-foot box car for sale at a discount. These are uninjured.

CHAS. S. FOSTER, well known as the mechanical engineer of the late World's Columbian Exposition, Chicago, announces that he is prepared to carry on a general engineering business, with offices at 1411-1412 Manhattan building, Chicago. Mr. Foster's excellent opportunities for studying the subject, and the magnificent success of his department at the World's Fair, point to his immediate success in this new venture.

THE Charles Munson Belting Company, Chicago, reports improved trade with a goodly number of contracts for large belts, and a large number of complete belt equipments. Arrangements have just been completed with the L. M. Rumsey Manufacturing Company, of St. Louis, to handle the different brands of Munson

At a recent meeting of the directors of the Peckham Motor, Truck & Wheel Company, the resignation of A. W. Field, as vice-president and director of the company, was received and accepted. H. C. Soop, of Kingston, N. Y., was elected to the vacancies thus created. Mr. Field takes charge of the Boston office of the company and will fill the position with the same ability he has shown in the past.

CHARLES A. SCHIEREN & Co., of New York, are making two 54-inch double belts for Allentown Traction Company, Allentown, Pa.; two 54-inch double belts for City & Suburban Railway Company, Baltimore, Md.; and have just shipped two 32-inch double belts for Richmond Light, Heat & Power Company, Richmond, Ind., and 50-inch double belt (second order) for the Steinway, Railway Company, Astoria, L. I.

The Ellis Car Company plant, of Amesbury, Mass., which was destroyed April 28, included in the loss ten box and fifteen open cars. The heavy wagon business of the company has been removed to the factory on Friend street, and it is not yet decided to rebuild the car

belt in the southern territory, and with the Revere Rubber Company to have a full line of different brands of Munson belt in stock at their San Francisco and Minneapolis houses.

THE McLean Armature Works, 197 South Canal street, Chicago, has reorganized. James McLean, George F. Heald and John S. Parmele have formed a copartnership and will continue the business under the name of McLean Armature Works, as heretofore. The accounts due the late firm are now payable to the new firm, and all debts or obligations of the old firm are assumed and payable by the new partnership.

THE Breese & Mansfield Company, of 1120 Betz building, Philadelphia, have taken an agency for the Walker Manufacturing Company of Cleveland and will represent their interests. The company is composed of Charles P. Breeze, who was formerly connected with the Hall Signal Company, and Frank Mansfield, whose connection with the General Electric, is well known. The combination is a strong one and will make a most excellent representation of the Walker interest.

THE Steel Motor Company, Cleveland, O., has secured the contract for sixty double car equipments of steel clad motors from the Nassau Electric Railway Company, of Brooklyn, N. Y. The order was secured on the strength of the excellent record made by the Steel at Allentown, Pa. The company is now building a fourth order for the Lehigh Valley Traction Company. Considering the short time the motor has been on the market, this is an excellent record.

THE ten motors furnished the Electric Traction Company of Philadelphia by the Curtis Electric Company have not met the expectation of the railroad people, and after quite an extensive trial the cars have been run into the barn and equipment ordered removed. The trouble seems to be the inability of the motors to make running time on account of losing so much time in starting, so that with frequent stops it is impossible to get under good headway between blocks.

#### TWO WISE MEN.

"As soon as my trade picks up a bit,"

Said the merchant, looking wise,

"As soon as my trade picks up a bit

I am going to advertise."

"As soon as my field of grain is grown,"

Said the farmer, sore in need,

"As soon as my field of grain is grown

I am going to sow the seed."

THE Jackson & Sharp Car Company, Wilmington, Del., has recently contracted to build cars for the Fairhaven & Westville, of New Haven, Conn.; the Fairport & Westport, of New Bedford, Mass.; the Buffalo, Tonawanda & Niagara Falls and the Derby, Conn., and the Hartford, Conn., street railways. Orders for the Philadelphia Electric Traction and the Pottstown, Pa., Street Railway Company have been delivered. They are elegant and substantial cars.

THE Simplex Electrical Company has made a change in its western business, by which George Cutter ceases to act for it, and H. R. Hixon, who has for some time been connected with Mr. Cutter in handling the simplex goods, becomes western representative. Mr. Hixon has a host of friends who will gladly aid him in his effort to push the simplex. A stock will be carried here from which prompt shipments can be made. Mr. Hixon's offices are 1137 and 1138 Monodnock building, telephone Harrison 305.

A NEW electrical appliance company has been formed at Grand Rapids, Mich., to exploit the invention of D. Fred Sweet for a device for the protection of motors. The officers of the company are: President, D. Fred Sweet; vice-president, Samuel Barnes; secretary, Charles H. Annin; treasurer and general manager, Chas. Kritzer. The officers are all men of experience and enterprise.

Mr. Sweet is the inventor of the appliance. Mr. Barnes is superintendent of the electrical construction department of the Street Railway Company. Mr. Annin is a member of the firm of J. C. Herkner & Company, and Mr. Kritzer is the general manager of the Butterworth & Lowe Manufacturing Company.

THE following "blind" notice appeared in a New York street railway publication: "A receiver for the McGuire Manufacturing Company of Chicago has been applied for through Richard B. Davis, of Petersburg, Va., counsel for the company." Unless cognizant of the circumstances the reader might think that the receiver was asked for the McGuire Company, whereas it was the McGuire Company that asked for a receiver for the Railway Company. The high standing and unquestioned credit of the McGuire Company places it among the foremost concerns in street railway supplies, and the item would be recognized as a mistake by all except those who are not acquainted with the company.

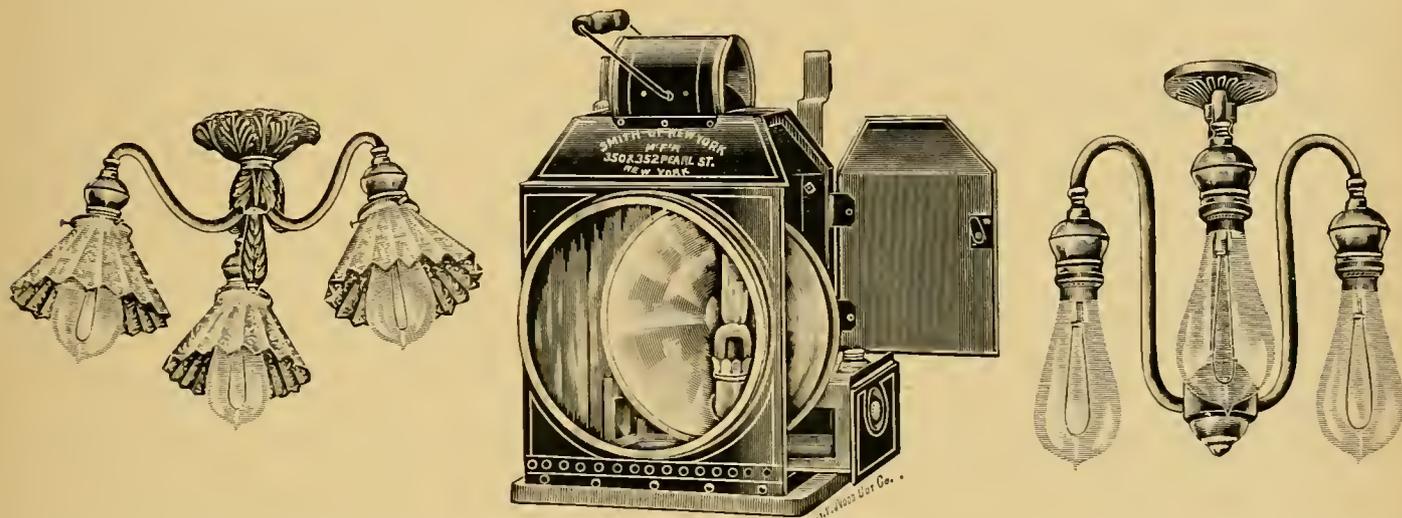

THE United Tramway Sprinkler Company, of Louisville, are meeting with good success and have just closed contracts for their system in Portland, Ore., Salt Lake City, Atlanta, Ga., and Paterson, N. J. Their equipment is operating very successfully where already introduced, and the local companies formed to operate on railway tracks are showing large earnings and consequently good dividends. The street railways also come in for a handsome rental for use of tracks and power. Managers who desire to promote the comfort of their patrons by well sprinkled streets, and to save money in accomplishing this, cannot do better than look into this method which has proved such a success in Davenport, Rock Island, Albany and Troy, N. Y., Louisville, Chicago, and elsewhere.

THE Genett Air-Brake Company means business. It has arranged to push its air-brake very actively in this market and the factory has been equipped with additional machinery, whereby the daily output is greatly increased. The brake is highly efficient and acts smoothly and promptly. In these days of high speed and frequent stops the motormen find it indispensable. A simple turn of a handle suffices to stop a heavy train of motor and trail cars. This leaves the motorman free to use his hands. The emergency stop brings the train to a standstill in a short space without damage or jar. The brake is in use very largely on the Third Avenue line, New York, and the Atlantic Avenue Road, Brooklyn, Buffalo Railroad Company, and other roads in this country. The equipments sent to Australia, Brazil and elsewhere are doing well. The company's new catalogue contains very interesting matter and is a valuable addition to the library of a railway manager. M. L. Rothschild continues the management in Chicago, and the company has just arranged to have E. J. Wessels act as its eastern manager. His office is at 33 Wall street, New York. In such able hands the company's interests are assured.

SOME SMITH CAR LIGHTING.

It is not worth while to speak of the value of the specialties made by Smith, of New York, because they have long been known to the street railway men of the country as first class in every respect, and because the many friends of the company would feel insulted if it were intimated that the Smith goods were not of national, nay, of international fame. For thirty years the Smith lights have illuminated the street railway cars of America and Europe, improving with the advance of street cars, and keeping pace with the demands of the times.

On the subject of headlights, Smith of New York has something to say. A good headlight means a great deal. It means safety and economy, and it means comfort for the employes and the public. Cheap headlights may be bought, but they are of cheap material and cheap workmanship, and every manager knows that reliability and strength are the chief requisites of a good headlight. Such is the new Number 25 headlight, shown in the engraving. It is sold at a price that is as low as is consistent with reliable goods. It is strong, powerful and economic. The elegant cluster electric chandelier shown

is a light to the world and a joy for a long time to the user. Elegant in appearance and good wearing qualities, another form is also shown, for three globes with shades. Nothing adds to the appearance and comfort of a car so much as an elegant chandelier, and the Smith make speaks for itself.

Charles Smith, the manager of the company, has been known, man and boy, for so many years, that we refrain from making further mention of him than to say that he is still at 350-352 Pearl street, New York, ready to treat all comers, whether customers or not, with the consideration and cordiality for which he is noted.

PHOTOGRAPHY as a means of detecting weakness in bridges has been used in England. A kodak shot was taken at the bridge before a train rushed over it and another film exposed as the train reached the middle of the structure, the camera remaining in exactly the same position. The two photographs compared showed a dangerous deflection in the bridge.

MARRIED.

Vice-president Arthur W. Field, of the Peckham Motor, Truck & Wheel Company, Boston office, and Miss Work, of Moberly, Mo., were united in marriage at Kansas City, May 17. The many friends of the groom in street railway circles unite in the REVIEW's felicitations.

CHAS. A. SCHIEREN & Co. have sold 75 feet of 34-inch double, perforated electric belting to the Metropolitan Electric Railway of San Francisco.

A BROOKLYN, N. Y., motorman saw a thief snatch a lady's purse and start out on a dead run along the route of the cars. The motorman speeded up his car, caught up with the thief and sat on him while the conductor called the police. When the thief saw the car approaching he panted, "Huh! Huh! I believe that d——d motorman was tryin' to catch me. I'll have him broke. He didn't have no right to run his car that fast." After this purse-snatchers will not run up streets occupied by the trolley line.

JAMES HOPKIRK, of 26 Turk street, San Francisco, has invented a reversible driving gear for cars driven by gasoline motors under the seats. It enables the motors to have a constant direction of rotation while the car can be reversed.

California in Three and One-Half Days.

If you are going to California and desire to make the journey in the most economical, quick and comfortable manner, purchase your ticket via. the Chicago & Northwestern, Union Pacific and Southern Pacific Railways. Pullman drawing-room sleeping cars are run from Chicago to San Francisco without change, in three and one-half days. Completely furnished tourist sleeping cars are also run in which accommodations can be procured by passengers holding either first or second-class tickets at a cost of only \$4 per berth from Chicago to San Francisco and other California points. The hour of departure of trains from Chicago affords prompt connections with all trains from the east and south. Variable route excursion tickets, allowing nine months' stay in the health-giving climate of California, second-class tickets of low rates, sleeping car reservations and full information can be procured of any ticket agent, or by addressing W. A. Thrall, General Passenger and Ticket Agent, Chicago & Northwestern Railway, Chicago.

## HALF FARES.

Interesting Bits of Information from all Parts of the Country,  
Boiled Down for Busy Readers.

THE Niagara Falls, N. Y., Street Railway Company has put a steam fire alarm whistle on its power house.

THE electric road at Terre Haute gives free band concerts Sunday afternoon, in the park, and hauls a large volume of business in consequence.

THE Lake Roland elevated, of Baltimore, Md., carried 4,652,000 passengers during its first year, ending May 7. Not one was killed or seriously injured.

GENERAL MANAGER C. D. WYMAN, of the Milwaukee Street Railway Company, finds that the cars on his system travel 20,000 miles a day and 8,000,000 miles a year on 125 miles of track.

THE Terre Haute, Ind., street railway motormen are required to wear dark blue sweaters, instead of coats, in the summer. This gives more freedom to the arms and the artistic effect is not bad.

THE estate of the late Hoadley B. Ives, of New Haven, Conn., president of the New Haven & Westville Street Railway Company amounts to \$800,000. He was thought to have been a multi-millionaire.

THE Wild West Show management, of San Francisco, is used as a pleasure resort by the Market Street Railway. Coupon tickets for ten cents admit the passenger to the grounds and gives him a ride to the place.

A UNIQUE feature of the real estate firms' methods of booming a Boston suburb is the granting to each purchaser of a lot, a five-year pass on the Lynn & Boston Electric Railway, paid for, of course, by the real estate men.

GOVERNOR FLOWER has vetoed the bill repealing the law which allows the superintendent of public works to grant permission to electric companies to trolley the canals of the state. The governor heartily favors electricity.

HOUSTON, Tex., young men have begun this summer to charter an electric car and take a three hours' ride over the system. Young ladies accompany them, and with banjo, guitar and song the occasion is very interesting.

THE Kalamazoo, Mich., Street Railway Company, at its recent annual election, named the following executives: Theo. P. Bailey, president, Chicago; Geo. J. Kobusch, vice-president, St. Louis, Mo.; Jas. W. Johnson, treasurer, Chicago; E. E. Downs, general manager, Kalamazoo. Mr. Downs succeeds G. K. Wheeler, as general manager. The officers were well pleased with the city and predict a bright future for the road.

GENERAL MANAGER A. BAUMAN, of the Lancaster, O., Street Railway, is at work on a scheme to build an inter-urban from Lancaster to Baltimore, O., and Buckeye Lake Park. The last legislature passed a bill making the latter place a national park.

IN the case of Miss Lyon, of New York, which attracted so much attention from her refusal to allow a personal examination by doctors, with a view to ascertaining the validity of her claims, the Court of Appeals has held that she need not do so, and that the law is unconstitutional.

THE first electric car over the One Hundred and Thirty-fifth street line, New York City, was run on trial May 7. President E. A. Mayer, Superintendent James Corrigan and Electrician Frank Wardlaw made the initial trip. This is the first line of the famous "Huckleberry" system.

THE piston head blew out of the engine of the City Passenger Railway of Baltimore, recently. The cylinder pressure at the time was 120 pounds and the cylinder itself measured 24 by 60. The accident, fortunately, caused little damage. It is thought that a piece of one of the valve seats became loosened and slipped between the rod and cylinder.

A LYNN, MASS., alderman is promoting a project for equipping an electric car with hose and reel for fire fighting. This car may be run out on the tracks to any place within reach of the electric line and make better time than the regular engines. Although nothing definite has been done, the idea is worthy of elucidation. Chemical engines might be so carried.

LOUIS KARSGARD, a driver on the Bridge line between Davenport, Ia., and Rock Island, Ill., recently committed suicide. He was appointed as conductor of the new electric line, but the thought of the suspension of the old horse car service so preyed upon a sensitive and unbalanced mind that he died by his own hand, heart-broken. Tally one more for the deadly ———.

ONE of our subscribers who commenced with the first issue, and who is interested in an excellent car fender, accompanies his annual remittance with the following:

To serve the present age,  
My calling to fulfill—  
Oh may it all my powers engage,  
And pay your little bill.

My fender is the same in principle—different in form.

GENERAL MANAGER WYMAN, of the Milwaukee Street Railway Company, has condemned the double-decked car to oblivion, as far as Milwaukee has to do with it. They are too dangerous, Mr. Wyman says. Besides causing the greatest inconvenience to passengers, conductors, while climbing on the roof after fares, are unable to look after their cars properly and the danger is very great.

## NEW HAVEN CAR REGISTER.

Though this register has been on the market now but only thirteen months, it has pushed steadily to the front and has achieved a record of which any company might well feel proud. It has been adopted and is now in satisfactory use on more than one hundred lines in this country and abroad, prominent among which are the Philadelphia Traction Company, the Rochester Railway Company, the Toronto Street Railway Company, the Montreal Railway, and the North Hutchinson County Railway. The management has been progressive from the start, and in addition to the excellence of the machine a strong executive force has had largely to do with bringing its merits before the street railway men of the country. General Manager Boyd is an indefatigable worker and has made many friends among the fraternity.

## NEW PUBLICATIONS.

THE Craghead Engineering Company, of Cincinnati, has issued its 1894 catalogue, showing a full line of electric railway overhead parts.

THE ECHO is the catchy title of a new and attractive 8-page weekly, published by the employes of the West End Street Railway, Boston. It is filled with interesting local matter, and reflects much credit on its makers. H. H. Perry is editor, E. S. Goff associate editor, and J. D. Main business manager.

MODERN TURRETT LATHE PRACTICE is a very artistic monthly publication, issued by the Gisholt Machine Company, of Madison, Wisconsin. It really deserves the name of an album, so fine is the engraver's work. It will be mailed regularly to those who desire it, and will prove a handsome addition to any mechanic's library.

THE Shiffler Bridge Company is furnishing those interested in such things with an album of designs comprising 140 pages of elegant half tone engravings of buildings built by this company in various parts of the United States. Both the book and the buildings are a credit to the concern, and display a great variety of designs, together with resources possessed by few companies in the business.

"THINGS ARE NOT ALWAYS WHAT THEY SEEM," is the title of a little work published under the auspices of the Goodrich Hard Rubber Company. It is one of the most original ideas ever incorporated into a trade catalogue or circular, and is well worth perusal for the "fun" there is in it. It illustrates the various hard rubber products, with an order letter under each giving the layman's idea as to what they are for.

LIPPINCOTT'S MAGAZINE, for June, has an unusually interesting table of contents, in which is seen announced a complete novel by M. G. McClelland, entitled the Wonder Witch. Under the heading, "Sea Island Cot-

ton Respun," Dora E. W. Spratt tells how those islands, with their simple population, passed under Northern care in war times. In "The New Northwest Passage to the Orient," J. Macdonald Oxley writes of the Canadian Pacific Railway and its line of steamers to Japan.

THE Chicago Electric Truck Company find enquiries numerous.

THE Chicago Rawhide Manufacturing Company, of 75 East Ohio street, Chicago, even during the hard times has been busy manufacturing rawhide dynamo belting, sometimes running a double shift.

SUPERINTENDENT WALKER, of the Sioux City Street Railway Company, has a proposition from a Cleveland, O., electrical manufacturing concern that desires to manufacture and handle his patent trolley wheel on a profit sharing basis.

THE Mekarski compressed air system in use at Berne, Switzerland, and other places in Europe, has just been installed on the Woronoco Street Railway, of Worcester, Mass. The system is being introduced by James F. Lewis and Addison C. Rand, of the Rand Drill Company.

DR. WILLIAM T. BARNARD, past president of the Alley Elevated, Chicago, died May 10, at Washington, D. C., at the age of 45, after an honorable career in governmental service and distinguished success in railroad lines, as well as in his profession. His attainments were varied and his success in all his efforts was remarkable.

THE NEW CASTLE CAR MANUFACTURING COMPANY, of New Castle, Pa., since its machinery building was destroyed by fire, has constructed a new building for the machinery plant, with brick and iron boiler and engine house, and a new painting and finishing room 150 by 40 feet. The M. A. Green engine has been placed and a complete line of new wood-working machinery installed. The shops are again running under full headway.

AMONG the sales from the New York office of the General Electric Company for the second week in May are found the following items: 450 motors to the Brooklyn, Queens County & Suburban Company; 60 motors and generator to the Bridgeport, Conn., Traction Company; 20 motors to the Danbury, Conn., Street Railway; 20 motors and generator to the New Haven, Conn., Street Railway; to the Franklin, Pa., Street Railway 6 motors, and to the Electric Traction and the People's Passenger railways, of Philadelphia, large marble switchboards.

C. K. KING, manager of the Ohio Brass Company, has just returned from the East, where he has established agencies for that company's goods with Walker & Keply, Philadelphia, Brown Electric Company, Boston, Charles E. Chapin, New York, and Alfred Ely & Company, Baltimore.

### TESTIMONIAL TO WILLARD A. SMITH.

A fitting but fully deserved testimonial was the beautiful memorial vase, presented the chief of transportation department of the Fair. It was the gift of the American exhibitors; was made by Tiffany & Co., and is said, with one exception, to be the finest specimen of art metal

work produced in this country. It is of silver and represents upon its surface the history of transportation. Mr. Smith's pleasure in thus being so notably honored will have to be large if equal to the genuine good will which prompted and created this noble souvenir.

F. A. SCHEFFLER, who has been connected with the Stirling Company for the last year as its sales agent in New York, has gone to Boston, where he will co-operate with J. Bradford Sargent, the New England representative of the Stirling Company, in his efforts to bring the Stirling more prominently before the steam users of that section. John MacCormack, who is very well and favorably known to the boiler trade throughout the East, succeeds Mr. Scheffler as manager of the New York office of the Stirling Company.

THE genial George E. Pratt called on the REVIEW recently, fresh from victories of the Jackson & Sharp Car Company, which he now represents. Mr. Pratt has been eminently successful in his new connection, as recited elsewhere in our trade notes.

E. J. WESSELS, formerly manager for the Short Electric Railway Company, will handle the business of the Genett air brake in the East. His long experience and wide acquaintance will make his services specially valuable, and his many friends will wish him the success he is sure to achieve.

ADOLPH SUTRO, the capitalist, and the Southern Pacific's street railway syndicate, have been having a lively time at St. Francisco. The Cliff House, Sutro Heights, has always been a popular resort, and it is owned by Mr. Sutro. A fare of ten cents has been instituted by the railway company, to the resort, which materially diminishes traffic. After much logic and many conferences nothing could be done with the railway company, so Mr. Sutro takes heroic measures and builds a high board fence around his property, shutting out both view and traffic. The public will not care to view a dead wall covered with soap advertisements, and so the road is expected to lose money or come to a five-cent fare.

CHAS. J. MAYER, 600 Betz building, Philadelphia, is meeting with continued good success, and reports a constantly increasing business. The Nuttall specialties are much sought after, and Mr. Mayer's long experience with the wants of railway men enables him to know just what is required. The Macallen sheet mica is also handled by Mr. Mayer.

THE Hubley Manufacturing Company, of Lancaster, Pa., are rapidly making themselves known and felt as one of the most progressive supply houses in the trade. And they can show a record, too. Trolley wheels of their make, having made 10,000 miles, are still going, with a good start on the second ten thousand. In harps, they lay special stress on their light and strong construction, and as being very low priced. Motor and dynamo bearings of their make are guaranteed to give 20 per cent longer life than any other. In overhead fixtures they make a complete line. Users speak very highly of the Hubley supplies.

### Custer's Last Battlefield.

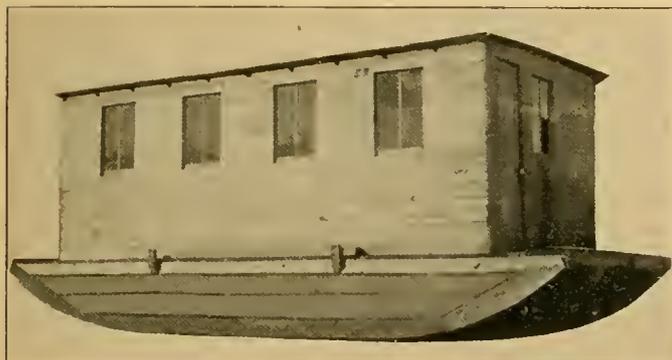

A visit to this spot, which is now a National Cemetery, is extremely interesting. Here, seventeen years ago, General Custer and five companies of the Seventh U. S. Cavalry, numbering over 200 officers and men, were cut to pieces by the Sioux Indians and allied tribes under Sitting Bull. The battlefield, the valley of the Little Big Horn, located some forty odd miles south of Custer, Montana, a station on the Northern Pacific Railroad, can be easily reached by stage. If you will write Chas. F. Fee, St. Paul, Minnesota, inclosing four cents in postage, he will send you a handsomely illustrated 100 page book, free of charge, in which you will find a graphic account of the sad catastrophe which overtook the brave Custer and his followers in the valley of the Little Big Horn, in June, '76.

## A CABLE RAILWAY ON THE ICE.

The Amphibian of Duluth and Superior.—Crossing Cold Superior on the Ice.—An Unique Idea.

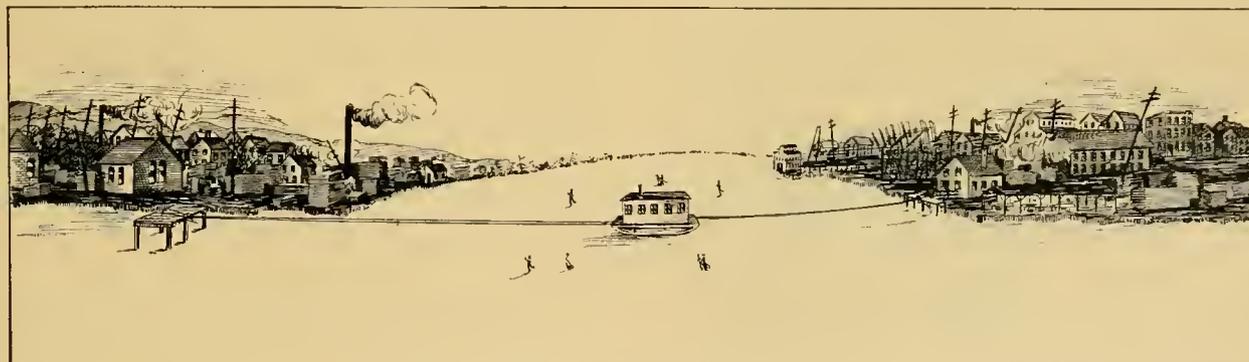

The REVIEW has in its day illustrated a number of unique forms of transit, some practical and some only curiosities. To the practical category, however, belongs the idea brought out in the story of the Duluth-Superior ferry barge, last winter, and which was the joint idea of that competent and progressive street railway man, H.

THE ICE FERRY SCOW.

M. Sloan, superintendent of the Superior Rapid Transit Company, Superior, Wis., and A. C. Majo, a bright marine designer.

The details of the matter were placed in the hands of A. C. Majo, who forthwith began to devise a means of giving street railway passengers a continuous trip, both summer and winter, across the icy waters of the bay, dividing Duluth, Minn., and West Superior, Wis. The present article described is the means of winter passage.

Mr. Majo says, in relation to the work: "Though a sailor by profession, with the trackless deep as a right of way, and while I have seen times when joints were low and the whole roadbed needed surfacing badly, still I presume any novelty connected with passenger transportation will be of interest to REVIEW readers."

"While engaged in the ferry service between Connor's Point, Superior, and Rice's Point, Duluth, it occurred to me that the service could be continued throughout the winter when the ice had formed and navigation was impossible."

Briefly, the idea was to provide a scow with a cabin and a pair of runners, using a cable as a motive power. This plan was accepted by the Duluth and Superior street railway managements and the construction of the scow begun. The plan was enlarged to admit of the use of the vessel in water during the times of bad ice in early spring, as well as on the hard surface in the winter time. It was regarded as possible, however, that its use as a sailing vessel would be limited, as judicious sprinkling of the roadway would render the ice thick and smooth enough to keep up the weight a little time after the surrounding ice had yielded up part of its strength to spring-time's approach. After this date of course, regular ferry business between the cities would be resumed.

The scow, an engraving of which we present, is 10 feet wide by 26 feet long by 34 inches deep. Six truss gunwales of 4 by 6-inch pine add strength; it is planked with 2-inch pine, with deck and all securely caulked and sheathed with iron. The cabin extends the whole width of the vessel, leaving three feet at each end for a platform. The runners are two in number and made of 4 by 6-inch oak, steel shod.

The distance between the two landing points is 1,200 feet, and to propel this amphibian a cable plant was improvised. The power plant was situated on the Superior side of the channel and consisted of two 20-horsepower motors geared to two 3-foot drums, or strictly speaking, to one drum, for the second mentioned served as the idler and also as a tension carriage, being set in a sliding bed, from the end of which was attached a chain which ran over pulleys to a weighted box. A sheave was set on the dock at the Duluth end for the terminal sheave. The cable used is an inch steel rope with the necessary carrying and guiding pulleys. This was all the

propelling machinery required. The rope was run over the deck of the scow, which is provided with two simple screw grips, one at each end of the boat, to control the motion.

After a few alterations the boat started regular trips the first of January. On March 15th, the ice gave way at a point 1000 feet from the Superior shore. This was the anxious moment, but the amphibian did all that was expected of her, by sliding from the ice into the water, crossing the water and mounting the ice again, without a hitch. The break in the ice extended 150 feet and from

that point to the shore the ice was three feet thick and solid to within 200 feet of the Duluth landing. It was thought afterwards advisable to cut a channel from one side to the other, but it was soon found that the floating ice was a graver danger than the jump from ice to water. Then, too, the passengers had become used to these leaps and did not consider them objectionable. In a short time the boat broke through again on the Duluth side, so that the ferry was in and out of the water twice each half trip. On account of the heavy float ice the ferry had to be pulled off a few days before the regular boats began running. The last winter was an exceptionally open one, and Mr. Majo is of the opinion that ordinary winters will find the amphibian a great convenience to the inhabitants of the two cities. Our sketch of the cable arrangement shows its simplicity and we think that the Superior and Duluth populace may be well proud of two such enterprising and ingenious citizens as Superintendent Sloan and Engineer Majo have proven themselves.

The success of the plan opens up a field, perhaps, for further experiment on the subject, and no doubt the coming year will chronicle a number of other applications of electric power to cable traction for ferry purposes.

#### DEATH OF JOHN H. DALZELL.

John H. Dalzell, one of the best known citizens of Pittsburgh, Pa., died at his home in Allegheny City, May 29. Mr. Dalzell was one of the earliest capitalists to invest in electric traction and was a large stockholder in several lines, as well as president of the Allegheny & Manchester Traction Company. Mr. Dalzell made his money in the early days of the oil business. He was a man of large public spirit, a college graduate and a business man of exceptional foresight and courage. He was connected with several manufacturing concerns and banks in an official capacity. He leaves a wife and two daughters.

JOHN H. DALZELL.

A RUNAWAY hog, at Louisville, Ky., recently made great diversion for the populace by lying down in a nice muddy puddle between the street railway tracks, and refusing to "git" when urged to do so by the owner. The pig weighed several hundred pounds, and the combined efforts of a dozen darkies were required to remove him.

#### ELECTRIC LAUNCHES FOR PLEASURE RESORTS.

Electric launches afford an excellent attraction for street railway pleasure resorts which are fortunate enough to have a body of water on which to operate them. Probably this has occurred to a great many superintendents who saw the electric launches gliding over the lagoons at the World's Fair last summer. The opportunity now offered by the General Electric Launch Company for the purchase of a number of those in use at the fair by street railways will doubtless be taken

advantage of by a number of companies. These launches can be charged from the railway's own circuit or any other source of electric power. The boats are staunch and can ride in quite rough water. They seat 30 passengers and can be run all day on one charge, which can be given at night. The length over all is 36 feet; the beam is 6½ feet and when loaded they draw 30 inches of water. They require less care than other mechanically propelled boats, besides being vastly more attractive and neat. The appearance at night, when electrically lighted, is in itself enough to settle any doubt as to this. They ought to be a good investment.

THE extension of the Liverpool elevated railway to Seaforth was inaugurated last month.

THE Barmen, Germany, town council has decided to compel the Elberfeld-Barmen street railway to put in electric traction.

WILBUR B. ALLEN, the genial and popular representative of the Brownell Car Company, spent several days in Chicago last week.

THE Independent Electric Company, Chicago, has issued a neat pamphlet, giving descriptions and price of the Independent trolley marketed by the company.

THE Berlin Iron Bridge Company has the contract for the power station of the Electrical Association of Waterbury, Conn. The building will be 66 by 183 feet, brick, with a Berlin patent anti-condensation roof.

O. W. RUSSELL, advertising manager for the Link-Belt Machinery Company, has issued an attractive catalogue of the Link-Belt manufactures. It is one of the best arranged that has come to our notice.

Editor.

F. S. KENFIELD,  
Business Manager.

**CORRESPONDENCE.**

We cordially invite correspondence on all subjects of interest to those engaged in any branch of Street Railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers. Address:

THE STREET RAILWAY REVIEW,

269 Dearborn Street, Chicago.

Eastern Office, Room 14, No. 126 Liberty Street, New York.

This paper member Chicago Publishers' Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. 4.

JULY 15, 1894

NO. 7.

**Contributions.**—*Subscribers and others will materially assist us in making our news accurate and complete if they will send us early information of events which take place under their observation, such as changes in railroad officers, organizations and changes of companies in their management, particulars as to the business of the letting, progress and completion of contracts for new work or important improvements, experiments in construction and operation, and suggestions as to improvement. Discussions of subjects pertaining to ALL DEPARTMENTS of street railroad business, by men practically acquainted with them, are especially desired. Officers will oblige us by forwarding early copies of notices of meetings, elections, appointments, and especially annual reports, some notice, of all of which will be published.*

THE "vestibule" law has been declared by the supreme court of Minnesota as constitutional, and it is to be expected that the electric cars of the twin cities will be adorned accordingly next winter.

ANOTHER argument in favor of electricity for elevated roads. A little girl walking beneath the elevated road in Brooklyn was burned to death by her dress catching fire from a live coal dropped by a passing train.

THE Michigan Central Railroad is crossed by an electric line at Saginaw. When the trolley wire was hung the railroad notified the electric people to raise the wire from 22 to 24 feet, and on their failure to do so, executed a threat to cut the wires, doing so at a time of day most inconvenient to the street railway. Suit was brought for damages, which have been allowed in the supreme court of the state.

BALTIMORE is one of the most "legislated" street car cities in the country, and as may well be surmised, the result is productive of little benefit to the public and much annoyance to the roads. The latest is an order requiring cars or trains not to approach nearer than 50 feet to the one ahead. As the electrics are 28 feet and the cable trains 52 feet in length, it is readily seen that under the rule the former must occupy not less than 78 and the latter 102 feet of street. In the business portion of the city this cannot fail to work much hardship, not only on the company, but cause serious inconvenience to the public.

BIDDING on engineering contracts in Egypt does not seem to meet with much favor among English manufacturers. Only recently an English contractor has brought suit for the recovery of \$10,000, forfeit money, put up with his bid, for constructing the street railway at Cairo. The facts seems to show conclusively that the contractor kept his part of the bargain to the letter, but the official authorization of the Under-Minister of Public Works was dishonored by the Mixed-Tribunal—whatever that august body may be—and the contractor lost his case, and his money. American builders thinking of bidding on the Cairo tramway will do well to insert a clause providing for "cash in advance."

THE past month has seen the signing of the contract for the electrical equipment of the Metropolitan Elevated Railroad of Chicago. This equipment will be the first real invasion of the steam locomotive field by electricity. The contract, which was awarded to the General Electric Company, calls for two 1,500 kilowatt and two 800 kilowatt direct connected generators, and 55 motor cars, with two 100-horse-power motors each. These motors will be sufficient to operate three car trains, and as the traffic requires longer trains in the future, the number of motors will be increased to four to a car. There is reason for gratification in the fact that so strong a company as the Metropolitan has made this move, and we predict that the use of electricity will be even more satisfactory than was anticipated in the same way that electric surface traction developed unthought of advantages.

How so elaborate a publication as the REVIEW can be furnished for two dollars a year is a frequent query from our readers. We cannot better answer than to quote from that brainiest of American lady journalists, who, in her "Kate Field's Washington," says:

"If you are a scrupulous person, you will always read all the advertisements in the back of your magazine, as it is on the supposition that you will do this that you get it at a price below the cost of production."

Aside from any obligation which the reader of an expensive publication at a low price may have, our advertising pages will be found extremely valuable reading, representing everything new and advanced in operative practice, and including all the best and most progressive manufacturers. It is an almost daily occurrence

for managers to write or tell us they peruse the advertising pages with the same care and thoroughness which they bestow upon the reading articles.

THERE are times in the development of every science or industry when a large number of inventors are induced to work simultaneously on the same problem, and, public opinion to the contrary notwithstanding, there will invariably be a number of men who arrive at the same results at about the same time. It is now an utter impossibility to establish in the courts fundamental patents on any class of apparatus which has been worked upon simultaneously by a great many able inventors. The man or company that is first in the commercial field with any new apparatus is invariably the one that is successful, provided of course that business ability is present and the apparatus is not a manifest infringement from the start. The swarm of devices brought to light by the fifty thousand dollar Metropolitan prize bids fair to result in innumerable conflicts of claims in the patent office as to priority of invention.

A CHICAGO daily paper takes exception to the use of the word "lady" as used by conductors in addressing female passengers. The word is probably used unnecessarily by some employes, but there is an absolute need of some such word and we would meekly inquire what word can be used in its place? "Madam" would bring down the wrath of the young lady patrons, and "Miss" would have a like effect when wrongly applied or addressed to some maiden ladies of forty. There is one term, however, that is sufficiently broad and which we would recommend to the daily in question. "Woman" has a sanctimonious scriptural sound and would be very effective on some occasions. "Woman have a care," "woman make haste," or "woman arise, this is Twenty-first street," if delivered with the proper dramatic inflection, would create a small revolution in modern street car travel and tend to relieve a journey of its monotony.

THE Omaha city council had an attack of the slow speed ordinance, and things looked very hopeful, from the council point of view, of its becoming a law. When interviewed on the subject, Manager Smith was radiant. Hadn't been under the impression that it was such a good thing, but now his attention was directed to the matter, wondered why he had failed to comprehend the beauties of the scheme long ago. In fact, he was greatly taken with the plan. This emphatic declaration of harmonious opinion was a poser to the aldermen, but it wasn't a circumstance to the row raised the next morning, when every car in the city crawled along at exactly two miles an hour. And they did it all day, and the next day; and when the frenzied populace let up on the aldermen, it was quite unnecessary for Manager Smith to even attend the council meeting when the ordinance came up, and promptly went down again—into the waste basket.

ACCIDENT insurance has proved alike unsatisfactory to street railways and the companies which accepted their risks. As set forth elsewhere in this number, it is one of the most difficult and uncertain matters to fairly estimate the proper premium in any special case. What constitutes a good basis of estimate in one city utterly fails in another, and so after vigorously inviting the business for several years, the accident companies are now turning a cold shoulder. There are several reasons why insurance companies cannot handle this business as economically as the roads themselves. This is accounted for in several ways. With no insurance, employes are more careful. Witnesses will often consent to appear in court through friendship for employes, or on account of past or future favors from the road, who would otherwise profess ignorance of the facts, to avoid the annoyance of witness duty. Roads are more apt to discipline careless employes when uninsured than when no insurance is carried. Other reasons may be mentioned. The whole matter seems to simmer down to the proposition: Where a risk would be profitable for a company the road cannot afford it, and where it would be profitable for the road the insurance people do not care to take the business.

ONE of the most absurd moves ever made by a public official was recently made by the sheriff at Omaha. A suit for personal damages resulted in a verdict for \$5,500 against the company. After the case was tried in both the lower and supreme courts, the company discovered new evidence and tried to have the case reopened, but the supreme court refused, and a mandamus was handed down on which the attorneys for plaintiff got the sheriff to levy on some cars. The mandamus was presented for payment at the street railway office at a time when the officers were absent and the company knew nothing of the mandamus having been sent down. Meanwhile the sheriff levied on the cars in service at the most important point of the system, effectually blockading traffic for several hours during the rush of the evening. Public opinion naturally gave the sheriff a good "roasting." Finally an injunction was obtained against the sheriff and the cars returned to the company. The case was taken before the court. After a day's proceedings, the prosecuting attorneys, who raised the commotion, and the sheriff, got scared, and offered to pay damages and costs and allow the injunction to be perpetual against the sheriff if the street railway would pay the original judgment. This was done; the judge entered stipulations accordingly, and stated that this was about the way he would have decided it. The sheriff evidently wanted to cause all the inconvenience possible as there were plenty of cars in the barn. He and the attorneys have now had \$210 worth of spite, and we presume they do not care about taking any more until prices are lower.

ON a prominent interurban line crossing a river on a bridge nearly 100 feet above the water, a car struck a paving block which had fallen from a passing wagon,

derailing the rear truck, and before the car could be stopped, one truck had left the track and the end of the car crushed through the wooden railing and overhung the terrible abyss. As usual, the passengers made a wild rush for exit, and with great difficulty and considerable presence of mind, the conductor drove them back, fearing the increased weight thus massed at one end might overbalance the car body and hurl them all to destruction. Fortunately the car held the bridge, no lives were lost, and the material damage was repaired in a few hours. The occurrence, however, suggests dangers too great to be passed unnoticed. We find that while the bridge is ironed with a heavy T rail, there was no guard rail used, and that cars have been crossing at a high rate of speed. Had the accident fulfilled its possibilities, the consequences would have been simply awful, and in all probability resulted in as many fatalities as there were passengers. And in such event the company could not have been exonerated of blame. No road operating over perilous places, as this, has any right to neglect all reasonable and established methods of precaution. It was a small obstruction which derailed the car, but at any moment a wheel or axle might have given way, or any one of many unlikely circumstances happened, and with disastrous consequences. The lesson for us all is, that on high, exposed construction, strong guard rails be adopted, and that less speed and greater safety at such points will not be unsatisfactory to the riding public.

THE postal authorities, both general and local, are rapidly awakening to the importance of using street railway lines for a more rapid delivery of mails, especially in large cities, and smaller cities where the centers of population are scattered. The high degree of success which has attended all the attempts thus far made has been very satisfactory both to the department and the public, and the decision during the past month to adapt the system to Chicago and Brooklyn, again draws attention to the possibilities in other cities which have so far made no move in the matter. Where the local conditions and geography of the sub-stations permit, the carriage of mails should be secured at the earliest possible moment. And the man to study out and urge this is the general manager of the street car company, for the plan has very much to commend itself to him, and there can be few, and minor, if any, objections. While the revenue is not great, it is worth having, and even if the operation of mail cars brought no profit, there are other reasons which make them highly desirable. Fortunately, the question of expense to the department will not stand in the way of this desired advance, for the expense of haulage over rails in cars is not as great as the same and slower service as at present with wagons. It is to be hoped the institution of the street car mail service already in operation will be carefully studied and promptly taken up by all progressive street railroaders, and its general adoption achieved in the near future on many mechanically operated lines. For interurban purposes it is already

proving a great saving in time, and affording frequency and promptness in the delivery of mails to many points heretofore limited to one mail or less per day.

SO MUCH has been printed in the daily press of the country, descriptive of the great labor eruption, we need scarcely more than refer to the event, which a few months later will appear to the misguided strikers, as it has all along to thoughtful persons, as a phenomenal exhibition of want of common sense. Because a parcel of carpenters in a little town out in the borders of this city were unsuccessful in dictating to their former employer, they vent their spite on a generous public, and drag in thousands of well meaning workingmen, who have absolutely no grievance of their own, and who in many cases have deliberately broken faith and contracts made a few months since. That many such have gone out under duress, and had at heart no sympathy in the unholy cause, there can be no doubt. But having put their heads in the noose, they cannot complain when ambitious, ignorant and criminal leaders pull the rope and throttle them. The president of the United States has won the respect and confidence of all true Americans by his prompt and wise movement of federal forces to the suppression of mob rule, and the maintenance of the majesty and dignity of the law and the government. Chicago has been given her hour of greatest peril, and the state a disgraceful humiliation, to be contemplated only with shame, by the encouragement of riot and arson through the connivance of an office seeking mayor and an anarchist governor; neither of whom raised a rebuking hand until a dangerous foreign element had trampled upon the law and its officers, and insulted the flag. The attempt to further cripple the breast which nourishes them, by calling out the building and other trades, cannot fail of defeat. Already it is a failure. The street car men, of whom there are some 10,000 in Chicago, will not go out, Debs to the contrary notwithstanding. Others have already refused, and the bluff has fallen flat. Nor can it be otherwise, with three idle men for every one employed, even were the "strike order" not an unrighteous one. The friends of labor cannot but deplore the backset which must be the inevitable result of this foolish and sinful attempt to overturn the natural laws of supply and demand. The proportion of those who have seized upon this opportunity to show their lawlessness is but a handful when compared to the great body of order loving Americans, who hold country dearer than all else, and millions of whom are ready, as in '76 and '61, to rise in the majesty of truth and right and crush out irresistibly the growing element of anarchy.

INSURANCE men in New York City are indignant because the Broadway Cable Company have built a wreck wagon resembling in many respects the patrol of the insurance department. We were not aware that the insurance people held in fee simple any rights of this kind.

## HOW PORTLAND PADDLED.

The June floods in Oregon generally give some anxiety to the street railway men of Portland and vicinity. This year the anxiety was not fruitless, as the rains descended and the floods came, enough to scare Noah and his ark. The electric lines were the first to feel the inconvenience, but all the low lying districts were more or less incommoded by the high water. The cause of the flood was the tremendous rain in the up country and the consequent rising of the great Columbia river. For about ten days the good people of Portland had to turn to aquatic exercises, nolens volens, and he who possessed a water craft, from a raft to a steam yacht, was in it in several senses of the term.

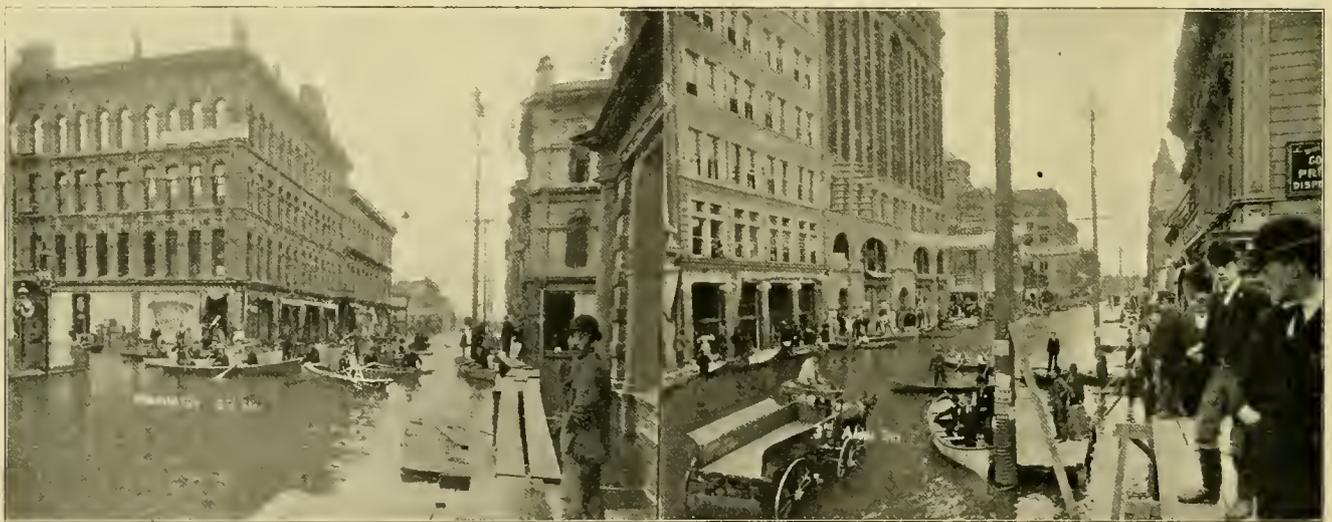

The water rose to such an extent that the engines were stopped in one electric railway power plant, although no serious damage was done.

## NEW PUBLICATIONS.

LIPPINCOTT'S MAGAZINE for this month has a very entertaining story by Col. King, entitled Capt. Close. It is a story of the South during the reconstruction period.

THE Walker Manufacturing Company has gotten out a neat and complete catalogue of its entire line of electrical car equipments. The Walker apparatus all being new and of very ingenious design, it will be found interesting reading.

WE are in receipt of two bulletins from the engineering department of the University of Wisconsin which will prove of value to engineers. One of them is entitled "Track," and is a lecture given at the University on the history and future of track construction by L. F. Loree,

THE GREAT FLOOD IN PORTLAND, OREGON.

The views we present of this interesting occurrence show the corners of Washington and Second streets and Third and Alder streets, both places not far from the river. The improvised gondolas and elevated sidewalks will be noticed, as well as the local Chinese coloring.

The people of Portland are never surprised when the Columbia river rises forty feet in a single night, but the floods of this season are rather more than was bargained for.

A DEPARTURE in tramway traveling has been made in Glasgow, Scotland. The tramways committee of the corporation has decided to institute half-mile stations, marked after dark by a colored lamp, on all the routes, and to charge a halfpenny for each half-mile traversed.

THE Allgemeine Electricitats Gesellschaft of Berlin, two years ago built an electric railway at Kiew, Russia. It proved so successful that three other lines in the same place were electrified, and now Kiew has thirteen kilometers of electric railway.

division superintendent of the Pennsylvania Railroad. The other pamphlet, which is of great value to young dynamo designers, is entitled "Some Practical Hints on Dynamo Design," by Gilbert Wilkes, chief engineer of the Detroit Electrical Works.

THE New York Street Railway Association proceedings for the meeting of September 9, 1893, have just been issued by Secretary Richardson. The report of the executive committee shows that five new companies joined during the year. The consolidation of other companies makes the net increase in membership two, or the total membership twenty-nine.

AMERICAN STREET RAILWAY INVESTMENTS.—Street Railway Journal, New York. Price, \$5. This is the first publication giving in a comprehensive and systematic manner, data regarding the operation and management of street railway properties. The book is put up in attractive shape, and shows an immense amount of labor. Street railway investments have increased so much in importance recently that such a work is amply justified.

## EMERGENCY AND WRECK WAGON SYSTEMS.

A Product of Modern Street Railroading—A System as Perfect as The Fire Department.

It is now about ten years since the Chicago City Railway put in use the first street railway wreck wagon for quick service. Previous to that time, the company of course, owned wreck wagons, but they were not prepared to do quick work in answering emergency calls. When a report came of a wreck, some of the men around the barn would harness up a team of horses and start for the scene of trouble. While the time made by this system would perhaps do credit to a German fire department, it was hardly up

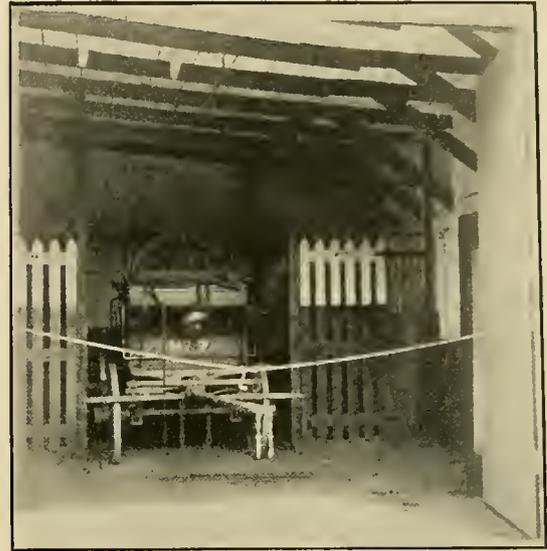

STATION NO. 1 (HORSES OUT).

to the requirements of a large cable road furnishing the daily means of transportation of several hundred thousand Chicago citizens. Delays are long enough without adding the time lost in the barn. The present system, modeled after modern fire departments, was accordingly established. Many other large roads have since taken the matter up so that the City Railway's wreck wagons are not the objects of curiosity to railway men that they once were. However, it is to be expected that as this road had the enterprise to be the first in the field it has since had the enterprise to be among the foremost in making improvements, so that a description of this system will be a description of the best practice, embodying the results of a long experience.

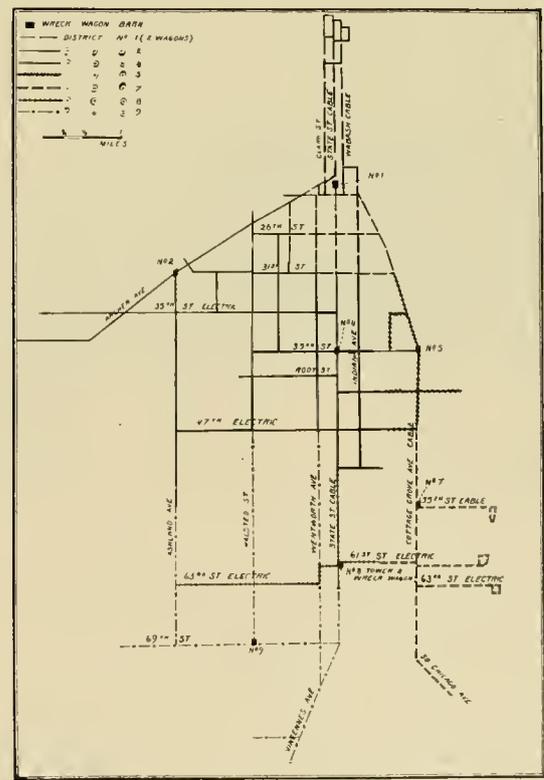

The accompanying map shows the City Railway system and the seven wreck wagon districts into which it is

divided, the districts being indicated by different kinds of lines. All routes not marked otherwise are horse lines. The most important district is of course that including the down town loops which is designated as Number 1. It

COTTAGE GROVE STATION.

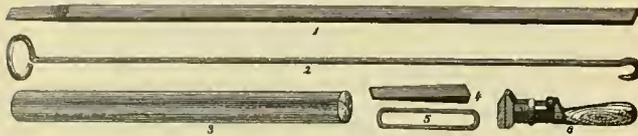

is over three miles long. The wagon is located on Twentieth street near State. At this barn the horses are kept harnessed to the wagon and the weight of the collars is taken by ropes and pulleys as in fire departments.

At the other barns they are kept under suspended harnesses and near at hand, as in the less important fire department stations. At Twentieth street two wagons are kept on account of the importance and size of the

district and as soon as the regular wagon is called out a team is hitched up to the second one to be ready to meet any other call that might come.

The tools carried on all of the wagons serving cable line territory are more numerous than those necessary for horse lines. For ordinary breakdowns of wagons on the

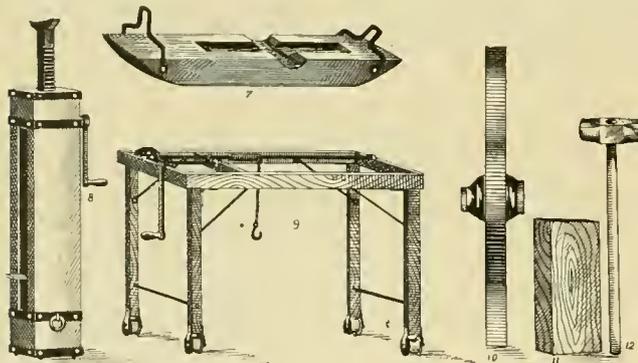

WRECK WAGON OUTFIT.

- 1. Cutting bar.
- 2. Cable hook.
- 3. Roller.
- 4. Wedge.
- 5. Coupling link.
- 6. Monkey wrench.

track or troubles independent of the cable system, the tools carried consist of:

- A skid 3½ by 5 inches.
- A rack and pinion jack.
- A 14 pound sledge.
- A wagon wheel with 4-inch bore.
- Some brake chains.
- A block of wood 6 by 8.
- A monkey wrench.
- Three 12 foot chains.
- Wooden rollers.
- Crowbars and a few coupling links.

The wagon has a rope attached to the middle of the front axle and extending back under the box. In clearing wrecks it is used as a tow rope and saves unhitching the horses from the wagon. For repairs peculiar to the cable system additional tools are needed. These are, a cable hook 5½ feet long, a cutting bar 2 by 1 inches by 5

WRECK WAGON OUTFIT.

- 7. Skid.
- 8. Jack.
- 9. Grip hoist.
- 10. Wheel, 4 inch bore.
- 11. Block of wood.
- 12. Fourteen pound sledge.

feet, for cutting grips, punches, wedges for forcing open slots, and a machine for hoisting out grips, made to be set on the edges of the gripman's aisle. For use in case of fire on the cable lines, a set of hose tripods for carrying the hose over the track so that the cars can run underneath, is kept suspended over the wagon so that it can be lowered onto the wagon at any time in case of a call to a fire.

Alarms are given by telephone to the central telephone office of the company at which place is also located a fire alarm tapper. In this way verbal alarms can be given

for the different crews and the men know before starting what to expect.

At Sixty-first and State streets is located the combination tower and wreck wagon which serves all the electric lines and does a regular wrecking service in the small district indicated on the map. However, in case the wrecking work is very heavy, another wagon is called instead.

The regular crew for a wagon consists of two men.

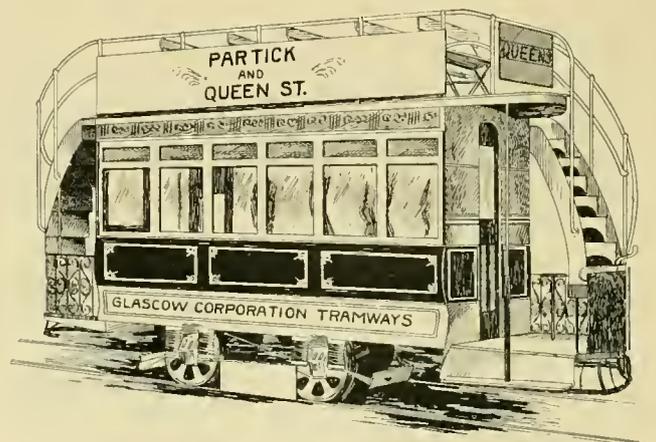

They are run two shifts to a day and do some work at the barns at which they are located.

The time made is fully equal to that made by the fire department. The run down town from Twentieth street to Madison, a distance of nearly two miles, is made almost daily inside of eight minutes. The wagon has answered calls three blocks from the barn in a minute and a half.

## THE GLASGOW MUNICIPAL TRAMWAYS.

On July 1 the tramways of Glasgow, comprising 31 miles of double track, were taken out of the hands of the company which leased them since 1870, and are now operated by the city. The lines were originally laid by

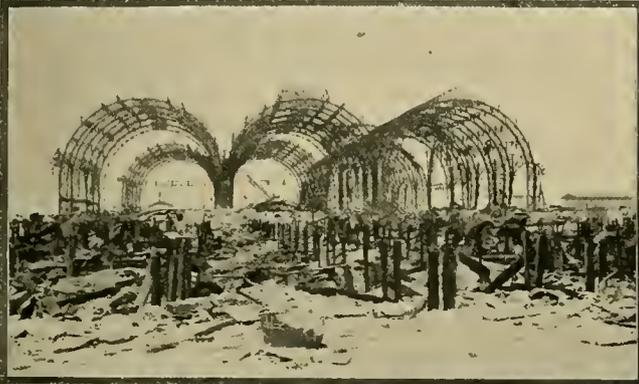

the city and have been leased to the tramway company on conditions which provided for the payment of interest

on the investment and the renewal of the track at certain periods. When the city took control, it furnished its own rolling stock and horse flesh throughout, leaving the old equipment on the company's hands. The company has been preparing for the change for some time so that the loss will not be as great as it otherwise would. The company has already an extensive express and 'bus service in the city, and the 'bus service will be still more enlarged so as to seriously compete with the tram lines. It is paying a dividend of five per cent. The city has built its own barns and shops to the number of eleven, and starts out with 250 cars and 3,000 horses. The city

guard the spot where one short year ago the earth and the inhabitants thereof gathered in the White City by the inland ocean.

The fire originated in the terminal station and spread to the Administration building, whose magnificent tower and sculptures, as if unable to bear the sight of destruction, leaped inwardly upon the fiery mass, falling in twelve minutes after igniting. The Mining and Electricity buildings and the Machinery Hall by this time were seething masses of flames, followed by Liberal Arts, and before the material gave out all that was left of the White City were the buildings mentioned. The fire department was

Machinery Hall, Looking East.

Liberal Arts, Looking North (Government Building in Distance).

Liberal Arts, Looking Southeast (Hide and Leather in Distance).

Agricultural Building (Colonade in Background).

will make its own cars and do all its own repair work. Some of the barns were built with a view of changing to mechanical traction soon.

### THE LAST GLIMPSE OF THE WORLD'S FAIR.

Just after the general pyrotechnic display of July 4, the World's Fair buildings at Jackson Park, Chicago, took it upon themselves to furnish further excitement. So on July 5, at six o'clock in the evening, the lonely relicts of the greatest of expositions bade a fiery farewell to the scene of their former grandeur, and before the sun rose next morning, only the United States Government, Fine Arts, and Transportation buildings were left to

powerless and could only devote its attention to saving the Art building, now the Field Columbian Museum. While all mourn the loss of these relics, none can feel other than that the end, though awful in its grandeur, was far more fitting and appropriate than the work of vandal wreckers.

A HITCHING-ON ordinance has been passed by the Cleveland, O., city council, with a \$5 fine penalty for its contravention.

SUPERINTENDENT HEINS, of the De Kalb Avenue Electric line, Brooklyn, discovered a motor car on fire in the barn recently. The only explanation is that an incendiary had been at work. A detective was detailed to find out the miscreant.

## PERSONALS.

J. L. McLEAN, of the Denver Tramway Company, Denver, was a recent caller at our New York office.

WILLIAM C. WILCOX, of Utica, N. Y., a prominent street railway and brewery capitalist, died last month, aged 62.

W. S. JEWELL, the general manager of the Toledo Consolidated, called on the REVIEW when in Chicago, recently.

WM. ROSSBOROUGH, formerly superintendent of the Rochester Street Railway, has been made superintendent of the Norfolk, Conn., system.

EUGENE T. WORTHING, superintendent of the Biddeford & Saco Street Railway, was severely injured by being jammed in between a post and a car, in the car barn.

PRESIDENT J. H. RHOMBERG, of the Dubuque Street Railway, says that his company will put in a new ball park, which will be so arranged that it can be turned into a skating rink in winter.

GOVERNOR BROWN, of Maryland, president of the Baltimore Traction Company, has decided to run for a second term. He is prominently mentioned also as a successor for Senator Gorman.

PRESIDENT FLYNN says that the Nassau electric railway of Brooklyn will be opened about the middle of July. An iron bridge over the Ocean Parkway at Church lane is a feature of the undertaking.

ON the retirement of Superintendent Huenerfauth, of the Mansfield, O., street railway, the employes presented to him a Knight of Pythias ring of elegant design. Mr. Huenerfauth responded by inviting the men to a dinner.

PRESIDENT LANNES and the officers of the Carrollton Railway, of New Orleans, have started a series of popular concerts at Audubon Park. The place has been refitted, cleared of under growth and rubbish and furnished with seats.

D. N. McBRIER, the genial vice-president of the Ball Engine Company, of Erie, Pa., is spending a few weeks at the Chicago office, while Western Manager McBrier takes a vacation. Mr. McBrier reports things very lively and inquiries numerous.

FRANK A. MORRELL, the ever popular representative of the Lewis & Fowler Manufacturing Company, Brooklyn, is spending a few days in Chicago, calling on his many friends, of whom few supply men can boast of more than Mr. Morrell.

J. C. BRIDGEMAN, of the Hazard Manufacturing Company, Wilkes-Barre, Pa., made us a call while in Chicago looking after the interests of his company, whose excellent cables are in use, and have been for years, on many of the cable lines in this city.

INSPECTOR RICHARD JOHNSON, who has charge of the Niagara street division of the Buffalo Railway, was decoyed into a room in the power house and presented with a gold watch by the conductors and motormen under him, at the first anniversary of his connection with the road, recently.

SUPERINTENDENT THOMAS A. ROBERTS, of the Augusta, Ga., Electric Railway Company, died June 27, of congestion of the brain. Mr. Roberts was a self-made man and rose from a conductor to his late position. His three and a half years at Augusta were marked by ability and good will from employer and employes. He leaves a young wife. Mr. Roberts came from Kansas City, Mo., where Col. Dyer met him first. Every one who knew him mourns the loss of a gentleman and a business man of worth. He was but 30 years of age.

## MASSACHUSETTS ASSOCIATION.

The Massachusetts Street Railway Association assembled for its monthly meeting, June 28, at Lakeview, Lowell, as the guests of the Lowell & Suburban Street Railway Company. The committee on entertainment was composed of Col. Percy Parker, Manager P. J. Sullivan, August Fells, W. G. Benedict, M. F. Brennan, S. B. Puffer, Ed. Conant, et al. A visit to the power station, dinner at the Lakeview Pavillion, followed by the speeches, were the main exercises, and a box party at the theatre closed the day. The meeting was one of the most widely attended ever called by the association.

The visitors present were:

THE Sterling Supply & Manufacturing Company, of New York, is putting its fender on the Broadway cars, New York. The fender is simple in construction, strong in material, and efficient in operation.

## HE HAD A STRIKE IN THE FAMILY.

The walking delegate never tired of talking of the strike, says the Detroit Free Press. He held that it was justifiable if ever a strike was, and he was prepared to demonstrate that it was perfectly proper to strike to secure any desired result. He so told his wife, and she seemed to agree with him. She said it seemed to be the easiest way of enforcing a demand.

And that night when he came home he found that the table was not set.

"I want a new dress," she said, when he asked what the trouble was.

"I know; you've been bothering me for that dress for a month," he said, "But how about supper?"

"There isn't any," she replied. "This is a strike."

"A strike?"

"Yes, a general tie-up. I've been trying to secure a peaceable settlement of this trouble for some time, but now I mean to enforce my rights."

"Mary, do you dare—?"

"O, don't talk to me that way! If I can't get you to arbitrate, why I've got to strike. I don't care if it does block the wheels of trade."

"But, Mary, you don't understand."

"O, yes, I do. I've made my demands, and they've been refused. I've asked for arbitration with a view to compromise, and that has also been refused. A strike is all that there is left, and I've struck."

"But your demands are unreasonable."

"I don't think they are."

"You're no judge."

"You're the judge of your own demands when you strike, and I'm just as good a judge as you are when I want something. It's no use talking. The strike is on."

She folded her arms in a determined way, and he subsided. It was perhaps half an hour later when he looked up and asked:

"Mary, is the strike still on?"

"It is still on," she replied.

"Aren't you hungry?"

"No. I saw that I had something in the treasury before the strike was ordered."

"Meaning the pantry?" he asked.

"Meaning the pantry," she returned.

"I believe I'll get a bite," he said.

"It's locked," she replied. "The reserve is to be used simply to keep the strike going. You can't touch the striker's resources."

"Be careful, Mary," he said, warningly. "If I shut off the cash——"

She laughed and nodded toward the pantry.

"I can stick it out a week," she returned.

Five or ten minutes later he proposed that they compromise on the basis of \$10.

"Twenty," she replied firmly.

"But that means ruin," he protested. "I can't afford it."

"That's your business," she answered. "I offered to arbitrate once."

It was 10 o'clock that night when he finally gave in, and somehow he felt that he had experienced a new phase of the strike business. It looked different from the other side of the fence.

## S. V. PICKENS, OF NORTH CAROLINA.

We have this month the pleasure of presenting to our readers the portrait of S. V. Pickens, the president, vice-president, general manager, secretary and treasurer of the Hendersonville, N. C., Street Railway Company. Mr. Pickens is a North Carolina Prohibitionist and a lawyer of eminence. Mr. Pickens was a visitor at the REVIEW office last summer, and we speak whereof we know when we say that no visitor to Hendersonville's elevated and wholesome climate should miss meeting the genial gentleman or forego a ride on the street railway in the smallest town on earth having a street railway. Mr. Pickens has a franchise for ninety-nine years, which will give Hendersonville a chance to grow and the railway to extend.

S. V. PICKENS.

## THOU SHALT NOT SMOKE.

An old ordinance has been resurrected at Indianapolis, Ind., by the zealous city law department. The ordinance provides that: "It shall be unlawful for any man to smoke a cigar, cigarette or pipe in any street car of the city of Indianapolis while the same is carrying passengers, or, waiting on any public street for passengers, in said city. Any person violating the foregoing provision shall be fined in any sum not exceeding \$100, to which may be added imprisonment not exceeding thirty days, on complaint of any citizen before the mayor." President Mason says, however, that smokers may still smoke on the three rear seats of open cars. We suggest now that if any Indianapolis man has an enemy, that he watch for infraction of this rule and haul him to the justice.

THE new purchasers of the Maryland Central Railroad, which is the Maryland end of the Baltimore & Lehigh, say that they intend to use electricity as a motive power to supersede steam. John W. Brown, of Baltimore, was the buyers' agent.

THE Aurora, Ill., street railway has resumed the use of coal, discontinuing oil fuel as too expensive.

## RAILWAY MAIL SERVICE.

Sketch of how the Mails are Handled on Railway Cars.—Possibilities of Mail Carrying by Street Railways Promises to be an Important Feature of the Future. Success of the Scheme in Various Cities.

## PART I.

There is probably no department of that magnificent business achievement of the United States government, known as the postal service, so much discussed and so little understood as the railway mail section.

Figures are delusive affairs, and as inartistic as the skeleton frame of statistics can well be, but nothing else can startle the mind into a realization of the magnitude of this branch of the public weal.

Therefore, we submit to the kind reader's attention the following data:

On June 30, 1893, there were 1,116 railway post office lines in operation, covering 146,666 miles of railway upon which 6,082 postal clerks were employed in the distribution of mail. Besides this, 36 steamboat lines, with 45 clerks assisted in these duties.

The railway postal clerks traveled in crews, 152,979-607, and the steamboat men, 1,752,062 miles. These two classes received, handled and distributed 9,772,075,810 pieces of mail matter in transit! The mind staggers at this array of figures, but the accounts at Washington attest the truth of the statement.

In addition to this immense mass, a mere bagatelle of 446,449,469 pieces were redistributed and prepared for immediate city delivery. It is to assist this latter service that the REVIEW advocates the general adoption of street railway mail service in large cities and upon interurban lines.

Of this immense number only 1,367,880 pieces were distributed "contrary to schedule" and "counted as error

It is an interesting fact that out of the 68,403 post-offices in the United States, the ten largest show aggregate receipts of 30.2 per cent of the total revenue of

EXTERIOR—RAILWAY POST OFFICE.

the department. These ten are: New York, Chicago, Philadelphia, Boston, St. Louis, Cincinnati, Brooklyn, San Francisco, Baltimore and Pittsburg. This shows also the fact of the great preponderance of the service in large cities, the expediting of which is commended by the REVIEW to the magnificent street railway systems of each city named.

The postmaster general, in his last, 1893, report, says: "At this point it is in place for me to call attention to the importance which already attaches to, and which I believe will grow from, the utilization of the electric car lines for mail transportation purposes. These companies can perform much service that would otherwise depend on the star carriers; and as the visible outlay incurred by the road is small, they are disposed to accept ordinary railroad rates for the same. My desire is, that wherever the general service can be advanced, without the duplication of routes unnecessarily, it is in the direction of improvement to make use of rapid transit, street and suburban street car lines."

The system of paying the transportation companies now in vogue is by weight per day.

The railway mail clerk is perhaps the most thoroughly competent employe of the government. He is selected by a thorough civil service examination, and only by a constant study of the duties of his position is he able to retain it.

The examination for admission to the ranks is a severe one, embracing a knowledge of orthography, penmanship, copying, arithmetic, and the geography and railway systems of the United States, especially of the state and railway mail service division in which he is to work. Having passed these examinations, he is admitted on probation for six months at a salary of \$800 per annum. When this period is passed, if he has passed his monthly examinations at a grade of 95 per cent, he receives a position at \$900 a year. If, however, his post is on a car where there is but one clerk and makes more than 80 miles a day, he receives \$1,000.

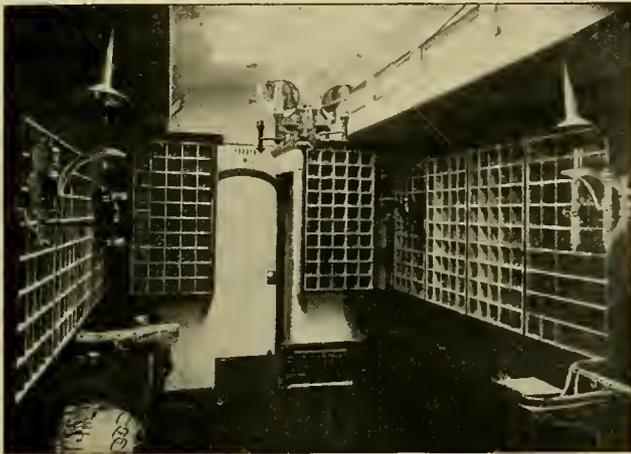

INTERIOR—RAILWAY POST OFFICE.

against the clerk." Thus for one piece incorrectly sent, 7,144 were correctly thrown. It may be stated in this connection that every piece of mail matter delayed ten minutes is counted as "error" against the clerk so delaying it.

The new clerk, on reporting for duty, finds himself in a car built after the fashion indicated in our engraving (that is, if it is a regular R. P. O. car), with several others of the staff. Two styles of cars are in use—one 60 feet long, for letter mail, and the other 40 feet, for paper mail and storage. On each side of the "paper" car, extending half its length, is a peculiar iron frame in which sacks may be hung, and when not in use, folded up against the wall. Between these iron frames are distributing tables which are movable at will of the clerks. From the tables the mail is assorted into the proper pouches. At each end of the car are stalls for the storage of the pouches after being properly marked.

In the letter car, substantially the same arrangement is found, except that only one end is used for storage, while at the other is the "letter case" and pouch rack. The former consists of numerous pigeon holes which line the walls of this end of the car from the distributing table to the roof. Different sections of these pigeon holes are devoted to the distribution of the letter mail of the various states which the clerks "work," each one being labeled with the name of a town or railway postoffice.

LETTER RACKS—RAILWAY POST OFFICE.

Into these holes the letter mail is distributed, and as fast as they, fill the letters are tied up into packages and thrown into the proper pouch hung on the pouch rack.

From the moment that the first mail wagon lumbers up to the car, the mail clerks are on the jump, dragging in the pouches, arranging them in order and finally distributing the contents as outlined. The pouches are full of letters tied up in neat packages, with slip on each package which shows the destination of the package and the name of the clerk who arranged it, his run and the date.

As soon as the pouches are opened and dumped on the distributing table and "set up," i. e., placed in proper position right side up for the mail clerk, the distribution is made by the clerks. This performance is continued to the end of the run, and the various sacks and pouches en route are disposed of by the same method. Such is life on a regular R. P. O., with variations for a combination car and a "lone man" run.

During his leisure time or lay off, the clerk has something to do besides amuse himself, namely, to prepare for his monthly examination. This latter preparation is made by means of a card system and a "scheme" by which the clerk becomes familiar, not only with his run but with every postoffice and mail receiving point in the state. To remember the route for every small postoffice and cross roads country store where mail is received, is no easy task and the mail clerk's week "off" is as hard a period of work as his regular run.

On examination, a set of cards is given the clerk, and a "case" similar to the one in his car is to be filled correctly. Besides his own state, the surrounding states must also be learned. On one line, for instance, between Indianapolis and St. Louis, the men must know the post-offices of ten states—24,000 postoffices in all. Thus, oh patriot, who would sacrifice yourself in the country's postal service, you may learn the royal road to proficiency.

In the service within city boundaries there is less detail of this kind, but nevertheless a complete knowledge of local stations, routes and methods, is necessary to the intramural mail clerk. The different streets and numbers correspond to the mail receiving points, and post-offices, and every carrier's route should be kept in mind so as to leave as few "pieces" for redistribution as possible. Where regular substations are served, the process will be more analogous to the regular steam system.

The REVIEW has already in the past noted the complete street railway mail systems at St. Louis, Mo., and at Ottawa, Canada, showing photographs of the cars in connection therewith, as well as the pouch systems of other cities.

Later attempts at intramural mail service have like systems, but without special cars.

#### IN NEW YORK CITY

the Manhattan elevated carries pouch mail to and from stations on the different lines. Col. Hain, general manager, says: "We have an agreement with the postal authorities. The mail is carried in pouches on the front platform of the forward car of such trains as suit the convenience of the department, and all matter is in charge of a United States mail agent. We transport each month about 58,000 bags."

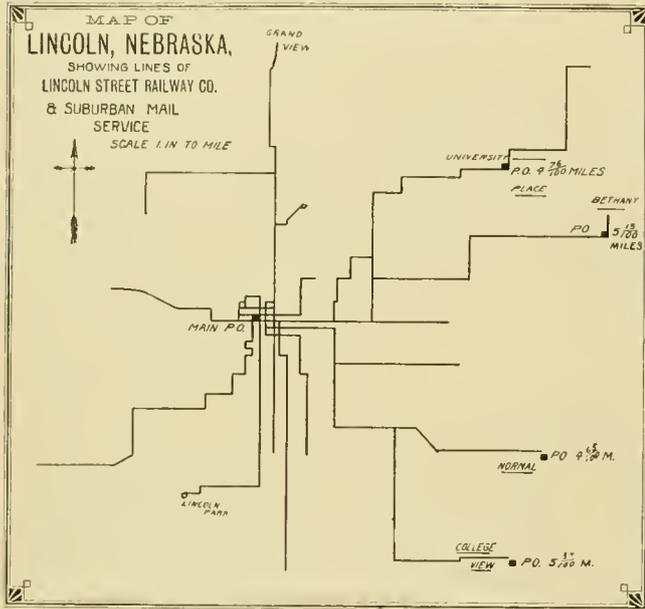

#### AT DENVER, COLO.,

the service is performed by ordinary cars. The Denver postoffice makes up locked pouches of mail which are delivered to the train crews of the electric cars to and from the suburbs of Athens, Berkeley, Edgewater, Harman, Lyman, Montclair, South Denver, the University, and between Villa Park and Barnum. The rate of pay is on the same basis as that for regular steam road routes, or at a minimum of \$42.75 per mile per annum for the mileage of each route. This arrangement in Denver not only gives quicker service between the city postoffice and the several offices surrounding reached by the electric cars, but affords opportunity for such frequency in

exchanging mails as the necessity of the patrons of the offices may at any time require.

LINCOLN, NEBRASKA,

has a complete system of intramural mail service as rep-

resented on the accompanying map. No mail car is necessary, but the pouches are carried as in the other cases mentioned upon the platform of the cars in care of the train crews. The government here also pays steam road rates, namely, \$42.75 per mile of track per year. Mail is delivered twice each day to all offices except on Sunday. This service has been in use ten months and seems eminently satisfactory to the department, the suburban residents and the street railway company. The street railway has five miles of track in this service which nets it \$213.75 a year without any additional expense or trouble.

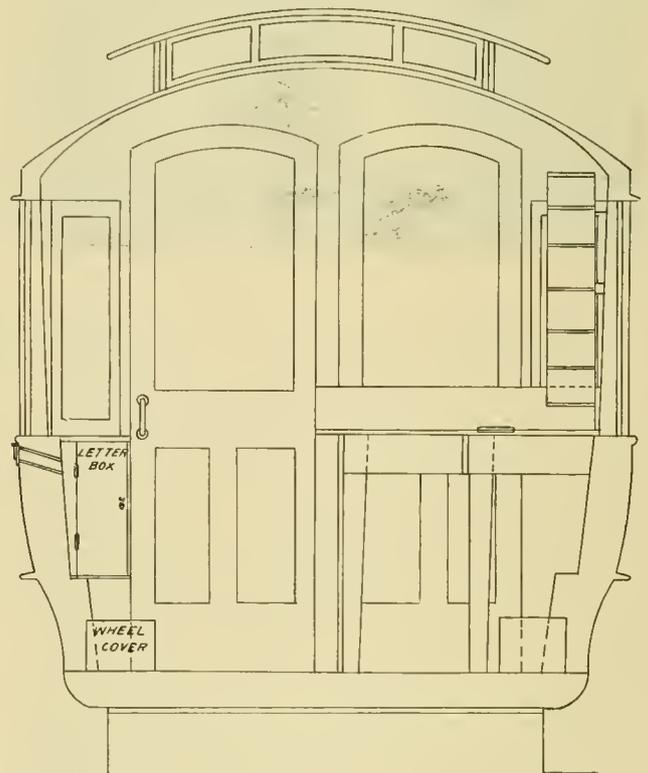

TOLEDO, O.,

has a rather more extensive system of street railway mail distribution. The route used is the Robinson system of electric railway. No mail cars are used, but the trainmen take charge of the pouches, which are made up at the postoffice and "tossed off" to the carriers along the line, thus saving them a trip to the postoffice and back. Five points of this distribution are to be made when the system is perfected. The carriers all report for the first distribution at the office, remaining each in his district until evening.

CHICAGO'S

progressive postmaster, Col. Washington Hesing, had not been in office six months before he had begun to devise some method of expediting the tremendous mail service of the second largest postoffice in the country. Having decided that the rapid transit street railway lines were most adapted to the increase in postal efficiency, Col. Hesing called into council General Manager Parsons, of the West Chicago Railroad Company; Manager

Roach, of the North Chicago, and Superintendent Bowen, of the Chicago City Railway. There were also present, J. M. Masten, department agent for contracts for carrying mails, and others from Chicago's post official staff. Three propositions were advanced, viz., mail cars specially built to run on the three different systems, with switches to allow them to go into the postoffice building. The second plan is similar to those outlined above, giving the mail into the care of the transportation companies' employees. The third is to place messengers on the cars to take care of the mail to be consigned to the various sub-stations. For instance, on West Madison street there are to be three stations, namely, the Madison street station, corner of Madison street and Center avenue, the next receiving and discharging station at Western avenue and Madison street, and the last at Crawford avenue, near the limits. The carrier in charge of the mail will start out from the postoffice on a West Madison street car. At Center avenue he will be met by an employe of the sub-station, who will receive the pouch or pouches intended for that locality and give into the charge of the messenger two pouches, one for the Western avenue sub-station and one for Crawford avenue. On reaching Western avenue, the messenger will throw off in the same manner two pouches, namely, the one from the postoffice and the other from the Center avenue station, taking on one for the Crawford sub-station. On the return trip the same process will be gone through, taking Crawford avenue mail for the Western avenue station,

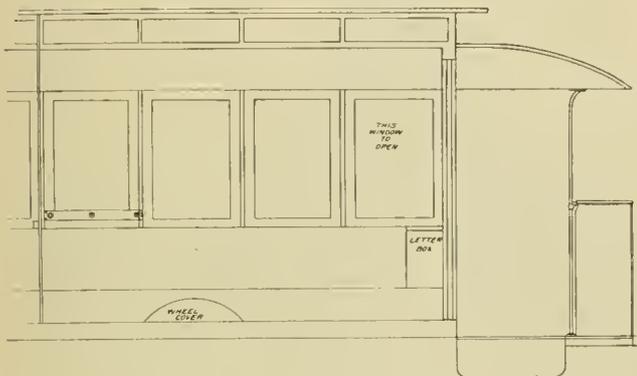

END ELEVATION—BROOKLYN STREET CAR POST OFFICE.

the Center avenue district and the main office. On the North and the South division a similar arrangement will be made and the service made from one and a half to

two hours quicker. With regular postal cars the mail may be sorted en route and for this method the REVIEW unqualifiedly declares.

BROOKLYN, N. Y.,

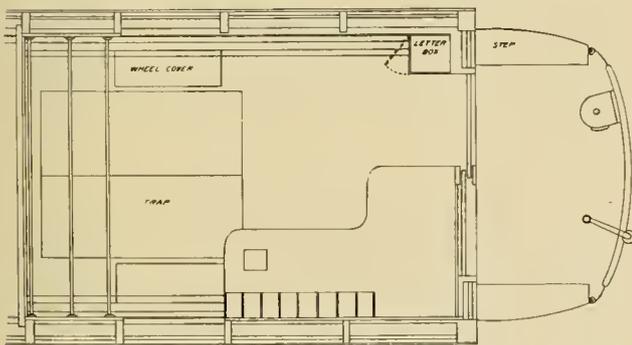

is to have a complete system of street railway postal facilities, and President Benjamin Norton, of the Atlantic Avenue Railroad Company, writes that his system has closed a contract with the government for carrying mails on the Fifth Avenue line from the main postoffice as far as Thirty-sixth street, the station at which the electric lines to Coney Island and intermediate points terminate. The plan went into effect June 25. A special car is fitted up for the transportation of the mail. One-half of it is arranged exactly like a railway postal car for steam roads and the other half is to be used by the company as a

SIDE ELEVATION—BROOKLYN POSTAL CAR.

smoker. The exterior is painted white with gold lettering. It is intended to have several of these cars as necessity demands. Nothing definite has been done as yet in regard to placing letter boxes on the cars.

Mail will be sorted on the cars en route, and a special side track into the main postoffice will facilitate the handling of the mails in and out of the building. All cars on

PLAN—BROOKLYN STREET POSTAL CAR.

the Fifth Avenue line will be allowed the privilege of being labeled "U. S. Mail," with the concomitant advantages of government protection in troublous times and an advertisement not to be disregarded.

The Atlantic avenue car, a series of plans of which we represent, is a remodelled Brownell made originally by the Brownell Car Company, St. Louis. It is divided in the center by a partition and one-half is used as a railway postoffice. By reference to the plan view it will be seen

that a letter box for the convenience of passers by is placed on one side at the end, while opposite is a sorting table, above which at one corner is a rubber mat 6 by 6 inches square for stamping purposes. Above the sorting table is a "case" of 48 boxes  $4\frac{1}{2}$  by 5 by 7 inches. These are in six rows of eight boxes each. The board is six inches high that keeps the letters on the table, and a wire net stretches to the wall so that none fall in behind the table or into the window grooves. A combination oil and electric light fixture lights the compartment. At the end of the compartment, next to the partition, is a series of  $\frac{3}{4}$  inch iron pipe, to which the pouches are hung. The sectional view shows the position of the letter box and the relative place of the table and case. The longitudinal section shows the side exterior of the car and the only window which may be opened and shut. Frank Silliman, Jr., was the designer of the car under direction of President Norton and his advisers.

THE St. Augustine Railway & Steamboat Company, of St. Augustine, Fla., will build a line to North Beach from the city. Electricity will probably be used and Charles Sperry is superintendent.

ON the Davenport and Rock Island Railway Company, Secretary J. F. Lardner has instituted a method of numbering his conductors similar to that in use elsewhere, namely, numbers on the cap over the ears, as well as in front. By this means the man's number is visible in three positions.

THE medically-expert daily press has discovered another danger in the trolley, namely, that it causes insanity. As the editorial staffs of these papers are the only victims of trolley insanity, we presume that they ought to know whereof they speak. Trolley insanity is particularly rampant in New York City, although its effects are observable in Philadelphia, where its form is trolley paresis.

SOME foolish employes on the Hammond, Whiting & East Chicago Street Railway went on a strike last month out of sympathy for the Pullman employes. They claimed that the cars on the electric railway had been leased from the Pullman Company. The cars had been bought and paid for, which, having been proved, the men went back to work. Such idiocy makes the public lose respect for organized labor.

THE subway commission of St. Louis has submitted an ordinance for the approval of the council, which demands the removal of all overhead wires in the down town district. Telephone, telegraph, electric light and electric power wires are specified, and the district named is that bounded by the north side of Cass avenue, the south side of Chouteau avenue, the west side of Twenty-second street and east of the Mississippi river. The time given for removal is by July 1, 1896, and the removal is to be at the expense of the companies owning the wires.

### THE VALUE OF AIR BRAKES.

Practical men are apt to think too lightly of the question of improved brakes. There is, of course, a great deal of rot going the rounds of the press as to what a brake should do. A brake would need to perform miracles to reach the newspaper ideal. When the safety of passengers, cars and tracks is considered, it is useless to expect much quicker stops than can be made with a good air brake. However, the real question at issue is as to whether the first cost and maintenance of some modern type of brake is not too high in proportion to the advantages gained. The question of increasing the complications under a car is included in the previous one, as it influences simply the cost of maintenance. It is impossible to figure how many dollars worth of damage claims will be avoided, how much increase in revenue the quicker schedule made possible by the improved brakes will bring, or how much advantage there will be in not being restricted to men of the Hercules type when hiring motormen. We believe that the account will foot up on the air brake side after a few months trial on roads operating electric or cable cars. There is no doubt but that the physical labor involved in working the common brake takes away from the other good qualities of a motorman; there is no doubt but that several seconds are wasted at each application of the crank and chain brake; and there is no doubt but that flat wheels are more common than they would be with air brakes. The air brake is no experiment, and can be applied to trailers with equally good results.

### COMPRESSED AIR AT WESTFIELD.

A car operated by compressed air has been running experimentally at Westfield, Mass., under the direction of J. F. Lewis, of the Rand Drill Company, and our report from that point states that the operation has been carried on without failure of any kind, and that the public are much pleased. On July 4 as high as 75 passengers were carried on the small car, and during the day 1,800 fares were collected. The operation of this car is being watched with much interest, and it is expected that the line will be equipped with this system in the near future.

### MARRIED.

George Nicholas Sargent, of the engineering firm of Almon & Sargent, Boston and New York, and Miss Alice Adelaide Proctor Poor, of Albany, N. Y., were married June 11, at the Cathedral rectory in Boston.

At noon, June 14, George Barton Muldaur, associate editor of the *Electrical Engineer*, and Miss Caroline Southmayd, of New York, were married in Christ Episcopal church, Elizabeth, N. J. The REVIEW extends congratulations to both of the happy couples.

### THE SIMONDS STEAM WAGON.

A steam wagon recently designed and built by C. L. Simonds, of Lynn, Mass., and herewith illustrated, weighs 437 pounds, and is constructed almost entirely of iron and steel. The boiler is of the porcupine type with twenty-eight square feet of heating surface. The engine is vertical, with a link motion, and cranks ninety degrees apart. There are two pumps, one for feeding the boiler with water from a ten gallon tank, and the other for supplying air to the naphtha tank. There are five large burners for burning naphtha. The exhaust steam passes

SIMONDS STEAM WAGON.

through a feed water heater to a perforated coil of pipe in the combustion chamber, destroying the noise and improving the combustion. The usual steam pressure is 100 pounds. The wagon is hung on three elliptic springs and runs ten miles an hour on ordinary roads, carrying two people.

### HELP OUT THE ATLANTA PROGRAM.

Richard McCulloch, engineer of the Cass Avenue & Fair Grounds Railway of St. Louis, was appointed a committee to report at the Atlanta Convention on "Mail, Express and Freight Service For Street Railways." A circular has been sent out by him to all the roads in the United States, requesting information on this point. The attention of companies is called to this, and we hope that there will be a response that will enable a full report.

The assignment of this paper could not have gone into better hands, and the convention is assured a very interesting and valuable paper on a most inviting subject.

SINCE the introduction of electricity the Brussels, Belgium, tramways have largely increased their receipts.

THE CARTER BRAKE.

A LITTLE OF EVERYTHING.

The Carter brake, made by the Carter Car Brake Company, of Minneapolis, belongs to the class in which the motion of the car wheels is made use of to aid in stopping the car, but differs mainly from that, inasmuch as, while most brakes of that kind are provided with the usual brake gear together with a friction clutch on the

JUDGE BAKER recently decided that John C. Shaffer, of Indianapolis, Ind., was entitled to \$25,000 commission for selling the Citizen's Street Railway to the McKee-Verner syndicate.

THE Highgate cable tramway of London is to be sold at bankrupt sale. It has been closed for eighteen months. About \$5,000 worth of repairs are necessary before it can be operated.

A PROPOSITION is advanced by the New Haven, Conn., electric railways to carry freight at night to and from the various factories on the lines between the places of business and the railroad depots and wharves.

AN unfortunate foreigner recently took literally the adjuration of an Indianapolis street car conductor to "look out." When he looked out he bumped his head \$10,000 worth—so he claimed. The court held that the company was in no wise responsible for the stupidity of the passenger, who ought to have known better on general principles.

THE State Supreme Court has decided that the Denver Tramways Company's original franchises, granted in 1885, are in full force and effect. This reverses the decision of the lower court, which invalidated the franchise.

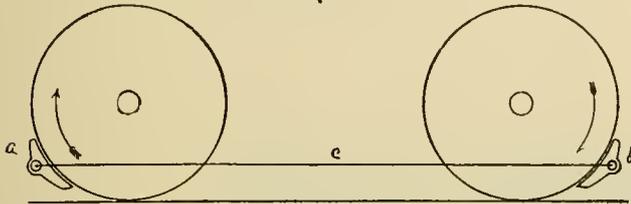

THE Pettingill-Andrews Company, of Boston, is meeting with great success in the sale of commutator bars made by the Billings & Spencer Company. The company also has a large number of overhead line material contracts.

BRIDGEPORT, Conn., has had a varied experience with street railway strikers. A few months ago the horse lines were tied up, and recently the construction men on the electric building struck. The affair was soon settled and work resumed.

THE Cincinnati, O., Railway Company recently passed a resolution thanking Superintendent John Harris for his satisfactory management of the May Musical Festival crowds, which are to Cincinnati the largest and most enthusiastic gatherings of the Queen City.

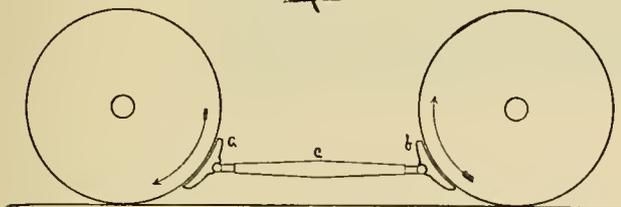

W. E. BAKER is electrical manager of the Metropolitan Elevated, Chicago, in recognition of his distinguished ability in the management of the Intramural at the World's Fair. Starting without precedent and with the most untried propositions, Mr. Baker's masterly energy brought out the success of the Intramural, and marked an era in the equipment of elevated railways. The success of the Intramural, more than any other factor, has opened the eyes of capitalists to the advantages of transmitted energy for elevated railway work, and it is safe to say that not another steam elevated will be built.

Fig. 1

axle, this brake not only simplifies the usual brake gear but is rigged in such a manner as to use the motion of the wheels direct from the shoes so that there is no extra mechanism on the axle. Figure 1 is the inward acting form of brake, and Figure 2 the outward acting. The principle of both is the same. Suppose the wheels, Figure 2, to be moving as indicated by the arrows, and the shoes are lifted so as to come against the wheels. The shoe B will be carried down upon its seat or hanger, and the shoe A will be at the same time carried up until it reaches the limit provided by the tie rod C. If the wheels are traveling in the opposite direction the reverse will be the case. The brakes thus not only apply themselves but equalize themselves. It might appear that as soon as the shoes were brought lightly against the wheels the brake would lock itself and skid the wheels, but such is not the case. The portion of the wheel at the shoe A may be considered as a very obtuse wedge, so that the power with which the brake is applied is proportional to the lifting power applied at

Fig. 2

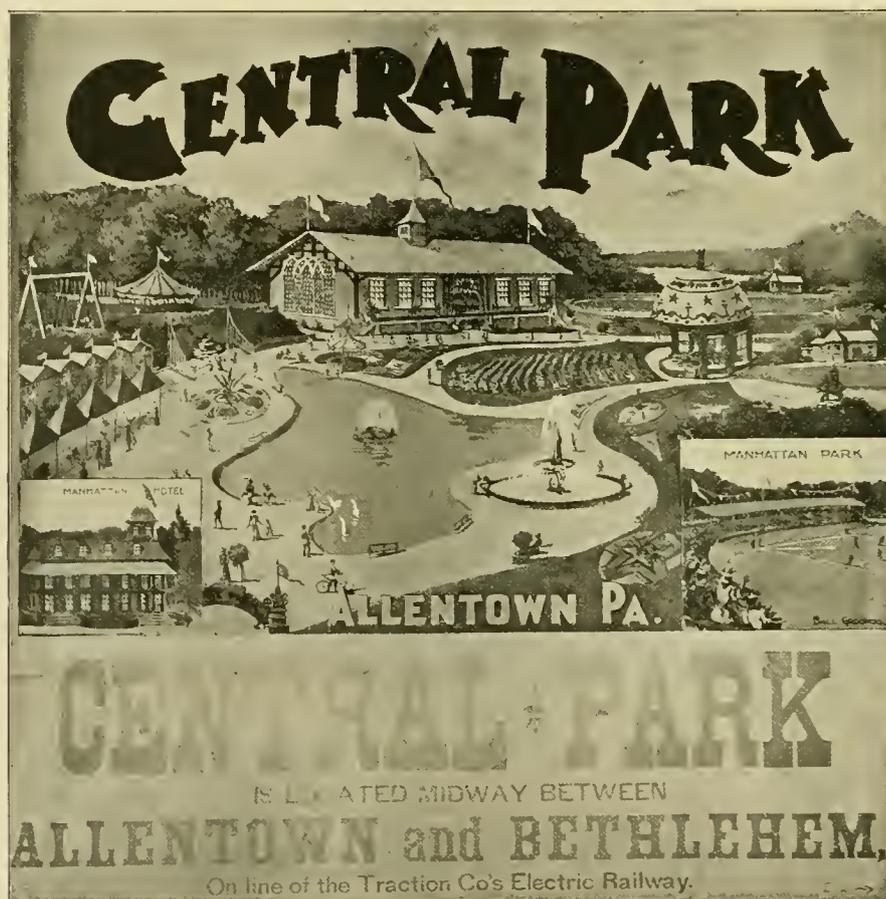

the shoe A. At the same time an immense leverage is exerted. The advantage of this is manifest. The actual leverage required is so small that a hand lever instead of a winding staff is used, saving in the time of application and allowing the motorman to carry out the correct braking principle: that is, to apply the brakes hardest at first. It is much more simple than any equalized lever system brake now in use. No springs are required to release the shoes from the wheels, as they drop of their own weight. C. G. Goodrich, vice-president of the Twin City Rapid Transit Company, says that they have carefully tested the brake; that it has proven very satisfactory, and that they desire to use it on their lines.

## CENTRAL PARK, ALLENTOWN, PA.

The accompanying engraving is a reproduction of an enormous but at the same time artistic colored poster sent out from the office of the Allentown & Bethlehem Rapid Transit Company. It is self-explanatory and tells better than words the attractions of Central Park and Manhattan Park.

THE Gleason & Bailey Manufacturing Company, of New York, reports a goodly number of orders for its hurry-up wagons for street railway service.

THE tramways in Havana, Cuba, and the suburbs, which are owned by a company called the Ferro Carril Urbano, comprise a steam tramway from Havana to Vedado, a suburb three miles distant on the seacoast, and three lines of horse trams to Castillo del Principe, Cerro, and Jesus del Monte. The fare is 2½d. or 5d., according to distance. According to the British consul-general, arrangements have been made by an English company for laying down an electric tramway. The projected line is twenty miles long, and its principle object is to connect the principal thoroughfares and wharves with the existing tramlines.

THE following table gives the time required to go two hundred feet at various rates of speed:

|                            |                          |
|----------------------------|--------------------------|
| 10 miles per hour requires | 13.6 seconds for 200 ft. |
| 11 " " " "                 | 12.4 " "                 |
| 12 " " " "                 | 11.4 " "                 |
| 13 " " " "                 | 10.5 " "                 |

| 17 " " " "                 | 8.0 " "                  |

THE Electrical World appeared July 7 in a "new dress," the style of type being changed to admit of more matter to a given space. We congratulate our contemporary on its much improved appearance, and give thanks for the greater ease with which it can be read.

THE Robinson lines, of Toledo, Ohio, have begun carrying the United States mail. The carriers make collections as usual, lock their pouches, and send them back to the post office via the street railway, in care of the conductors, who are now sworn mail agents. The mail to be distributed is treated in the same manner to the carriers in each district into which the cars run. No special car is in use.

THE official returns regarding the working of the electric tramway at Marseilles, France, show that it is being greatly appreciated by the inhabitants. During the first two months of this year, the number of passengers carried over the lines—which is about five miles long—amounted to 645,384, as against only 423,267 in the corresponding period of last year.

## ACCIDENT INSURANCE OF STREET RAILWAY COMPANIES.

Since the failure of the American Casualty Insurance Company, which created considerable stir in the street railway world there has been a decided disinclination of other employers' liability insurance companies to enter the street railway field. The American Company made a specialty of this class of risks, and to its sorrow.

The manager of the company, immediately after its fall, refused to be interviewed upon the subject, saying that he was now out of the business, and did not care to give an experience to the public that spoke of the disaster to his company. A prominent under official, who does not care to be quoted, said that the greatest difficulty experienced was the lack of reliable data from which to base the premium. "The insurance companies have absolutely no means of getting at the liability to accidents," said he, "and it would be impossible to judge whether proper precautions are taken, and whether the plant and equipment is in good order. Then, too there is the always uncertain quantity of litigation, the end of which no man can tell, because it is left to a jury which, in spite of the greatest care in selection, is always more or less prejudiced against a wealthy and powerful corporation. Our risks in some cases have been safe enough, but in others have been so costly as to completely cover anything gained from the fortunate ones."

In an interview with the manager of another company of wider scope, but which has taken street railway business as a side line, the gentleman talked very freely upon the subject.

"Our company," he said, "no longer accepts street railway business. We cannot afford to. The street railway company expects to save something by its insurance and we must make something on our risks. In England, where the business was first introduced, it was profitable because of the prevalence of horse-traction and the stringent laws in regard to the overcrowding of vehicles. There the premium may be safely reckoned at 2½ per cent of the gross proceeds of the company. Here with the radical difference in practice, with the almost universal use of mechanical traction and no laws as to the number of passengers to be carried by each car, it is safe to say that 5 per cent is the lowest possible premium at which we can make money. The street railway companies can ordinarily pay their own damages and fight their own cases for this amount and there you are. We can't afford it and they can't afford it. I am sorry to say that we have accepted risks at a less premium and am glad to state that we are out of the business now. A large number of component forces enter into this matter. When we take the risk of paying damages for the possible accidents occurring in any ordinary manufacturing establishment we know about what we are doing. The average manufacturer may expect a serious and costly accident every five years. The ordinary manufacturer, when accidents happen, does not

know what to do. A bond of sympathy exists between himself and the victim of the accident. He has been a long time and faithful servitor, and money considerations set aside, he is really sorry that the man is hurt. He tries to do what is right, but if litigation is entered he has no idea of the procedure. He goes to his lawyer and is charged \$50 to \$100 for advice. If litigation begins he has this expense, and the accident may cost him from \$500 to \$2,500. If the liability is assumed by an insurance company, all this is taken away. The company has the best of legal talent, has an experience that can not be exceeded by any manufacturer, and knows full well the tricks of shyster lawyers and rapacious relatives. It is a claim bureau of universal experience and knowledge. For a manager of a manufactory with a pay roll of \$250,000 a year, the premium amounts to from \$500 to \$1,000 according to dangers attendant. Both sides are satisfied and both gain something from the transaction. Besides this, almost every part of the plant is inspected, elevators and engineers are licensed, and the employes are competent men used to the machinery and processes and regarding each other's lives as interdependent. Boilers, engines, electric equipments and sanitary arrangements are all inspected by city officials and this item of inspection taken from the hands of the insurance companies."

"With a street railway company the conditions are almost diametrically opposed. In the first place, the street railway company has still to maintain its claim bureau if the road is a metropolitan system. The employes are rarely hurt, and constant handling of a million with safety makes them a little careless in the million and first case, and a fatal accident happens. The difficulty of inspection is one that cannot be overlooked. The employe thinks: 'Well, the accident growing out of this weak brake chain doesn't come out of the company's pocket, anyhow, and I'll just risk it. The insurance company pays for it, anyhow, and none of my mates will be hurt at any event.' Then the insurance company has no right to discharge unfaithful help, and the men know it. The insurer can recommend but not execute a discharge. This is a positive handicap, and works to our disadvantage.

"The uncertainty of the jury's verdict is another tremendous item. The public from which the jury is drawn is the natural enemy of the corporation. A man with whom you would trust your last personal dollar seems in no wise conscientious about fleecing a corporation or the government. Public sentiment is infectious, and can enter the walls of a jury room without help, let or hindrance. When a case is called, the company may expect in ninety-nine cases out of a hundred that the damages will be in a handsome amount. This means appeal, and an appeal means more money for litigation.

"Most railway companies count on 5 per cent of gross proceeds as a damage claim fund where the system is a large one. In the English practice 2½ per cent stands in this place. With steam roads, if a large number of systems would enter a pool of their claim departments it

might prove beneficial. I might also suggest a similar arrangement in a city where a number of street railways do business. This is simply a suggestion.

"In small towns, where the crowds are not so great and where the management is in close touch with the employes, the risk is considerably reduced, and in all cases as practice becomes standard the liability is lessened. But nevertheless local conditions are so much at variance, local laws are lax or severe, crowds are great or small, until it is impossible as yet to form any basis other than the 5 per cent mentioned upon which to reckon.

"One point which I am particularly desirous of bringing out is this: The doctrine of Contributory and Comparative Negligence. In many states the latter obtains in the courts and the former in all. An attorney of national reputation, residing in Chicago, says of the doctrine of comparative negligence:

"In all cases of negligence it should be borne in mind that what is known as the rule of comparative negligence" prevails in this state. (Ill.)

"It is a rule which perhaps every lawyer and every judge thinks he understands, but which probably no lawyer and no judge could satisfactorily explain, as the supreme court has held again and again that no plaintiff can recover unless he alleges in his declaration and proves that he was in the exercise of due care and diligence. At the same time the courts sanction such instructions as the following:

"The courts instruct the jury that the plaintiff, before he can recover, must show by the evidence that he was in the exercise of due care and diligence for his safety at and immediately before the time of the accident. But if you find from the evidence that, at or immediately before the time of the accident, the plaintiff was guilty of some slight negligence, but that the defendant was guilty of gross negligence, and that the negligence of the plaintiff, in comparison with the negligence of the defendant, was slight, and that the negligence of the defendant, in comparison with the negligence of the plaintiff, was gross, and the accident was the result of the negligence of the defendant, then your verdict must be in favor of the plaintiff.

"This gives an additional onus for the defendant and enters into the uncertainties of accident litigation and settlement."

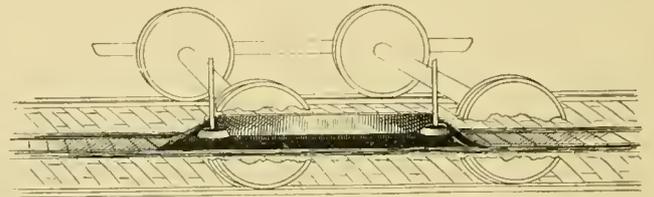

PRESQUE ISLE PARK, on the line of the Marquette City & Presque Isle street railway, Marquette, Mich., has opened for the summer. Music and dancing are the principal attractions.

A LANCASTER (Pa.) man has recovered \$18,000 for the loss of an arm in a street railway accident. He sued for \$25,000. This is one of the largest, if not the largest, amounts ever recovered for a single limb.

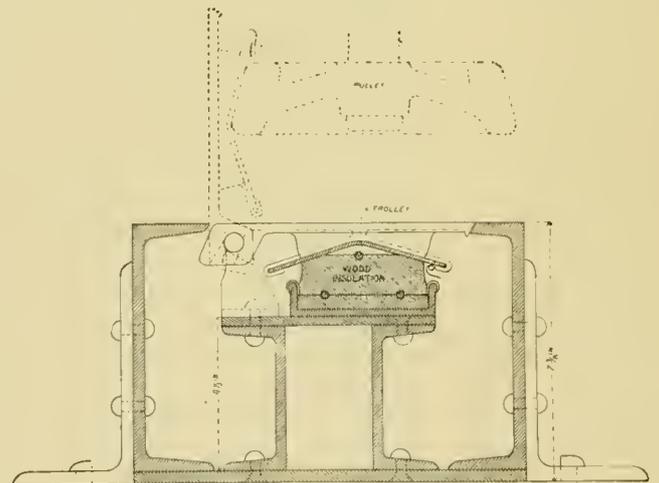

A DRUNKEN man at Boston recently made three attempts to get run over by electric cars, but the quickness of the motormen in each case saved his life. Another tribute to the "careless and irresponsible" employe.

## THE KING CONDUIT AT WASHINGTON.

A short section of the Bethesda Park branch of the Georgetown & Tenallytown Railway at Washington has been fitted up with a conduit system which is the invention of F. L. King, Hutchins building, Washington, D. C. It is of a very peculiar and novel construction. The conduit, which is only seven inches deep and rests on the ties, is covered by a series of iron trap doors. Under

these doors runs a continuous 4-ply leather belt. On the car are two pulleys which lift the cover as the car passes along and allows the trolley to make contact with the uncovered trolley wire. When the car has passed, the cover falls back into place again. The trolley wire is laid on top of a strip of insulating wood and supported on channel irons in the middle of the conduit. The sides

are left unoccupied so as to receive the dirt that would naturally accumulate around the cover edges. The cover fits down tight over the trolley wire when the conduit is closed. The leather belt of the cover is said to be water proof. The inventor's estimate as to the cost of the conduit is \$12,000 per mile of single track, including sewerage, repair of pavement and all other items. As it rests on top of the ties it can be put on track already laid.

A MILWAUKEE shoemaker in great favor with the "boys" says that the pedal gongs are a great help in his business of half soleing. Some genius ought to devise an iron plate for the right boot for motormen.

THE Salt Lake City Railway Company has built a car remodeling it from an old car. It is larger than the other cars and has a device for turning it into a semi-open car at will by lowering the windows.

OPERATING EXPENSES IN ENGLAND AND AMERICA.

W. B. Thompson, in Engineering, of London, gives some comparative figures as to the relative earning power of horse and steam tramways in England and Electric lines in the United States. He finds that in the United Kingdom the working expenses absorb from 70 to 85 per cent of the gross receipts, while on American electric lines, the percentage is from 50 to 73 per cent. After tabulating the annual reports of the West End Street Railway, of Boston, for six years past, he says of it:

“Attention is especially directed to the decrease in percentage of working costs to gross receipts, which has varied almost directly in proportion to the introduction of electric plant. This reduction has been made notwithstanding the fact that the additional investment required for the introduction of electric plant had to be provided for, and that such part of the company’s former plant as was rendered useless, or disposed of at a loss, had to be written off.”

The tramways of London and Boston are then compared. Boston had a population of 417,720 in 1890 and London 4,306,411 in 1893.

(a) London uses top-seat cars, Boston does not. Boston has to keep a double set of cars; open for summer, closed for winter.

(b) London has the greatest number of car-miles run. The majority of Boston cars are much larger than the London ones.

(c) Boston investment includes £1,500,000 spent during the last five years in re-equipping electrically.

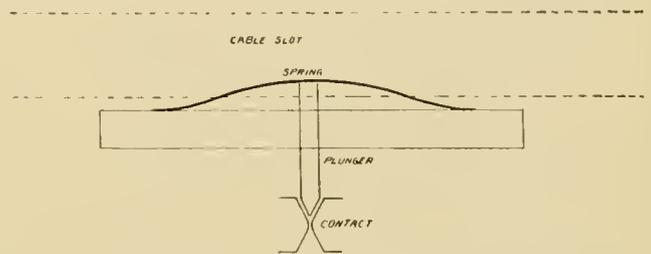

(d) If London’s percentage of expenses to receipts could be reduced from the present 82.7 to 70 per cent., net receipts would be increased to £321,174; if to 60 per cent., net receipts would be £428,231.

It is almost unnecessary to call attention to the fact that the cost of material and labor involved in the re-equipment electrically of a tramway, is much higher in America than in England.”

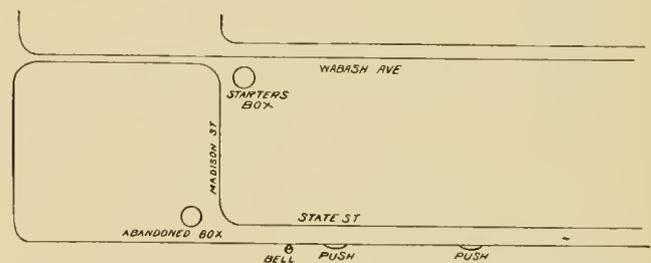

THE South Ferry cable was laid in the conduit on the Broadway, New York, system recently. It weighed 19,863 pounds and was 5,000 feet long. Ten horses were required. It is a Roebling rope.

THE NEW CAR STARTING SYSTEM OF THE CHICAGO CITY RAILWAY.

The Chicago City Railway has inaugurated a system of car starting on the down town loops of its two cable lines that has so far proved thoroughly reliable and at the same time done away with the wages of two men. Heretofore each cable line had its separate starter. The State street line had a starter at the corner of State and

Madison streets, as shown on the map, and the Wabash avenue cars were started from Wabash avenue and Madison street. The starter at the latter post now does the work formerly performed by the two and the State street box has been abandoned. At the corner of State and Madison streets, from which point the State street cars start, is located a bell in the cable conduit. This bell is connected to the starter’s box on Wabash avenue. That the starter may know when a train has arrived at

the corner of State and Madison streets, a push button is located in the slot so that it is operated by the grip shank. Farther south on the block is another push that serves the purpose of notifying the starter that the train has departed. The pushes are connected to an annunciator in the starter’s box. The push buttons are placed just under the slot rail. The grip shank strikes a flat spring which operates a plunger making the contact. The connections with the starter’s box are made with lead covered wires run in the cable conduit. The Wabash avenue cars are of course started as before.

THE Guernsey Electric Tramway, England, runs five cars, averaging seventy miles each per day, at a speed of seven miles an hour. Passengers average seven per car mile on week days and thirteen on holidays. The expenses per car mile are 11 + cents total; running expenses, 8 cents. The fare charged is 2 cents, any distance. Parcels are delivered along the route by the conductors for 2 cents. The average traffic is 15,000 passengers a week, not including holiday traffic.

## THE CORNSTALK CLUB DISCUSS THE TROLLEY.

And Decide They Want None of it in Theirs—Why the Electric Interurban is Not Adapted to the Pike Road District.

In a recent issue of a Philadelphia daily there appeared the following item:

### Farmers Discuss the Trolley Question.

At a meeting of the Gloucester County Board of Agriculture, held at Mullica Hill, the question of the trolley on the public roads was discussed, and resulted in the following resolution being adopted:

"Resolved, That it is the opinion of the Gloucester County Board of Agriculture that we do not want the trolley on our public roads, and that we do not approve of the use of public property for private corporations."

Why so important a meeting should have been dismissed with these few paltry lines we cannot understand, for the opinions of the farmers of Gloucester county are entitled to great weight, and are well known to exercise a national influence. The REVIEW, however, was present in the person of its agricultural editor, from whose shorthand notes we condense the following report:

The meeting was called to order by Farmer Turpin, who explained that the president was prevented from being present owing to the sudden illness of his red cow—the one "which was snagged on the burbed wire." Thereupon Mr. Turpin was made chairman, and after protesting he was "no hand at parlymentry," stated the object of the meeting and invited all to "speak your mind and not bein' afear'd of telling what you think on't these trolleys."

No one responded for a while, each being buried in his own meditations, until Sam Hull hitched nervously about in his seat, and after crossing and uncrossing his legs a few times, ventured with "Well now, it 'pears like it was a good thing for to me. You all knows how as its a big ten miles to Woodbury, and that them hills 'fore you get to the crick is powerful hard on a hoss, and you can't load more'n 'bout half noways, and it looks like to me as if them electic cars what can go on one side of the road where they don't do no harm to nobody and what will stop right by a man's field and like as not drive right inside the fence so you can load your truck right there, is bound to be a mighty good thing, and besides, one on 'em will hold more'n a full wagon load anyhow, and we'll have some on 'em fer hay, and some fer corn, and some more fer turnips and sich like, and you kin go to raisin' different kinds of berries and the women folks kin pick 'em and put the boxes right in the car when the men is hayin' and sich like, and when the roads is bad as they allers be in the June rise and the fall rains, it'll be 'mazing handy to git a ride to town even if you ain't got no load to take, and in winter, and in hot weather you don't kill no hosses with the sunstroke, and when the folks is

sudden sick or gets hurted on a mowin' machine and you wants the doctor, or is short of sweetin' for puttin' up presarves and can send a car to town for sugar when its onconvenient to go yourself, and out where I cum from I hear now how they got 'em and has gone to raisin' garden truck and things what they never used to raise before on account not paying to go to town with a armful of pie-plant or a box of radishes, and so believin' in progress for my part I'm satisfied as how it be a good thing, and I'd motion we have it come and the sooner the——"

SAM HULL.
